('New blastoids from the Permian of Timor, with a contribution to the systematics of the blastoids'. New Permian blastoid species, mainly from De Marez Oyens and Brouwer 1937 collections from Basleo, W Timor. Basleo area contains commeon microblastoids and microcrinoids. Of the 13 Permian blastoid genera known from Timor only two or three (Schizoblastus, Orbitremites) also occur outside Timor (But: Timoroblastus and Deltoblastus also in North Oman; Webster 2007; JTvG)

Wanner, J. (1940)- Neue Permische Lamellibranchiaten von Timor. In: H.A. Brouwer (ed.) Geological Expedition of the University of Amsterdam to the Lesser Sunda Islands, etc., 1937, 2, Noord Hollandsche Publ. Co., Amsterdam, p. 370-395.
(Permian bivalves collected by Ehrat in 1927 and Brouwer1937 expedition. Most from Basleo area, and are species of Atomodesma, already known from earlier Timor papers)

Wanner, J. (1941)- Neue Beitrage zur Kenntnis der permischen Echinodermen von Timor XV. Echinoidea. Palaeontographica, Suppl. 4, Beitr. Geologie Niederl.-Indien IV, 5, p. 295-314.
('New contributions to the knowledge of the Permian echinoderms of Timor 15- echinoids')

Wanner, J. (1941)- Neue Beitrage zur Kenntnis der permischen Echinodermen von Timor XVI. Poteriocrinidae 4 Teil. Palaeontographica, Suppl. 4, Beitr. Geologie Niederl.-Indien V, 1, p. 297-314.
('New contributions to the knowledge of the Permian echinoderms of Timor 16- Poteriocrinidae part 4')

Wanner, J. (1942)- Beitrage zur Palaontologie des Ostindischen Archipels XIX, Die Crinoidengattung *Paradoxocrinus* aus dem Perm von Timor. Zentralblatt Mineralogie Geol. Palaont., B, 7, p. 201-214.
('Contributions to the paleontology of the East Indies Archipelago 19- The crinoid genus Paradoxocrinus from the Permian of Timor'. In German)

Wanner, J. (1951)- Uber die Crinoidengattung *Timorocidaris*. Neues Jahrbuch Geol. Palaont., Monatshefte 1950, 12, p. 360-370.
('On the crinoid genus Timorocidaris')

Wanner, J. (with F. Weber) (1956)- Zur Stratigraphie vom Portuguesisch Timor. Zeitschrift Deutsche Geol. Ges. 108, p. 109-140.

('On the stratigraphy of Portuguese Timor'. Comprehensive discussion of Permian and Triassic facies in 'pseudoautochthonous'(flysch facies) and in nappe complexes (limestones, basic volcanics) of Timor Leste. Jurassic marine marls and limestones (with Buchia malayomaorica in nappe complex?).)

Wanner, J. & H. Sieverts (1935)- Zur Kenntnis der permischen Brachiopoden von Timor. 1. Lyttoniidae und ihre biologische und stammesgeschichtliche Bedeutung. Beitrage Palaeontologie des ostindischen Archipels 12, Neues Jahrbuch Mineral. Geol. Palaontologie, Beilage Band 74, B, p. 201-281.
('On the knowledge of the Permian brachiopods of Timor: 1. Lyttoniidae and their biological and evolutionary significance'. Descriptions of Lyttoniidae (incl. Leptodus, Oldhaminella, Poikilosakos) from Permian of Timor (mainly Basleo), and reconstruction of lifestyle (mostly attached to other fossils, like crinoid stems, etc.). With Lyttonia catenata n.sp., Paralyttonia transiens n.gen., n.sp., P. permica n.sp, Paralyttonia girtyi, etc.))

Ware, P. & L.O. Ichram (1997)- The role of mud volcanoes in petroleum systems: examples from Timor, the South Caspian and the Caribbean. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum systems of SE Asia and Australasia, Indon. Petroleum Assoc. (IPA), Jakarta, p. 955-970.
(Main mud volcano fields on Timor-Roti associated with Bobonaro Complex which consists of matrix of extruded scaly clays derived from Kekneno Series. Mud volcanoes common in front of thrust zones)

Warwick, D.J. (1970)- The Mesozoic geology of the area between the Ira Bere and Namalutun Rivers, Portuguese Timor. Timor Oil Ltd. Report, 11p.
(Brief report on S coast of East Timor mapping; some photos, but no maps in report ?)

Waters, J.A. (1990)- The palaeobiogeography of the Blastoidea (Echinodermata). In: W.S. McKerrow & C.R. Scotese (eds.) Palaeozoic palaeogeography and biogeography, Geol. Soc., London, Mem. 12, p. 339-352.
(Permian blastoids widespread but most diverse in SE Asia and Australia. Timor faunas Sakmarian-Asselian and Kazanian, and most diverse and abundant. Paleoecology and stratigraphy poorly understood. Some common species between Timor and Australia, but others conspicuously absent: Angioblastus, Deltoblastus not in Australia; Australoblastus not in Timor. Reasons for local endemism unclear. Kazanian Timor fauna is last successful blastoid community before going extinct)

Webster, G.D. (1998)- Distortion in the stratigraphy and biostratigraphy of Timor; a historical review with an analysis of the crinoid and blastoid faunas. In: G.R. Shi, N.W. Archbold & M. Grover (eds.) Strzelecki Int. Symp. Permian of Eastern Tethys: biostratigraphy, palaeogeography and resources. Proc. Royal Soc. Victoria. 110, 1-2, p. 45-72.
(Rich Permian Timor fossils poorly constrained stratigraphically. Two-thirds of Timor crinoid and blastoid genera unknown outside Timor)

Webster, G.D. (1998)- Palaeobiogeography of Tethys Permian crinoids. In: G.R. Shi, N.W. Archbold & M. Grover (eds.) Strzelecki Int. Symposium on Permian of Eastern Tethys: biostratigraphy, palaeogeography and resources, Proc. Royal Soc. Victoria 110, 1-2, p. 289-308.
(No Permian crinoid fauna in world as diverse and abundant as Timor. Five horizons between Sakmarian-Wuchiapingian. Australian faunas generally considered as cooler water faunas, >35°S. Timor warm-water shelf. In Artinskian greater similarity beween W Australia and Timor than between W and E Australia)

Webster, G.D. (2012)- A canted-cup Permian crinoid *Exotikocrinus* n. gen. (Crinoidea, Dichocrinidae) from Timor with comments on canted or inclined radial summits. Palaeoworld 21, p. 64-68.
(New canted-cup crinoid from W Timor described as Exotikocrinus dochmos n.gen. and n.sp.)

Webster, G.D. & S.K. Donovan (2012)- Revision of two species of ?*Ulocrinus* and a new pelecocrinid crinoid from West Timor. Palaeoworld 21, 2, p. 108-115.
(Two cladid crinoid species of ?Ulocrinus described by Wanner (1924, 1937) reinterpreted as cladid crinoid and renamed as Katerocrinus indicus n. gen., n. comb. and Dochmocrinus conoideus n. gen., n. comb.)

Webster, G.D. & S.K. Donovan (2012)- Before the extinction- Permian platyceratid gastropods attached to platycrinitid crinoids and an abnormal four-rayed *Platycrinites* s.s. *wachsmuthi* (Wanner) from West Timor. Palaeoworld 21, 3-4, p. 153-159.
(Examples of gastropods attached to Permian platycrinitid camerate crinoids from W Timor)

Webster, G.D. & S.K. Donovan (2015)- Review and revision of the West Timor Permian *Graphiocrinus* species of Johannes Wanner. Palaeoworld 24, p. 497-522.
(26 species of crinoid Graphiocrinus described from Permian of Timor by Wanner (1916-1949), but 12 belong to other genera, many others considered indeterminate members of several families. New taxa introduced)

Weiler, W. (1932)- Uber Fischreste aus der Kreide von Timor. Neues Jahrbuch Mineral. Geol. Palaontologie, Beilage Band 67, p. 287-304.
('On fish remains from the Cretaceous of Timor'. Shark teeth, believed to be of Late Cretaceous age, from red clays above Triassic Halobia Limestone in Noil Tobee, collected by Ehrat. Incl. Strophodus, Lamna, Scapanorhynchus raphiodon, Odontapsis, etc.. Branson 1937 suggested possible Permian elements(?))

Wells, N. (2005)- Redefining the Lolotoi Formation, Timor-Leste. PESA News, 12/2004, p. 36 *(Abstract only; Geology in Timor Symposium)*
(Greenschist-epidote facies metamorphism in E Timor Lolotoi Fm. Mafic precursor basalts oceanic crust? Three stages of ductile deformation and three types of brittle deformation. Fault trends 100º, 050º and N-S. Basal contact of Lolotoi Fm is >100m fault gouge with underlying Eocene units. Ductile shear zone separates Lolotoi Fm from overlying Cablac Fm. Lolotoi Fm significantly deformed prior to juxtaposition with Cablac Fm. Slivers of Lolotoi Fm involved in ductile shear zone and intercalated with base Cablac Fm suggest these two units were structurally juxtaposed. Lolotoi Fm and Aileu Fm not similar, but Mutis Complex of W Timor broadly similar)

Welter, O.A. (1914)- Die Obertriadischen Ammoniten und Nautiliden von Timor. In: J. Wanner (ed.) Palaeontologie von Timor, Schweizerbart, Stuttgart, 1, 1, p. 1-258.
(online at: http://mmtk.ginras.ru/pdf/welter1914_t3_timor.pdf)
('The Upper Triasic ammonites and nautiloids from Timor'. Monograph of ammonites collected by Molengraaff 1910-1912, Wanner 1911 and Weber 1911 W Timor expeditions. Rich assemblages with 205 Carnian-Norian species, mainly from blocks of 'Halstatter Facies' red limestone (~2m thick fossil accumulation without terrigenous sediment) from S half of W Timor. Incl. Sirenites malayicus n.sp. Some ammonites with black manganese staining. Remarkable similarities to Mediterranean and Himalayan ammonites. In N of Timor age-equivalent Norian 'Fatu' coral limestones (Both these U Triassic carbonate facies considered part of 'allochthonous' nappe complex by Wanner 1956 and others; JTvG))

Welter, O.A. (1915)- Die Ammoniten und Nautiliden der Ladinischen und Anisischen Trias von Timor. In: J. Wanner (ed.) Palaontologie von Timor 5, 10, Schweizerbart, Stuttgart, p. 71-136.
('The ammonites and nautiloids from the Ladinian and Anisian Triassic of Timor'. Rich assemblage of Middle Triassic ammonites (>27 genera) from blocks of thin, reddish, bathyal Triassic cephalopod limestones called 'Halstatt Facies' from various Timor localities, collected by Wanner and Molengraaff 1909-1911 expeditions. Associated with white tuffs and ammonites commonly with black iron-manganese coating. Ammonite assemblages more 'Alpine' than 'Asian' in character)

Welter, O.A. (1922)- Die Ammoniten der unteren Trias von Timor. In: J. Wanner (ed.) Palaeontologie von Timor 11, 19, Schweizerbart, Stuttgart, p. 83-154.
('The ammonites from the Lower Triassic of Timor'. Monograph on high-diversity (26 genera, 71 species) Lower Triassic ammonites from various Timor localities, collected by Wanner and Molengraaff 1909-1911 expeditions. Oldest horizon is yellow Meekoceras limestone from Kapan and Nifoekoko near Niki-Niki (overlying dark red Permian limestone). Other blocks are limestones with Owenites egrediens from Bihati, Anasiberites multiformis from Noil Saban and Ophiceras crassecostatum from Fatu Toekoenenu. All blocks of condensed 'Hallstatt facies' with tuffs and black manganese coating. Many similarities with Himalayan-Mediterranean Triassic faunas. No locality maps)

Welter, O.A. (1922)- Nachtrag zu den obertriadischen Ammoniten von Timor. In: J. Wanner (ed.) Palaeontologie von Timor 11, 19, Schweizerbart, Stuttgart, p. 155-159.
('Supplement to the Upper Triassic ammonites from Timor'. Descriptions of 4 additional Early Triassic ammonoid species. Genus Amarassites first described from Timor now also found in Alps. Timor 'Bihati C' fauna has more Mediterranean than Asian elements)

Wensink, H. & S. Hartosukohardjo (1990)- The paleomagnetism of Late Permian- Early Triassic and Late Triassic deposits on Timor: an Australian origin? Geophysical J. Int. 101, p. 315-328.
(Paleomagnetic work on non-recrystallized Permian Maubisse Fm red limestones from Kelamenanu and Suanae suggest paleolatitude of ~39° (averages of two localities 37.7° and 43.2°) and 55° clockwise rotation. Late Triassic Aitutu radiolarian calcilutites from Maubesi River and Sabau with Halobia and quartz arenites: paleolatitude ~33° and clockwise rotation of 25°. Results suggest presence of displaced terrane of Australian origin on Timor island)

Wensink, H. & S. Hartosukohardjo (1990)- Paleomagnetism of younger volcanics from Western Timor, Indonesia. Earth Planetary Sci. Letters 100, 1-3, p. 94-107.
(Eocene Metan volcanics from Mutis Massif, W Timor (= allochthonous Banda Terrane), formed at ~17°N, possibly on continental fragment that broke away from Gondwana in Mesozoic, shifted to SE Asia, broke away in Eocene and collided with Australia at ~3 Ma. Late Miocene obducted Manamas Fm of NW coast (=Oecussi volcanics?) pillow lavas and arc volcanics suggest paleolatitude of 8° and 45° CCW rotation of Timor in last 3 My)

Wensink, H., S. Hartosukohardjo & K. Kool (1987)- Paleomagnetism of the Nakfunu Formation of Early Cretaceous age, western Timor, Indonesia. Geologie en Mijnbouw 66, 2, p. 89-99.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0V3liNFNEeW9NdDg/view)
(Early Cretaceous (Albian?) Nakfunu Fm bathyal red clays in S Central Timor Kolbano accretionary prism probable paleolatitude of ~19-21°, probably in S Hemisphere. Today at 10°S, suggesting original site of deposition of Nakfunu sediments were 10° S of present position on Timor and sediments moved ~1200 km N since deposition in an oceanic environment. but Australian NW Shelf was closer to 30-40° S at that time, so probably formed well N of Australian Shelf)

Wichmann, A. (1882)- Gesteine von Timor nach Sammlungen von Macklot, Reinwardt und Schneider. Sammlungen Geol. Reichs-Museums Leiden, Ser. 1, 2, E.J. Brill, Leiden, p. 1-172.

('Rocks from Kisar Island', NE of Timor. Same as paper above)

Wichmann, A. (1892)- Bericht uber eine im Jahre 1888-89 im Auftrag der Niederlandischen Geographischen Gesellschaft ausgefuhrte Reise nach dem Indischen Archipel, part 4, Timor. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap ser. 2, 9, p. 161-221.
(online at: https://resolver.kb.nl/resolve?urn=MMUBA13:001625001:pdf)
(Part 3 of Wichmann geographic narrative of 1888-1889 trip for Netherlands Geographic Society (Timor, Rotti Kambing and Samau). Mainly geographic descriptions, with some of earliest observations on Timor geology. First significant collection of Permian- Jurassic fossils from E Indonesia(Timor, Roti), described by Rothpletz 1891, 1892. Also report of crystalline schists from Lakan, which Wichmann believes to be part of belt of metamorphic rocks that continues to islands of Kisar, Leti, Babar, etc. to Buru (p. 217))

Wichmann, A. (1892)- Bericht uber eine im Jahre 1888-89 im Auftrag der Niederlandischen Geographischen Gesellschaft ausgefuhrte Reise nach dem Indischen Archipel, part 5. Rotti. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap, ser. 2, 9, p. 222-276.
(Final part of Wichmann geographic narrative of 1888-1889 trip for Netherlands Geographic Society (Rotti Kambing and Samau))

Wichmann, A. (1892)- Die Insel Rotti. Petermanns Geogr. Mitteilungen 38, p. 97-103.
('The island Rotti'. Early geographic and geological observations of Roti island, SW of Timor. Geologically Roti is relatively simple, and mainly a clump of Triassic, covered by Neogene foraminifera marl. Triassic sandstones overlain by Upper Triassic limestone with 'alpine' Monotis salinaria, Halobia spp. (described by Rothpletz 1891). Mud volcanoes on Landu Peninsula in NE Roti with sedimentary rock clasts and Permian, Triassic and E-M Jurassic (Arietites, Harpoceras, Belemnites gerardi) macrossils.)

Wichmann, A. (1892)- Over het voorkomen van Alpine Trias op Timor (volgens fossielen verzameld door H.F.C. ten Kate). Natuurkundig Tijdschrift Nederlandsch-Indie 51, p. 446-447.
('On the occurrence of Alpine Triassic on Timor'. Brief note on the discovery of Triassic Halobia mollusc limestone from Timor, in float from Halemea River or Mota Muruk, Fialarang SSE of Atapupu, collected by Ten Kate. With abundant thin Monotis salinaria, a characteristic species of Norian stage in Alpine Triassic (= first record of Triassic sediments in Indonesia))

Winkler Prins, C.F. (2008)- Some spiriferid brachiopods from the Permian of Timor (Indonesia). In: G.R. Shi et al. (eds.) A memorial issue in honour of Professor Neil W. Archbold, Proc. Royal Soc. Victoria 120, 1, p. 389-400.
(online at: http://repository.naturalis.nl/document/544734)
(Revision of Permian neospiriferine and spiriferidine brachiopods from Timor in Leiden collections: Spirifer (Crassispirifer) timorensis Martin 1881 and Crassispirifer broilii Waterhouse 2004. New species Latispirifer archboldorum (ex-Spirifer fasciger) from near Noki-Niki. New genus Archboldiella based on aberrant species Spirifer basleoensis Hayasaka & Hosono 1951)

Wittouck, S.F. (1937)- Exploration of Portuguese Timor. Report of Allied Mining Corporation to Asia Investment Company, Ltd., Asia Investment Company, Ltd., Kolff & Co., Batavia, p. 1-107.
(Monograph on geology of Portuguese Timor, and the account of mineral and oil exploration work by Allied Mining. With 22 full-page maps and sketch-maps and two 1:250,000 scale maps of topography and geology)

Wittouck, S.F. (1938)- Exploration of Portuguese Timor. The Geographical J. 92, 4, p. 343-350.
(Mainly geographic summary of Timor Leste, compiled during 1936-1937 survey by Belgian mining engineer Wittouck. Oil and gas seeps in S coastal area in Aliambata, Iriamo, Suete and Suai districts)

Yamagiwa, N. (1963)- Some Triassic corals from Portuguese Timor (Palaeontological study of Portuguese Timor, I). Mem. Osaka University, Lib. Arts Educ. Branch, Nat. Sci. Mem. 12, p. 83-87.

(Short paper on U Triassic corals collected in 1961 from Fatu Laculequi near Pualaca in C Timor Leste)

Yensusnimar, D., J. Setyoko & L. Ginting (2017)- Biomarker characterization of mud volcano seepage (oil seep) and sediment samples from Atambua Field. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI (JCM 2017), Malang, 2p. *(Extended Abstract)*
(Biomarker compositions of oils from Masin Lulik mud volcano seep and surface sediments from the Atambua area, onshore Timor, show signatures of marine source facies (Pr/Ph 1.30- 1.83, absence of land plant biomarker signatures such as bicadinanes and oleananes). Low thermal maturity of oils (early mature) and surface sediments (immature). No information on sample locations or ages of rocks)

Zobell, E.A. (2007)- Origin and tectonic evolution of Gondwana sequence units accreted to the Banda Arc: a structural transect through Central East Timor. M.Sc. Thesis Brigham Young University, p. 1-83. *(Unpublished)* *(online at: http://scholarsarchive.byu.edu/cgi/viewcontent.cgi?article=1897&context=etd)*
(Petrographic analyses of Permian- Jurassic 'Gondwanan sequence' in E Timor. Detrital zircons from 'Asian' Banda unit as young as 80 Ma. Zircons from Triassic 'Gondwana sequence' no younger than ~234 Ma and with peak ages at 301 Ma and 1873 Ma, also some Archean ages. QFL ratios of Triassic greywacke of Timor suggest proximal, syn-rift, intracratonic or recycled orogen source, from NE. Mount Isa region to E has most similar peak U/Pb zircon ages, but extension of this terrane to W, which would have rifted away during Jurassic breakup, is required to account for immaturity of sandstones)

Zobell, E.A. (2007)- New insights into the stratigraphic and structural evolution of the active Banda orogen. GSA Rocky Mountain Section, 59th Ann. Mtg, 2007, p. *(Abstract only)*
(Banda arc-continent collision comprised of Australian passive margin cover sequences and portions of uplifted Banda forearc. Uplifted Banda forearc units indicate Asian affinity with maximum age of 80 Ma. Detrital zircons from sandstones of Australian continental margin sequences have peak ages at 237-353 Ma and 1788-1895 Ma. Provenance analysis of Triassic Australian-affinity greywacke consistent with proximal syn-rift intracratonic or recycled orogen source, probably from N. Structural measurements indicate N-NW to S-SE vergence direction and 30-40% shortening. Banda forearc is 200 km wide N of Savu, and completely over ridden by retro-wedge thrusting north of E Timor. Structural models constructed to test different geometries)

(Neogene deformation in Timor Sea flexure-dominated in NE, transtension-dominated to SW. Cretaceous and Upper Jurassic ductile shales and claystones cause detachment of basement from Neogene. Two major and one minor Neogene structural reactivation events: Earliest Miocene (25-23 Ma; rel. minor; =New Guinea collision?), Late Miocene (11- 5.5 Ma; related to Sumba collision/ uplift or New Guinea collision/ folding; 8 Ma seems widespread Indo-Australian event) and late E Pliocene (~3 Ma- present-day; =Timor collision). Late Miocene event widespread, with synchronous deformation through Indo-Australian plate. Dominantly right-lateral transpression in Browse, left-lateral transtension in Timor Sea)

Kihara, K., R. Feraldo, K. Chalik, T. Naito & N. Morita (2012)- Paleozoic to Mesozoic tectonostratigraphy of the Abadi gas feld, Eastern Indonesia. Proc. 36th Ann. Conv. Indon. Petroleum Assoc. IPA, Jakarta, IPA12-G-057, p. 1-12.
(Abadi area of Timor Sea tectonostratigraphic elements oriented NNW-SSE in Paleozoic, NNE-SSW in Upper Triassic- Jurassic and NE-SW in Upper Jurassic-Cretaceous. Main sediment supply in Triassic-Jurassic from N of Abadi field, with major turnover of direction E Cretaceous due to continental breakup. U Triassic- Jurassic syn-rift sequences in rift basins with NE-SW trend (Malita Graben to SW) or NNE-SSW trend (Calder Graben))

Kihara, K., H. Nagura & H. Honda (2007)- Jurassic coastal to shallow marine sandstone reservoir in present deep water; an example from the Abadi gas field, Indonesia. In: Exploration and exploitation in deep water. J. Japanese Assoc. Petroleum Technologists 72, 1, p. 65-75.
(online at: /www.jstage.jst.go.jp/article/japt/72/1/72_1_65/_pdf)
(In Japanese, with English summary. Coastal to shallow-water Plover Fm sandstone in Abadi gas-field reservoir now in deep water. Plover Fm M Jurassic (partly lowermost U Jurassic), subdivided into upper and lower sandstones by Bathonian MFS. Upper unit main reservoir. Plover Fm two remarkable, rapid deepening events in Late Cretaceous (thick, muddy deltaic succession) and Pleistocene (deepening of Timor Trough))

Londono, J. & J.M. Lorenzo (2004)- Geodynamics of continental plate collision during late Tertiary foreland basin evolution in the Timor Sea: constraints from foreland sequences, elastic flexure and normal faulting. Tectonophysics 392, p. 37-54.
(Modeling of flexure of Australian NW margin as result of Timor collision. Late Tertiary (~6.5-1.6 Ma) foreland basin subsidence of Australian lithosphere propagates from SW to NE in Timor Sea, as consequence of oblique collision between Eurasian and Australian plates. Normal faulting related to bending implies some inelastic yielding. Flexural models indicate at least 570 km of Australian plate was flexed, primarily by tectonic loading of Timor Island and at least 100 km of plate subducted. Modeled forebulge uplift ~300m between ~200-400 km away from Timor Trough trench)

(Dozyite new mineral involving interstratification of serpentine and chlorite units. Occurs as colorless crystals in altered skarn adjacent to Ertsberg East copper-gold mine in W Papua. Named after J.J. Dozy, Dutch Shell geologist who discovered and named Ertsberg ore province in 1936)

Bailly, V., M. Pubellier & J.C. Ringenbach (2008)- Structure of the Lengguru fold-and-thrust belt, New Guinea island: consequence of rapid kinematic changes. Abstracts 33rd Int. Geol. Congress, Oslo 2008 *(Abstract)*
(Main structures of Lengguru Foldbelt controlled by Late Miocene- E Pliocene NE-SW compression against ophiolitic or arc backstop. Thin-skinned thrusting of Mesozoic and Tertiary sediments over previously structured basement followed by thick-skinned thrusting. Late Pliocene-Quaternary deformation (still active) is extensional with exhumation of Wandamen Metamorphic Complex in internal zone and NE-SW collapses along high-angle normal faults (Triton Bay) cross-cutting folds in external zone. Structuring of LFTB over short time; NE-SW compression in Late Miocene-E Pliocene and Late Pliocene-Quaternary extension in whole range)

Bailly, V., M. Pubellier, J.C. Ringenbach, J. de Sigoyer & F. Sapin (2009)- Deformation zone ójumpsô in a young convergent setting; the Lengguru fold-and-thrust belt, New Guinea Island. Lithos 113, p. 306-317.
(online at: http://www.geologie.ens.fr/spiplabocnrs/IMG/pdf/Bailly_et_al-_2009.pdf)
(Lengguru foldbelt young orogen. Shortening ceased recently and now under extension. Two superimposed prisms of stacked Mesozoic marine sediments of Australian margin against crustal buttress, formed after 11 Ma. Internal part of Lengguru fold belt active E-W extension, coeval with transition from compressive to transtensional regime in C Range, and onset of Tarera-Aiduna and Paniai left-lateral faults. Late Miocene NE-SW compression linked to subduction. Evolution of belt reflects rapid changes in accommodation of oblique shortening, with isolated orogenic wedge of Lengguru fold-and-thrust belt left to collapse. At lithospheric scale, deformation remains rooted at suture zone, but at surface shortening spread over large area in short time span prior to being transferred to other plate boundary)

Bailly, V., J. de Sigoyer, M. Pubellier & J.C. Ringenbach (2011)- The Bird's Neck: new data, new interpretation. Proc. 35th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA11-G-229, 7p.
(Lengguru foldbelt formed by Late Miocene- E Pliocene NE-SW compression linked to subduction, followed by Late Pliocene- Quaternary extension in whole range and exhumation of high pressure metamorphic rocks. Last stage linked to deformation zone jump to S onto Seram wedge. Wandamen Peninsula metamorphics new high P and T estimates (S1 high P schistosity ~12 kbar, 600°C, followed by S2 N-S stretching at 6-8 kbar, 680-730°C). Zircon metamorphic rims in samples characterized by high P paragenesis ages of ~8-7 Ma, zircon ages from more retrogressed samples ~5- 6 Ma. Zircon cores ages of 388±27 Ma, 636±32, 736±30 Ma and 1484±49 Ma)

('Lower Callovian and Coronatus beds between MacCluer Gulf (Bintuni Bay) and Geelvink (=Cenderawasih) Bay' M Jurassic (Bajocian- Lower Callovian) ammonites collected from Upper Aramasa River, S of Bintuni Bay, and by Wichmann from Mamapiri and Papararo rivers in Wendesi area on W side Cenderawasih Bay. Most common species Macrocephalites keeuwensis and Phylloceras mamapiricum)

Boro, H. & B. Sapiie (2003)- Structural geology of Ertsberg intrusion and its relationship to Papua foldbelt in the Guning Bijih mining district, Papua. Proc. 29^{th} Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 1-12.
(Two deformation events around Ertsberg mine: (1) Mio-Pliocene NW trending foldbelt, (2) Pliocene left-lateral strike-slip deformation, with emplacement of Ertsberg Intrusion)

Boureau, E. & W.J. Jongmans (1955)- *Novoguineoxylon lacunosum* n.gen., n.sp., bois fossile de cycadophyte de la Nouvelle-Guinee hollandaise. Revue Generale Botanique 62, p. 720-734.
('Novoguineoxylon lacunosum n.gen., n.sp., new cycadophyte fossil wood from Netherlands New Guinea'. New wood species of supposedly Jurasssic age, collected by NNGPM geologists from fluvial 'Jass Fm' in Kamundan River area of central Birds Head (wood reportedly similar to Australoxylon mondii described from U Permian of East Antarctica; Permian age more likely according to Bamford & Philippe 2001))

Brash, R.W., L.F. Henage, B.H. Harahap, D.T. Moffat & R.W. Tauer (1991)- Stratigraphy and depositional history of the New Guinea limestone group, Lengguru, Irian Jaya. Proc. 20th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 67-84.

(Mobil field program in Lengguru Foldbelt. Extensive Paleocene- early Late Miocene carbonate platform, 1000-1600m thick. 6-7 zones distinguished. Middle-Late Eocene limestone in backreef facies with with Lacazinella wichmanni. In most places Early Oligocene unconformable over M Eocene. After Rupelian erosion (with reworked Eocene clasts) carbonate deposition resumed by latest E Oligocene with deposition of Sirga Fm with Nummulites fichteli and Lepidocyclina (Eulepidina) (zone Td))

Broili, F. (1924)- Zur Geologie des Vogelkop (N.W. Neu-Guinea). Dienst Mijnbouw Nederlandsch Oost-Indie, Wetenschappelijke Mededeelingen 1, p. 1-15.
('On the geology of the Birds Head (NW New Guinea)'. Early paper on Birds Head geology, recognizing Permo-Carboniferous with brachiopods (Chonetes, Martinia) and solitary coral (Amplexus coralloides) from Kamoendan River area, Late Jurassic (Oxfordian) with belemnites (Belemnites gerardi) and molluscs (Inoceramis galoi, Posidonomya) from Itegere River, NE Birds Head, etc. Good cross-section)

Brouwer, H.A. (1924)- Bijdrage tot de geologie der Radja Ampat eilanden-groep (Waigeoe, Salawati, etc.). Jaarboek Mijnwezen Nederlandsch Oost-Indie, Verhandelingen 52 (1923), p. 63-136.
('Contribution to the geology of the Raja Ampat islands'. Early paper on geology of Waigeo, N Salawati, Pulau Snapan, Batang Pale and Jen islands)

Bulman, O.M.B. (1964)- Lower Palaeozoic plankton. Quart. J. Geol. Soc. London 120, p. 455-476.
(General review of graptolites, with mention of Late Silurian Monograptus turriculatus from Kemum Fm of North Central Birds Head, collected by NNGPM geologists)

Casarta, L.J., J.P. Salo, S. Tisnawidjaja & S.T. Sampurno (2004)- Wiriagar Deep: the frontier discovery that triggered Tangguh LNG. In: R.A. Noble et al. (eds.) Proc. Deepwater and Frontier Exploration in Asia & Australia Symposium, Jakarta, Indon. Petroleum Assoc. (IPA), p. 137-157.
(Wiriagar Deep-1 first commercial pre-Tertiary gas discovery in Indonesia (1994). Five subsequent gas discoveries combined in Tangguh LNG Project, with reserve potential of 24 TCF. Two main M Jurassic reservoir horizons, sourced from Late Permian coals. Unconformity between Late Permian- Jurassic, with Triassic sediments generally absent or thin redbeds. Jurassic sands shallow marine in transgressive systems tract, onlapping 'Permo-Triassic Rift Unconformity' in N direction. Cretaceous uplift, Late Cretaceous subsidence, Oligocene early compression phase, Miocene NW-SE trending anticline formation. Late Miocene-Pleistocene Bintuni Basin foreland creation lead to maturation)

Challinor, A.B. (1989)- Early Cretaceous belemnites from the central Bird's Head, Irian Jaya, Indonesia. Publ. Geol. Res. Dev. Center, Bandung, Seri Paleontologi 5, p. 1-21.
(Description of belemnites from central Birds Head collected by Skwarko from Jass Fm calcareous mudstone and sandstone, assigned Hauterivian age)

Charlton, T.R. (1991)- Evolution of the Sorong Fault Zone, Northeast Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 75, 3, p. 75.
(Abstract only; Sorong FZ zone of left-lateral shear at triple junction of three plates, with fragments of New Guinea margin detached and translated W until collision with E margin of Eurasia in Sulawesi. Recent investigations suggest less mobilist interpretation. Closest inter-island geological correlations are between geographically closest islands (e.g. Banggai-Sula-S Obi; N Obi-Bacan; W Halmahera-E Halmahera-Waigeo; Misool-Buru-Seram), favoring more conservative reconstructions. Although arc-continent collision started in New Guinea in M Oligocene and slightly later in Sulawesi, SFZ did not develop before Late Miocene)

Charlton, T.R. (1996)- Correlation of the Salawati and Tomori basins, eastern Indonesia: a constraint on left-lateral displacements of the Sorong fault zone. In: R. Hall & D. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc. London, Spec. Publ. 106, p. 465-481.
(Birds Head Salawati Basin and E Sulawesi Tomori Basin similar Mesozoic-Tertiary stratigraphies and may have formed one single basin prior to the development of the Sorong Fault Zone)

Charlton, T.R. (1998)- Yapen island: a right-lateral paradox in the left-lateral ôNorth New Guinea megashearö: implications for the biogeography and geological development of the Bird's Head, Irian Jaya. In: J. Miedema et al. (eds.) Perspectives on the Bird's Head of Irian Jaya, Indonesia, Editions Rodopi, Amsterdam, p. 783-796.
(Early movement along Yapen Fault Zone (M-L Miocene- E Pliocene); left lateral, since later E Pliocene. Proposes Pliocene anticlockwise rotation of Birds head as mechanism for opening of Cenderawasih Bay)

Charlton, T.R. (2000)- Late Cretaceous evolution of the Birdôs Head, Irian Jaya: a failed rift ? AAPG Int. Conf., Bali 2000 *(Abstract)*
(Late Cretaceous Jass Megasequence bathyal succession with local volcanics varies in thickness and developed above Intra-Cretaceous unconformity. Sediments above unconformity onlap onto structural high near Kalitami-1, C Bintuni Basin. Late Cretaceous Birds Head was site of N-S extension, probably related to separation of continental terrane from N of E Irian Jaya/PNG. Extension started in ~Turonian and continental margin terrane separated from Greater Australia in Maastrichtian. By end-Cretaceous C and S Bird's Head formed subsiding block-faulted terrane, with emergent Kemum block high to N. Oligocene initiation of arc-continent collision produced structures in Mesozoic section and structural ridges on which Miocene Kais reefs nucleated)

Fraser, T.H., J. Bon & L. Samuel (1993)- A new dynamic Mesozoic stratigraphy for the West Irian micro-continent, Indonesia, and its implications. Proc. 22nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 707-761.
(Thorough overview of Mesozoic stratigraphy on and around Birds Head- Bintuni Bay, W Papua. Jurassic-basal Cretaceous subdivided into three 'polysequences', separated by stratigaphic breaks: Inanwatan (Toarcian- Bajocian), Roabiba (Callovian- E Kimmeridgean) and Sebyar (mid-Tithonian- E Valanginian). Cretaceous Jass sequence mainly Coniacian and younger; E -M Cretaceous rocks probably deposited, but eroded probably in Aptian or Albian (or later?))

Friehauf, K.C., S.R. Titley & S.L. Gibbins (2005)- Porphyry-style mineralisation in the Ertsberg Diorite, Gunung Bijih (Ertsberg/Grasberg) District, West Papua, Indonesia. In: T.M. Porter (Ed.) Super porphyry copper and gold deposits - a global perspective, PGC Publishing, Adelaide, 2, p. 357-366.

Froidevaux, C.M. (1977)- Tertiary tectonic history of the Salawati area, Irian Jaya, Indonesia. Proc. 6th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 199-220.
(Same paper as Froideveax 1978)

Froidevaux, C.M. (1978)- Tertiary tectonic history of Salawati area, Irian Jaya, Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 62, p. 1127-1150.
(Salawati Island was attached to Irian Jaya during Miocene-E Pliocene reef development, and separated in M Pliocene- Pleistocene, by opening of Sele Strait rift zone, after creation of left-lateral Sorong fault zone. Island moved 17.5 km SW after ~13° CCW rotation. Motion triggered during widespread magmatic intrusion of Sorong fault zone, when basalt infiltrated right-lateral fault system in Sele Strait area. Rifting along three parallel left-lateral strike-slip faults, later site of down-to-NW normal faulting, accommodating subsidence from Pliocene-Pleistocene load from northern basaltic mountains. If Salawati is placed in former Irian Jaya frame, and N compartment of left-lateral Sorong fault zone moved back E, Miocene landscape appears characterized by widespread carbonate development with reefs thriving at edge of early New Guinea landmass facing open sea on W. Original distribution of reefs different from present)

Froidevaux, C.M. (1980)- Radar, an optimum remote sensing tool for detailed plate tectonic analysis and its application to hydrocarbon exploration (an example in Irian Jaya, Indonesia). In: Radar geology; an assessment report of the Radar geology workshop, Jet Propulsion Lab. (JPL), Pasadena, Publ., p. 457-501.
(Geometric, geomorphic, and structural information derived from radar imagery and combined with geologic and geophysical evidences strongly indicates that Salawati Island was attached to Irian Jaya mainland at time of Miocene-lower Pliocene reef development, and that it was separated in M Pliocene- Pleistocene time,

opening Sele Strait rift zone. Island moved 17.5 km SW after initial 13° CCW rotation. Rift zone is subsequent to creation of left lateral Sorong fault zone)

Gandler, L.M. & J.R. Kyle (2008)- Stratigraphic controls of calc-silicate alteration and copper-gold mineralization of the Deep Mill Level Zone skarn, Ertsberg District, Papua, Indonesia. In: The Pacific Rim: mineral endowment, discoveries and exploration frontiers, Proc. PACRIM 2008 Conf., Gold Coast, p. 313-317.

Garwin, S. (2013)- The tectonic and geological framework of New Guinea and the relationships to gold copper metallogeny. In: Proc. Papua & Maluku Resources, Indonesian Soc. Econ. Geol. (MGEI) Ann. Conv., Bali, p. 125-138.

Garwin, S. (2015)- The tectonics, geology and gold-copper metallogeny of New Guinea. In: Proc. PACRIM 2015 Congress, Hongkong, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, Publ. Ser. 2/2015, p. 151-164.
(Since Eocene, New Guinea tectonics driven largely by SW-directed collision of accreted arc terranes with N margin of Australian Craton, and subsequent W-directed transport of these exotic terranes by left-lateral strike-slip fault systems. Two major magmatic belts, both with world-class Cu-Au mineralisation: (1) M-L Miocene Maramuni arc (Frieda River, Nena, Wafi-Golpu, etc. deposits), tied to subduction of Solomon Sea plate beneath NE New Guinea; (2) Medial New Guinea magmatic belt (Grasberg, Ok Tedi, Porgera porphyry and epithermal deposits) localised by dilational zones formed at intersections of NE-trending reactivated basement faults and N-dipping reverse faults related to S-ward progression of Papuan fold belt in Late Miocene- Pleistocene. These deposits probably formed during short mantle-derived magmatic episodes in zones of regional isostatic uplift, attributed to delamination of lithospheric mantle beneath New Guinea)

Gautama, A.B. (1982)- Geologi daerah Carstensz Pyramide- Platen Spitz, Pegunungan Jayawijaya, Irian Jaya. Proc. 11th Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. 31-54.
(Geology of the Carstensz peaks region (+4884m) near Freeport copper mine, Central Range of West Papua. Outcrops from U Cretaceous- Recent. Paleocene-Oligocene Faumai Lst >2000m thick, with Lacazinella, Alveolina, etc. in lower part. Kais Lst Oligocene- E Miocene. Plio-Pleistocene Birim Fm volcanics)

Gealey, W.K. (1980)- Ophiolite obduction mechanism. In: A. Panayiotou (ed.) Ophiolites, Proc. Int. Ophiolite Symposium, Cyprus 1979, Geol. Survey Dept. Cyprus, Nicosia, p. 228-243.
(Good discussion of ophiolite obduction model. Includes discussion of New Guinea main ophiolite belt along N margin of Central Range of W Papua and PNG and continuing into New Caledonia, where 'ophiolite obduction' is result of Oligocene collision between N Australian passive continental margin and Auwewa volcanic arc. K-Ar ages on gabbros in E New Guinea 147 and 150 Ma (latest Jurassic)

Gerth, H. (1927)- Ein neues Vorkommen der bathyalen Cephalopoden Fazies des mittleren Jura in Niederlandisch Neu Guinea. Leidsche Geol. Mededelingen 2, 3, p. 225-228.

(online at: www.repository.naturalis.nl/document/549577)
('A new occurrence of the bathyal cephalopod facies of the Middle Jurassic in Netherlands New Guinea'. Small collection of M Jurassic ammonites supposedly from Birds Head (but unlikely from there?; Visser and Hermes 1962, p. 54), donated to Leiden Museum by government official from Fakfak. Reportedly from Wairor River and its Weriangki tributary, presumably near Fak Fak. Ammonites in geodes from hard black limestone, similar to those from Cenderawasih Bay and Sula islands. From Werianki River: Macrocephalites keeuwensis, Sphaeroceras cf. bullatum and Peltoceras, probably Callovian age. From Wairori River two Stephanoceras species, probably Bajocian age)

Gerth, H. (1927)- Eine *Favosites* Kolonie aus dem Palaozoikum von Neu-Guinea. Leidsche Geol. Mededelingen 2, 3, p. 228-229.
('A Favosites colony from the Paleozoic of New Guinea'. Brief report on discovery of Paleozoic tabulate coral in dark limestone float in Noord River, S of Central Range, W Papua. Age range of genus is Silurian-Permian (but in Australia most common in U Silurian- M Devonian; JTvG))

Gold, D.P., P. Burgess & M. Boudagher-Fadel (2017)- Carbonate drowning successions of the Birdôs Head, Indonesia. Facies 63, 25, p. 1-23.
(online at: https://link.springer.com/content/pdf/10.1007%2Fs10347-017-0506-z.pdf)
(Anggrisi River section in E Birds Head of W Papua shows E Miocene (Te) Kais Lst platform carbonates overlain by ~20m thick heterolithic Burdigalian- Serravallian drowning sequence of progressively upward-deepening marine units. Uppermost brown packstone bed with Katacycloclypeus annulatus and Miogypsina antillea. Drowning sequence overlain by Tortonian Klasafet/ Klamogun marine clastics. Cause of platform drowning attributed to reduction in rates of carbonate accumulation due to excess nutrients. Duration of drowning event across Birds Head region ~9.5 My (18.0- 8.6 Ma))

Gold, D., R. Hall, P. Burgess & L. White (2014)- The Biak Basin and its setting in the Birdôs Head region of West Papua. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-298, 13p.
(Seismic and multibeam data across Sorong Fault Zone E of Birds Head. Drowning of Kais Limestone platform in Biak Basin may be linked to initiation of strike-slip movements on Fault Zone and parts of Biak Basin sequences may be deposits of Mamberamo River delta now displaced W)

Gold, D., R. Hall & P. Burgess (2014)- Neogene structural history of Biak and the Biak Basin, Eastern Indonesia. American Geophys. Union (AGU), Fall Mtg., San Francisco, T53C-4705, 1p. *(Poster Abstract)*
(Biak Basin between Biak and Yapen underlain by Paleogene intra-oceanic island arc basement. Structural history three stages: (1) E Miocene compression, tied to collision of arc with N edge of Australian continental margin, with E Miocene carbonate deposition following collision; (2) M-L Miocene rifting and (3) Pliocene-Pleistocene strike-slip, tied to initiation of major regional faults that accommodated convergence between Pacific and Australian plates and uplifted Miocene carbonates as pop-up structures)

Gold, D.P., L. White, I. Gunawan & M. Boudagher-Fadel (2017)- Relative sea-level change in western New Guinea recorded by regional biostratigraphic data. Marine Petroleum Geology 86, p. 1133-1158.
(Paleogeography of W New Guinea from Carboniferous- Present. Biostratigraphic data suggests two major transgressive-regressive cycles in regional relative sea-level, with highest sea levels in Late Cretaceous and Late Miocene and terrestrial deposition prevalent in Late Paleozoic and E Mesozoic. Sea levels dropped between Late Cretaceous and Paleogene, with widespread shallow water carbonate platform development in the M-L Eocene. Minor transgressive event in Oligocene. E Miocene collision marked by regional unconformity. Carbonate drowning event in M Miocene, etc.)

Gouwentak, C.J. (1939)- De exploratie naar goud in Nederlands Zuidwest Nieuw Guinea. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 56, 2, p. 220-235.
('The exploration for gold in Netherlands SW New Guinea'. Travel account of 1937 expedition up Lorentz/ Noordoost/ Van der Sande Rivers area S of Central Range by 'Mijnbouwmaatschappij Nederlandsch Nieuw Guinea' expedition. Limited geology info: occasional outcrops of marine sediment, further upstream Eocene-Miocene Nummulites- Lepidocyclina limestones, coal and older rocks. One flammable gas seep along Noordoost River. Frequent earthquakes. Very little or no traces of gold in surveyed area)

Gow, P.A & J.L. Walshe (2005)- The role of preexisting geologic architecture in the formation of giant porphyry-related Cu ± Au deposits: examples from New Guinea and Chile. Economic Geology 100, 5, p. 819-833.
(Development of giant porphyry copper/ gold deposits in New Guinea and Chile during Tertiary magmatic events that overprinted earlier extensional tectonic settings. During collision deeply detached listric faults inverted and focused uplift, exhumation and fluid flow. Steep transverse faults activated to form wrench systems, pathways for magma or fluid. Ore deposits commonly in hanging wall of thrusts. Competent flat-lying packages formed plates, like Darai/Mendi Limestone or equivalents in New Guinea, overlying folded, weaker units underneath. These plates appear impeded magma ascent and formed cap)

Graham, S., N. Pearson, S. Jackson, W.Griffin & S.Y. O'Reilly (2004)- Tracing Cu and Fe from source to porphyry; in situ determination of Cu and Fe isotope ratios in sulfides from the Grasberg Cu-Au deposit. Chemical Geology 207, 3-4, p. 147-169.
(Cu and Fe isotope variations occur within Grasberg porphyry and skarn sulfides, showing isotopes can be important tool for interpretation of hydrothermal processes)

Granath, J.W. & R.M.I. Argakoesoemah (1989)- Variations in structural style along the eastern Central Range thrust belt, Irian Jaya. Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 79-89.
(Warim block in E part of West Papua Central Ranges part of S-vergent thin-skinned fold and thrust belt. East of 140°E thick-skinned structures, which persist into PNG. Structures in thin-skinned part of belt appear to be in process of overprinting by major strike-slip zone)

Granath, J.W. & S.A. Hermeston (1993)- Relationship of the Toro formation and the Alene Sands of Papua New Guinea to the Woniwogi Formation of Irian Jaya. In: G.J. & Z. Carman (eds.) Petroleum exploration and development in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby, p. 201-206.
(Central Irian Jaya unconformity between M Jurassic Kopai clastics and Late Valanginian. Woniwogi sst mainly of Hauterivian- E Barremian age, and equivalent of PNG Alene sst of PNG, not Berriasian- Valanginian Toro sst)

Granath, J.W., T.O. Simanjuntak & M.S. Gage (1992)- Cretaceous stratigraphy of Eastern Irian Jaya. Abstracts AAPG Int. Conf. Sydney 1992, American Assoc. Petrol. Geol. (AAPG) Bull. 76, 7, p. 1103. *(Abstract only)*
(C Irian Jaya U. Valanginian-Lw Hauterivian Woniwogi sst transgressive over M Jurassic clastics, with more complete Jurassic- Lw Cretaceous section in E Irian Jaya. Coniacian- Campanian Ekmai sst marks abrupt downward shift in relative sea level, followed by transgression. Angular unconformity in Maastrichtian-Paleocene Waripi Fm suggest Late Cretaceous tectonics overprinting passive margin subsidence)

Granath, J.W., K.A. Soofi & J.B. Mercer (1991)- Applications of SAR in structural modeling of the Central Ranges thrust belt, Irian Jaya, Indonesia. In: R.H. Rogers (ed.) Proc. 8th Conf. Geologic remote sensing; exploration, engineering and environment, Denver, p. 105-116.

Gunawan, I., R. Hall, C. Augustsson & R. Armstrong (2014)- Quartz from the Tipuma Formation, West Papua: new insights from geochronology and cathodoluminescence studies. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-303, 14p.
(Triassic or Jurassic-age Tipuma Fm sandstones of E Birds Head with common quartz of volcanic and low-grade metamorphic origin. Zircons mainly Permo-Triassic age (205-275 Ma; peak ~230-250 Ma). Also Proterozoic populations of ~975 Ma, 1.4-1.6 Ga and 1.8-2.0 Ga; few Archean grains (2.8-3.2 Ga). Two main sources: (1) volcanoes at active N New Guinea margin, N of Tasman Line, and (2) Precambrian basement of N Australia (or nearby Kemum Terrane provenance?; JTvG). Detrital zircon ages in 'Tipuma Fm' sample from Birds Body (Tembagapura area) differ from Birds Head: absence of Late Permian-Triassic, but with common

Permian-Devonian grains (292-412 Ma) and few Silurian- Ordovician grains, suggesting sample is either older(E Permian?), or was deposited further from Permo-Triassic N Andean type volcanic arc)

Gunawan, I., R. Hall & M.A. Cottam (2011)- Age, character and provenance of the clastic Tipuma Formation, West Papua, Indonesia: new insights from detrital zircon dating. In: Conf. Sediment provenance studies in hydrocarbon exploration & production, Geol. Soc., London, 2011, p. 30 *(Abstract only)*
(Tipuma Fm of Birds Head poorly dated fluvial deposits between Permian- Cretaceous, 90-150m thick. Detrital zircon age populations from Lower Mb Triassic, Permian and Carboniferous and Proterozoic peaks. Ages in Middle Mb mainly Triassic-Carboniferous with few Ordovician grains. Upper Mb has important M Triassic and Late Permian populations, also Carboniferous, Devonian, Silurian and Ordovician. Maximum depositional ages for Tipuma Fm Late Triassic (Lower Mb ~214 Ma, Middle Mb 229 Ma, Upper Mb 205 Ma). No strong evidence for rifting event. Common Late Triassic subhedral zircons in Upper and Lower Members suggest volcanic activity in Birds Head)

Gunawan, I., R. Hall & B. Sapiie (2014)- Triassic reservoir characteristics of the Bird's Head, New Guinea, Indonesia: new insight from provenance study. Int. Petroleum Techn. Conference (IPTC), Kuala Lumpur, 9p.
(Triassic- Jurassic Tipuma Fm sandstones and conglomerates sourced from acid volcanic, metamorphic and recycled sedimentary rocks to N and from N Australian Craton. Quartz provenance dominated by low-T metamorphics and volcanics with little plutonic origin. Youngest zircon ages indicate deposition in Triassic. Recycled zircon populations Permo-Triassic (205-275 Ma) and Proterozoic (~975 Ma, 1.4-1.6 Ga and 1.8-2.0 Ga) populations), with few grains of Archean age (2.8-3.2 Ga). Tipuma Fm probably not deposited in simple continental setting. Decline of volcanic quartz and increase in Carboniferous-Proterozoic zircons in Middle Member indicate reduced contribution of sediment from arc and increased contribution from N Australia)

Gunawan, I., R. Hall & B. Sapiie (2015)- Late Neogene history of the Bird's Head area, West Papua, Indonesia: an insight from detrital zircon. AAPG/SEG Int. Conf. & Exh., Melbourne 2015, Search and Discovery Art. 51245, 44p. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2016/51245gunawan/)
(Detrital zircon age groups in M Miocene clastic Klasafet, E Pliocene Steenkool/ Klasaman Fms and Pleistocene fluvial quartz-rich Konjah Fm (formerly mapped as Sirga Sst?): Pliocene (~3 -5 Ma; only in Konjah Fm), Miocene (~12-20 Ma; from Lembai diorite?), and Permian-Triassic (~205-275 Ma) and Proterozoic (~0.9-1.2 Ga, ~1.4-1.6 Ga, ~1.8-2.0 Ga). Increase in Precambrian zircons from M Miocene-Lower Pliocene, probably reflecting unroofing of NE Birds Head (Kemum High). Second phase of acid igneous activity in Pliocene reflected by E-M Pliocene zircons in Konjah Fm and may derive from nearby dacite intrusions (~3.5 Ma). M Pliocene unconformity in Bird's Head, continuing offshore, probably related to Sorong Fault and predating Seram Trough development)

Gunawan, I., R. Hall & I. Sevastjanova (2012)- Age, character and provenance of the Tipuma Formation, West Papua: new insights from detrital zircon dating. Proc. 36th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA12-G-027, p. 1-14.
(SHRIMP U-Pb ages of detrital zircons from 11 Tipuma Fm sandstone samples show Permo-Triassic (234-280 Ma), Mesoproterozoic (1.4-1.6 Ga) and Paleoproterozoic (1.8-2.3 Ga) age peaks. Maximum age of deposition of Tipuma Fm Late Triassic (~202 Ma). Tipuma Fm immature lithic sandstone; lithic fragments mainly sedimentary and metamorphic rocks. Fresh volcanic quartz and zircon suggest acid igneous activity in Birds Head during deposition in M-L Triassic)

Harahap, B.H. (1996)- New age results from the Tertiary succession of the Yera anticline, south Central Range of Irian Jaya. J. Geologi Sumberdaya Mineral 6, 63, p. 2-9.

(Yera Anticline in Waghete map sheet in SW part of W Papua Central Range contains ~2500m of folded Pre-Permian- Cretaceous clastic sediments, overlain by Tertiary New Guinea Limestone. Permian Aiduna Fm (~1300m) sandstones-shales with up to 40cm thick coals with common palynomorphs incl. Protohaploxypinus limpidus, P. amplus, Cordaitina, etc. ?Triassic Tipuma Fm (280m) reddish mudstones-sandstones barren of fossils. No fossil evidence for Triassic or Jurassic ages. Kembelangan Gp entirely of Cretaceous age: (1) Kopai Fm (90m) glauconitic quartz sst with Late Berriasian- Barremian palynomorphs (Muderongia spp., etc.), (2) M-L Barremian Woniwogi Sst (60m) 'orthoquartzite' with Ovodinium cinctum, Muderongia mcwhaei, M. australis, etc. (= E Aptian?), (3) Late Aptian- E Albian Pinya Fm (565m) with Muderongia tetracantha, Dingodinium cerviculum and (4) Santonian- Maastrichtian Ekmai Fm (380m) glauconitic sst)

Harahap, B.H. (1997)- The metamorphic complex of the Central Range of Irian Jaya, with special reference to Enarotali Quadrangle. J. Geologi Sumberdaya Mineral 7, 67, p. 16-25.
(Derewo metamorphic complex of Central Range of W Papua located between deformed Australian margin platform sediments in S and ultramafic Irian Jaya ophiolite in N. Metamorphics mainly low T and low P black slate, phyllite and schist, with some metavolcanic intercalations and quartzite. Metamorphic increases gradually from S to N. Original rocks Mesozoic and possibly also E Tertiary-age fine marine slope deposits. Complex isoclinally folded structures suggest at least two phases of deformation. Initial metamorphism during Pacific Plate obduction, probably in Oligocene (in PNG Late Eocene foraminifera in slightly metamorphosed rocks, Late Oligocene- E Miocene forms in unmetamorphosed rocks; Dow 1977). In M Miocene local intrusions by Utawa diorite, then deformed by Late Miocene- Pleistocene Melanesian orogeny)

(On 2.7-3.0 Ma Ertsberg East Skarn System, adjacent to Grasberg diorite intrusion and 2.5 km from giant 3.3 Ma Grasberg porphyry copper deposit. Formed through flux of magma-derived fluid through carbonate rock sequences at T> 600° C and P<50 MPa (~2 km depth?))

Henry, C. & S. Das (2002)- The Mw 8.2, 17 February 1996 Biak, Indonesia, earthquake: rupture history, aftershocks, and fault plane properties. J. Geophysical Research 107, B11, 2312, doi:10.1029/2001JB000796, 20p.
(Large earthquake E of Biak on shallow dipping thrust fault (strike 109°, dip 9°). Rupture propagated bilaterally on fault extending 180 km W and 50 km E of hypocenter)

Herdiyanti, A.N.A., A. Moris, A. Fakhri, R.P. Putra & I. Oktafirman (2015)- Evaluation of underexplored *Textularia* layer in the Salawati Basin, Eastern Indonesia. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-348, 3p.
(Thin (5-10m) limestone bed in clastic U Miocene Klasafet Fm, formerly called Textularia II marker bed, is secondary oil producer in Walio area of Salawati Basin. Also proven oil in Kasuari, Payao, etc. Greatest thickness in S. Potential underexplored hydrocarbon play)

Hermes, J.J. (1968)- The Papuan geosyncline and the concept of geosynclines. Geologie en Mijnbouw 47, 2, p. 81-97.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0Rmd5ay1rcmhNR3c/view)
('Pre-plate tectonics' review of geologic history of W Papua, in 'Papuan geosyncline' is described in terms like miogeosyncline and eugeosyncline. Deformed by collision between Asian and Australian continent, during which segment of the Papuan geosyncline was torn loose, bent and broken, leading to present sinuous shape of W part of New Guinea island. Sorong fault zone recognized as major up- to-10km- wide, left-lateral fault zone with gigantic tectonic breccias)

Hermes, J.J. (1974)- West Irian. In: A.M. Spencer (ed.) Mesozoic-Cainozoic orogenic belts. Geol. Soc. London, Spec. Paper 4, p. 475-490.
(Overview of W New Guinea geology/ stratigraphy, using geosynclinal terminology. Age of metamorphism in N Central Range most likely Late Oligocene. Also Late Oligocene 'Sirga phase' of deformation. Deformation in Mamberamo basin is Pleistocene)

Hermes, J.J. (1982)- On the alleged rotation of the island of New Guinea. Pacific Geology 16, p. 53-57.
(No major rotations between New Guinea and Australia, but good evidence for transcurrent movement between North New Guinea and Central New Guinea provinces. M Miocene Makats Fm in N New Guinea has detritus from apparently metamorphosed and uplifted Central Range)

Hermes, J.J. & F.C. Schumacher (1961)- Summary of stratigraphy of New Guinea. Proc. 9th Pacific Science Congress Bangkok 1957, 12, p. 318-324.
(Overview of Silurian- Pliocene stratigraphy of W New Guinea. Kemum Fm in Birds Head contains Lower Silurian Monograptus. Permo-Carboniferous rel. widespread clastics and sandy limestones with spiriferid brachiopods and Glossopteris flora, etc.)

Hidayati, S., A. Cipta, A. Omang, R. Robiana & J. Griffin (2013)- Earthquake hazard map of Papua, Indonesia. In: Proc. 49th Annual Session Coord. Comm. Geoscience Programmes E and SE Asia (CCOP), Sendai, p. 61-72.
(online at: www.ccop.or.th/download/as/52as2.pdf)
(Probabilistic seismic hazard model, based on recognition of 9 tectonic plates, 14active thrust and strike-slip faults,2-3 subduction segment, and 9 zones for diffuse earthquakes (from historic earthquakes))

Hill, K.C. & R. Hall (2003)- Mesozoic- Cenozoic evolution of Australia's New Guinea margin in a West Pacific context. In: R.R. Hillis & R.D. Muller (eds.) The evolution and dynamics of the Australian Plate. Geol. Soc. America (GSA), Spec. Paper 372 and Geol. Soc. Australia Spec. Publ. 22, p. 265-290.
(Island of New Guinea at N Australian margin. Complex evolution, largely masked by Mio-Pliocene orogenesis. In Paleozoic, New Guinea contained boundary ('Tasman Line') between Late Paleozoic active margin in E and extensional margin in W. Permian- Early Triassic active margin with widespread M Triassic granite intrusions. Triassic-Jurassic rifting followed by Cretaceous passive margin subsidence and renewed rifting in Late Cretaceous- Paleocene. Rapid N-ward movement of Australian Plate since Eocene resulted in Mio-Pliocene collision with Philippine-Caroline Arc, which commenced in Late Oligocene and orogenesis continues today. Change in character of New Guinea lithosphere from thick and strong in W to thin and weak N and E of Tasman Line important influence on style and location of Mesozoic and Cenozoic deformation)

Hill, K.C., N. Hoffman, P. Lunt & R. Paul (2002)- Structure and hydrocarbons in the Sareba Block, 'Birdôs Neck', West Papua. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 227-248.

(E Birds Neck- W Cenderawasih Bay NE- trending Sareba Graben, originated in Late Jurassic- Early K. Cretaceous- M Miocene starved basinal facies. Adjacent Lengguru foldbelt formed by collision of Weyland Terrane with Birds Neck, consuming Paleocene oceanic crust of Cenderawasih Bay. Thin-skinned thrusting in Late Miocene, thick-skinned thrusting/ uplift in Pliocene, Pleistocene orogenic collapse into Cenderwasih Bay Pliocene oceanic crust, leaving <2 Ma metamorphic core compex on Wandamen Peninsula)

Hill, K.C., J.T. Keetley, R.D. Kendrick & E. Sutriyono (2004)- Structure and hydrocarbon potential of the New Guinea foldbelt. In: K.R. McClay (ed.) Thrust tectonics and hydrocarbon systems, American Assoc. Petrol. Geol. (AAPG), Mem. 82, p. 494-514.
(Papuan Fold Belt structures inverted extensional faults and asymmetric detachment folds that break through overturned forelimb. Previous fault-bend foldmodel flawed. PNG deformation front has not yet impinged on strong Australian lithosphere, so low fold belt occupies its own foreland basin. W PNG Fold Belt gas-condensate province just impinged on strong lithosphere, developing foreland basin and basement-cored anticlines. Irian Jaya Fold Belt deformation front encountered strong Australian lithosphere, causing 15km-thick Paleozoic- Mesozoic sequence thrust to surface along previously extensional basin-margin fault. Focusing deformation on one fault created mountains 5km high and adjacent foreland basin. Birds Neck Lengguru Fold Belt resembles oil province in Papuan Fold Belt, but Pleistocene extensional faulting may cause breaching)

Hill, K.C., R.D. Kendrick, P.V. Crowhurst & P.A. Gow (2002)- Copper-gold mineralisation in New Guinea: tectonics, lineaments, thermochronology and structure. Australian J. Earth Sci. 49, 4, p. 737-752.
(Late Miocene-Pliocene copper-gold deposits tied to intrusives (of mantle origin, not subduction-related). Richest deposits at intersections of N-NE trending transfer faults and inverted Mesozoic extensional faults. Mineralisation during inversion of these faults and correlates with propagation of orogenesis from NE to SW)

Hill, K.C., P.B. O'Sullivan, K. Lumbanbatu et al. (1998)- Tectonics and hydrocarbons in Irian Jaya, constraints from zircon fission track analysis. Proc. 26th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. *(Poster Abstract)*

('Geology of the Wamena and Depapre Jayapura areas, Irian Jaya'. Lithologic analysis of sandstones and dolomitic limestones in Wamena area, Central range. Petrographic analysis of (Cretaceous?; JTvG) sandstone in Aikima area 95-99% quartz. Depapre-Sentani-Jayapura in NE Irian Jaya common harzburgite, lateritized, overlain by limestone)

Indarto, S., M. Syafei, Praptisih & S. Djoehanah (1999)- Provenance study of shaly-sandy unit of Kembelengan Formation, Wamena, Irian Jaya. Proc. 28th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, 3, p. 75-82.
(U Cretaceous Kembelangan sandstones in Wamena area, Central Range, 20-30 cm thick beds and thinning upward. Petrography shows quartz (58-70%), clay (10-12%), feldspar (6-8%), calcite, muscovite (3-7%), glauconite, and is classified as quartz wacke of recycled orogen provenance)

Insley, M. & M. Tocher (1999)- Comparison of field development in the frontal regions of the fold and thrust belts of PNG/Irian Jaya and Pakistan. In: C.A. Caughey & J.V.C. Howes (eds.) Proc. Conf. Gas habitats of SE Asia and Australasia, Jakarta 1998, Indon. Petroleum Assoc. (IPA), p. 225-236.

Jablonski, D. (2007)- Geology and exploration potential of the offshore S.W. Bintuni Basin, Semai-Gorong Basin, Eastern Indonesia. Proc. SE Asia Petrol. Soc. (SEAPEX) Conf., Singapore, 2p. *(Abstract only)*
(No wells in SW Bintuni Basin, but large structures. Three provinces: Seram Thrust Belt in W, Seram Trough in centre and Seram Fold Belt in E. Area underlain by older extensional regime, overprinted by latest Miocene-Recent compressional pulses, younging to NE. W part of area imbricate thrusts, E area gentle folds. Source rocks may include Permian paralic shales and coals, M-U Triassic restricted marine claystones, and L-M Jurassic paralic coals and clays. Plays: (1) Paleozoic rift fault blocks, (2) Triassic limestone build-ups, (3) Triassic-M Jurassic rift fault blocks, (4) Callovian-Oxfordian fractured limestone, (5) Upper Cretaceous-

Lower Tertiary sandstones associated with M Palaeocene Coral Sea rifting, (6) Miocene build-ups (Kais Fm-equivalent); (7) Imbricate thrusts in Seram Thrust Belt and (8) Gentle folds in Seram Fold Belt in E)

Jackson, J.E. (2010)- Neogene intrusions in the Western Central Range, Papua, Indonesia: petrologic, geochemical, and isotopic comparison of the Miocene Ular Merah and Pliocene Komopa Magmatic Districts. M.Sc. Thesis University of Texas at Austin, p. 1-360. *(Unpublished)*
(Two belts of Neogene igneous rocks in New Guinea Central Range, with Miocene (20-10 Ma) belt outcropping N of Pliocene (7-3 Ma) belt. Miocene magmatic rocks in PNG (Maramuni Volcanic Arc) intruded Australian continental rocks; those in W Papua intruded allochthonous arc/forearc terranes. Pliocene magmatic rocks young from W to E, and emplaced into Australian continental crust at highest elevations in C Range. Two magmatic districts in W Central Range studied here: (1) Komopa Pliocene (3.9-2.9 Ma) quartz monzodiorites, granodiorite and monzogranites, emplaced into Australian passive margin strata, shoshonitic, similar to intrusions from Minjauh Volcanic Field, Ertsberg Mining District and Etna Bay (products of collisional delamination tectonism as leading edge of Australian continental lithosphere jammed N-dipping subduction zone beneath Irian Ophiolite) and (2) Ular Merah late E Miocene (17.4-16.6 Ma) calc-alkaline, porphyritic diorites and monzodiorites, emplaced into allochthonous Irian Ophiolite Belt. Adakite-like characteristics sugges partial remelting of garnet-bearing plutons emplaced into mantle beneath allochthonous ophiolite)

Jongmans, W.J. (1940)- Beitrage zur Kenntnis der Karbonflora von Niederlandisch Neu Guinea. Mededelingen Geol. Stichting 1938-1939, p. 263-274.
('Contributions to the knowledge of the Carboniferous flora of Netherlands New Guinea'. Description of mixed 'Cathaysian' flora (Taeniopteris, Pecopteris spp.) and Gondwanan 'Glossopteris' fauna from two localities in Otakawa River, Central Range foothills, S of Carstensz Peaks. Here believed to be of Late Carboniferous age, but regarded as Permian by Hopping and Wagner (in Visser & Hermes, 1962), or Late Permian by McLoughlin (1993), based on correlation with Bowen Basin (Glossopteris, etc.; Identifications re-evaluated by Rigby (1997)and Playford & Rigby (2007); JTvG) (JWJ, p. 265-266 also mentions several occurrences of possible Carboniferous or Permian wood (Calamites, Dadoxylon) and plant fossils (Pecopteris arborescens) from NW Kalimantan and Sarawak; not published elsewhere?))

Jongmans, W.J. (1941)- Elementen der *Glossopteris* flora in het Carboon van Nieuw Guinea. Handelingen 28e Nederlandsch Natuurkundig Geneeskundig Congres, C, p. 267-271.
('Elements of the Glossopteris flora in the Carboniferous of New Guinea'. Plant fossils from two localities collected by BPM in Akimeugah area, SW Papua, of Carboniferous age (now deemed to be Permian; HvG). Two localities, one with Gondwanan flora (Vertebraria only) and one with rel. rich Asian flora (Cathaysian; Pecopteris, Taeniopteris; also Euramerican elements), proving the two floras lived in close proximity (not necessarily 'mixed floras' as often suggested; HvG))

(Epicenters of shallow earthquakes used to identify active seismic zones, signifying present-day plate boundaries, particularly across New Guinea)

McDowell, F.W., T.P. McMahon, P.Q. Warren & M. Cloos (1996)- Pliocene Cu-Au-bearing igneous intrusions of the Gunung Bijih (Ertsberg) district, Irian Jaya, Indonesia: K-Ar geochronology. J. Geology 104, p. 327-340.
(Nine potassic intermediate intrusives in Ertsberg area, aged 2.6-4.4 Ma. Do not appear related to subduction. A more northerly Miocene belt (10-20 Ma; PNG Maramuni Arc and extension to W) does represent a subduction-related arc above a SW dipping Benioff zone)

McMahon, T.P. (1994)- Pliocene intrusions in the Ertsberg (Gunung Bijih) Mining District, Irian Jaya, Indonesia: petrography, geochemstry, and tectonic setting. Ph.D. Thesis, University of Texas at Austin, p. 1-298. *(Unpublished)*
(16 Pliocene (3-4 Ma) intrusions crop out in Ertsberg Mining District, mainly small (<4 km3), hypabyssal dikes and plugs, but Ertsberg 10-20 km3. Intrusions high-K (latites, trachytes, trachydacites) and low-K (andesites, dacites) and equigranular (Ertsberg) to porphyritic (others). Plagioclase dominant mineral, most also with amphibole and biotite. Differences in type of ore deposits of Ertsberg (large body of crystal-poor magma cooling slowly, forming peripheral calc-silicate skarns) and Grasberg (periodic tapping of magmas and fluids from cupola of deeper magma chamber led to porphyry Cu mineralization) related to magmatic evolution. Younger magmatism in W Papua result of lithospheric delamination)

McMahon, T.P. (1994)- Pliocene intrusions in the Gunung Bijih (Ertsberg) mining district, Irian Jaya, Indonesia; petrography and mineral chemistry. Int. Geology Review 36, 9, p. 820-849.
(Part 1 of 2 papers. At least 16 Pliocene hypabyssal intrusions crop out within Gunung Bijih (Ertsberg) Mining District, W Papua, with several associated Cu-Au ore deposits. Most skarns associated with quartz monzonite Ertsberg Intrusion. Intrusions emplaced at < 2 km depth into deformed sedimentary rocks that originally were deposited on N margin of Australian continent. Emplacement of at least one intrusion controlled by cross-cutting NW- and NE-trending fault sets. Intrusions can be divided into high-K group of latites, trachydacites, and trachytes (volumetrically more important), and low-K andesites and dacites)

McMahon, T.P. (1994)- Pliocene intrusions in the Gunung Bijih (Ertsberg) mining district, Irian Jaya, Indonesia; major- and trace-element chemistry. Int. Geology Review 36, 10, p. 925-946.

(Gunung Bijih (Ertsberg) Mining District is group of small, hypabyssal Pliocene intrusions with Cu-Au ore deposits, near highest parts of Central Range of W Papua. Several skarn orebodies around margins of Ertsberg Intrusion. All but Big Gossan deposit related genetically to Ertsberg Intrusion. Nearby supergiant Grasberg porphyry copper deposit related to first two stages of intrusions in Grasberg Complex. Intrusions intermediate in composition, with high-K latite- trachydacite-trachyte, and low-K andesite and dacite. Chemical variation product of combined fractionation, assimilation, and recharge prior to emplacement in shallow crust, derived from same lower crustal magma chamber)

McMahon, T.P. (1999)- The Ertsberg intrusion and the Grasberg Complex: contrasting styles of magmatic evolution and Cu-Au mineralization in the Gunung Bijih (Ertsberg) Mining District, Irian Jaya, Indonesia. Buletin Geologi (ITB) 31, 3, p. 123-132.

(Conference proceedings. Includes invited papers on geology by Ratman and Dam)

Milsom, J. (1991)- Gravity measurements and terrane tectonics in the New Guinea region. J. Southeast Asian Earth Sci. 6, p. 319-328.
(Interpretation of gravity data in 7 areas of W Papua and PNG. In some areas gravity conforms to geological models like in Papuan Ultramafic belt. Others, like Weyland Terrane in W Papua more complicated, where Dow et al. (1986) is not compatible with gravity data. Main gravity high located over large M Miocene diorite batholith, possibly emplaced after overthrusting)

Milsom, J., D. Masson, G. Nichols, N. Sikumbang, B. Dwiyanto, L. Parson & H. Kallagher (1992)- The Manokwari Trough and the western end of the New Guinea Trench. Tectonics 11, p. 145-153.
(New Guinea Trench seafloor depression parallel to N coast of New Guinea for 700 km. W end lies 600 km E of Philippine Trench; intervening region series of N- trending ridges and troughs. Ayu Trough and Tobi and Mapia ridges most prominent. Trench marks site of subduction, but present-day activity disputed. W termination at ridge system culminating in Mapia Island. Trench with 1 km undisturbed sediments and S slopes extensively channeled, suggesting lack of recent deformation. 400 km W of W end of trench, N coast of New Guinea is flanked, at distance of only few tens of km, by deep trough. Sonar imagery of 'Manokwari Trough' suggests recent convergence and transcurrent movement. Trough and abrupt termination of New Guinea Trench are consequences of seafloor spreading in Ayu Trough after subduction ceased at trench)

Moerman, C. (1908)- Verslag over een geologische verkenningstocht door het terrein beoosten der Etna Baai (19 Nov. 1904- 16 Febr. 1905). In: G.P. Rouffaer et al., De Zuidwest Nieuw Guinea Expeditie van het Kon. Nederlands Aardrijkskundig Genootschap 1904/5, Brill, Leiden, p. 401-416.
('Report of a geological reconnaissance trip through the area East of Etna Bay 1904-1905'. SW New Guinea Expedition 1904-1905'. Etna Bay (Lahakia Bight), SE of Lengguru foldbelt, is surrounded by massive Eocene Discocyclina-Nummulites-alveolinid limestone, locally with andesite intrusions. Also quartz sandstones, probably underlying limestones, and float of diorite and andesite. Area E of Etna Bay mainly dark slates, locally steeply dipping, with one deformed ammonite, possibly of Late Jurassic age according to G. Boehm (first record of Mesozoic marine sediments in SW New Guinea))

Moffat, D.T., L.F. Henage, R.A. Brash et al. (1991)- Lengguru, Irian Jaya: prospect selection using field mapping, balanced cross-sections and gravity modeling. Proc. 20th Ann. Conv. Indon. Petroleum Assoc., p. 85-106.
(Balanced cross-sections through Lengguru foldbelt. Plio-Pleistocene thrust-fold belt with inversion and non-inversion imbricate thrust structures. External zone detached, ramp anticlines, dominantly thin-skinned and no basement-involvement. Sub-thrust extensional systems which offset basement suggested by regional gravity at boundary with internal zone. Platform carbonates of New Guinea Lst form competent unit. Internal zone closely spaced imbricates, many of which breached to Kembelangan Gp. Close thrust spacing reflects lithological change from platform to distal facies carbonates; boundary with external zone represents paleo-shelf margin)

Moig, N.A.W. (1994)- High resolution aeromagnetics as an aid to structural interpretation over the Muturi PSC, Irian Jaya. Proc. 23rd Ann. Conv. Indon. Petroleum Assoc., p. 417-438.
(1993 'High Resolution' aeromagnetic survey allowed resolution of lineaments and domains in basement and sedimentary section. NE-SW and NW-SE trends fundamental structural elements controlling distribution of features in Mesozoic and younger sections)

Monnier, C., J. Girardeau, M. Pubellier & H. Permana (2000)- Lôophiolite de la chaine centrale dôIrian Jaya (Indonesie): evidences petrologiques et geochimiques pour une origine dans un bassin arriere-arc. Comptes Rendus Academie Sciences, Paris, Series IIA, Earth Planetary Sci. 331, 11, p. 691-699.
('The ophiolite of the Irian Jaya Central Range (Indonesia): petrological and geochemical evidence for a back-arc origin'. Central Range ophiolite belt with peridotites, gabbros, dolerites and basalts outcrops over 450 x 50 km area. Chemistry suggests it formed in backarc environment rather than oceanic domain. Probable age Jurassic. Obduction age Tertiary, but exact age still to be determined)

Monnier C., J. Girardeau, M. Pubellier, M. Polve, H. Permana & H. Bellon (1999)- Petrology and geochemistry of the Cyclops ophiolites (Irian Jaya- East Indonesia): consequences for the evolution of the North Australian margin during Cenozoic. Mineralogy and Petrology 65, p. 1-28.
(Cyclops Massif ophiolitic sequence with peridotites, gabbros, dolerites, mid-oceanic ridge basalts and minor boninitic lavas. Tectonically overlies high T-high P mafic rock, metamorphosed in E Miocene. Basalts and cumulate rocks typical of back-arc magmas. K/Ar ages from basalts (29 Ma) and boninites (43 Ma) combined with geochemical signatures indicate Cyclops Mts formed in single suprasubduction environment. This implies S-ward subduction of Australian oceanic lithosphere beneath N Australian margin. Ultramafic rocks and related lavas (boninites) likely formed in Eocene in forearc, before S-ward obduction onto island arc in E Miocene. Pliocene back-thrusting event led to slicing of backarc basin series onto arc and fore-arc sequences)

Musper, K.A.F.R. (1938)- Over het voorkomen van *Halysites wallichi* Reed op Nieuw Guinea. De Ingenieur in Nederlandsch-Indie, IV. Mijnbouw en Geologie, 5, 10, p. 156-158.
('On the occurrence of Halysites wallichi Reed on Nieuw Guinea'. Second record of tabulate coral Halysites since Teichert (1928), from limestone, collected by Terpstra in pebbles of Penanggi River, a tributary of the Oesak R. in headwaters of Noord or Lorentz River of Central Range foothills). Probably of Silurian age, although E Devonian can not be excluded)

Musu, J.T., H. Sutanto, D.V. Mamengko, A. Yusriani, A Mannappiang & A.H. Satyana (2015)- Opportunities in frontier North Papua Basin, Indonesia: constraints from oil seep of the Teer River and its expected petroleum system. Poster presentation AAPG/ SEG Int. Conf. Exhib. (ICE), Melbourne.

(Underexplored North Papua Basin with famous oil seep of Teer River. Biomarker study of oil shows minor biodegradation. Pristane/ phytane ratio >3 indicates oil generatio from shaly to coaly source rocks, deposited in oxidizing environment. High oleanane and appearance of bicadinanes suggest Miocene or younger age. Oil generated from maturity equivalent with Ro of 0.9 (top oil window) in area at ~4000m. Main candidates for active source rocks in M-L Miocene Makats Fm or E Pliocene Memberamo B Fm)

Nash, C., G. Artmont, M.L. Gillan, D. Lennie, G. O'Connor & K.R. Parris (1993)- Structure of the Irian Jaya mobile belt, Irian Jaya, Indonesia. Tectonics 12, p. 519-535.
(Freeport paper on Irian Jaya Mobile belt/ Central Range. Seven structural domains, from N to S: (1) N Coast region: Tertiary volcanics and sediments overlain by Pliocene-Pleistocene successor basin (2) allochthonous terrane of ophiolites and high-grade metamorphics; (3) Derewo metamorphic assemblage, displaying polyphase deformation; (4) marginal zone within Mesozoic-Paleogene miogeoclinal sediments with steep duplex structures and remnant klippen; (5) 40-50 km-wide partly inverted synclinorium composed of miogeoclinal sediments; (6) regional S- vergent overturned anticlinorium formed by incompetent Paleozoic sediments; (7) foreland thrust domain involving both Mesozoic-Cenozoic miogeoclinal cover and deformed Neogene foreland molasse basin sequence. Late Oligocene-Miocene docking of metamorphics, island arc assemblages and ophiolites produced tectonically stacked E-W trending structures thrust onto N margin of Australian continent. Late Miocene-Pliocene collision with Melanesian Arc brought accreted Australian margin into contact with W-moving Pacific Plate and instituted regime of oblique transpression. Resulting structures E-W sinistral wrenching and NW thrusts along lateral E-W ramps)

Nauw, M., M. F. Riza, R. Mardani & P. Butterworth (2017)- Compartmentalization of Paleocene-aged deep water reservoirs at Wiriagar Deep, Papua Barat Province. Proc. 41st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA17-392-G, 15p.
(Paleocene basin floor fan and slope channel sandstones of Wiriagar Deep field with gas trapped in large NW-SE closure, created during Oligocene compression and reactivated during Plio-Pleistocene. Reservoir compartmentalisation by combination of depositional facies and strike slip faults)

New, B.T.E. (2005)- Controls of copper and gold distribution in the Kucing Liar deposit, Ertsberg mining district, West Papua, Indonesia. Ph.D. Thesis James Cook University, Townsville, p. 1-235.
(online at: http://eprints.jcu.edu.au/2083)
(Kucing Liar large sediment-hosted Cu-Au deposit in Ertsberg District in Central Ranges of W Papua. High sulphidation ore continuous with porphyry-skarn chalcopyrite, both formed from mixing of magmatic with meteoric waters in fault zone in calcareous shale and limestone adjacent to Grasberg Igneous Complex)

Newton, R. Bullen (1916)- Notes on some organic limestones, etc., collected by the Wollaston expedition in Dutch New Guinea. In: Reports on the collections made by the British Ornithologists Union Expedition and the Wollaston Expedition in Dutch New Guinea 1910-1913, 2, 20, p. 1-20.
(Mainly on larger foraminifera from limestones collected by Wollaston Expedition in 1912-1913 along Utakwa River, on way to Carstensz Peaks. Dominated by Lepidocyclina spp (Nephrolepidina and Eulepidina types) and Spiroclypeus (not Cycloclypeus; latest Oligocene- Early Miocene age; JTvG). Also occurrence of Jurassic mollusc Ctenostreon cf. terquemi in pebbles of Utakwa River. With review of older paleontological literature of New Guinea)

Setiawan et al. (eds.) Deep-water sedimentation of Southeast Asia, Proc. 2nd Regional Seminar Indonesian Sedimentologists Forum (FOSI), Jakarta 2001, p. 66-84.
(Late Miocene- Pliocene post-Kais Limestone clastics in Bintuni Basin overall coarsening upward strata, characterizing change from Klasafet to Steenkool Fms. Depositional environment changes from deep-marine Klasafet to deltaic to deep-water Lower Steenkool. Basin floor and slope fans and (N to S?) progradational complexes with clinoformal and shingled geometries interpreted within Lower Steenkool interval)

Nuraeni, A., G.J. Schurter, Y. Supriyatna, Supriyono, B. Hornby & C. Erdemir (2008)- 3D VSP finite-difference modeling to address advance seismic imaging challenges in Bintuni Bay, Irian Jaya Barat. Proc. 32nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA 08-G-061, 10p.
(3D seismic modeling method to better image gas-bearing Paleocene turbiditic channel sands over Wiriagar Deep field, previously hard to see below thick karstified Oligo-Miocene carbonates. Channel complexes trend NW-SE, ~1km wide))

Nurwani, C., Z. Imran, C.I. Abdullah, S. Nurmala Mulyati & D.R. Aprillian (2017)- Hydrocarbon prospectivity of Cendrawasih Bay area. Int. Proc. Chemical Biological Environmental Engineering 101, 15, p. 106-112.
(online at: http://www.ipcbee.com/vol101/rp017_ICGES2017-E0010.pdf)
(Cenderawasih Bay covers Cendrawasih Basin and North Waipoga/Memberamo Basin in E. Underlain by Pacific oceanic and volcanic arc crust. Several wells drilled since 1973, with oil and gas shows. Reservoir rocks in Pliocene-Pleistocene Memberamo Fm turbidites. Source rocks include shale of Miocene Makats Fm. Area high potential of hydrocarbons, thermogenic or biogenic)

Nurzaman, Z.Z. & A. Pujianto (1994)- Geology and reservoir characterisation of Wiriagar Field as a diagenetic facies for reservoir stimulation. Proc. 23rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 29-45.

(Reservoir characterization of U Miocene reefal Kais Lst in Wiriagar Field, Bintuni Basin. Producing up to 8470 BOD from 3 wells since 1990. Recoverable reserves ~3.5 MBO, with additional potential of 7.4 MBO. OWC at -1686' subsea. Wiriagar oil with low dissolved gas, sweet and low wax content, probably sourced from Jurassic Lower Kembelangan shales and Permian Aifam Fm. After 18 months of production water cut increased to 93%. Complex diagenetic history, including fracturing)

Nyoman Suta, I. & L. Silahi (1994)- The structurally trapped Matoa field and porosity distribution, Salawati Basin, Irian Jaya. Proc. 23rd Ann. Conv. Indon. Assoc. Geol. (IAGI), 2, Jakarta, p. 1128-1141.
(Matoa field 1991 Santa Fe- Pertamina discovery and only structural trap field in Salawati Basin. Production from non-reefal M-L Miocene Kais Fm platform carbonates. Three productive zones, with av. porosities 11.6-21%, both primary and secondary. Upper 100' of Kais Fm thick pelagic marine planktonic foram mudstone. NE-SW trending fault-bounded antinlinal structure. 14 wells producing 10,000 BOD)

O'Connor, G.V., L. Soebari & S. Widodo (1994)- Upper Miocene-Pliocene magmatism of the Central Range mobile belt, Irian Jaya, Indonesia. Proc. 23rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, 1, p. 316-333.
(Major magmatic event in Central Range from 7.1- 2.6 Ma (mainly 7-5 Ma), possibly related to S-dipping subduction after Late Miocene arc reversal. Belt of quartz-poor 'shoshonitic-affinity' calc-alkaline intrusions and volcanics (andesite, trachytes) extends from Etna Bay in W (134.5°) to Ilaga in E (138.0°) and includes Grasberg and porphyry copper and Ertsberg gold-copper skarn. Apparent younging of magmatism in SW direction. After ~4 Ma plate convergence taken up in large transform system; no currently active Benioff zone)

OøConnor, G.V., L. Soebari & S. Widodo (1994)- Upper Miocene- Pliocene magmatism of the Central Range Mobile Belt, Irian Jaya, Indonesia. Proc. 4th Asia Pacific Mining Conference, Jakarta, AFMA, p. 1-27.
(Same paper as O'Connor et al. 1994, above)

OøConnor, G.V., W. Sunyoto, & L. Soebari (1999)- The discovery of the Wabu Ridge gold skarn, Irian Jaya, Indonesia. In: G. Weber (ed.) Proc. PACRIM ø99 Congress, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 549-557.
(Wabu Ridge Gold Skarn deposit identified in 1990 at elevations up to 3100m in Central Range, W Papua, 35 km NNW of Grasberg porphyry deposit. Mineralisation in skarn along S boundaries of Late Miocene Pagane intrusive monzonite-diorite. Intrusive complex in footwall of E-W Derewo fault with sinistral strike-slip and reverse fault movement. Derewo fault separates Derewo metamorphics to N from Australian craton platform sediments to S. Skarn area 6 x 1.5 km, in Tertiary New Guinea limestone group, dominated by prograde garnet. Same paper re-published as Sunyoto & Soebari 2005?)

Oehlers, M. (2005)- Defining structural style using satellite imagery and DEM's: examples from the Bird's Head, Western Papua and the Masilah Basin, Yemen. Proc. 2005 SE Asia Petrol. Expl. Society (SEAPEX) Exploration Conf., Singapore, 51p. *(Abstract + Presentation)*.

Trans. 5th Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1990, Gulf Publishing, Houston, p. 445-458.
(Compilation of wells temperature and basins heatflow data for all of New Guinea island. Heat flow averages for basins: Salawati 1.98±0.76 HFU (geothermal gradient 3.9 ± 1.48°C/100m), Bintuni 1.49±0.77 HFU (3.31 ± 1.5°C/100m) and Papua Basin 1.57±0.49 HFU (2.61±0.8°C/100m. With calculations to depth of Top oil window for Salawati- Bintuni and Gulf of Papua basins. Similar to Pigott (IPA 1994))

Pigram, C.J. (1986)- Western Irian Jaya: the end-product of oblique plate convergence in the late Tertiary- discussion. Tectonophysics 121, 2-4, p. 345-348.
(Critique of Dow & Sukamto 1994 paper. In Pigram's opinion differences in basement geology and Late Paleozoic and Mesozoic history between Birds Head, Birds Neck and Misool regions and Australian Craton cannot be explained in terms of simple lateral facies changes, but suggest W Irian Jaya is complex

amalgamation of continental fragments, not simply an extension of Australian Craton. E Paleozoic rocks of Australia- New Guinea craton not undergone M Paleozoic regional metamorphism that affected Birds Head)

Pigram, C.J. & H.L. Davies (1987)- Terranes and the accretion history of the New Guinea orogen. Bureau Mineral Res. J. Australian Geol. Geoph. 10, 3, p. 193-212.
(online at: www.ga.gov.au/corporate_data/81217/Jou1987_v10_n3_p193.pdf)
(Classic paper, with interpretation of New Guinea- E Indonesia complex tectonic history in terms of numerous plates, many which derived from E margin of New Guinea, rifted off and transported West. Prior to 40 Ma N edge of Australia- New Guinea continent faced ocean basin that had developed in Mesozoic By ~25 Ma (latest Oligocene) first composite terranes docked (Sepik and probably also Rouffaer terranes). By ~14 Ma (latest M Miocene) N part of E Papua composite terrane had docked. By 10 Ma (Late Miocene) W lrian Jaya composite terrane and northern island-arc terranes of C New Guinea docked. By 2 Ma Late (Pliocene) northern terranes of W lrian Jaya (Tamrau, Arfak, Waigeo terranes) docked, also Seram composite terrane. Opening of Woodlark Basin currently dismembering E end of E Papua composite terrane)

Pigram, C.J. & H. Panggabean (1981)- Pre-Tertiary geology of western Irian Jaya and Misool Island: implications for the tectonic development of Eastern Indonesia. Proc. 10th Ann. Conv. Indon. Petroleum Assoc., Jakarta (IPA), Jakarta, p. 385-399.
(Dated, broad interpretation of W Irian Jaya stratigraphy, tectonics)

Pigram, C.J. & H. Panggabean (1984)- Rifting of the northern margin of the Australian continent and the origin of some microcontinents in Eastern Indonesia. Tectonophysics 107, 3-4, p. 331-353.
(Classic paper linking New Guinea Jurassic-Cretaceous rift-drift stratigraphy to E Indonesian microcontinents like Buton, Buru-Seram and Banggai-Sula. New Guinea N margin rifting began at ~230 Ma. Onset of seafloor spreading (marked by post-breakup unconformity) ranges in age from 185 Ma in PNG to 170 Ma in Irian Jaya and continues to young in SW direction along W margin of Australian continent, reflecting opening of Indian Ocean off W Australia. By end Jurassic N margin of Australian continent faced seaway which linked proto-Indian and proto-Pacific oceans, which was separated from pre-existing Neo-Tethys and Panthalassa oceans by microcontinents, now preserved in E Indonesia. Banggai-Sula and Buton rifted off PNG side of margin, Birds Head closer ties to N Queensland, NE Australia)

Pigram, C.J. & H. Panggabean (1989)- Geology of the Waghete Sheet area. Geol. Res. Dev. Centre (GRDC), Bandung, 46p., 1: 250,000 scale map.

Pigram, C.J., G.P. Robinson & S.L. Tobing (1982)- Late Cainozoic origin for the Bintuni Basin and adjacent Lengguru fold belt, Irian Jaya. Proc. 11th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 109-126.
(Bintuni Basin and Lengguru foldbelt are very young features, possibly result of collision between W Irian Jaya microcontinent and NW margin of Australian continent. Deposition of New Guinea Limestone in Irian Jaya ceased in M Miocene and this limestone forms basement to Late Cenozoic clastic sediments of asymmetrical Bintuni Basin. Intensity of deformation in Lengguru foldbelt increases E-wards; along E margin folded sediments are low-grade metamorphics faulted against Late Miocene- Pliocene gneisses of Wandamen Peninsula (K-Ar ages two clusters: ~5 Ma= age of metamorphism, and 1.5 Ma= age of uplift))

Pigram, C.J., G.P. Robinson & S.L. Tobing (1982)- Late Cainozoic origin for the Bintuni Basin and adjacent Lengguru foldbelt. Geol. Res. Dev. Centre Bull. 7, p. 24-36.
(Same paper as above)

Pigram, C.J. & U. Sukanta (1982)- Geological data record of the Taminabuan 1:250,000 sheet area, Irian Jaya. Geol. Res. Dev. Centre (GRDC), Bandung, Open file Report, p.. *(Unpublished)*

Pigram, C.J. & U. Sukanta (1989)- Geology of the Taminabuan sheet area, Irian Jaya, scale 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung, p. 1-51. *(Unpublished)*

Pigram, C.J. & P.A. Symonds (1991)- A review of the timing of the major tectonic events in the New Guinea orogen. J. Southeast Asian Earth Sci. 6, p. 307-318.
(Three major events shaped New Guinea orogen: (1) Mesozoic extension with Triassic and E Jurassic rifting, leading to passive margin along N edge of Australian craton; (2) Second phase of rifting in Late Cretaceous, dismembering E part of margin and opening Coral Sea basin and contemporaneous ocean basin to N in Latest Cretaceous-Eocene; (3) Initiation of mountain building. First foreland load-induced basin flexing in Mid-Oligocene, coinciding with switch in main clastic source from S to N. Darai carbonate platform backstepping from Late Oligocene- M Miocene)

Pireno, G.E. (2008)- Potensi Formasi Sirga sebagai batuan induk di Cekungan Salawati, Papua. M.Sc. (S2) Thesis, Inst. Teknologi Bandung (ITB), p. 1- . *(Unpublished)*
('The potential of the Sirga Formation as a source rock in the Salawati Basin, Papua'. SF-1X well (2007) in Salawati Basin with oil and gas shows in Late Oligocene Sirga Fm sandstones, in SAR-1X well (2008) oil in pre-Kais sandstones, making M-Miocene Klasafet source rock unlikely. Oils from both wells waxy (3.6 wt%) with very low sulphur, heavy carbon isotopes (-22 to -23), pristane/phytane ratio 1.33- 2.61, with oleanane as biomarker of Tertiary land plants and diahopane/ neohopane as biomarker of shallow lacustrine source. Most likely source E Tertiary lacustrine rocks, possibly Sirga Fm deposited in extensional-graben system)

Pitaloka, R., A. Vanessa & O. Verdiansyah (2013)- Mineralogy of sulfide ore from skarn type deposits, Oksibil, Papua, Indonesia. Proc. Joint Conv. Indon. Assoc. Geoph. (HAGI) - Indon. Assoc. Geol. (IAGI), Medan, JCM2013-0222, 4p.
(Ok Sibil area in E part of W Papuan fold-thrust belt known for five types of calcic-skarn deposits: iron-skarn, tungsten, copper, zinc-lead and tin-tungsten. Mineralization due to Pliocene intrusion into Tertiary Yawee Fm limestone. Sulphide ore of Oksibil skarn mainly sphalerite, also chalcopyrite, pyrite, galena, covellite, chalcosite, anglesite, etc.. Temperature of ore fluid 234-266 °C to 258-320 °C)

Playford, G. & J.F. Rigby (2008)- Permian palynoflora of the Ainim and Aiduna formations, West Papua. Revista Espanola Micropal. 40, 1-2, p. 1-57.
(online at: http://revistas.igme.es/index.php/revista_micro/article/view/359/357)
(Palynology of Permian samples from Birds Head (Ainim Fm) and W part of Central Range (Aiduna Fm) of W Papua. Similar palynoflora in both places, with 26 species of spores, 18 species of pollen, incl. Laevigatosporites vulgaris, Protohaploxypinus limpidus, etc., and 5 species of microphytoplankton. Dated as late Early- early M Permian (Kungurian-Roadian). Mainly Gondwanan affinity spore-pollen suite (but key Gondwanan trilete genus Dulhuntyispora spp. absent) and megaflora, but also minor Cathaysian elements)

(online at: http://ci.nii.ac.jp/naid/110004313633/en)
(24 species/ 18 genera of Permian bryozoa from Aiduna Fm at 4 localities in Waghete map sheet. Fauna very similar to Timor described by Bassler (1929), also Peninsular Thailand and W Australia. Incl. Fistulipora spp, Eridopora, Tabulipora, etc. Part of typical S Tethys realm. Age most likely early Guadalupian, M Permian)

Salo, J.P. (2005)- Evaluating sites for subsurface CO2 injection/ sequestration: Tangguh, Bintuni Basin, Papua, Indonesia. Ph.D. Thesis, University of Adelaide, p. 1-368.
(Text online at: http://digital.library.adelaide.edu.au/dspace/bitstream/2440/49746/2/02whole_v.1.pdf)
(Downdip aquifer leg of M Jurassic (Bathonian- Bajocian) Roabiba Fm quartzose marine sandstone is most viable option for disposal of excess CO2 from Tangguh gas production. Second best is 'Aalenian sandstone'. M Jurassic (Aalenian-Callovian) overall transgressive series over Permian (Triassic- E Jurassic absent over Tangguh study area; E Jurassic only in nearby East Onin 1 well), with deeper marine facies to SW and S, with sediment supply mainly from NE. Major unconformity between Late Jurassic- Late Cretaceous, with Early Cretaceous missing, followed by Late Cretaceous (Turonian- Maastrichtian) rifting in Birds Head region, probably separating Birds Head microcontinent from Australia- New Guinea Plate. Erosion of folded Eocene-Oligocene at Basal Miocene unconformity reflects collision of Birds Head and Australia-New Guinea)

Samuel, L., K. Lukman & Suharno (1990)- Dominant geological factors which controlled petroleum potential of Salawati and Bintuni basins, Irian Jaya. Proc. 19th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 41-51.
(Birds Head Salawati basin more productive for Tertiary hydrocarbon discoveries than Bintuni basins. Possibly related to presence of Cretaceous shale seal in Bintuni, absence in Salawati)

Samuel, L. & L. Kartanegara (1991)- The role of Cretaceous seal to the hydrocarbon potential of the Salawati and Bintuni Basins, Irian Jaya, Indonesia. AAPG Ann. Mtg., Dallas, Abstracts, American Assoc. Petrol. Geol. (AAPG) Bull. 75, 3, p. 666.
(In Bintuni basin rel. little success in Miocene carbonates (only in Mogoi and Wagian fields). Presence of Cretaceous shales seal important: where this regional seal is noneffective, oil may migrate vertically from pre-Tertiary sources to Tertiary reservoirs)

Samuel, L. & R.S.K. Phoa (1986)- Problems. of source rock identification in the Salawati basin, Irian Jaya. Proc. 15th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 404-422.

Sapiie, B. (1998)- Strike-slip faulting, breccia formation and porphyry Cu-Au mineralization in the Gunung Bijih (Ertsberg) Mining District, Irian Jaya, Indonesia. Ph.D. Thesis, University of Texas at Austin, p. 1-304. *(Unpublished)*
(Most of Cenozoic tectonic evolution in New Guinea result of obliquely convergence and collision between Australian and Pacific Plates. In area of Gunung Bijih (Ertsberg) Mining District two deformation stages: (1) 12- 4 Ma 10's of km of contractional deformation, generating NW-trending folds and reverse/ thrust faults, (2) few km of strike-slip offset between 4- 2 Ma. Five major left-lateral strike-slip fault zones identified)

Sapiie, B. (2000)- Structural geology and ore deposit: case study of the Grasberg super porphyry Cu-Au mineralization, Irian Jaya, Indonesia. Proc. 29th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 2, p. 1-21.
(Strike-slip faulting in Central Range Irian Jaya started at ~4 Ma, after 10's of km of contractional deformation. Grasberg igneous complex emplaced at major left step in left-lateral strike slip system)

Sapiie, B. (2002)- Structural pattern and deformation style in the Central Range of Irian Jaya (West Papua), Indonesia. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 369-376.
(Central Range two stages of deformation: NW-trending folding between ~12- 4 Ma, followed by strike-slip faulting after 4 Ma. Change of deformation style related to change in relative plate motions between Australia and Pacific Plates)

Sapiie, B. (2007)-Strike-slip faulting and collisional delamination in the Central Range of West papua, Indonesia. Proc. Joint Conv. 32nd HAGI, 36th IAGI and 29th IATMI, Bali 2007, p. 1001-1002. *(Extended Abstract)*
(Change in deformation style in Central Range from regional folding to localized strike-slip between ~4-2 Ma interpreted to be manifestation of short-lived change in relative plate motion between Australian and Pacific plates at 4 Ma (transform movement between Australian plate and short-lived Caroline plate).

Sapiie, B. (2016)- Kinematic analysis of fault-slip data in the Central Range of Papua, Indonesia. Indonesian J. Geoscience 3, 1, p. 1-16.
(online at: http://ijog.bgl.esdm.go.id/index.php/IJOG/article/view/225/202)
(Most of Cenozoic tectonic evolution in New Guinea result of oblique convergence that led to arc-continent collision between Australian- Pacific Plates. Structural analysis in Gunung Bijih (Ertsberg) District indicates two deformation stages since ~12 Ma: (1) en-echelon NW-trending folds and reverse faults; (2) left-lateral strike-slip faulting sub-parallel to regional strike. Change from contractional to left-lateral strike-slip offset due to change in relative plate motion between Pacific-Australian Plates from 246° to 253° at ~4 Ma. From ~4- 2 Ma, transform motion along ~270° trend caused left-lateral strike-slip. Strike-slip faulting with 100s of m to at most a few km of offset significant for magma intrusion and mineralization)

Sapiie, B., A.C. Adyagharini & P. Teas (2010)- New insight of tectonic evolution of Cendrawasih Bay and its implications for hydrocarbon prospect, Papua, Indonesia. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-G-158, 11p.
(Deformation of Cendrawasih Bay related to coupling movement of Yapen-Sorong Fault Zone and Tarera-Aiduna left-lateral strike-slip faults. Cenderawasih Basin formed by NW-SE directed shortening and is most likely overlain by Australian continental crust)

Sapiie, B. & M. Cloos (2000)- Strike slip faulting in the core of the Central Range of New Guinea: aftermath of collisional delamination. Geol. Soc. America 2002 Denver Annual Meeting, 1p. *(Abstract only)*
(Strike-slip faulting in Gunung Bijih (Ertsberg) District during latest stage of collisional orogenesis, localizing igneous intrusion and copper-gold mineralization at 3 Ma. C Range tectonically inactive; current movements along N edge of island and Tarera-Aiduna fault zone. Between 3 Ma and Pleistocene glaciation, strike-slip motion ceased in W highlands. Rupture of N end of Australian plate (collisional delamination) started at ~8 Ma and propagated >1000 km E by 3 Ma, causing short-lived melting event. Batholithic-scale magma chambers in lower crust from ~7 to 3 Ma. Core of collisional belt was zone of weakness, localizing tectonic motions. Since then upper ~20 km of upwelled asthenosphere cooled, forming new lithospheric mantle. Healing of lithosphere beneath W Central Range caused plate motions to become concentrated at weaknesses along N coast of island)

Sapiie, B. & M. Cloos (2004)- Strike-slip faulting in the core of the Central Range of west New Guinea: Ertsberg Mining District, Indonesia. Geol. Soc. America (GSA) Bull. 116, 3-4, p. 277-293.
(Most of New Guinea Cenozoic tectonic evolution result of obliquely convergent motion. Two stages of deformation: (1) ~12- 4 Ma: km-scale folds and thrusts recording many tens of km of shortening; (2) starting at ~4 Ma five NW-trending (~300°) strike-slip fault zones in core of W Highlands, aiding ascent of magmas. Intrusives of 4.4- 2.6 Ma ages formed in pull-aparts along left-lateral strike slip faults. NE trending normal faults and veins suggest NW-SE extension)

Sapiie, B. & M. Cloos (2013)- Strike-slip faulting and veining in the Grasberg giant porphyry Cu-Au deposit, Ertsberg (Gunung Bijih) mining district, Papua, Indonesia. Int. Geology Review 55, 1, p. 1-42.

(Ertsberg mining district in core of Central Range of W New Guinea best known for Grasberg igneous complex, the host of giant Cu-Au deposit that was emplaced at 3 Ma. Three domains of strike-slip faulting in deposit, E-NE, NW and N-trending faults, formed in left-lateral Riedel shear system trending N60W)

Sapiie, B., W. Naryanto, A.C. Adyagharini & A. Pamumpuni (2012)- Geology and tectonic evolution of Bird Head region Papua, Indonesia: implications for hydrocarbon exploration in the Eastern Indonesia. AAPG Int. Conf. Exh., Singapore 2012, Search and Discovery Art. 30260, p. 1-39.
(online at: www.searchanddiscovery.com/documents/2012/30260sapiie/ndx_sapiie.pdf)
(Birds Head region of W Papua in region with deformation varying from area to area, indicating several translations and rotations during history)

Sapiie, B., D.H. Natawidjaja & M. Cloos (1999)- Strike slip tectonics of New Guinea: transform motion between the Caroline and Australian plates. In: I. Busono & H. Alam (eds.) Developments in Indonesian tectonics and structural geology, Proc. 28th Ann. Conv. Indon. Assoc.Geol. (IAGI), Jakarta 1999, 1, p. 1-15.
(Most of Cenozoic tectonic evolution of New Guinea result of oblique convergence that led to collisision between Australian continent and oceanic arc at leading edge of Pacific Plate. Ertsberg mining district of W Papua two stages of deformation: (1) ~12- 4 Ma WNW-trending en-echellon folds (10's of km of shortening) and (2) ~4-2 Ma mainly left-lateral strike slip faulting, with offsets up to 1-2 km. Change in style related to minor change in plate motion at ~4 Ma, also forming Caroline Plate)

Sapin, F., M. Pubellier, J.C. Ringenbach &, V. Bailly (2009)- Alternating thin versus thick-skinned decollements, example in a fast tectonic setting: the Misool-Onin-Kumawa Ridge (West Papua). J. Structural Geol. 31, p. 444-459.
(Misool-Onin-Kumawa Ridge between Seram accretionary wedge and Lengguru fold belt (<8 My). Three deformation stages: (1) Messinian thin-skinned fold-and-thrust belt over shaly-silty Permian-Paleocene; (2) Pliocene thick-skinned event responsible for uplift of ridge, possibly induced by onset of continental subduction; (3) Pleistocene deformation when thin-skinned tectonics resumed in Seram Trough. Currently, Seram wedge abuts ridge, transferring compression N into Salawati Basin. Jumps of active detachment levels may be response to changes in subduction parameters (velocity, rugosity, etc.) during transition between oceanic and continental subduction, or from thinned crust to thicker continental crust)

Saputra, A., R. Hall & L.T. White (2014)- Development of the Sorong Fault Zone north of Misool, Eastern Indonesia. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-086, 14p.
(Sorong Fault Zone W of Birds Head with several small basins along 3 major fault strands. Evidence of both transpression and transtension along sinistral strike-slip system. Kofiau Basin may be N part of Salawati Basin, displaced to W on Molucca-Sorong Fault during Pliocene)

Saragih, R.Y., A.K. Gibran, D.A.R. Prawiranegara, G.G. Arvillyn & A. Kusworo (2017)- Mesozoic source rock potential in Lengguru Basin, West Papua. Proc. 41st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA17-273-G, 16p.
(Jurassic-Cretaceous Kopai Fm in NE part of Lengguru foldbelt rel. high organic richness (TOC up to 1.2-17.7%). Most samples Type III kerogen. High thermal maturity in samples from NE area (overmature). Hydrocarbon seeps)

Saragih, R.Y., G.M.L. Junursyah, F. Badaruddin & Alviyanda (2018)- Structural trap modelling of the Biak-Yapen basin as a Neogen frontier basin in North Papua. Proc. 42nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA18-408-G, 25p.
(Biak Island and Supiori Islands interpreted as series of extensional fault blocks with >2000m of Neogene sediments, overlying Eocene arc volcanics)

Sardjono (1998)- Gravity field and structure of the Sorong Fault Zone, Eastern Indonesia. Ph.D. Thesis University of London, p. 1-269. *(Unpublished)*
(Gravity surveys along coastlines of Banggai-Sula islands, E Sulawesi, Halmahera, Bacan and Obi, integrated with earlier gravity data. Values <-250 mGal in S part of Molucca Sea to >+320 mGal near sea level in coastal

areas S of Mangole and N of Sulabesi (Sula Group). Steep free-air gravity gradients S of Mangole and W of Obi. Gravity along Sorong FZ near Banggal-Sula Islands suggest mainly attenuated continental fragments, juxtaposed to thick tectonic melange and anomalous oceanic crust. Continental fragments of Banggai-Sula dip N-ward, interpreted as response to sinking of Molucca Sea lithosphere. Obi region gravity suggests most of island peridotitic and basaltic rocks, with continental crust in S and S offshore. Ultramafic and basic rocks emplaced on Obi by reverse fault. Exposed basaltic rocks may be remnant of oceanic Philippine Sea Plate)

Sarmili, L., F.K. Jevie & M.F. Rosiana (2009)- Keterdapatan mineral zirkon dan hubungannya dengan batuan metamorfik di Teluk Wondama, Papua. J. Geologi Kelautan 7, 1, p. 37-45.

('Occurrence of zircon minerals and their relationship to metamorphic rocks in Wondama Bay, Papua' (= Wandamen Bay). Zircon-bearing metamorhic schist and amphibolite of Roon Island along Wandamen Bay point to granitoid, continental crust composition of precursor rock)

Sastratenaya, A.S., P. Sampurno & D. Soetarno (1988)- Favourable formations for uranium occurrences in Irian Jaya. In: Proc. Conf. Uranium deposits in Asia and the Pacific; geology and exploration, Jakarta 1985, Int. Atomic Energy Agency (IAEA), Vienna, IAEA-TC-543/19, p. 259-274.
(Probability of Uranium occurrences in basement complexes of W Papua good, owing to younger (Jurassic, Tertiary) intrusions of intermediate acidic magmatic rocks. Most important province is C Irian Jaya with formations favorable for U occurrences, i.e. Aifam, Iwur, Buru, Klasaman and Steenkool Fms. Some indications of mineralized granitic outcrops found by ground surveys in Ransiki area)

Satyana, A.H. (2001)- Dynamic response of the Salawati Basin, Eastern Indonesia, to the Sorong Fault tectonism: example of inter-plate deformation. Proc. 30th Ann. Conv. Indon. Assoc. Geol. (IAGI) and GEOSEA 10th Reg. Congress, Yogyakarta 2001, p. 288-291.
(Sorong Fault major left-lateral fault responsible for reversal of Salawati basin polarity. Late Paleozoic-Miocene beds thicken to S-SE, revealing presence of long-lived southern depocenter. At Miocene-Pliocene boundary basin tilted to W-SW, marking inception of Sorong Fault in N Irian Jaya. By mid-Pliocene Sorong Fault splayed into Salawati Basin and basin subsided rapidly to N-NW with uplift of S and E parts of basin. Coeval with rapid deposition of Late Pliocene Klasaman Fm sediments, which triggered shale diapirism)

Satyana, A.H. (2003)- Sorong Fault and the reversal of the Salawati Basin. Indon. Petroleum Assoc. (IPA) Newsl., March 2003, p. 15-21.
(Major E-W trending left-lateral Sorong strike-slip fault system along N Birds Head, W Papua and Papua New Guinea separates W-moving Pacific oceanic (Caroline and Philippine Sea) plate from relatively stable Australian continental plate. In Salawati Basin polarity reversal in Pliocene)

Satyana, A.H. (2003)- Re-evaluation of the sedimentology and evolution of the Kais carbonate platform, Salawati Basin, Eastern Indonesia: exploration significance. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 185-206.
(New paleogeographic model of Miocene Kais carbonates, making previous basinal zone lagoonal)

Satyana, A.H. (2008)- Aromatic methylphenanthrene biomarker and maturity of oils keys to identifying new active source rocks in the Salawati Basin, Indonesia. American Assoc. Petrol. Geol. (AAPG), Int. Conf. Exhib., Cape Town, 1p. . *(Abstract only)*
(Salawati Basin with foredeep kitchen bordered by Sorong Fault zone. Early-migrated and moderate-heavy oils in updip area, late-migrated and light oils and gas in downdip area approaching kitchen. Hydrocarbon sources Miocene Kais and Klasafet mudstones and shales. Maturity of oils derived from aromatic biomarker methylphenanthrene (MP) index increases towards downdip area. Low maturity oil seeps at Sorong deformed zone do not follow pattern, suggesting source from E Pliocene Lower Klasaman shale)

Satyana, A.H. (2009)- Emergence of new petroleum system in the mature Salawati Basin: keys from geochemical markers. Proc. 33rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 775-795.

(Salawati Basin proven petroleum system is Miocene Kais/Klasafet. Over Sorong foredeep kitchen, oils generated from lower maturity rocks than overmature Kais/Klasafet marly carbonaceous shales, must be sourced by Early Pliocene Lower Klasaman shales)

Satyana, A.H. & N. Herawati (2011)- Sorong fault tectonism and detachment of Salawati Island: implications for petroleum generation and migration in Salawati Basin, Bird's Head of Papua. Proc. 35th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA11-G-183, 21p.
(Sorong Fault at N and W margin of Salawati Basin reversed basin polarity from basin with S depocenter before Pliocene to the basin with N depocenter today. Subsidence of basin to N resulted in petroleum generation from Miocene Kais-Klasafet carbonates and shales main source rocks. Salawati Island, once attached to main Bird's Head, detached and rotated CCW, opening Sele Strait. After rotation Salawati Island translated SW-ward to present position)

Satyana, A.H., M.E.M. Purwaningsih & E.C.P. Ngantung (2002)- Evolution of the Salawati structures, eastern Indonesia: a frontal Sorong fault deformation. Proc. 31st Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, 1, p. 277-293.
(Neogene structures in Salawati Basin tied to Sorong Fault tectonism. Four stages of development, reflecting 25° CCW rotation of strain ellipsoid between M Pliocene- Pleistocene. Sorong Fault started at ~3.5 Ma, dissecting N margin of Salawati Basin. Present-day structuring mainly SSW-NNE normal faulting)

Satyana, A.H., Y. Salim & J.M. Demarest (2000)- Significance of focused hydrocarbon migration in the Salawati Basin: controls of faults and structural noses. Proc. 27th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 513-530.

Satyana, A.H. & I. Setiawan (2001)- Origin of Pliocene deep-water sedimentation in Salawati Basin, Eastern Indonesia: deposition in inverted basin and exploration implications. In: A. Setiawan et al. (eds.) Deep-water sedimentation of Southeast Asia, Proc. 2nd Regional Seminar Indonesian Sedimentologists Forum (FOSI), Jakarta, p. 53-65.
(New Mid-Late Pliocene NW Salawati Basin depocenter created by tectonic loading of contemporaneous Upper Klasaman Fm thrust sheets along regional Sorong left-lateral strike-slip fault. Accommodation filled with bathyal debris flow deposits. Thick Klasaman deposits buried Miocene source rocks once deposited in lagoonal environment to reach oil window and triggered overpressuring and shale diapirism of E Pliocene Lower Klasaman Fm shales)

Satyana, A.H. & M. Wahyudin (2000)- Meteoric water flushing and microbial alteration of Klamono and Linda oils, Salawati Basin, Eastern Indonesia: geochemical constraints, origin and regional implications. Proc. 29th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 71-84.
(Klamono and Linda fields oils evidence of biodegradation. Water from Kais Limestone outcrop flowed W to Klamono field. Linda field probably affected by meteoric water moving along fault)

Schappert, A. (1990)- The seismicity of the Tembagapura region, Irian Jaya. Proc. 19th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 2, p. 50-56.
(Tembagapura at S slopes of West Papua Central Range in seismically active Southen Highland seismic zone. Two groups of events: (1) deep events (>100km deep epicenters), associated with S-ward subduction of Solomon/ Pacific plate; (2) shallow earthquakes (<30km), related to mountain building in upper crust)

Schellart, W.P. & W. Spakman (2015)- Australian plate motion and topography linked to fossil New Guinea slab below Lake Eyre. Earth Planetary Sci. Letters 421, p. 107-116.
(online at: https://www.sciencedirect.com/science/article/pii/S0012821X15001855)
(On relation between latest Cretaceous- E Eocene (~71-50 Ma) N-dipping subduction at N edge of New Guinea-Australian plate and Cenozoic Australian plate motion changes and topography evolution of Australian continent. Evidence for ~4000 km wide subduction zone, which culminated in ophiolite obduction and arc-continent collision in New Guinea- Pocklington Trough region during subduction termination, coinciding with cessation of spreading in Coral Sea. Renewed N-ward motion caused Australian plate to override sinking

subduction remnant, detected with seismic tomography at 800-1200 km depth in mantle under C-SE Australia. Slab sinking and mantle flow cause S-migrating negative dynamic topography of several 100m to present-day ~200m deep depression of Lake Eyre Basin and Murray-Darling Basin)

Schlumberger, C. (1894)- Note sur *Lacazina wichmanni* Schlumb. n.sp.. Bull. Soc. Geologique France (3), 22, p. 295-298.
(Lacazina wichmanni n. sp. described from (Eocene) limestone from Triton Bay area, Lengguru foldbelt, collected by Wichmann. Species also known from New Caledonia?; Koolhoven 1929.)

Schroo, H. (1961)- Some pedological data concerning soils in the Baliem Valley, Netherlands New Guinea. Boor en Spade 11, p. 84-103.
(Early paper on geomorphology and relatively poor soil quality in Baliem Valley, Central Range)

Schurter, G.J., Y. Supriatna, A. Nuraeni & Supriyono (2009)- A 3D finite-difference modeling study of seismic imaging challenges in Bintuni Bay, Irian Jaya Barat. The Leading Edge 28, p. 1008-1021.

Seno, T. & D.E. Kaplan (1988)- Seismotectonics of Western New Guinea. J. Physics of the Earth 36, p. 107-124.
(online at: www.journalarchive.jst.go.jp/...)
(No seismological evidence of subduction along New Guinea Trench W of 140°E (believed to be relic of ancient subduction). Region between N New Guinea Trench and Central Range characterized by strike-slip faulting and reverse faulting. Yapen Island earthquake suggests active strike-slip motion along this part of Sorong fault zone. Thrust mechanisms common in Meervlakte Basin. Additional strike-slip faulting and thrust faulting in Tarera and Wandamen Fault Zones. Oblique convergence between Caroline and Australian plates in W New Guinea divided into strike-slip and dip-slip components. East of 140°E along New Guinea Trench, Bismarck plates are subducting, producing intermediate- depth seismicity beneath central New Guinea)

Setiadi, I. & Marjiyono (2018)- Interpretasi geologi bawah permukaan dan delineasi Cekungan Salawati wilayah Sorong dan sekitarnya berdasarkan analisis spektral serta pemodelan 2D dan 3D Data Gayaberat. J. Geologi Sumberdaya Mineral 19, 3, p. 117-130.
(online at: https://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/409/3560
(Geological subsurface interpretation and delineation of the Salawati Basin in the Sorong area and surroundings based on spectral analysis of 2D and 3D modelling of gravity data'. Average sediment thickness in area 3.4 km. Five subbasins. Basement metamorphics)

Setiawan, Y., E. Syafron, N. Arbi, M. Hardenberg, M. Jones, H. Banjarnahor, Nakamoto, I. Argakosesoemah et al. (2016)- Chasing the Jurassic sand in Semai Basin, Papua. Proc. IPA 2016 Technical Symposium, Indonesia exploration: where from- where to, Indon. Petroleum Assoc. (IPA), Jakarta, 40-TS-16, p. 1-23.
(Since 2006 oil companies invested $600MM in unsuccessful exploration of Semai basin between Onin Peninsula/ Birds Head and Seram Trough (Trench). Tight Lower Jurassic sandstone penetrated in Lengkuas-1 well at 6500m TVDSS (63m gross, but not fully penetrated; porosity <1-2%), i.e. older than M Jurassic main reservoirs in Tangguh fields. Probably part of W-E (or SW to NE?) backstepping pattern in E-M Jurassic deltaic sandstones. Same age reservoir much shallower in Bawang Putih-1 and Serai-1 wells to E; also poor reservoir quality. Reduced porosity in E Jurassic sandstones due to deep burial (quartz overgrowth) and >3km of late structural uplift and inversion. With paleogeographic maps for E Jurassic, Paleocene, Miocene)

(Multiple scenarios for structure and evolution of Lengguru Fold Belt. Early Paleozoic detrital zircons in Paleocene Waripi section of Bintuni Bay suggest attachment to Australian continent (but could also be from Birds Head Kemum terrane?; JTvG)

Sutriyono, E. (2003)- Provenance study and tectonic implications for rock sequences in the Lengguru fold belt of Western Papua: constraints from zircon fission track thermochronology. Forum Teknik 27, p. 121-131.
(online at: http://i-lib.ugm.ac.id/jurnal/detail.php?dataId=5789)
(Zircon fission track thermochronology study shows Triassic-Pliocene source terrains for W Papua clastics. Pliocene Buru Fm in Lengguru Fold Belt abundant Paleogene (~55 Ma) volcanic zircons, possibly derived from erosion of Weyland Terrane, which may be part of Paleogene 'Caroline Arc', eroding after Late Miocene collision with W Papua microcontinent. Main compression 12- 4 Ma, followed by transpression in Central Range, but continued compression in frontal Lengguru FB (Buru anticline, etc.). U Cretaceous Ekmai sst in E Lengguru FB has Triassic age zircons, suggesting erosion of Triassic igneous rocks at that time)

Sutriyono, E. (2005)- Thermochronological constraints on cooling and uplift episodes in the Lengguru fold belt of Western Papua. Jurnal Teknologi Mineral (ITB) 12, 2, p. 65-75.
(Apatite fission track data from Triassic- Lower Jurassic in Lengguru foldbelt suggest maximum T of ~130°C, and ~7 km pre-deformation burial due to deposition of thick Tertiary carbonates. Sequence underwent ~50°-60°C cooling at 5 Ma, consistent with ~4 km unroofing in response to uplift, due to collision with Paleogene volcanic arc in Late Miocene-Pliocene. Upper Miocene-Pleistocene provenance terrain cooled through partial annealing isotherm to ~60°C in E Miocene. Protolith then buried below 3 km and exposed to paleotemperature of ~110°C in M-L Miocene prior to uplift in last 4 My)

Sutriyono, E. (2006)- Hydrocarbons and thermal evolution of the Bintuni basin of Western Papua, assessed by apatite fission track study. Media Teknik (UGM) 28, 1, p. 13-19.

(AFT data from Bintuni basin with ~9 km Permian- Recent sediments, gently folded by Lengguru foldbelt deformation. U Miocene-Pleistocene Steenkool Fm 4-5 km thick, with paleotemperatures below 85°C, Triassic-Lower Jurassic Tipuma Fm max. paleo-T ~110°C. Rocks at maximum temperature today. Exposure of Mesozoic rocks to high paleotemperatures due to Late Cretaceous-Pleistocene burial. Deeper sequences in basin not buried as deeply, allowing preservation of reservoir porosity. Gas generation/ migration for 30 TCF Tangguh field in last 5 My, with kitchen area ~50 km to E)

Sutriyono, E. (2008)- Accretion history of Paleogene arc terranes in Western Papua: evidence from Apatite Fission Track data. J. Ilmiah Magister Teknik Geologi (UPN) 1, 2, 13p.
(online at: http://jurnal.upnyk.ac.id/index.php/mtg/article/view/172)
(Apatite Fission Track (AFT) data from Tosem and Tamrau blocks in N part of Birds Head. Tosem Block (collided with Birds Head microcontinent at ~5 Ma) with Oligocene Mandi island arc Volcanics(K-Ar ages mainly Oligocene, 32-11 Ma; probably part of Auwewa Paleogene arc. Lembai Diorite K/Ar age ~16 Ma), showing effects of Late Miocene collision of Tosem Paleogene arc and Tamrau continental block. Tosem Block: (1) cooling in E Miocene at ~18 Ma; (2) Late Miocene (~8 Ma) cooling, due to uplift and denudation after collision with Tamrau terrane. M Miocene Tamrau Block Moon volcanics rapid cooling caused by uplift and denudation in Late Miocene at ~5 Ma, also resulting from collision with Tosem island arc)

Sutriyono, E. & K.C. Hill (2002)- Structure and hydrocarbon prospectivity of the Lengguru Fold Belt, Irian Jaya. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 319-334.
(Restored cross-sections Lengguru foldbelt. Major uplift and cooling of LFB at ~5 Ma; tight Woniwogi sst at Kamakawala 1 may have been as deep as 6.3 km in Late Miocene, followed by ~4km of E Pliocene uplift, downgrading hydrocarbon potential of LFB)

Sutriyono, E., P.B. O' Sullivan & K.C. Hill (1997)- Thermochronology and tectonics of the Bird's Head Region, Irian Jaya: apatite fission track constraints. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum Systems of SE Asia and Australia Conf., Jakarta 1997, Indon. Petroleum Assoc. (IPA), p. 285-299.
(AFT analyses in N Birds Head Tosem Block shows rapid cooling of dacite/diorite in E Miocene and Late Miocene cooling of granite-syenite intrusions, the latter probable response to uplift/obduction of Tosem Block onto N Birds Head. Also AFTT results from Tarof 2 and E Lengguru)

Suwarna, N. & Y. Noya (1995)- Geological map of the Jayapura (Peg. Cyclops) Quadrangle, Irian Jaya, scale 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.
(Common mafic-ultramafic rocks, all in tectonic contact with other units. Cycloops metamorphic Gp includes schist, gneiss, amphibolite, marble, some with glaucophane, E Miocene radiometric ages of schists associated with ophiolites in Cyclops Mts: 20.6±4 Ma and 21.4±4 Ma. Middle Oligocene age of emplacement of ultramafic rocks(?). Ultramafics probably overlain by Late Oligocene- E Miocene Nubai Fm limestone (with Spiroclypeus) in E part Cycloops Mts, lower part interfingering with ?Oligocene Auwewa Fm basaltic-andesitic arc volcanics, upper part interfingers with M-L Miocene turbiditic and volcanoclastic marine Makats Fm (with Miogypsina). Pleistocene Jayapura Fm limestones uplifted over 700m)

Tjia, H.D., R. Hadian, A.R. Sumailani & A. Martono (1980)- The nature of Umsini volcano, Irian Jaya, Indonesia. Bull. Volcanology 43, 3, p. 595-600.
(Mount Umsini at N end of Arfak Range in NE Birds Head of W Papua listed as active volcano. Consists of folded turbidites, mainly dipping 32° to ENE, with greywacke sands composed mainly of mafic volcanic debris, and volcano-clastic rocks. Intruded by E Oligocene gabbroic, occasionally dioritic, rocks (K-Ar age 33 Ma). Absence of volcanic activity, crater relicts and general morphology and lithology suggest Mount Umsini not an active volcano (part of Auwewa Oligocene intra-oceanic arc?; JTvG))

Tonggiroh, A. (2014)- Indikasi tipe endapan emas porfiri daerah Mamberamo, Provinsi Papua. Pros. 2014 Seminar Penelitian Teknologi Terapan 2014, 8, Hasanuddin University, Makassar, TG1, p. 1-6.
('Indications of a porphyry-type gold deposit in the Mamberamo area, Papua Province')

Tonny, S.A. & H. Bagiyo (1993)- New insight on tectonic setting and hydrocarbon potential of Cenderawasih Bay and its adjacent areas. Proc. 22nd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 2, p. 664-677.
(Cenderawasih Bay underlain by deformed oceanic and volcanic rock basement. Pull-apart basin between Sorong and Tarera-Aiduna fault zones. Sediment-fill similar to Miocene- Recent Mamberamo Basin, where there are hydrocarbon indications)

Trautman, M.C. (2013)- Hidden intrusions and molybdenite mineralization beneath the Kucing Liar skarn, Ertsberg-Grasberg mining district, Papua, Indonesia. M.Sc. Thesis University of Texas, Austin, p. 1-335.
(online at: http://repositories.lib.utexas.edu/handle/2152/21903)
(Ertsberg-Grasberg Cu-Au Mining District of W Papua hosts Ertsberg Skarn, Grasberg porphyry and several other orebodies. Two 1700m cores beneath Kucing Liar ore skarn and Grasberg Complex contain high concentrations of vein and disseminated molybdenite. Core KL98-10-22 intersects two previously unencountered intrusions: (1) "Tertiary intrusion Kucing Liar" (Tikl; 3.28 Ma) and (2) "Tertiary Pliocene intrusion" (Tpi; 3.18 Ma). Magmatic zircons ages ~3.4 Ma (Dalam Andesite) and 2.8 Ma (Ertsberg intrusion). Inherited zircon cores indicate Precambrian basement (mostly Proterozoic;mainly ~1650-2400 Ma; some grains at ~2500 Ma). Deep Molybdenite veining postdates stockwork veining (~3 Ma Re-Os ages))

Tregoning, P. & A. Gorbatov (2004)- Evidence for active subduction at the New Guinea Trench. Geophysical Research Letters 31, L13608, 4p.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2004GL020190)
(Seismic tomography shows SW-ward subduction along New Guinea Trench in PNG and Indonesia. High-velocity zone down to ~300km, with dip angle gradually increasing from ~10° at ~143°E to 30° at ~136°E. Length of ~650 km of subducted slab under New Guinea suggests subduction started at ~9 Ma)

Turner, S., J.M.J. Vergoossen & G.C. Young (1995)- Fish microfossils from Irian Jaya. Mem. Assoc. Australasian Palaeontologists (AAP) 18, p. 165-178.
(Late Silurian (M Ludlow) thelodonts and acanthodians micro-remains from Lorenz River in eastern W Papua and Kemum Fm of N part of Birds Head are first Paleozoic fish fossils from W Papua. Most forms comparable to Late Silurian- earliest Devonian N Hemisphere forms (Burrow et al. 2010: Silurian thelodont scales originally referred by Turner et al. (1995) to Thelodus trilobatus might be better placed in Praetrilogania))

Wafforn, S. (2017)- Geo- and thermochronology of the Ertsberg-Grasberg Cu-Au mining district, west New Guinea, Indonesia. Ph.D.Thesis University of Texas at Austin, p. 1-356.
(online at: https://repositories.lib.utexas.edu/handle/2152/61523)

(Novel U/Pb depth profiling technique shows Grasberg Igneous Complex intrusive magmatism active from 3.6-3.1 Ma. Cu-Au mineralization started after intrusion of MGI (3.22 Ma) and predates EKI (3.20 Ma) and LKI (3.09 Ma). High grade core of Grasberg deposit formed in <100 to 220 kyr. Ertsberg pluton (3.1-2.8 Ma) and other minor intrusions shows magmatism in district took less than 1 Myr. Rapid cooling of surface samples precludes presence of 2 km volcanic edifice overlying orebody. Garnets from Big Gossan skarn show skarn formed between 2.9-2.7 Ma)

Wafforn, S., S. Seman, J.R. Kyle, D. Stockli, C. Leys, D. Sonbait & M. Cloos (2018)- Andradite garnet U-Pb geochronology of the Big Gossan skarn, Ertsberg- Grasberg mining district, Indonesia. Economic Geology 113, 3, p. 769-778.
(Big Gossan Cu-Au skarn formed near contact between Cretaceous Ekmai limestone and Paleocene Waripi dolomitic limestone, adjacent to 3.1-2.8 Ma Ertsberg diorite. Andradite garnets dated as 2.9-2.7 Ma, compatible with district-wide zircon U-Pb geochronology and single 2.82 Ma phlogopite 40Ar/39Ar age for skarn. Confirm that Big Gossan was one of last ore-forming events in Ertsberg-Grasberg district)

Warren, P.Q. (1995)- Petrology, structure and tectonics of the Ruffaer metamorphic belt, west central Irian Jaya, Indonesia. M.A. Thesis University of Texas, Austin, 2 vols., p. 1-338. *(Unpublished)*

Warren, P.Q. & M. Cloos (2007)- Petrology and tectonics of the Derewo metamorphic belt, West New Guinea. Int. Geology Review 49, 6, p. 520-553.
(Derewo-Rouffaer Metamorphic Belt (DM) >500 km long, ~10-30 km wide terrane of slate and phyllite on N flank of Central Range. S edge is Derewo fault in W, but gradational with unmetamorphosed passive margin strata in E. N boundary is fault contact with Irian Ophiolite Belt. Metamorphic protoliths are Jurassic-Cretaceous Australian passive-margin strata. Most of rock pelitic, with minor siltstones, sandstones protoliths. Peak metamorphic conditions in Hitalipa area 250-350°C at 5-8 kbar (burial depths 15- 25 km). DM formed as Australian continental rise and slope sediments entered N-dipping subduction zone since 30 Ma. Widespread emergence by 12 Ma, followed by major uplift from collisional orogenesis at ~8 Ma. Present-day high topography of C Range established by ~4 Ma when delamination of subducting plate was complete and collisional movements changed into left-lateral transform fault system. Tens of km of strike-slip displacement in core of C Range, offsetting parts of metamorphic belt along Derewo and related faults)

Wass, R.E. (1989)- Early Permian bryzoa from Irian Jaya, Indonesia. Geol. Res. Dev. Centre (GRDC), Bandung, Seri Paleontologie 6, p. 11-25.
(Common late E Permian (Baigendzhinian) bryozoa in outcrops of Aifat Fm (= M Aifam) of upper Aifar River, SW part of Birds Head. Assemblages affinities with Ko Muk region of Peninsular Thailand (with Sulcoretepora, Streblascopora, Rhabdomeson; interpreted Late Artinskian age by Sakagami 1976) and NW Australia Canning Basin (with Stenodiscus variablis))

Webb, M. & L.T. White (2016)- Age and nature of Triassic magmatism in the Netoni Intrusive Complex, West Papua, Indonesia. J. Asian Earth Sci. 132, p. 58-74.
(Zircon U-Pb dating of in Netoni Intrusive Complex in Tamrau Mountains along Sorong Fault Zone in N Birds Head suggests series of pulses of Triassic magmatism between 248- 213 Ma (earlier K-Ar ages of 241-208 Ma in Pieters et al. 1983, 1989). Extensive incorporation of country rock xenoliths into Netoni Intrusive Complex. Granitoids likely emplaced in Andean-style subduction belt along E Gondwana (New Guinea - E Australia) through much of Paleozoic. Volcanic ejecta produced along this arc potential source of detritus for Triassic and younger sedimentary rocks in New Guinea and E Indonesia)

Webb, M. & L.T. White, B.M. Jost& H. Tiranda (2019)- The Tamrau Block of NW New Guinea records late Miocene-Pliocene collision at the northern tip of the Australian Plate. J. Asian Earth Sci. 179, p. 238-260.
(Tamrau Block is terrane in Birds Head at N side of Sorong strike-slip Fault Zone. Oldest rocks (Tamrau Fm) Jurassic-Cretaceous passive margin sediments, deformed and metamorphosed in three events. First phase with amphibolite facies possibly in Oligo-Miocene. Tamrau Fm unconformably overlain by Ajai Lst. Both units cross-cut and overlain by M Miocene Moon Volcanics. Overlying M-L Miocene Koor Fm partially contemporaneous with volcanism. Post-Koor folding/ faulting followed by deposition of undeformed Opmorai Fm (~10.5–4.5 Ma) and records collision of part of oceanic island arc (Tosem Block) to Tamrau Block. No provenance relationship between Tamrau and Kemum blocks. Tamrau Block transported ~300 km W along Sorong FZ after late Miocene-Pliocene collision between Tosem Block and N margin of Australian Plate)

Webb, M. & L.T. White, B.M. Jost, H. Tiranda & M. BouDagher-Fadel (2020)- The history of Cenozoic magmatism and collision in NW New Guinea- new insights into the tectonic evolution of the northernmost margin of the Australian Plate. Gondwana Research 82, p. 12-38.
(In NW New Guinea six units of Oligocene-Pliocene igneous rocks, recording magmatism in response to interaction between Australian and Philippine Sea plates. In Eocene start of oblique subduction of Australian Plate under Philippine Sea Plate (Philippine–Caroline Arc; recorded in Dore, Mandi and Arfak volcanics of NW New Guinea; 32-27 Ma). Collision in Oligocene-Miocene caused reversal in subduction polarity from N-dipping to S-dipping. Subduction of Philippine Sea Plate under Australian Plate produced M Miocene magmatism in W New Guinea (18–12 Ma Moon Volcanics). Following terminal arc–continent collision in late Miocene–Pliocene mantle derived magmas migrated up large strike-slip faults and erupted in Plio-Pleistocene)

Weiland, R.J. (1993)- Plio-Pleistocene unroofing of the Irian fold-and-thrust belt South of the Gunung Bijih (Ertsberg) Mining district, Irian Jaya, Indonesia: apatite fission-track thermochronology. M.A. Thesis, University of Texas, Austin, p. 1-84. *(Unpublished)*

Weiland, R.J. (1999)- Emplacement of the Irian ophiolite and unroofing of the Ruffaer metamorphic belt of Irian Jaya, Indonesia. Ph.D. Thesis, University of Texas, Austin, p. 1-526. *(Unpublished)*
(Irian Ophiolite metabasites near Gauttier Offset exhumed from NE dipping subduction zone. Amphibolites metamorphosed at ~700°C, blueschists at ~400°C, eclogites at ~450°C. Metamorphism ages between 65/70 Ma- 50/ 45 Ma. N Rouffaer Metamorphic Belt metapelites K-Ar ages ~35-20 Ma, recording metamorphism of passive margin strata. Intrusives near Irian Ophiolite characteristic of volcanic arcs; isotopic ages ~35-24 Ma (allochthonous Oligocene- E Miocene oceanic arc) and ~12-10 Ma (autochthonous M Miocene Maramuni Arc). Subduction of Australian passive margin strata and continental lithosphere led to uplift of Irian Ophiolite. Exhumation of metamorphic rocks by normal faulting near ophiolite-metamorphic belt contact (amphibolites from <15 km, slate from 15-20 km, phyllites from 25-30 km). Blueschists and eclogite exhumed from 25-35 km depth along Gauttier Offset. Unroofing in E metamorphic belt increased from 23 to 2 Ma. W metamorphic belt unroofed at ~0.3 km/My from 21-3 Ma and ~6.9 km/My. Age of ophiolite uncertain, probably around Late Cretaceous- Paleocene)

Weiland, R.J. & M. Cloos (1996)- Pliocene-Pleistocene asymmetric unroofing of the Irian fold belt, Irian Jaya, Indonesia: apatite fission-track thermochronology. Geol. Soc. America (GSA) Bull. 108, 11, p. 1438-1449.
(Fission-track ages of apatite from Pliocene intrusions at Ertsberg district at crest of C Range 3.7 ± 0.9 to 2.0 ± 0.3 Ma. Grasberg pluton emplaced into its own volcanic cover and <2 km of material eroded since Pliocene. Apatites from Triassic-Jurassic Tipuma, Carboniferous-Permian Aiduna Fms and igneous dikes exposed halfway S slope of range fission-track ages between 2.7 ± 0.7 and 2.0 ± 0.5 Ma and indication of slower cooling than Pliocene intrusions. Resetting of provenance fission-track ages in detrital apatite requires burial deeper >4 km. Uplift of Mapenduma Anticline S of Central Range started at ~7 Ma, with ~9km of erosion of sediment since then (unroofing here 2.5-5 x faster than at crest of C Range, probably due to higher rainfall on S slope)

Westermann, G.E.G. (1995)- Mid-Jurassic Ammonitina from the Central Ranges of Irian Jaya and the origin of stephanoceratids. In: Barnabas Geczy Jubilee Volume, Hantkeniana 1, Budapest, p. 105-118.

(Arafura Sea shelf is submerged subaerialle eroded land surface with fluvial pattern of channels and drowned reefs near edge of shelf. Marine survey in Arafura Sea supports eustatic sea level lowering of >130m between 21,000- 14,000 yrs BP. Submarine teraces down to 200m (dated at probably 170,000 yr BP) reflect much lower sea levels during earlier Pleistocene glacials)

Jongsma, D. (1974)- Marine geology of the Arafura Sea. Bureau Mineral Res. Geol. Geophysics, Canberra, Bull. 157, p. 1-56.
(online at: www-a.ga.gov.au/web_temp/1366411/Bull_157.pdf)
(Results of BMR marine geological survey in Australian sector of Arafura Sea in 1969. Seismic profiling revealed series of unconformities in the top few 100m of section. Regional unconformity at base Mesozoic, which overlies Precambrian. Paleozoic sediments may be present in graben in Money Shoal area and N of Melville Island. Another unconformity correlated with regional Mio-Pliocene surface encountered in Ashmore Reef 1 well, etc., corresponding to later Cenozoic orogenies. Near Aru Islands the post-Mesozoic section thin or absent as result of uplift and erosion associated with active orogenic belts to N)

IX.1. Andaman Sea Region

Acharyya, S.K. (1991)- Late Mesozoic- Early Tertiary basin evolution along the Indo-Burmese range and Andaman Island. In: S.K. Tandon et al. (eds.) Sedimentary basins of India, p. 104-130.

Acharyya, S.K. (1997)- Stratigraphy and tectonic history reconstruction of the Indo-Burma-Andaman mobile belt. Indian J. Geology 69, p. 211-234.

Acharyya, S.K. (2007)- Collisional emplacement history of the Naga-Andaman ophiolites and the position of the eastern Indian suture. J. Asian Earth Sci. 29, 2-3, p. 229-242.
(Dismembered Late Mesozoic ophiolites in 2 belts along E margin of Indian Plate: (1) E Belt follows magmatic arc of C Burma Basin high gravity, mafic and continental metamorphic rocks and two closely juxtaposed sutures); (2) W Belt along E margin of Indo-Burma Range and Andaman outer island arc (negative gravity anomalies; rootless ophiolites over Eo-Oligocene flysch); with two sets of ophiolites accreted in E Cretaceous and M Eocene in this belt, inferred to be nappes from E Belt, emplaced during Late Oligocene collision between Burmese and Indo-Burma-Andaman microcontinents. Andaman Islands Ophiolites belong to W Belt, formerly interpreted as upthrust oceanic crust, accreted due to prolonged subduction to W of island arc, but subduction began only in Late Miocene and could not have produced ophiolitic rocks accreted in E Eocene)

Acharyya, S.K., K.K. Ray & S. Sengupta (1990)- Tectonics of the ophiolite belt from Naga Hills and Andaman Islands, India. Proc. Indian Academy Sci. (Earth Planetary Sci.) 99, p. 187-199.
(Ophiolitic rocks of Naga Hills-Andaman belt rootless slices, gently dipping over Paleogene flysch. Blueschists in ophiolite melange indicates involvement in subduction process. Subduction initiated prior to M Eocene as proved by lower age limit of ophiolite-derived cover sediment and olistostromal trench sediment. In Late Oligocene terminal collision between India and Sino-Burmese blocks, basement slivers from Sino-Burmese block, accreted ophiolites and trench sediments thrust W-ward as nappe and emplaced over down-going Indian plate. Root-zone of ophiolite nappe (suture) marked by partially-exposed E ophiolite belt of same age and gravity high passing through C Burma-Sumatra-Java. Subduction W of Andaman islands began only in Late Miocene, later than emplacement of ophiolites. Post-collisional N-ward movement of Indian plate developed leaky dextral transcurrent faults and caused Neogene-Quatemary volcanism in C Burma)

Acharyya, S.K., K.K. Ray & D.K. Roy (1989)- Tectono-stratigraphy and emplacement history of the ophiolite assemblage from the Naga Hills and Andaman island arc. J. Geol. Soc. India 33, p. 4-18.

Acharyya, S.K., K.K. Ray & S. Sengupta (1991)- The Naga Hills and Andaman ophiolite belt, their setting, nature and collisional emplacement history. Physics and Chemistry of the Earth 18, 1, p. 293-315.
(Indo-Burmese Range and Andaman-Nicobar Island Arc trend of ophiolite occurrences (dismembered mafic-ultramafic rocks with associated oceanic pelagic sediments). They occur as thrust slices at highest tectonic levels, overlying distal shelf sediments of Eocene- Oligocene age. Ophiolites unconformably overlain by M-L Eocene ophiolite-derived clastics. Ophiolites remnants of one or several intra-continental ocean basin(s), created during Cretaceous rifting of Greater India from Gondwana)

Alam, M., M.M. Alam, J.R. Curray, M.L.R. Chowdhury & M.R. Gani (2003)- An overview of the sedimentary geology of the Bengal Basin in relation to the regional tectonic framework and basin-fill history. Sedimentary Geology 155, p. 179-208.
(Bengal Basin at junction of three interacting plates: Indian, Burma and Tibetan (Eurasian) Plates. Major switch in sedimentation pattern during M Eocene- E Miocene as result of collision of India with Burma and Tibetan Blocks. By M Miocene, with continuing collision events and uplift in Himalayas and Indo-Burman Ranges a huge influx of clastic sediments came into basin from NE and E. From Pliocene onwards, large amounts of sediment filling basin from W and NW)

(Description of Andaman Sea accretionary prism and outer arc ridge, a series of forearc basins and major N-S faults, developed as result of highly oblique subduction at W Sunda Trench)

Curray, J.R. (1999)- A new look at present tectonics and opening history of the Andaman Sea. American Assoc. Petrol. Geol. (AAPG) Bull. 83, 13 (Supplement), p. *(Abstract only)*
(Andaman Sea active backarc basin behind Sunda subduction. Oblique convergence formed sliver plate between subduction zone and right lateral fault system after Oligocene. Eocene India- Asia hard collision started rotation and bending of W Sunda Arc. Sliver faulting started in Oligocene on W Andaman fault from off Sumatra through Andaman Sea into Sagaing fault. Late Oligocene Mergui Basin opening by extension of continental crust. E Miocene/ 25 Ma, backarc spreading started forming sea floor which became Alcock and Sewell Rises. From M Miocene/~15 Ma, these features separated from continental slope C Andaman Basin)

Curray, J.R. (2005)- Tectonics and history of the Andaman Sea region. J. Asian Earth Sci. 25, p. 187-232.
(Major review of Andaman Sea geology. Andaman Sea active backarc basin above and behind Sunda subduction zone where convergence is highly oblique. Sliver plate formed between subduction zone and right-lateral fault system (Sagaing Fault, etc.). Late Paleocene collision of Greater India-Asia started CW rotation and bending of N and W Sunda Arc. Series of extensional pull-apart basins opened by the combined backarc extension and strike-slip motion: Mergui Basin (started at 32 Ma), Alcock and Sewell Rises (23 Ma), East Basin (15 Ma). Alcock and Sewell Rises separated by formation of C Andaman Basin, and faulting moved onshore from Mentawai Fault to Sumatra Fault System of Sumatra (NB: ages revised from earlier Curray publications)

Curray, J.R. (2014)- The Bengal depositional system: from rift to orogeny. Marine Geology 352, p. 59-69.
(Bengal Depositional system one of greatest sediment accumulations in world, extends from alluvial-lacustrine sediments of lower Ganges and Brahmaputra Rivers, across Bengal Delta, Bangladesh continental shelf and slope to Bengal Fan. history from Mesozoic breakup of E Gondwanaland, N-ward drift of India, collision with S margin of Asia, rotation and bending of W Sunda Arc, and penetration of Indian continental mass into S Asia. Sources and provenance of sediments changed with ultimate uplift of Tibetan Plateau and Himalayas)

Curray, J.R. (2015)- Discussion: óóIs spreading prolonged, episodic or incipient in the Andaman Sea? Evidence from deepwater sedimentationò by C.K. Morley and A. Alvey. J. Asian Earth Sci. 111, p. 113-119.
(Disputes Morley and Alvey (2015) conclusion that crust of Alcock and Sewell Rises is continental, but is oceanic, thickened by back arc volcanism. Andaman Sea spreading not necessarily episodic, but sedimentation is episodic, caused by Plio-Pleistocene sea level fluctuations)

(Andaman Sea forearc basin with subduction complex accretionary prisms and ponded Neogene sediments. Oldest exposed rocks in Andaman Islands Upper Cretaceous oceanic sediments with radiolarian chert, overlain by Upper Cretaceous- Oligocene greywacke turbidites. Late Oligocene unconformity followed by Neogene clastics and carbonates. Low heatflow)

Mitra, D. (2005)- Late Oligocene and Miocene evolution of the carbonate system in the Gulf of Martaban (northern Andaman Sea): effects of eustacy, tectonics, and siliciclastic input; comparison with the Maldives carbonate system. M.Sc. Thesis Rice University, Houston, p. 1-142. *(Unpublished)*
(Gulf of Martaban Field 13x18 km isolated carbonate platform in Myanmar part of N Andaman Sea, formed on top of E-dipping (20-24°), faulted accretionary basement that influenced Late Oligocene Lower Martaban

Limestone growth. At Oligocene-Miocene boundary ~20m thick siliciclastics (age ~23 Ma/ Mi-1 SB?), temporarily inhibiting carbonate growth. Followed by growth of E Miocene U Martaban Lst platform, first aggradation, then backstepping and drowning at ~18 Ma. With common rhodoliths; red algae near top)

Moeremans, R.E. & S.C. Singh (2015)- Fore-arc basin deformation in the Andaman-Nicobar segment of the Sumatra-Andaman subduction zone: insight from high-resolution seismic reflection data. Tectonics 34, 8, p. 1736-1750.
(Deep seismic reflection data across the Andaman-Nicobar fore-arc basin, from 8°N to 11°N. Despite obliquity of subduction fore arc is dominated by compression, suggesting strong slip partitioning)

Mohan, K., S.G.V. Dangwal, S. Sengupta & A.G. Desai (2006)- Andaman Basin- a future exploration target. The Leading Edge 25, 8, p. 964-967.
(Summary of Andaman Sea basin evolution and exploration potential. Eocene-Recent basinal area >1200km from Sumatra into Myanmar. No significant hydrocarbon discoveries yet)

Morley, C.K. (2016)- Cenozoic structural evolution of the Andaman Sea: evolution from an extensional to a sheared margin. In: M. Nemcok et al. (eds.) Transform margins: development, controls and petroleum systems, Geol. Soc., London, Spec. Publ. 431, p. 39-61.
(Andaman Sea developed from margin where Palaeogene back-arc collapse closed mid-Cretaceous back-arc oceanic basin, and resulted in collision between island arc crust to W and W margin of Sundaland. Subsequent E-W to WNW-ESE extension in Late Eocene–Oligocene resulted in highly extended continental crust under Alcock and Sewell rises and E Andaman Basin, and moderately extended crust in Mergui-N Sumatra Basin. As India coupled with W Myanmar, margin became dominated by dextral strike-slip and NNW–SSE transtensional deformation during Miocene)

Morley, C.K. (2017)- Cenozoic rifting, passive margin development and strike-slip faulting in the Andaman Sea: a discussion of established v. new tectonic models. In: P.C. Bandopadhyay & A. Carter (eds.) The Andaman- Nicobar accretionary ridge: geology, tectonics and hazards, Geol. Soc., London, Mem. 47, Chapter 4, p. 27-50.
(Andaman Sea evolved from near-pure extension (WNW-ESE) in Late Palaeogene, to oblique extension (NNW-SSE) in Neogene, to strike-slip-dominated deformation in Late Miocene-Recent, probably reflecting switch from slab rollback-driven extension to India coupling with Myanmar. Possible revisions to traditional models for Andaman Sea: (1) Alcock and Sewell rises may be hyperextended continental or island arc crust, not Miocene oceanic crust; (2) E Andaman Basin mainly underlain by strongly necked to hyper-extended continental crust, not oceanic crust; or (3) C Anadaman Basin oceanic crust of Miocene, not Pliocene-Recent age)

Morley, C.K. & A. Alvey (2015)- Is spreading prolongeded, episodic or incipient in the Andaman Sea? Evidence from deepwater sedimentation. J. Asian Earth Sci. 98, p. 446-456.
(C Andaman Basin generally accepted to be site of continuous sea floor spreading since E Pliocene (~4.0 Ma). Seismic lines across E half of spreading centre show 100's m of sediment up to Central trough, suggesting either spreading in central basin was episodic or Central trough is incipient spreading centre in hyper-thinned continental or island arc crust. Gravity indicates C Andaman Basin is oceanic crust, but adjacent Alcock and Sewell Rises and E Andaman Basin are extended continental crust (see also Discussion by Curray (2015))

Morley, C.K. & A. Alvey (2016)- Reply to discussion óóIs spreading prolonged, episodic or incipient in the Andaman Sea? Evidence from deepwater sedimentationò by J.R. Curray 2015. J. Asian Earth Sci. 115, p. 62-68.
(Thick sediment section in axial trough of Andaman Sea spreading center incompatible withrapid influxes of sediment, but more indicative of Miocene spreading, with recently renewed, activity, if at all. Nature of crust adjacent to spreading centre remains uncertain)

Morley, C.K. & M. Searle (2017)- Regional tectonics, structure and evolution of the Andaman-Nicobar Islands from ophiolite formation and obduction to collision and back-arc spreading. In: P.C. Bandopadhyay & A. Carter (eds.) The Andaman- Nicobar accretionary ridge: geology, tectonics and hazards, Geol. Soc., London, Mem. 47, Chapter 5, p. 51-74.

(Proposed model for Cretaceous- Cenozoic development of Sumatra-Andaman-Myanmar region suggests continuity of single continental mass between Myanmar and Sumatra during Cenozoic, E Cenozoic ophiolite emplacement as imbricate slices in accretionary complex and no emplacement of a major overthrusting oceanic slab. Subsequent collisional deformation further dismembered ophiolites. ~30° CW rotation of SE Asia occurred following Asia- India collision, accompanied by transition from paired Andean-type magmatic belt to regional oblique-slip and strike-slip tectonics. In Neogene Andaman sea region became dominantly transtensional, while Myanmar in Late Neogene became transpressional)

Mukhopadhyay, B., S. Dasgupta & P. Mukherjee (2016)- Slab tear and tensional fault systems in the Sundaï Andaman Benioff zone: implications on tectonics and potential seismic hazard. Geomatics Natural Hazards Risk 7, 3, p. 1129-1146.

(Late Miocene volcanic ash layer in deep marine sediments of N Indian Ocean ODP Site 758 dated at ~8.2 Ma, compositionally similar to Toba tuffs and probably derived from Indonesian arc)

Pal, T. (2011)- Petrology and geochemistry of the Andaman ophiolite: melt-rock interaction in a suprasubduction-zone setting. J. Geol. Soc., London, 168, 4, p. 1031-1045.
(Andaman ophiolite (Cretaceous-Paleocene) occurs as thrust slices in outer arc of Andaman-Java subduction zone. Mantle sequence of layered serpentinized lherzolite and harzburgite, intrusive and extrusive rocks. Geochemistry indicates mid-ocean ridge basalt or suprasubduction zone setting. MORB mantle of subducting Indian plate accreted into mantle wedge, then melting of accreted mantle first produced boninite melt, followed by tholeiitic melt)

Pal, T. & A. Bhattacharya (2010)- Greenschist-facies sub-ophiolitic metamorphic rocks of Andaman Islands, Burma- Java subduction complex. J. Asian Earth Sci. 39, 6, p. 804-814.
(Greenschist facies metabasics (actinolite schist) and metasediments (garnetiferous quartzo-feldspathic mica-chlorite schist, etc.) at sole of ophiolite slices and as blocks in melange zone under Andaman ophiolite. Top part

of subducting slab and overlying trench sediments metamorphosed and dislocated by thrusts in accretionary prism. Metamorphism and uplift of metamorphic rocks with ophiolite slices between Cretaceous and Oligocene, later than emplacement of ophiolites of Sumatra and Java)

Pal, T., P.P. Chakraborty & R.N. Ghosh (2003)- PGE distribution in chromite placers from Andaman ophiolite and its boninitic parentage. J. Geol. Soc. India 62, 6, p. 671-679.
(Chromite placers in Rutland coast of Andaman and Nicobar Islands, derived from serpentinised dunite with thin stringers of chromite, show PGE incidence. Derivation of source rock from boninitic melt)

Pal, T., P.P. Chakraborty, T.D. Gupta & C.D. Singh (2003)- Geodynamic evolution of the outer-arc-forearc belt in the Andaman islands, the central part of the Burma-Java subduction complex. Geol. Magazine 140, 3, p. 289-307.
(Andaman Islands, part of Burma-Java subduction complex, expose outer-arc accretionary prism and forearc Oligocene-Pliocene turbidites. N-S-trending dismembered ophiolite slices of Cretaceous age at different levels with Eocene trench-slope sediments, uplifted and emplaced by E-dipping thrusts. Metapelites and metabasics of greenschist to amphibolite grade in melange zone of ophiolites. Eocene Mithakhari Group represents pelagic trench sediments and clastics derived from ophiolites. Eocene sediment deposited in isolated basins of immature trench-slope setting. Deposition of Oligocene Andaman Flysch Gp in forearc setting. Mio-Pliocene Archipelago Gp siliciclastic turbidites and subaqueous pyroclastic flow deposits in lower part and carbonate turbidites in upper part, suggesting deposition in shallower forearc compared to Oligocene)

Pal, T., T.D. Gupta, P.P. Chakraborty & S.C.D. Gupta (2005)- Pyroclastic deposits of Mio-Pliocene age in the Arakan Yoma- Andaman- Java subduction complex, Andaman Islands, Bay of Bengal, India. Geochemical J. 39, p. 69-82.
(online at: www.terrapub.co.jp/journals/GJ/pdf/3901/39010069.pdf)
(400m thick Archipelago Group Mio-Pliocene sequence of bedded tuff alternating with non-volcanogenic turbidites on Andaman Islands, overlying Andaman Flysch. Interpreted as tuffs from subaerial eruptions that landed in water and behaved as cold subaqueous flow. No lithic volcanic fragments. Origin of Andaman tuffs in convergent margin)

(online at: http://www.mantleplumes.org/WebDocuments/shethetal2009-bv.pdf)
(Barren Island little known volcano in Andaman Sea, and northernmost active volcano of Great Indonesian arc. Recent eruptions (1991, 1994-95, 2005-06) produced aa lava flows of basalt and basaltic andesite and tephra)

Shrivastava, J.P. & V. Sharma (2014)- Compositional variation in magma through Early Neogene in the Northeast Indian Ocean: a testimony from glass shards. J. Geol. Soc. India 84, 2, p. 181-186.
(Volcanic ash/ glass shards widely distributed in E Miocene marine succession of Andaman-Nicobar Islands, also few records from early M Miocene (~21-15 Ma). Range in composition from basalt to rhyolite. Andesite/ basalt-andesite most common, implying island arc tectono-magmatic setting, possibly in Indonesian region)

Singh, O.P. & S.A. Jafar (1995)- Late Miocene discoasters from Sawai Bay Formation, Neill Island, Andaman Sea, India. The Palaeobotanist 44, p. 189-206.
(21 species of Late Miocene discoasters from Sawai Bay Fm. Discoster berggrenii and D quinqueramus common forms. Calcareous nannofossil subzone CN9A = lower NN11)

Singh, O.P., S.M. Subramanya & V. Sharma (2000)- Early Neogene multiple microfossil biostratigraphy, John Lawrence island, Andaman Sea. Micropaleontology 46, p. 343-352.
(Planktic foraminifera, calcareous nannofossils and radiolaria examined from E Neogene of John Lawrence Island, Andaman Sea. Planktonic foraminifera referable to upper Globigerinatella insueta and lower

Praeorbulina glomerosa zones (E-M Miocene boundary). Nannofossil assemblages assigned to Helicosphaera ampliaperta (NN4) zone, radiolarians to Calocycletta costata Zone)

Singh, S.C. & R. Moeremans (2017)- Anatomy of the Andaman-Nicobar subduction system from seismic reflection data. In: P.C. Bandopadhyay & A. Carter (eds.) The Andaman- Nicobar accretionary ridge: geology, tectonics and hazards, Geol. Soc., London, Mem. 47, Chapter 13, p. 193-204.
(online at: http://mem.lyellcollection.org/content/memoirs/47/1/193.full.pdf)
(Andaman-Nicobar subduction system is NW segment of Sunda subduction system, where Indian Plate subducts beneath Sunda Plate in nearly arc-parallel direction. Entire segment ruptured during 2004 Andaman-Sumatra earthquake (Mw 9.3). Seismic characterization of Andaman-Nicobar subduction system from W to E. Ninety-East Ridge overlain by thick continental margin sediments beneath recent Bengal Fan sediments. Fracture zones on subducting plate beneath forearc, influence morphology of upper plate. Forearc region (accretionary wedge, forearc high and forearc basin) exceptionally wide (250 km). Forearc basin contains active backthrust and floored by continental crust of Malay Peninsula origin. Active sliver strike-slip fault in deep basin connects with Great Sumatra Fault in S and Sagaing Fault in N, via Andaman Sea spreading centre and large transform)

Singh, S.C., R. Moeremans, J. McArdle & K. Johansen (2013)- Seismic images of the sliver strike-slip fault and back thrust in the Andaman-Nicobar region. J. Geophysical Research, Solid Earth, 118, p. 5208-5224.
(Great Sumatra Fault defines present day plate boundary between Sunda Plate in N and Burmese Sliver Plate in S. Continues N of Banda Aceh in Andaman Sea for >700 km until it joins Andaman Sea Spreading Centre. Two strands between Banda Aceh and Nicobar Island: transpression in S, and deep narrow active rift system in N with volcanoes in center, suggesting volcanic arc is coincident with rifting. N of Nicobar Island active Andaman-Nicobar strike-slip fault, cuts through rifted deep basin; volcanic arc lies just E of rift. W margin of this basin seems to be rifted continental margin, tilted W, and flooring Andaman-Nicobar fore-arc basin)

Spicak, A. & J. Vanek (2013)- Earthquake clustering in the tectonic pattern and volcanism of the Andaman Sea region. Tectonophysics 608, p. 728-736.
(Earthquake swarms of S Andaman Sea zone induced by intrusions of subduction-generated calc-alkaline magmas, in N zone by intrusions of basaltic magmas associated with seafloor spreading. Earthquake swarm occurrence defines brittle, seismogenic layer at depths of 9-35 km)

Ariffin, K.S. & N.J. Hewson (2007)- Gold-related sulfide mineralization and ore genesis of the Penjom gold deposit, Pahang, Malaysia. Resource Geology 57, 2, p. 149-169.
(Penjom gold deposit ~20km E of Raub-Bentong Suture zone, Kuala Lipis, Pahang. Within C Belt of Permian-Lower Triassic Padang Tungku Fm argillaceous marine clastics with thin limestones and Pahang Volcanic Series intermediate to acid volcaniclastics and subordinate rhyolitic lava sequences. Intruded by tonalite and quartz porphyry. Penjom gold deposit associated with Tertiary, volcanic and hydrothermal activity)

Asama, K. (1973)- Lower Carboniferous Kuantan Flora, Pahang, West Malaysia. In: T. Kobayashi (ed.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 11, p. 109-118.
(Lower Carboniferous (Visean) flora from Raub series near Kuantan, East coast Malay Peninsula. This warm-humid 'Kuantan flora' is on East Malaya/ Indochina Block and contains Lepidodendron spp., Stigmaria, etc.))

Asnachinda, P. (1978)- Tin mineralization in the Burmese-Malayan Peninsula. In: P. Nutalya (ed.) Proc. 3rd Regional Conf. Geology and Mineral Resources of SE Asia (GEOSEA III), Bangkok, p. 293-299.

Aung, A.K. & J. Azmi (2014)- *Yatsengia jengkaensis*- a new yatsengiid rugose coral from the ñJenga Pass Limestoneò, Pahang, central Peninsular Malaysia. Warta Geologi 40, 1-2, p. 1-6.
(online at: www.gsm.org.my/products/702001-100339-PDF.pdf)
(Yatsengia jengkaensis n.sp. rugose coral from early M Permian (Wordian) Jengka Pass Limestone, ~24km E of Temerloh and 8km E of Bukit Kepayang, Pahang, C Peninsular Malaysia (= W margin of Indochina Plate). Jengka Fm steeply folded. Associated with fusulinds Neoschwagerina katoi, Verbeekina verbeeki, Sumatrina annae, Pseudofusulina, indicating M Permian age. Also with corals Michelinia cf. indica and Parawentzelella socialis and dasyclad algae Mizzia sp.)

Aung, A.K., Ng T. Fatt, K.K. Nyein & M.H. Zin (2013)- New Late Permian rugose corals from Pahang, peninsular Malaysia. Alcheringa 37, p. 1-13.
(Late Permian rugose solitary corals Iranophyllum aequabilis and I. pahangense from limestone lens in Gua Musang Fm, Selborne Estate, Padang Tengku, Pahang (C Peninsular Malaysia), belonging to Waagenophyllidae (Waagenophyllum, Iranophyllum). Associated with rich Late Permian Paleofusulina-Colaniella- Reichelina foraminiferal fauna, indicating Changhsingian age)

Aung, A.K., Ng T. Fatt, & K.K. Nyein (2012)- The first record of the Late Permian waagenophyllid rugose corals from Pahang, Central Peninsular Malaysia. Geol. Soc. Malaysia, Nat. Geoscience Conf., Kuching 2012, Paper A1, p. 7-8. *(Extended Abstract)*
(Late Permian solitary waagenophyllid rugose corals from limestone unit of Gua Musang Fm in Selbourne Estate, Padang Tengku area, Pahang, C Peninsular Malaysia. One new genus, 5 new species. First record of Iranophyllum in Malaysia. See also Aung et al. 2013)

Aung, A.K., Meor H.A. Hassan & Ng T. Fatt (2013)- Discovery of Late Devonian (Frasnian) conodonts from the ñSanai limestoneò, Guar Jentik, Perlis, Malaysia. Bull. Geol. Soc. Malaysia 59, p. 93-99.
(onine at: www.gsm.org.my/products/702001-100325-PDF.pdf)
(First record of Late Devonian (Frasnian) conodonts (Ancyrodella, Ancyrognathus, Palmatolepis, Polygnathus, Icriodus, Ozarkodina and Belodella) of linguiformis Zone from U Sanai Lst, Perlis, Malaysia. Limestone dips 60° NE, is pelagic with common tentaculitids, straight nautiloids, trilobites and bivalves. Sanai Lst limited distribution in Malaysia. Frasnian conodonts comparable to fauna (linguiformis Zone) of NW Thailand)

Aung, A.K. & M.K. Shuib (2013)- Similarities in Middle-Late Permian fossils from Myanmar and Malaysia and its paleogeographic implications. In: Proc. Nat. Geoscience Conf., Ipoh 2013, Geol. Soc. Malaysia, B14, p. 87-88. *(Abstract only)*
(online at: www.gsm.org.my/products/702001-101658-PDF.pdf)
(M-L Permian rugose corals from 'Plateau Limestone' of Myanmar (Sibumasu Block) include Thomasiphyllum ('Cimmerian' province) and Wentzellophyllum, suggesting mixed Cimmerian (Sibumasu) and Cathaysian provinciality in M Permian and imply M Permian Paleo-Tethys is only narrow seaway that probably closed by collision in Late Permian)

Aung, A.K., K. Simon & Ng T. Fatt (2011)- Permian foraminiferal assemblages from the limestone unit of the Gua Musang Formation in the Padang Tengku area, Pahang, Malaysia. Proc. 24th Ann. National Geoscience Conference 2011 (NGC2011), Johor Baru, P2-19, p. 142. *(Abstract)*
(online at: http://geology.um.edu.my/gsmpublic/NGC2011/NGC2011_Proceedings.pdf)
(Permian Gua Musang Fm limestone in Selbourne Estate, 4 km NW of Padang Tengku, Pahang, C Malay Peninsula, with 18 smaller foram genera: Tetrataxis, Reichelina, Climacammina, Geinitzina, Dagmarita, Pachyphloia, Globivalvulina, Paleotextularia, Ozawainella, Pseudokahlerina, Colaniella, Langella, etc. Fusulinids absent. Similar assemblages in M-U Permian of E Malay Peninsula, Phra Nang Bay of Peninsular Thailand, Plateau Limestone of E Myanmar, etc. Assemblages assigned to late M- early Late Permian)

Aw, P.C. (1990)- Geology and mineral resources of the Sungai Aring Area, Kelantan Darul Naim. Geol. Survey Malaysia District Mem. 21, p. 1-116.

Aw, P.C., K. Ishii & Y. Okimura (1977)- On *Palaeofusulina- Colaniella* fauna from the Upper Permian of Kelantan, Malaysia. Trans. Proc. Palaeontological Soc. Japan, N.S, 104, p. 407-417.
(online at: https://www.jstage.jst.go.jp/article/prpsj1951/1977/104/1977_104_407/_pdf)
(First record of uppermost Permian fusulinids (Palaeofusulina cf. bella, Reichelina, also Colaniella media and C. parva) in Malay Peninsula. In folded, WSW-dipping argillo-tuffaceous limestone interbedded with tuffs of Sungei Paloh, Lebir River area of S Kelantan, S of Kotabaru (= W margin of E Malaya Block?). Overlain by E Triassic with bivalve Claraia)

Aziz Ali, C., M.S. Leman & K.R. Mohamed (2004)- Fasies karbonat dan diagenesis di dalam batu kapur Bukit Biwah dan Bukit Taat, Kenyir, Ulu Terengganu. Bull. Geol. Soc. Malaysia 49, p. 61-65.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2004011.pdf)
Carbonate facies and diagenesis of M Permian shallow marine limestones in Terengganu province, NE Malay Peninsula)

Aziz Ali, C. & K.R.Mohamed (2013)- Microfacies and diagenesis in the Setul Limestone in Langkawi and Perlis. Bull. Geol. Soc. Malaysia 59, p. 59-66.
(online at: http://gsmpubl.files.wordpress.com/2014/08/bgsm2013010.pdf)

(Ordovician - E Devonian Setul Limestone outcrops in E Langkawi and Perlis seven microfacies. Depositional environments tidal flats to lagoon and shallow subtidal carbonate ramp. Diagenetic environments freshwater phreatic zone, marine phreatic zone, mixing zone and deep burial zone)

Azman, A.G. (2000)- The Western Belt granite of Peninsular Malaysia: some emergent problems on granite classification and its implication. Geosciences J. 4, 4, p. 283-293.
(Western Belt granites of Malay Peninsula considered as exclusively 'S' type granites, but consists of mixed 'I' and 'S' type features. This implies W Belt granites not solely derived from metasediments, but mixed origin of crustal material such as metapelites, greywackes and meta-igneous rocks)

Baioumy, H., M.N. Akmal Bin Anuar, M.N.M. Nordin, M.H. Arifin & K. Al Kahtany (2010)- Source and origin of Late Paleozoic dropstones from Peninsular Malaysia: First record of Mississippian glaciogenic deposits of Gondwana in Southeast Asia. Geological J. *(in press)*
(First record of Lower Carboniferous glacio-marine dropstone-bearing formations in Peninsular Malaysia. Dropstones subrounded-rounded clasts, 0.5-20 cm in size, scattered in red mudstone, black shales, sandstones and shales, and are composed of granite, quartzite, and sandstone. Precambrian basement rocks and Cambrian- Ordovician quartzite and sandstones main sources of dropstones. Glaciomarine rocks of tRebak and Chepor Mbs of the Singa Fm correlated to E Carboniferous global glaciation of Gondwana. Glaciomarine deposits of Kentut and Bukit Raja Mbs (Singa and Kubang Pasu Fms) correlated with global Middle Carboniferous glaciation, those of Kubang Pasu Fm, Ulang and Selang Mbs of Singa Fm and Kenny Hill Fm correlative to Late Carboniferous-Early Permian glaciation episode known as apex of Late Paleozoic ice Age. Results confirm Sibumasu Terrane initially was attached to Late Paleozoic Gondwana)

Baioumy, H. & Y. Ulfa (2016)- Facies analysis of the Semanggol Formation, South Kedah, Malaysia: a possible Permian-Triassic boundary section. Arabian J. Geosciences 9, 8, 530, p. 1-16.
(NW Malay Peninsula outcrop sections of deep-marine Late Permian- Triassic Semanggol Fm. Common volcanogenic material in Late Permian, probably from E China)

Baioumy, H., Y. Ulfa, M. Nawawi, E. Padmanabhan & M.N.A. Anuar (2016)- Mineralogy and geochemistry of Palaeozoic black shales from Peninsular Malaysia: implications for their origin and maturation. Int. J. Coal Geology 165, p. 90-105.
(19 Cambrian- Permian black shale-bearing formations form 25% of sediment cover in Malay Peninsula. Compositions indicate changes in degree of weathering of sediment-source of shales and relatively wet climate in Cambrian, dry in Ordovician, wet from Silurian- Carboniferous, dry in Carboniferous-Permian and relatively wet in Permian. Black shales deposited under reducing conditions. Possible Devonian anoxia. Majority of Paleozoic black shales in Peninsular Malaysia anchimetamorphic and overmature)

Basori, M.B.I. (2014)- Geology and genesis of volcanic-hosted massive sulfide deposits in the Tasik Chini District, Central Peninsular Malaysia. Ph.D. Thesis, University of Tasmania, p. 1-365.
(online at: http://eprints.utas.edu.au/22747/)
(Two polymetallic volcanic-hosted massive sulphide deposits in Tasik Chini district ~250km E of Kuala Lumpur in Pahang, in felsic volcano-sedimentary sequence of E Permian island arc of East Malaya Block. E Permian U-Pb zircon ages of from Bukit Botol (~273, 286, 292 Ma) and Bukit Ketaya (286, 288 Ma) deposits. Also widespread Triassic volcanic- plutonic rocks (Eastern Granite Belt), with zircon ages ~233-242 Ma (Ladinian-Carnian). Massive sulphide deposits are 'kuroko-type' volcanic-hosted seafloor deposits)

Basori, M.B.I., S. Gilbert, R.R. Large & K. Zaw (2018)- Textures and trace element composition of pyrite from the Bukit Botol volcanic-hosted massive sulphide deposit, Peninsular Malaysia. J. Asian Earth Sci. 158, p. 173-185.
(Bukit Botol volcanic-hosted massive sulphide deposit in Central Belt of Peninsular Malaysia, in Permian felsic volcanic and volcaniclastic rocks with volcanic arc geochemical signature. Mineralisation sulphide zone at footwall followed by barite lenses and exhalite layers (Fe-Mn ore) at top. Three types of pyrite)

Basori, M.B.I., M.S. Leman, K. Zaw, S. Meffre, R.R. Large et al. (2018)- Implications of U-Pb detrital zircon geochronology analysis for the depositional age, provenance, and tectonic setting of continental Mesozoic formations in the East Malaya Terrane, Peninsular Malaysia. Geological J. 53, 6, p. 2908-2917.
(U-Pb geochronology of detrital zircons in continental Late Jurassic or older formations of Central Belt of Peninsular Malaysia (E Malaya Terrane). Bertangga Fm zircon populations Jurassic (139-194 Ma), Permo-Triassic (226-274 Ma), Ordovician-Devonian (372-459 Ma), Neoproterozoic (631-876 Ma), and Mesoproterozoic- Palaeoproterozoic (1.5- 2.6 Ga). Gerek Fm significant Carboniferous grains. Detrital zircons correlate well with regional uplift and erosion to tectonic stability of East Malaya Terrane basin in Mesozoic)

Basori, M.B.I., K. Zaw, R.R. Large & W.F.W. Hassan (2017)- Sulfur isotope characteristics of the Permian VHMS deposits in Tasik Chini district, Central Belt of Peninsular Malaysia. Turkish J. Earth Sciences 26, 1, p. 91-103.
(online at: http://journals.tubitak.gov.tr/earth/issues/yer-17-26-1/yer-26-1-5-1510-17.pdf)
(Sulfur isotope data from E Permian volcanic-hosted massive sulfide deposits of Tasik Chini district in Central Belt of Malay Peninsula suggest source of ore fluids is seawater-dominated with minor magmatic input)

Basori, M.B.I., K. Zaw, S. Meffre & R.R. Large (2016)- Geochemistry, geochronology, and tectonic setting of early Permian (~290 Ma) volcanic-hosted massive sulphide deposits of the Tasik Chini district, Peninsular Malaysia. Int. Geology Review 58, p. 929-948.
(Tasik Chini district in C Belt of Malay Peninsula hosts Bukit Botol and Bukit Ketaya VHMS deposits. Hosted by Permian felsic volcanics. Four mineralization zones: (1) stringer sulphide; (2) massive sulphide; (3) barite; and (4) Fe-Mn and Fe-Si zones. U-Pb zircon dating of rhyolites E Permian ages (~286-292 Ma). Differences between E Permian host and later Triassic igneous rocks due to tectonic progression from volcanic arc to collisional setting)

Basori, M.B.I., K. Zaw, S. Meffre, R.R. Large& W.F.W. Hassan (2016)- Pb-isotope compositions of the Tasik Chini volcanic-hosted massive sulfide deposit, Central Belt of Peninsular Malaysia: implication for source region and tectonic setting. Island Arc 26, 2, e12177, 8p.
(Lead isotopes of sulfides and host volcanic rocks of Permian Tasik Chini volcanic-hosted massive sulfide deposit. Range of lead isotopic compositions reflect mixing of bulk crust/juvenile arc and minor mantle sources, are typical for VHMS deposits in island arc- back arc setting)

Batchelor, D.A.F. (1987)- The age of Malaysian fluvial tin placers. In: N. Thiramongkol (ed.) Proc. Workshop on Economic geology, tectonics, sedimentary processes and environment of the Quaternary in Southeast Asia, Haid Yai, Thailand 1986, IGCP 218/ Chulalongkorn University, Bangkok, p. 103-123.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1986/5083...)
(Latest Pliocene- M Pleistocene period principal phase of economic tin placer development. Old Alluvium placers formed during E Pleistocene interglacial period when increasing and more regular precipitation and sealevel rise initially caused increased sediment supply with subsequent stream entrenchment. Present environments unfavorable for tin placer formation)

Batchelor, D.A.F. (1988)- Dating of Malaysian fluvial tin placers. J. Southeast Asian Earth Sci. 2, 1, p. 3-14.
(Richest fluvial and piedmont fan tin placers in Malaysia formed mainly in 'Boulder Beds', 'Old Alluvium' and 'Transitional Unit' (YU) regional lithostratigraphic units. TU deposited during early Brunhes Normal Polarity Epoch, OA and BB during Matuyama Reversed Epoch (0.73-2.48 Ma). Latest Pliocene- M Pleistocene period principal phase of economic tin placer formation. Bulk of OA placers formed in Lower Pleistocene interglacial period. M Pleistocene age for TU placers)

Batchelor, D.A.F. (1994)- Geological characteristics of the Pulai alluvial gold deposit, South Kelantan, Malaysia. J. Southeast Asian Earth Sci. 10, p. 101-108.
(also in Proc. GEOSEA VI Conf. Jakarta 1987. Pulai area in Central Tectonic Belt, Peninsular Malaysia. Fluvial gold placer deposit along 17km of upper Galas River. Gold probably genetically tied to acid intrusions, with important primary sources near Kelantan-Pahang border, 3-5 km SE of Pulai village. Small granite stocks 3 km W of Pulai additional likely source. Area gold mined by Chinese settlers since late 1800's)

Batchelor, D.A.F. (2015)- Clarification of stratigraphic correlation and dating of Late Cainozoic alluvial units in Peninsular Malaysia. Bull. Geol. Soc. Malaysia 61, p. 75-84.
(online at: www.gsm.org.my/products/702001-101674-PDF.pdf)
(Review of Late Pliocene- Quaternary alluvial deposits that overlie M Pliocene 'Sundaland Regiolith' red-yellow lateritic soil development in Malay Peninsula. Old Alluvium/ Simpang Fm older than 775 ka, supported by presence of tektites (~785ka) within tin-bearing beds of Gambang tinfield in Pahang)

Batten, R.L. (1972)- Permian gastropods and chitons from Perak, Malaysia. Part 1. Chitons, bellerophontids, euomphalids and pleurotomarians. Bull. American Museum Natural History 147, 2, p. 1-44.
(online at: http://digitallibrary.amnh.org/dspace/handle/2246/1103)
(One of richest Permian gastropod faunas of Asia 92 species) in H.S. Lee No. 8 opencast tin mine near Kampar, Perak. Associated with fusulinids, all with Tethyan affinities (but on Sibumasu Terrane?; JTvG))

Batten, R.L. (1979)- Permian gastropods from Perak, Malaysia. Part 2. The trochids, patellids, and neritids. American Museum (Natural History) Novitates, 2685, p. 1-26.
(online at: http://digitallibrary.amnh.org/dspace/handle/2246/5386)
(Continuation of Batten (1972). Rich Permian gastropod fauna from white limestone in H.S. Lee Mine 8 near Kampar, Perak, associated with corals, scaphopods, bivalves, brachiopods, cephalopods and fusulinids. Fusulinids suggest Late Artinskian- E Guadalupian age, Misellina claudiae zone (Jones et al. 1966). Neritacean species similar to those found in Sicily, Timor and Sumatra and identified as typical Tethyan)

Batten, R.L. (1985)- Permian gastropods from Perak, Malaysia. Part 3. The murchisoniids, cerithiids, loxonematids, and subulitids. American Museum (Natural History) Novitates, 2829, p. 1-26.
(online at: http://digitallibrary.amnh.org/dspace/handle/2246/3583)

(First palynology on poorly-fossiliferous Kenny Hill Fm in Kuala Lumpur area, which overlies Silurian Kuala Lumpur Limestone. Sample with spores Leiotriletes, Punctatisporites, Dictyotriletes, Verrucosisporites microtuberculatus, Lycospora, Acanthotriletes suggest Carboniferous or Permian age)

Chu, L.H., F. Chand & D.S. Singh (1988)- Primary tin mineralization in Malaysia: aspects of geological setting and exploration strategy. In: C.S. Hutchison (ed.) Geology of tin deposits in Asia and the Pacific, Selected papers from Int. Symp. Geology of tin deposits, Nanning, China, 1984, Springer Verlag, Berlin, p. 593-613.
(Primary tin mineralization in Peninsular Malaysia four broad classes: (1) pneumatolytic-hydrothermal lodes, veins, stockworks and stringers, (2) pyrometasomatic skarns (Sn skarns mainly in W belt, Sn-Fe skarn in E Belt), (3) tin-bearing pegmatites and aplites, and (4) stanniferous polymetallic sulphide bodies (W belt))

Chu, L.H. & D.S. Singh (1986)- The nature and potential of gold mineralization in Kelantan, Peninsular Malaysia. In: G.H. Tan & S. Paramanthan (eds.) Proc. GEOSEA V Congress, Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 431-440.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986032.pdf)
(On primary gold-silver quartz vein mineralization at Ulu Sokor are, Kelantan Province, NE Malay Peninsula)

Cocks, L.R.M., R.A. Fortey & C.P. Lee (2005)- A review of Lower and Middle Palaeozoic biostratigraphy in west peninsular Malaysia and southern Thailand in its context within the Sibumasu Terrane. J. Asian Earth Sci. 24, p. 703-717.
(Review of Cambrian- Devonian stratigraphy of S Thailand and NW Peninsular Malaysia (Sibumasu plate). Single depositional basin in shallow-water and cratonic areas of S Thailand, Langkawi, and mainland Kedah and Perlis, in contrast to deeper-water basin of N Perak. Area was part of Paleozoic Sibumasu Terrane, which also included C and N Thailand, E Burma (Myanmar) and part of SW China (Yunnan). Ordovician-Devonian limestones paraconformably overlain by Late Devonian Langun Redbeds)

Courtier, D.B. (1974)- Geology and mineral resources of the neighborhood of Kulim, Kedah. Geol. Survey Malaysia Map Bull. 3, p. 1-50.

Cox, L.R. (1936)- On a fossiliferous Upper Triassic shale from Pahang, Federated Malay States. Ann. Mag. Natural History, ser. 10, 17, p. 213-221.
(Fossils from marly shale at Sungei Taba, N of Raub gold mine, Pahang, dominated by bivalves, mainly Myophoria spp., also Grammotodon malayensis, Modiolus raubensis n.sp.. Age interpreted to be pre-Rhaetian Triassic, but subsequent studies on ammonites (Sato 1963) and bivalves (Tamura 1973) suggest M Triassic age)

Cottam, M.A., R. Hall & A.A. Ghani (2013)- Late Cretaceous and Cenozoic tectonics of the Malay Peninsula constrained by thermochronology. J. Asian Earth Sci. 76, p. 241-257.
(Thermochronological analyses of granites from Malay Peninsula record thermal history in Late Mesozoic-Cenozoic: significant period of thermal perturbation between ~100-90 Ma, lesser perturbation between ~51-43 Ma, regional exhumation of Malay Peninsula in Late Cretaceous (~66-85 Ma), rapid regional exhumation in Late Eocene-Oligocene (30-46 Ma))

Crawford, A.R. (1972)- A displaced Tibetan massif as a possible source of some Malayan rocks. Geol. Magazine 109, 6, p. 483-489.
(Commentary on Burton (1970) and Ridd (1971) suggestion of the westerly origin from India of sediments now in NW Malaya. Instead, Tibetan massif could have provided material now forming part of Malaya)

Cummings, R.H. (1965)- Notes on the Malaysian limestones. Overseas Geology and Mineral Resources 9, 4, p. 418-426.
(Incl. first record of M Permian fusulinids Neoschwagerina and Padangia from Sungei Jengka, 2 km SW of Jengka Pass, Malay Peninsula (Indochina Plate))

Daanen, T. (2015)- On the structure and tectonic evolution of the Taku Schists and their surrounding units, Kelantan, NE Malaysia. M.Sc. Thesis, University of Utrecht, p. 1-72.
(online at: http://dspace.library.uu.nl/handle/1874/316231)
(Taku Schists in Kelantan, in Central Belt of NE Malay Peninsula, in asymmetric anticline, with steeply dipping E flank. Protoliths of schists quartz-rich E-M Permian sediments, accumulated on fore-arc of Sukhothai volcanic arc, with regional contractional event during Triassic collision of Sibumasu Terrane and Sukhothai Arc. Contact with surrounding sediments in SE mylonitic, indicating severe shearing. Stretching lineations developed throughout Taku Schists, show dominant tectonic movement top down to SE (130E). Eocene dextral transtension moves E Malaya Block to SE and causes local exhumation in core complex)

Darbyshire, D.P.F. (1988)- Geochronology of Malaysian granites. Natural Environment Research Council (NERC), Isotope Geology Centre, Open File Report 88/3, p. 1-59.

De Coo, J.C.M. & O.E. Smit (1975)- The Triassic Kodiang Limestone formations in Kedah, West Malaysia. Geologie en Mijnbouw 54, p. 169-176.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0YnpiMFZmQWo5MUE/view)
(Many isolated limestone hills on coastal plain of NW Malay Peninsula, mainly of Paleozoic age (Permian Chuping Fm, E Paleozoic Setul Fm). S and E of Kodiang (30km N of Alor Star, Kedah) also U Triassic limestone, first identified by Ishii & Nogami (1966). Thickness at composite stratotype of Kodiang Lst in 7 hills of Bukit Kecil and Bukit Kalong ~125 m or more. Composed of algal stromatolites, intraformational breccias, limestone conglomerates, black mudstones with radiolarian chert and limestone turbidites; deposited in shelf, slope and basinal environments. Paleoslope was dipping to E. With simple foraminifera, incl. Nautiloculina and Ophthalmidium. Conodonts incl. Gladigondolella tethydis, suggest mainly Ladinian- E Carnian age range (Koike 1973). Kodiang Lst may be lateral equivalent of much thicker flysch sediments of SemanggolFm in E)

Dodge, N.N. (1977)- Mineral production on the East Coast of Malaya in the nineteenth century. J. Malaysian Branch Royal Asiatic Society 50, p. 89-110.
(Before widespread tin production along W coast after 1850, Malaya's main mineral product for centuries was gold from E coast, mainly produced by Chinese. Extraction of gold restricted to narrow belt from Patani in NE, down into interiors of Perak, Kelantan and Pahang and then through Negri-Sembilan into Malacca. No maps)

Drahman, F.A. & J.A. Gamez Vintaned (2017)- Stratigraphy and palaeoichnology of ñBlack Shaleò facies: chert unit of the Semanggol Formation, Perak. In: M. Awang et al. (eds.) Proc. Int. Conf. Integrated Petroleum Engineering and Geosciences (ICIPEG2016), Kuala Lumpur 2016, Springer Verlag, p. 605-613.
(Black shales of chert unit of Semanggol Formation.exposed at Bukit Putus in abandoned quarry in Bukit Merah (NNW of Taiping, Perak). Chert unit repotedly deposited in deep oceanic basin. Black shale possibly shallower facies, with several levels with abundant Claraia (E Triassic pectinid bivalve))

Du, G., X. Yang, J. Cao & J.H.A. Aziz (2020)- Genesis and timing of the Sungai Lembing tin deposit in Pahang, East Malaysia: constraints from LA-ICP-MS zircon and cassiterite U-Pb dating, geochemical compositions and Sr-Nd-Hf isotopes. Ore Geology Reviews 119, 103364, p.
(Sungai Lembing one of largest primary Sn deposits in Malaysia. Typical hydrothermal vein-type deposit with spatial and genetic relationships with underlying granites. U-Pb dating of Sn-bearing stockworks average age of 264.2 ± 2.0 Ma, consistent with zircon U-Pb ages (~260-263 Ma) for granites. Late Permian granites sourced from magma generated by partial melting of Proterozoic meta-igneous rocks of Indochina Block. Extensive emplacement of Permian granites and Sn mineralization in Eastern Granite Belt of Peninsular Malaysia may be result of E-dipping subduction of Paleotethys under western Indochina Block)

Dzulkafli, M.A., Basir Jasin & M.S. Leman (2012)- Radiolaria berusia Perm Awal (Sakmarian) dari singkapan baru di Pos Blau, Ulu Kelantan dan kepentingannya. Bull. Geol. Soc. Malaysia 58, p. 67-73.
(online at: www.gsm.org.my/products/702001-100348-PDF.pdf)
('Early Permian (Sakmarian) radiolarians from a new outcrop at Pos Blau, Ulu Kelantan and their significance'. Sakmarian radiolaria from chert beds from new outcrop in or near Bentong-Raub suture zone, with 28 species/ 13 genera, representing two radiolarian assemblage zones: Pseudoalbaillella lomentaria (E Sakmarian) and Pseudoalbaillella scalprata m. rhombothoracata (Late Sakmarian). Radiolarian cherts interbedded with shale and interpreted as continental margin chert association)

Edwards, W.N. (1926)- Carboniferous plants from the Malay States. J. Malayan Branch Royal Asiatic Soc. 4, 2, p. 171-172.
(First record of Permo-Carboniferous plant fossils from 'Raub series' shale with thin ash beds at Sungei Chiku, Kelantan, Malay Peninsula. Incl. Pecopteris cf. cyathea (somewhat similar to P. verbeeki Gothan & Jongmans from Sumatra) and Cordaites sp.)

Edwards, W.N. (1933)- Triassic wood from the Malay States. J. Malayan Branch Royal Asiatic Soc. 11, 2, p. 236-241.
(Probably Late Triassic-age wood collected by Scrivenor from 2 localities on Malay Peninsula: (1) Sungei Tranang, Kelantan with Dadoxylon sp. and (2) Jerantut, Pahang with silicified log of Dadoxylon sclerosum from sandy beds overlying andesite. Apparent absence of growth rings)

Elliott, C.F. (1968)- Three new Tethyan Dasycladaceae (calcareous algae). Palaeontology 11, p. 491-497.
(online at: http://cdn.palass.org/publications/palaeontology/volume_11/pdf/vol11_part4_pp491-497.pdf)
(Incl. new taxa Epimastopora malaysiana n.sp. from M Permian of H.S. Lee Mine 8, Kinta Valley, Perak)

Endut, Z., R. Hasnur, S. Mohamed, S. Ismail and A. Prihananto (2014)- Geology of the Penjom gold deposit, Kuala Lipis, Pahang, Malaysia. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Indon. Soc. Econ. Geol. (MGEI) Ann. Conv., Palembang, p. 301-308.
(Penjom gold deposit at W side of C Belt of Malay Peninsula is largest gold mine in Malaysia. Host rock Late Permian turbiditic sequence. Intruded by felsic tonalitic intrusives. Both host rocks and tonalite intrusives folded during main Late Triassic orogeny along Bentong-Raub Suture. Mineralization at Penjom and other vein-hosted deposits such as at Bukit Koman, Raub along Bentong-Raub Suture in Late Triassic- E Jurassic)

Endut, Z., T.F. Ng, J.H. Abdul Aziz, S. Meffre & C. Makoundi (2015)- Characterization of galena and vein paragenesis in the Penjom gold mine, Malaysia: trace elements, lead isotope study and relationship to gold mineralization episodes. Acta Geologica Sinica (English Ed.) 89, 6, p. 1914-1925.
(Penjom Gold Mine 30 km E of Bentong-Raub Suture, near W boundary of C Belt in Peninsular Malaysia. Gold mineralization in vein system with pyrite, arsenopyrite, and minor base metals including galena. Galena crystallized from two different ore fluids, probably at different times. Pb isotopic ratios suggest derivation from arc rocks associated with continental crust)

Endut, Z., T.F. Ng, J.H. Abdul Aziz & G.H. Teh (2015)- Style of veins in Penjom Gold Mine, Malaysia- implications for gold mineralisation and structural episodes. In: Proc. PACRIM 2015 Congress, Hongkong, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, Publ. Ser. 2/2015, p. 507-514. *(Extended Abstract)*
(Gold mineralisation at Penjom gold deposit in C Belt of Peninsular Malaysia (Bentong-Raub Suture zone) hosted in quartz-carbonate veins of two main types: shear and extension veins)

Endut, Z., T.F. Ng, J.H. Abdul Aziz & G.H. Teh (2015)- Structural analysis and vein episode of the Penjom gold deposit, Malaysia: implications for gold mineralisation and tectonic history in the Central Belt of Malaysia. Ore Geology Reviews 69, p. 157-173.
(Central Belt of Peninsular Malaysia characterised by numerous vein-hosted gold deposits particularly in 50 km wide corridor on E side of Bentong-Raub Suture. Mineralised quartz-carbonate veins of Penjom Gold deposit, S of Kuala Lipis, in U Permian clastic sedimentary host rocks. K/Ar ages of alteration sericite related

to mineralisation ~197-191 Ma (E Jurassic). Veins formed under compressional- transpressional regime with later displacement in transtensional- extensional regime)

Fitch, F.H. (1952)- The geology and mineral resources of the neighbourhood of Kuantan, Pahang. Geol. Survey of Malaya, Mem. 6, p. 1-146.
(Incl. Lower Carboniferous argillaceous and calcareous facies, unconformably overlain by ?Triassic arenaceous series, ?Cretaceous tin-bearing biotite granite, etc.)

Ghani, A.A. (2009)- Plutonism. In: C.S Hutchison & D.N.K. Tan (eds.) Geology of Peninsular Malaysia, University of Malaya/ Geol. Soc. Malaysia, Kuala Lumpur, p. 211-231.

Ghani, A.A. & S.L. Chung (2013)- Ar Ar geochronology of volcanic rocks from Eastern Part of Peninsular Malaysia. In: Proc. Nat. Geoscience Conf., Ipoh 2013, Geol. Soc. Malaysia, B20, p. 95-96. *(Abstract only)*
(Along E margin of Bentong-Raub suture, from W Pahang to Kelantan State, elongate strip of Permian and Triassic volcanics, possibly extending to Bangka and Billiton, along W edge of Indochina Terrane. Andesitic and acidic volcanism in Permian, acidic volcanism predominates in Triassic. Hornblende separates from basalt/andesite at Kampung Awah give age of 266 Ma (M Permian). Sibu Island, SE Johore, ages around Carboniferous-Permian boundary (~298-336 Ma) from bedded pyroclastic rocks. Rhyolitic tuff from nearby Tinggi island significantly younger (mid-Cretaceous; ~85-122 Ma)

Ghani, A.A., F.I. Hazad, A. Jamil, Q.L Xiang, W.N.A.W. Ismail, S.L. Chung, Y.M. Lai, M.H. Roselee et al. (2014)- Permian ultrafelsic A-type granite from Besar Islands group, Johor, Peninsular Malaysia. J. Earth System Science 123, 8, p. 1857-1878.
(Granitic rocks of Malay Peninsula traditionally divided into two provinces: (1) W Province S-type granites coarse, tin-mineralised, continental collision granite; (2) E Province granite is bimodal I-type dominated by granodiorite and associated gabbroic of arc type granite. Highly felsic A-type granite occurs in Besar, Tengah, and Hujung islands off SE coast of peninsula (SiO2 content 76- 78%). Shallow level of emplacement. A-type granite can be related to extensional back arc basin in Indo-China terrane during earliest Permian)

Ghani, A.A., C.H. Lo & S.L Chung (2013)- Basaltic dykes of the Eastern Belt of Peninsular Malaysia: the effects of the difference in crustal thickness of Sibumasu and Indochina. J. Asian Earth Sci. 77, p. 127-139.
(Jurassic (~179 Ma) and Cretaceous (~79-129 Ma) basaltic dykes of Peninsular Malaysia confined to E Belt (Indochina/E Malaya block), not in W Belt (Sibumasu Block). Most dykes attributed to difference of crustal thickness between E and W belt (W Belt crust 13 km thicker than E and C belts, and more difficult to fracture))

Ghani, A.A., C.H. Lo & S.L Chung (2014)- Geochronology of volcanic and plutonic rocks from the islands off Pahang and east Johor, Peninsular Malaysia. Geol. Soc. Malaysia, Nat. Geoscience Conf. (NGC) 2014, Trengganu, P059, p. 99-100. *(Extended Abstract)*
(Ages of igneous rocks of islands off coast Johor-Pahang, SE Peninsular Malaysia, beteween 80-300 Ma. U Pb zircon age of granites of P. Tengah and P. Besar 280-282 Ma (E Permian), granite/diorite from Pemanggil and Tioman 80 Ma. Ar/Ar ages of pyroclastics from Sibu mainly ~297 Ma, from Tinggi ~85-120 Ma)

Ghani, A.A., V. Ramesh, B.T, Yong & T.T. Khoo (2004)- Geochemistry and petrology of syenite, monzonite and gabbro from the Central Belt of Peninsular Malaysia. In: GSM Ann. Geol. Conf. 2004, Kangar, Perlis, Bull. Geol. Soc. Malaysia 49, p. 25-30.
(online at: www.gsm.org.my/products/702001-100571-PDF.pdf)
(Benom Igneous Complex C Belt ofMalay Peninsula rocks intruding into M-U Triassic sediments of Semantan Fm. Composition ranges from granitic to syenitic to monzonitic and gabbroic. Range of SiO2 for gabbro 46.5-49.1%, syenite 52.9 -56.9% and monzonite 56.6-64.7%. High alkali content, shoshonitic with I type characteristics. Also high Ba and Sr (mantle material?)

Ghani, A.A., M. Searle, L. Robb & S.L. Chung (2013)- Transitional I-S type characteristics in the Main Range Granite, Peninsular Malaysia. J. Asian Earth Sci. 76, p. 225-240.
(Dominantly Late Triassic (~200-220 Ma) Main Range Granite of Peninsular Malaysia, located W of Paleo-Tethyan Bentong-Raub suture zone and host of large tin province, regarded as S-type granite, but also many features of I-type granites (large scale of plutonism, primary titanite and amphibole, etc.). Moderately peraluminous nature of bulk of Main Range Granite, without cordierite, Fe-Mg garnet or sillimanite, consistent with derivation from metasedimentary protolith that was undersaturated with respect to Al2SiO5)

Ghani, A.A., I. Yusoff, Meor H.A. Hassan & R. Ramli (2013)- Geochemical study of volcanic and associated granitic rocks from Endau Rompin, Johor, Peninsular Malaysia. J. Earth System Science 122, 1, p. 65-78.
(online at: www.ias.ac.in/jessci/feb2013/65.pdf)
(Late Permian-Triassic Jasin felsic volcanics (dacite/rhyolite and andesite) and Besar batholith (~214 Ma) granitic magmas from W of Johor National Park, Endau Rompin, probably from different sources. Granite produced by partial melting of quartz feldspathic rocks containing amphibole among residual phase. Magmas generated at different time during subduction of Sibumasu beneath Indochina block)

Gillespie, M.R., R.S. Kendall, A.G. Leslie, I.L. Millar, T.J.H. Dodd, T.I. Kearsey et al. (2019)- The igneous rocks of Singapore: New insights to Palaeozoic and Mesozoic assembly of the Sukhothai Arc. J. Asian Earth Sci. 183, 103940, p.
(Six plutons of granitic-gabbroic rocks in N and E Singapore. Five emplaced during 285-230 Ma, and record E Permian- Triassic arc-related magmatism at S end of Sukhothai Arc system of Thailand, Peninsular Malaysia and Indonesia. Volcano-sedimentary succession in SW Singapore records contemporaneous deposition in forearc basin, with largest pyroclastic unit developed as volcanic activity peaked at ~242 Ma. Part of Eastern Belt intrusions of Eastern granitoid provinces of SE Asia, and formed in Andean-type setting as Palaeo-Tethys crust descended beneath Indochina–East Malaya block. Widespread hydrothermal-tuffisite in Permo-Triassic intrusions correlated with rapid uplift following slab breakoff, when arc activity ceased in Singapore at ~230-205 Ma. Sixth pluton in NE Singapore emplaced in Upper Cretaceous)

Gobbett, D.J. (1966)- The brachiopod *Stringocephalus* from Malaya. J. Paleontology 40, 6, p. 1345-1348.
(Stringocephalus perakensis n. sp. from alluvial tin-mining area, Kinta valley, Perak, NW Malay Peninsula, indicating marine Givetian (M Devonian). Associated fauna: dasycladacean algae, stromatoporoids, tabulate corals, Murchisonia sp.)

(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1977030.pdf)
(Large granitic batholiths of mainly Permian and Triassic age characterize Main Range and Eastern Belt of Malay Peninsula. Main Range granites intruded into continental sialic basement (isoclinally folded phyllitic rocks), without notable contact aureoles. This and large difference between Rb-Sr (peaks at 300, 210 Ma) and K-Ar radiometric ages (av. 190 Ma) suggest emplacement at >4 km depth and main uplift by several km, in Jurassic and Cretaceous. Eastern Belt granites mainly Triassic (peak ~220 Ma), also Permian ages, and have concordant Rb-Sr and K-Ar radiometric ages. Eastern Belt stable area since Triassic. Local post-orogenic Late Cretaceous (60-90 Ma) granites, without tin mineralization)

Hutchison, C.S. (2009)- Bentong-Raub suture. In: C.S. Hutchison & D.N.K. Tan (eds.) Geology of Peninsular Malaysia, University of Malaya and Geol. Soc. Malaysia, Kuala Lumpur, p. 43-53.
(Description of 'Bentong-Raub ophiolite line', which separates W from E peninsular Malaysia. It represents suture zone with remnants of Lower Devonian- U Permian Paleotethys Ocean, which closed in Triassic with collision of Sibumasu (in W) and Indochina (E) blocks. Paleotethys deposits include Lower Devonian slaty shales with graptolite and shales with cherts with U Devonian- Permian radiolaria)

(U Carboniferous Panching Lst near Kuantan, E Malay Peninsula, formerly believed to be massive, folded and ~600m thick now interpreted as tightly folded and 88m thick. U Carboniferous conodonts identified by Metcalfe (1980). Five local foraminifera zones, incl. Eostafella, etc. fusulinid larger forams)

Idris, M.B. & C.N. Hashim (1988)- An Upper Permian fossil assemblage from Gunung Sinyum and Gunung Jebak Puyoh Limestone, Pahang. Warta Geologi 14, 5, p. 199-203.
(online at: www.gsm.org.my/products/702001-101505-PDF.pdf)

(Two prominent limestone hills 50km N of Temerloh, Pahang, surrounded by younger sediments of Semantan Fm, with conodonts Neogondolella rosenkrantzi and N. serrata serrata, indicative of U Permian (Capitanian). Also forams Parafusulina, Schubertella, etc.)

Idris, M.B. & S.M. Zaki (1986)- A Carboniferous shallow marine fauna from Bukit Bucu, Batu Rakit, Trengganu. Warta Geologi (Newsl. Geol. Soc. Malaysia) 12, 6, p. 215-219.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1986006.pdf)
(Sediments at Bukit Bucu, Batu Rakit N of Terengganu with U Carboniferous fauna of trilobites (Paladin ophistops= U Carboniferous), brachiopods (Brachythyrina strangwaysi, Chonetinella), bryozoans (Fenestella retiformes), crinoids ('Poterocrinus') and bivalves (Edmondia). These shallow marine invertebrates also reported from Kelantan, Pahang Darul Makmur and Thailand)

Igo, H. (1964)- Permian fossils from northern Pahang, Malaya. Japanese J. Geology Geography 35, p. 57-71.
(Description of Permian corals from N Pahang, associated with late M Permian fusulinids Yabeina, Verbeekina and Sumatrina annae, Kahlerina)

Igo, H. (1964)- Permian fossils from northern Pahang, Malaya. In: T. Kobayashi (ed.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 191-208.
(Same paper as Igo (1964) above. Permian NE corner of Pahang province, C Malay Peninsula. Silicified black limestone from Ulu Sungei Atok with diverse fusulinid forams (Climacammina, Pseudofusulina, Verbeekina verbeeki, Sumatrina annae, Yabeina, etc.; similar to Guguk Bulat fauna, W Sumatra)), corals (Wentzellella malayensis n.sp., Sinopora). Grey shale from Sungei Spia with brachiopod Spirifirellina, Neospirifer)

Igo, H. (1967)- Some Permian fusulinids from Pahang, Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 3, p. 30-38.
(M Permian fusulinid limestones in intensely folded clastic- andesitic volcanics series from Jengka Pass area and Kampong Awah quarry, Pahang, C Malay Peninsula. With Neoschwagerina, Verbeekina, Sumatrina, Chusenella, Yabeina, Pseudofusulina (very similar to fauna of Padang Highlands, Sumatra; see also Cummings 1965, Gowka 1967, etc.))

Igo, H. & T. Koike (1967)- Ordovician and Silurian conodonts from the Langkawi Islands, Malaya, Part I. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 3, p. 1-29.
(Simple cone-type conodonts from Ordovician- Silurian Setul Limestone of Langgon Island, NE Langkawi. Most species similar to species known from Europe and North America)

Igo, H. & T. Koike (1968)- Ordovician and Silurian conodonts from the Langkawi Islands, Malaya, Part II. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 4, p. 1-21.
(Additional types of conodonts from Ordovician- Silurian Setul Lst of Langgon Island, NE Langkawi. 41 species described. Silurian conodonts not described from Asia before)

Igo, H. & T. Koike (1968)- Carboniferous conodonts from Kuantan, Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 5, p. p. 26-30.
(Five species of conodonts from described from Bukit Charas, N Pahang, E Malay Peninsula (part of Indochina Plate). Dominated by cosmopolitan forms Idiognathoides and Hindeodella, also Spathognathodus, Ozarkodaina, indicating E Namurian age (rich brachiopod fauna from area described by Muir-Wood, 1948))

Igo, H. & T. Koike (1973)- Upper Silurian and Lower Devonian conodonts from the Langkawi islands, Malaysia, with note on conodont fauna of the Thung Song Limestone, Southern Thailand and the Setul Limestone, Perlis, Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 13, p. 1-22.
(Similar 'Setul Fm' U Silurian- Lw Devonian dark grey limestones on Langkawi islands, NW Malay Peninsula and peninsular Thailand. Nearby Silurian bituminous graptolite shales. Conodont faunas include

Spathognathodus steinhornensis repetitor similarities with Alps and Neningha Lst of N New South Wales and lower part of Mount Holly Bed of Queensland)

Igo, H., T. Koike & E.H. Yin (1966)- Triassic conodonts from Kelantan, Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 2, p. 157-171.
(Folded limestones from S Kelantan, central part of Malay Peninsula include white-grey Permian limestone with common fusulinids and grey M Triassic limestones rich in ammonoids and conodonts (dominated by Hindeodella spp and Hibbardella sp))

Igo, H., S.S. Rajah & F. Kobayashi (1979)- Permian fusulinaceans from the Sungei Sedili area, Johore, Malaysia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 20, p. 95-118.
(Low diversity fusulinid assemblages from massive lenticular Sumalayang Lst in NW-dipping argillaceous rocks of Dohol Fm (~30 miles N of Singapore; southernmost Permian limestone of Malay Peninsula). With fusulinids signifying late Early Permian- early M Permian age: Misellina, Cuniculinella globosa, Eoparafusulina malayensis, Parafusulina granum-avenae (very similar to Sumatra forms), P. johorensis n.sp. and other spp. and rare Monodiexodina kattaensis and M. shiptoni (but: Ueno (2003, p. 14) and Ueno et al. (2014) question Monodiexodina identification and re-assign to Pseudofusulina; JTvG). Many faunal similarities with 'Tethyan?' Pamir faunas))

Ingham, F.T. & E.P. Bradford (1960)- The geology and mineral resources of the Kinta Valley, Malaya Geol. Survey, Ipoh, Geol. Survey District Mem. 9, p. 1-347.
(Kinta Valley of W Central Malay Peninsula largest alluvial tin-producing area in world. Not much detail on stratigraphy: Kinta Valley sequence mainly 700m of Carboniferous- Lower Permian limestone, poor in fossils, and surrounded by post-Triassic granite intrusive complexes. Triassic arenaceous series. With 1:63,360 scale geologic map)

Ishida, K. & F. Hirsch (2011)- The Triassic conodonts of the NW Malayan Kodiang Limestone revisited: taxonomy and paleogeographic significance. Gondwana Research 19, 1, p. 22-36.
(Revision of M - early L Triassic conodonts from NW Malaya Kodiang Lst. Pseudofurnishius murcianus confers S Tethyan low-latitude character to Kodiang Lst, part of Cimmerian terranes that in Triassic formed diagonal partition between gradually closing Paleo-Tethys and widening Neo-Tethys, stretching E to Malaya (Shan Thai Terrane). Only E edge collided with Eurasia in Late Triassic, forming Sundaland platform. Jurassic Neo-Tethys ocean extended S of consolidated SE Asia block and Cimmerian terranes)

Ishida, K. A. Nanba, F. Hirsch, T. Kozai & A. Meesook (2006)- New micropalaeontological evidence for a Late Triassic Shan-Thai orogeny. Geosciences J. 10, 3, p. 181-194.
(Shan-Thai block is remnant of Paleotethys in SE Asia. Nan-Uttaradit/Nan-Chantaburi and Bentong-Raub sutures commonly proposed as main Paleotethyan suture, but Mae Sariang Zone suture further W advocated here as main suture. Triassic chert-sequence in Mae-Sot and Umphang, NW Thailand, with M and Late Triassic (Ladinian- Norian-Rhaetian) radiolarians, overlain by 'Jurassic base-conglomerate' and Toarcian- E Bajocian shelf deposits. Chert clasts in conglomerate with same Norian-Rhaetian radiolarians, suggesting age of collision is latest Triassic)

Ishihara, S. (2008)- Granite series, type and concentration of HREE in the Malay Peninsula Region. . Proc. Int. Symposia on Geoscience resources and environments of Asian terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 31-35.

(online at: www.gsm.org.my/products/702001-101658-PDF.pdf)
(Planktonic bivalve Posidonia common in Kubang Pasu and Singa Fms in NW Peninsular Malaysia and Langkawi Islands (= Sibumasu terrane). Probably Early Carboniferous age. Most of Posidonia in Malaysia closely related to Posidonia becheri (=Posidonomya; see Jasin 2015))

Jasin, Basir (2013)- Chert blocks in Bentong-Raub Suture Zone: a heritage of Palaeo-Tethys. Bull. Geol. Soc. Malaysia 59, p. 85-91.
(online at: www.gsm.org.my/products/702001-100326-PDF.pdf)
(Bentong-Raub Suture Zone is Triassic collision zone between Sibumasu and E Malaya terranes. Remnants of closed E-M Devonian- Permian Paleo-Tethys Ocean include blocks of oceanic sedimentary rocks such as bedded chert blocks in several localities. Radiolarian assemblages in cherts: (1) E Frasnian, (Late Devonian) Trilonche minax Zone, (2) Tournaisian (E Carboniferous) Albaillella deflandrei Zone and (3) Permian radiolarians, incl. M Permian/ Wordian Follicucullus monacanthus Zone)

Jasin, Basir (2015)- *Posidonomya* (Bivalvia) from Northwest Peninsular Malaysia and its significance. Sains Malaysiana 44, 2, p. 217-223.
(online at: www.ukm.my/jsm/pdf_files/SM-PDF-44-02-2015/08%20Basir%20Jasin.pdf)
(Thin-shelled pseudopelagic bivalve Posidonomya common in NW Malay Peninsula, in redbeds of Langkawi Island (Singa Fm) and Perlis and Kedah (Kubang Pasu Fm; above Tournaisian radiolarian cherts). Two taxa: Posidonomya becheri and P. cf. kochi (von Koenen). Occurrence of Posidonomya indicates E Carboniferous age of lower Kubang Pasu/ Singa Fms. Part of widespread tropical-subtropical Paleo-Tethys domain)

Jasin, Basir (2018)- Radiolarian biostratigraphy of Malaysia. Bull. Geol. Soc. Malaysia 65, p. 45-58.
(online at: https://gsmpubl.files.wordpress.com/2018/08/bgsm201805.pdf)
(Two types of radiolarian cherts in Malaysia:bedded chert and chert blocks. Bedded cherts in Peninsular Malaysia mainly in Western Belt (Kubang Pasu, Kenny Hill and Semanggol Fms). In Sabah in Sabah Ophiolite Complex. In Sarawak bedded cherts in Serian Volcanic Fm and at basal part of Pedawan Fm. Chert blocks mainly in Bentong Raub Suture Zone of Peninsular Malaysia and in melanges of Sabah and Sarawak. Radiolarians from Peninsular Malaysia Late Devonian-Triassic, with 16 biozones identified. Radiolarians from Sabah and Sarawak E Jurassic- Cretaceous ages. Five hypersiliceous periods, related to volcanism: Late Devonian-E Carboniferous, Permian, Triassic, E Jurassic and Late Jurassic-Cretaceous)

Jasin, Basir & C.A. Ali (1997)- Lower Permian Radiolaria from the Pos Blau area, Ulu Kelantan, Malaysia. J. Southeast Asian Earth Sci. 15, p. 327-337.
(22 radiolaria species from 30m folded chert sequence in roadcut near Pos Blau, Ulu Kelantan, Malay Peninsula. Located near E margin of Bentong suture and above andesitic volcanics and sheared olistostrome unit. Fauna represents upper Pseudoalbaillella lomentaria Zone, upper Wolfcampian (= Sakmarian; Lower Permian). Associated with ammonoid Agathiceras)

Jasin, Basir & C.A. Ali (1997)- Significance of Early Carboniferous radiolaria from Langkap, Negeri Sembilan, Malaysia. Bull. Geol. Soc. Malaysia 41, p. 109-125.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1997028.pdf)
(Thin-bedded folded-sheared mudstone in Langkap chert in Bentong Gp in S-C Malay Peninsula, with 34 radiolarian taxa, incl. Albaillella comuta, A. deflandrei and A. undulata, indicating A. deflandrei Zone of Late Tournaisian age. Assemblage similar to W Europe and suggests deposition in equatorial regions of Tethys. (Late Devonian and E Carboniferous radiolaria from Langkap also studied by Spiller and Metcalfe (1995))

Jasin, Basir, C.A. Ali & K. Roslan Mohamed (1995)- Late Triassic radiolaria from the Kodiang Limestone, northwest Peninsular Malaysia. J. Southeast Asian Earth Sci. 12, p. 31-39.

(Cherty packstone-wackestone in Bukit Kodiang quarry, Kedah, NW Malay Peninsula. With Late Triassic (Late Carnian- M Norian) radiolarian assemblage, not well preserved, 18 species (see also Jasin & Harun 2001))

Jasin, Basir, A. Bashardin & Z. Harun (2013)- Middle Permian radiolarians from the siliceous mudstone block near Pos Blau, Ulu Kelantan and their significance. Bull. Geol. Soc. Malaysia 59, p. 33-38.
(online at: www.gsm.org.my/products/702001-100333-PDF.pdf)
(Large siliceous sediment block in melange in Bentong-Raub Suture, exposed near Pos Blau, Ulu Kelantan, N central Malay Peninsula. Steeply dipping to SE; lower part ribbon chert, upper part interbedded siliceous mudstone and tuffaceous mudstone. Fourteen radiolaria taxa, divided into two zones, Pseudoalbaillella fusiformis and Follicucullus monacanthus, indicating M Permian age. Tuffaceous material related to volcanic activity on E Malaya terrane. Tuffaceous sediments became widespread in Late Permian and Triassic)

Jasin, Basir, A. Bashardin, N. Jamaluddin & N. Ishak (2010)- Occurrence of slate in Perlis and its significance. Bull. Geol. Soc. Malaysia 56, p. 75-78.
(online at: www.gsm.org.my/products/702001-100384-PDF.pdf)
(>100m thick unfossiliferous slate exposed at Bukit Tuntung, Pauh, Perlis, NW Malay Peninsula. Overlain by bedded chert of Kubang Pasu Fm with Tournaisian (basal Carboniferous) radiolarians)

Jasin, Basir & Z. Harun (2001)- Some Triassic radiolarians from the Kodiang Limestone, northwest Peninsular Malaysia. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conference 2001, Pangkor, p. 105-109.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2001_17.pdf)
(Kodiang Lst of NW Malay Peninsula yielded Late Permian- and early Late Triassic conodonts (Metcalfe 1984, 1992). New samples from clastic-chert sequence at base of Bukit Kechil with 11 taxa of radiolarians. Presence of Entactinia chiakensis, E. nikorni, Thaisphaera minuta, Cenosphaera andoi and Pantanellium? virgeum suggestive of Parentactinia nakatsugawaensis Zone, late Spathian age (E Triassic). Overlying limestone at Bukit Kechil with M Triassic conodonts (Koike 1973) and foraminifera (Gazdzicki & Smit 1977))

Jasin, Basir & Z. Harun (2001)- Some radiolarians from bedded chert of the Kubang Pasu Formation. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conference 2001, Pangkor, p. 110-114.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2001_18.pdf)
(Radiolarians from chert sequence at Bukit Binjal, Kedah, incl. Entactinia variospina, Callela hexatinian, C. cf. parvispinosa, Treanosphaera hebes, Duplexia parviperforata, etc. Assemblage indicates Late Tournaisian (E Carboniferous) age. Chert deposited on outer shelf of passive margin during high siliceous productivity)

Jasin, Basir & Z. Harun (2004)- Discovery of some Early Carboniferous radiolarians from North Perak and their significance. Bull. Geol. Soc. Malaysia 49, p. 19-24.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2004004.pdf)
(Albaillella deflandrei radiolarian assemblage from foldd bedded chert at NW Malay Peninsula- Thailand border area indicates Tournaisian, E Carboniferous age. Presumably from S side of Paleotethys Ocean (Sibumasu). Tournaisian radiolarian cherts widespread in Paleo-Tethys ocean)

Jasin, Basir & Z. Harun (2007)- Stratigraphy and sedimentology of the chert unit of the Semanggol Formation. Bull. Geol. Soc. Malaysia 53, p. 103-109.
(online at: http://geology.um.edu.my/gsmpublic/v53/Pdf%20individual%20papers/16%20Paper.pdf)
(Semanggol Fm outcrops in NW Malay Peninsula. Deep marine clastics with cherts with 5 Permian and 4 E-M Triassic radiolarian biozones. Common tuffaceous material in lower Semanggol Fm, older than Sakmarian, E Permian. Thickness of formation hard to determine due to intense folding-thrusting)

Jasin, Basir & Z. Harun (2009)- Radiolarian biostratigraphy of Peninsular Malaysia- an update. In: 11th Reg. Congress Geology, Mineral and Energy Resources of Southeast Asia (GEOSEA 2009), Kuala Lumpur, p. 57-58. *(Abstract)* *(online at: www.gsm.org.my/products/702001-101669-PDF.pdf)*
(16 radiolarian assemblage zones from Late Devonian- Late Triassic on Malay Peninsula)

Jasin, Basir & Z. Harun (2011)- Radiolarian biostratigraphy of Peninsular Malaysia- an update. Bull. Geol. Soc. Malaysia 57, p. 27-38.
(online at: http://geology.um.edu.my/gsmpublic/BGSM/bgsm57/bgsm2011005.pdf)
(Deep marine radiolarian cherts common in Late Paleozoic- E Mesozoic of W belt of Peninsular Malaysia. Sixteen radiolarian assemblage zones recognized, from Frasnian (Late Devonian)- Triassic. Most of Permo-Triassic biozones identified from Semanggol Fm)

Jasin, Basir & Z. Harun (2011)- Lower Carboniferous (Tournaisian) radiolarians from Peninsular Malaysia and their significance. Bull. Geol. Soc. Malaysia 57, p. 47-54.
(online at: http://geology.um.edu.my/gsmpublic/BGSM/bgsm57/bgsm2011007.pdf)
(Tournaisian radiolarians widespread in Peninsular Malaysia especially in W Belt, due to high radiolarian productivity during Tournaisian, related to upwelling of cold dense bottom water, which developed at glacial N Gondwana. Chert is marker bed for Tournaisian age and defines base of Kubang Pasu Fm)

Jasin, Basir, Z. Harun & Siti N. Hassan (2003)- Black siliceous deposits in Peninsular Malaysia: their occurrence and significance. Bull. Geol. Soc. Malaysia 46, p. 149-154.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2003025.pdf)
(Paleozoic black radiolarian cherts in NW Malay Peninsula in Setul, Mahang (Ordovician-Silurian), Kubang Pasu (Carboniferous) Fms. Related to high plankton productivity. Lithologic association of chert represents passive continental margin association, with episodic supply of terrigenous material from continent)

Jasin, Basir, Z. Harun & U. Said (2004)- Some Devonian radiolarians from chert blocks in the Bentong-Raub Suture Zone, Pahang. Bull. Geol. Soc. Malaysia 48, p. 81-84.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2004a16.pdf)
(Ten radiolarian species from chert blocks along Bentong-Raub road (mainly Trilonche spp. and Stigmosphaerostylus herculea), representing Famennian (Late Devonian) age)

Jasin, Basir, Z. Harun & U. Said (2005)- Triassic radiolarian biostratigraphy of the Semanggol Formation, South Kedah, Peninsular Malaysia. Bull. Geol. Soc. Malaysia 51, p. 31-39.
(online at: http://gsmpubl.files.wordpress.com/2014/09/bgsm2005005.pdf)
(27 taxa of E-M Triassic radiolaria from outcrop of chert units in Semanggol Fm, 4.5 km E of Kuala Ketil, S Kedah, NW Peninsular Malaysia. Four assemblage zones, Entactinosphaera chiakensis (late Spathian), Triassocampe coronata (M Anisian), Triassocampe deweveri (late Anisian) and Oertlispongus inaequispinosus (E Ladinian))

Jasin, Basir, Z. Harun, U. Said & S. Saad (2005)- Permian radiolarian biostratigraphy of the Semanggol Formation, south Kedah, Peninsular Malaysia. Bull. Geol. Soc. Malaysia 51, p. 19-30.
(online at: http://gsmpubl.files.wordpress.com/2014/09/bgsm2005004.pdf)
(37 taxa of Permian radiolaria from Semanggol Fm interbedded siliceous shale-chert-tuff in outcrop 4.5 km E of Kuala Ketil, S Kedah, NW Maly Peninsula. Five radiolarian zones recognized (Pseudoalbaillella scalprata, Folliculus monacanthus, F. porrectus, Neoalbaillella ornithoformis and N. optima), ranging in age from late E Permian (Sakmarian)- Late Permian)

Jasin, Basir, W.F.W. Hassan & M.S. Leman (1992)- The occurrence of bryozoan bed in the Singa Formation, Bukit Durian Perangin, Langkawi. Warta Geologi 18, 2, p. 29-35.
(online at: www.gsm.org.my/products/702001-101484-PDF.pdf)
(A 1m thick bed of E Permian thin-bedded bryozoan-bearing limestone and calcareous sandstone at Bukit Durian Perangin, 14km N of Kuah, Langkawi. Located near top of glacio-marine clastic Singa Fm, probably in transition zone to overlying Chuping Lst. Bryozoan genera Fenestella, Polypora, Dyscritella and Streblascopora exilis indicate Artinskian age, E Permian (similar to Late Artinskian assemblage described by Sakagami (1970) from nearby Ko Muk Island, SW Thailand))

Jasin, Basir, A. Jantan, I. Abdullah & U. Said (1987)- Volcanic ash beds at Kampung Temong, Kuala Kangsar, Perak. Warta Geologi 13, 5, p. 205-211
(online at: www.gsm.org.my/products/702001-101511-PDF.pdf)
(2.5m thick Quaternary volcanic ash on Malay Peninsula composed of 6 reverse-graded ash layers 0.2-0.7m thick. Believed to be derived from Toba eruptions in North Sumatra at ~75,000 years ago)

Jasin, Basir & L.T. Koay (1990)- Permian fusulinids from Bukit Wang Pisang, Perlis. Sains Malaysiana 19, 1, p. 35-44.
(Late Early Permian fusulinid Monodiexodina shiptoni from transitional beds between Kraeng Krachan Gr. clastics and overlying Ratburi Lst-equivalent in NW Malay Peninsula (= 'anti-tropical' genus from Kungurian or Artinskian of Sibumasu Terrane; JTvG))

Jasin, Basir, P. Pengajian, S. Sekitaran & D.S. Alam (2006)- Some deep water Middle Triassic foraminifera from the Semanggol Formation. Bull. Geol. Soc. Malaysia 52, p. 27-33.
(M Triassic benthic foraminifera from Semanggol Fm siliceous mudstones at Bukit Lada and Merbau Pulas include Pseudonodosaria densa. P. lata, P. obconica, P. simpsonensis, Prodentalina spp, Cryptoseptida, Protonodosaria spp., Associated with radiolaria Eptingium manfredi, etc. Indicate deep marine depositional environment above calcite compensation depth)

Jasin, Basir, U. Said & R. Abdul Rahman (1995)- Late Middle Permian radiolaria from the Jengka area, central Pahang, Malaysia. J. Southeast Asian Earth Sci. 12, p. 79-83.
(Nine species of radiolarians from tin, bedded chert in quarry in folded Semantan Fm(?)N of Jengka Pass, at E side of Central basin of Malay Peninsula. Assemblage with Entactinia spp., Hegleria spp., Follicucullus spp. and Pseudobaillella indicative of late M Permian Follicucullus japonicus Zone. Assemblage similar to those described from China and Japan)

Jennings, J.R. & C.P. Lee (1985)- Preliminary note on the occurrence of Carboniferous-age coals and in situ plant fossils in eastern Peninsular Malaysia. Warta Geologi 11, 3, p. 117-121.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1985003.pdf)
(On Carboniferous 'Cathaysian' plant fossils from E Pahang and Terengganu, on E Malaya Block, Malay Peninsula. With cf. Lepidodendron, cf. Archaeocalamites sp., Sphenophyllum tenerrimum, Sphenopteris spp., etc., interpreted as late Lower Carboniferous age (see also Asama 1973, Ohana et al. 1991))

Joeharry, N.A.M., M.S. Leman, C.A. Ali & K.R. Mohamed (2018)- Constraining the Permian-Triassic boundary in the Gua Panjang Hill, Merapoh, Pahang state, Malaysia. Bull. Geol. Soc. Malaysia 66, p. 75-80.
(online at: https://gsm.org.my/products/702001-101753-PDF.pdf)
(Permian- Triassic boundary in Gua Panjanglimestone hill in Merapoh, Pahang (Central Belt of Malay Peninsula). Basal beds with Late Permian foraminifera (Colaniella sp., Ichtyofrondina sp., Palaeotextularia sp.) overlain by dolomitized horizon with earliest Triassic conodonts (Hindeodus parvus, Isarcicella staeschi). Negative carbon isotope excursion, often seen in P-T Boundary sections worldwide, not observed here)

Jones, C.R. (1966)- Geologic map of Pulau Langkawi. Geol. Survey of Malaysia, scale 1:63,360.

Jones, C.R. (1967)- Graptolites of the *Monograptus hercynicus* type recorded from Malaya. Nature 215, 5100, p. 497.
(Brief note on presence of graptolites at many localities of NW Malay Peninsula (Kedah, Perak, Pahang) and Langkawi island, presumed to be of Silurian and E Devonian ages. Presence of monograptids of Monograptus hercynicus type suggestive of Early Devonian, as is presence of associated tentaculitid Nowakia acuaria)

Jones, C.R. (1968)- Lower Paleozoic rocks of Malay Peninsula. American Assoc. Petrol. Geol. (AAPG) Bull. 52, 7, p. 1259-1278.
(Lower Paleozoic in W part of Malay Peninsula comprises U Cambrian-Lower Devonian sediments, including Ordovician- Silurian shelf carbonates, Silurian euxinic facies graptolite argillite and thick flysch-type sequence to East. Acid pyroclastic rocks and ophiolitic igneous rocks associated with eugeosynclinal trough deposits)

Jones, C.R. (1970)- On a Lower Devonian fauna from Pahang, West Malaysia. Bull. Geol. Soc. Malaysia 3, p. 63-75.
(Foothils Formation of W Pahang contains shales with reticulate sponges, brachiopods (Orbuciloidea sinensis) and graptolites. Monograptus cf. praehercycnicus indicates early Lower Devonian age)

Jones, C.R. (1973)- Lower Palaeozoic. In: D.J. Gobbett & Hutchison (eds.) Geology of the Malay Peninsula (West Malaysia and Singapore), Wiley, New York, p. 25-60.
(Lower Paleozoic of Malay Peninsula includes well-developed Ordovician-Silurian Setul Lst in NW, mainly argillaceous Mahang Fm with Silurian- E Devonian graptolites and tentaculites in Kedah, etc.)

Jones, C.R. (1973)- The Siluro-Devonian graptolites of the Malay Peninsula. Inst. Geol. Sciences (Great Britain), Overseas Geology and Mineral Resources, 44, p. 1-28.

(Substantial review of mainly U Cambrian- Triassic marine fossils known from Malay Peninsula in 1965, compiled from publications, Geological Survey and British Museum files)

Jones, W.R. (1916)- The origin of the secondary stanniferous deposits of the Kinta District, Perak (Federated Malay States). Quart. J. Geol. Soc. London 72, p. 165-194.

Jusop, S. (2017)- Pyritization of coastal sediments in the Kelantan Plains as evidence for the sea level rise in the Malay Peninsula during the Holocene. Bull. Geol. Soc. Malaysia 64 (Geol. Soc. Malaysia 50th Anniversary Issue 2), p. 59-63.
(online at: www.gsm.org.my/products/702001-101718-PDF.pdf)
(Widespread pyritization (2-3%) of low-lying plains in Malay Peninsula linked to inundation by seawater due to sea level rise of 3-5m, ~43,000 years ago))

Kadir, A.A., B.J. Pierson, Z.Z.T. Harith & Chow W.S. (2009)- Kinta Valley Limestone: clues for a new play? AAPG Convention, Denver, Search and Discovery Article 1019826, p. *(Abstract and Presentation)*
(online at: www.searchanddiscovery.com/documents/2009/10198kadir/ndx_kadir.pdf)
(Karst hills of Ordovician-Permian limestone in Kinta Valley, Malay Peninsula, remnants of large Paleozoic carbonate complex on Sibumasu terrane. Limestones interbedded with sandstone, siltstone and carbonaceous shale over thickness of up to 3000m (??). Slumps and breccia beds indicate slope deposition, slumping to West and N-S platform margin orientation. Potential unexplored new carbonate play E of Malay Peninsula)

Kadir, A.A., B.J. Pierson, Z.Z.T. Harith & Chow W.S. (2010)- Elements of Paleozoic hydrocarbon plays around Peninsular Malaysia. Proc. 46th CCOP Ann. Sess., Vung Tau 2009, p. 18-29.
(Presence of effective Paleozoic hydrocarbon system in Peninsular Malaysia- Malay Basin cannot be ruled out. Permian limestones rel. common in Peninsular Malaysia and may extend offshore, but many are affected by contact metamorphism from Triassic granites)

Kato, M. & Y. Ezaki (1986)- Permian corals from Pahang and Trengganu, Malaysia. J. Fac. Science, Hokkaido University, Ser. 4, 21, 4, p. 645-668.
(online at: http://eprints.lib.hokudai.ac.jp/dspace/bitstream/2115/36745/1/21_4_p645-668.pdf)
(M Permian corals in black limestone breccia associated with andesites in Kampong Awah Quarry, Pahang, C Malay Peninsula. Assigned to Yabeina and Neoschwagerina Zones. Six species, including Waagenophyllum, Michelinia, Wentzelloides, Ipciphyllum, etc., all Tethyan elements (=Cathaysian; E Malaya Plate; JTvG))

Khan, A.A. & M.K. Shuib (2016)- A review of the Bentong-Raub suture vis-a-vis new insight of the tectonic evolution of Malay Peninsula, South East Asia. Acta Geologica Sinica (English Ed.) 90, 5, p. 1865-1886.
(Raub-Bentong suture does not fit model of subduction-related collision, but evolved from transpression tectonics after closure and exhumation of inland basin that underwent back-arc extension during Triassic)

Kimura, T. & C.R. Jones (1967)- Geological structures in the northeastern and southern parts of the Langkawi Islands, North-west Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 3, p. 123-134.
(Langkawi Islands off NW coast Malay Peninsula with complete Late Cambrian- Permian section, intruded by Mesozoic granites. Thrust zones between upper and lower Paleozoic. Probably multiple periods of folding)

Khoo, Han Peng (1983)- Mesozoic stratigraphy in Peninsular Malaysia. In: P. Nutalaya (ed.) Proc. Workshop Stratigraphic correlation of Thailand and Malaysia, Haad Yai 1983, Geol. Soc. Thailand and Geol. Soc. Malaysia, p. 370-383.
(online at: https://gsmpubl.files.wordpress.com/2014/10/sctm_26.pdf)
(Mesozoic of Malay Peninsula in two separate belts: (1) NW corner and (2) N-S axial region. Two main sequences, mainly Triassic flysch sequence and Late Jurassic- E Cretaceous molasse sequence. In NW corner M-L Triassic Kodiang Lst is time equivalent of deeper marine Semanggol Fm with Halobia, Daonella)

Khoo, K.K. (1978)- Serpentinite occurrence at Telok Mas, Melaka. Warta Geologi (Geol. Soc. Malaysia Newsletter) 4, 1, p. 1-6.
(online at: www.gsm.org.my/content.php?id=54&pid=702001-101569)
(Serpentinite in drill core ~11km SE of Malacca town. First in situ occurrence reported W of Main Range)

Khoo, T.T. (1984)- The terrane of the Patani Metamorphics. Bull. Geol. Soc. Malaysia 17, p. 79-95.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1984006.pdf)
(Regional metamorphic terrane in W Kedah, trending NW-SE, ~30km wide>and >650 km2 in size. Regional metamorphism is believed to have ended by M Carboniferous followed by emplacement of Jerai granite in M-L Carboniferous. Onset of regional metamorphism believed to be E Devonian (NB: Jerai granite dated as 204-206 Ma by Jamil and Ghani 2014; typical latest Triassic Main Range granite; JTvG))

Khoo, T.T. (1984)- Evidence of polymetamorphism in the Rebak Islands, Langkawi, Kedah. Bull. Geol. Soc. Malaysia 17, p. 265-281.
(online at: www.gsm.org.my/products/702001-101151-PDF.pdf)
(Clastics of Rebak islands (SW Langkawi) underwent low-grade regional metamorphism followed by contact metamorphism from granitic source (tourmalinization and pyritization evidence of metasomatism))

Khoo, T.T. & S.P. Lim (1983)- Nature of the contact between the Taku Schists and adjacent rocks in the Manek Urai area, Kelantan and its implications. Bull. Geol. Soc. Malaysia 16, p. 139-158.
(online at: www.gsm.org.my/products/702001-101170-PDF.pdf)
(Taku Schists widespread (750 km2) in N Kelantan Province, NE Malay Peninsula. Contact between schist and adjacent rocks interpreted to be conformable (but tectonic disconformity suggestd by Hutchison 1973). Age of protoliths Permo-Triassic, possibly also older. Age of regional metamorphism may be E-M Triassic, uplift likely in Late Triassic)

Khoo, T.T. & B.K. Tan (1983)- Geologic evolution of Peninsular Malaysia. In: T. Thanasuthipitak et al. (eds.) Proc. Workshop on Stratigraphic correlation of Thailand and Malaysia, Haad Yai 1983, Geol. Soc. Thailand and Geol. Soc. Malaysia, 1, p. 253-290.
(online at: https://gsmpubl.files.wordpress.com/2014/10/sctm_15.pdf)
(Peninsular Malaysia three longitudinal belts, E, C and W, each with own geological development. Post mid-Permian deposition of carbonates and clastics and whole region uplifted by culminating late Triassic orogenic event which affected entire peninsula. Aborted rift model for the tectonic development of Central Belt. Etc.)

Khoo, T.T., B.S. Yaw, T. Kimura & J.H. Kim (1988)- Geology and palaeontology of the Redang islands, Trengganu, Peninsular Malaysia. J. Southeast Asian Earth Sci. 2, p. 123-130.
(Redang islands highly folded clastic sediments, contact metamorphosed by granitic intrusion. Fluvial-nearshore Redang beds and deeper marine Pinang beds. Fossil plants in Redang beds include Calamites, Pecopteris, Cordaites and Taenopteris, resembling Late Carboniferous-Permian species)

Kobayashi, T. (1959)- On some Ordovician fossils from the northern Malaya and her adjacence. J. Fac. Science, University of Tokyo, 2, 11, p. 387-407.
(Early study of Ordovician fossils from NW Malay Peninsula/ Langkawi. Incl. gastropod Teiichispira zonata)

Kobayashi, T. (1963)- On the Triassic *Daonella* beds in central Pahang, Malaya (Contributions to the geology and Palaeontology of Southeast Asia 3). Japanese J. Geology Geography 34, p. 101-112.
(Triassic Daonella faunas with 5 species incl. D. indica, D. lommeli, D. pichleri and D. pahangensis n.sp., from Temerloh area, Pahang, Central Malay Peninsula. Triassic shales of Temerloh associated with Pahang Volcanics tuffs. Typical Tethyan fauna, mainly of Ladinian age. Similar distribution to Myophoria sandstones across Malay Peninsula)

Kobayashi, T. (1963)- *Halobia* and some other fossils from Kedah, northwest Malaya (Contributions to the geology and Palaeontology of Southeast Asia 4). Japanese J. Geology Geography 34, p. 113-128.
(Occurrence of Ladinian-Norian hemipelagic bivalves Posidonia kedahensis n.sp., Halobia talauana Wanner, Halobia parallella Kobayashi and Halobia comata Bittner in Semanggol Fm, NW Malay Peninsula)

Kobayashi, T. (1964)- On the Triassic *Daonella* Beds in Central Pahang, Malaya. In: T. Kobayashi (ed.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 53-68.
(Same paper as Kobayashi 1963. Five species of Daonella (one new species Daonella pahangensis) from M Triassic shales NW of Temerloh. Same paper as Kobayashi 1963)

Kobayashi, T. (1964)- *Halobia* and some other fossils from Kedah, northwest Malaya. In: T. Kobayashi (ed.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 69-87.
(Same paper as Kobayashi 1963. Occurrence of Ladinian-Norian hemipelagic bivalves Posidonia kedahensis n.sp., P. siamensis, P. cf. japonica, Halobia talauana Wanner, H. charlyana, H. parallella Kobayashi and Halobia comata Bittner, Daonella indica, etc., in Semanggol Fm, NW Malay Peninsula))

Kobayashi, T. (1984)- On the geological history of Thailand and West Malaysia. In: T. Kobayashi, R. Toriyama & W. Hashimoto (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 3-42.
(Stratigraphy-oriented review of Paleozoic- Recent of Thailand-Malay Peninsula area)

Kobayashi, T., C.K. Burton, A. Tokuyama & E.H. Yin (1967)- The *Daonella* and *Halobia* facies of the Thai-Malay Peninsula compared with those of Japan. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 3, p. 98-122.
(M-L Triassic mollusc-bearing beds in Malay Peninsula E and W zones. Daonella and Halobia widespread in deep-water W zone, from S Thailand through Kedah to N Perak ('Semanggol Fm'). Daonella Beds mainly Ladinian, Halobia beds mainly Carnian- E Norian. E zone on E side of Main Range, from Kelantan via Pahang and Johore to Singapore, characterized mainly by nearshore Myophoria sandstones)

Kobayashi, T. & T. Hamada (1964)- On a new Malayan species of *Dalmanitina*. In: T. Kobayashi (ed.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 221-235.
(Early Silurian (Landoverian) trilobite Dalmanitina malayensis n.sp. from Langkawi Island. Comparable to D. hastingsi from basal Silurian of Shan States, Myanmar)

Kobayashi, T. & T. Hamada (1966)- A new proetoid trilobite from Perlis, Malaysia (Malaya). In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 2, p. 245-250.
(New trilobite Cyrtosymbole (Waribole) perlisensis from Kubang Pasu Fm in Perlis, NW Malay Peninsula (probably E Carboniferous age))

Kobayashi, T. & T. Hamada (1970)- A Cyclopygid-bearing Ordovician faunule discovered in Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 8, p. 1-16.

Kobayashi, T. & T. Hamada (1971)- Agnostoid trilobites in a Devonian formation in West Malaysia. Proc. Japan Academy 47, 4, p. 396-400.
(online at: www.journalarchive.jst.go.jp/...)

Kobayashi, T. & T. Hamada (1971)- Silurian trilobites from the Langkawi islands, West Malaysia, with notes on the Dalmanitidae and Raphiophoridae. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 9, p. 87-134.

Kobayashi, T. & T. Hamada (1972)- A unique trilobite assemblage of the Devonian Kroh fauna in West Malaysia, with notes on the *Tentaculites* facies and the older Palaeozoic faunal sequence in Thailand-Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 10, p. 1-34.
(Trilobite assemblage from Kroh, Upper Perak, NW Malay Peninsula with 13 species, incl. Pseudotrinodus spp., Perakaspis spp., Blanodalmanites spp., etc.. Associated with tentaculites (Nowakia acauria))

Kobayashi, T. & T. Hamada (1973)- Cyrtosymbolids (Trilobita) from the Langgon red beds in northwest Malaya, Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 12, p. 1-28.
(Trilobites associated with brachiopods from 4 localities U Devonian- Lower Carboniferous Langgun Fm marine red mustones of NW Malay Peninsula and Langkawi. Four species, incl. Cyrtosymbole (Waribole) perlisensis, Macrobole kedahensis, etc.)

Kobayashi, T. & T. Hamada (1978)- Upper Ordovician trilobites from the Langkawi islands, Malaysia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 19, p. 1-27.

Kobayashi, T. & T. Hamada (1979)- Permo-Carboniferous trilobites from Thailand and Malaysia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 20, p. 1-21.
(New collections of trilobites from U Carboniferous- Lw Permian from Loei District. Seven new species of M-L Permian trilobites Paladin, Thaiaspis, etc. described. Also two M Permian pygidia from N Pahang, Malay Peninsula: Ditomopyge sp and a Neoproetus from near Kuala Lipis, Pahang)

Kobayashi, T. & T. Hamada (1981)- Trilobites of Thailand and Malaysia. Proc. Japan Academy, Ser. B, 57, 1, p. 1-6.
(online at: www.jstage.jst.go.jp/article/pjab1977/57/1/57_1_1/_pdf)
(Brief review of 11 occurrences of Late Cambrian- Permian trilobites from Thailand and Malaysia (mainly from Sibumasu terrane?))

Kobayashi, T. & T. Hamada (1984)- Trilobites of Thailand and Malaysia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 273-284.
(Same paper as Kobayashi & Hamada (1981))

Kobayashi, T., C.R. Jones & T. Hamada (1964)- On the Lower Silurian shelly fauna in the Langkawi Islands, northwest Malaysia. In: T. Kobayashi (ed.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 209-220.
(Pulau Langgon (Langkawi Islands) with >2400' thick Setul Fm limestone-dominated section. With detrital bands with graptolites (Climacograptus), trilobites (Dalmanitina malayensis), etc.)

Kobayashi, T., G.A. Sai & K.N. Murthy (1984)- On the geological age of the Tanjong Malim Limestone in Peninsular Malaysia. Proc. Japan Academy 55, B, 6, p. 259-263.

(online at: https://www.jstage.jst.go.jp/article/pjab1977/55/6/55_6_259/_pdf)
(Macrofossils in limestone intercalated with argillaceous rocksand quartzite at Tanjung Malim, 80km NNW of Kuala Lumpur. thermally metamorphosed by Triasic granite intrusion. Fossils incl. straight nautiloids (Endoceras, Orthoceras, Ormoceras) and gastropods (Lophospira). Most likely of M Ordovician age)

Kobayashi, T. & M. Tamura (1968)- *Myophoria* (s.l.) in Malaya with a note on the Triassic Trigoniacea. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 5, p. 88-137.
(Taxonomic review of 13 species of M-U Triassic Trigoniacea bivalves from 'Myophoria Sandstone belt' in Central Belt at E side of Main Range of Malay Peninsula (Chegar Perah, Temerloh, Jurong-Singapore, Kuala Lipis). Presence of Neoschizodus, Myophoria, Costatoria (7 species, incl. C. myophoria, C. pahangensis, C. chegarpahangensis n. sp.), Elegantinia, etc. (Deposits now called Semantan Fm, viewed as M-U Triassic foreland or fore-arc basin along W side of E Malaya Terrane (Ismail 2007); Myophorids from Padang Beds of Sumatra limited to 3 Norian species of Costatoria))

Kobayashi, T. & M. Tamura (1968)- Upper Triassic pelecypods from Singapore. In: T. Kobayshi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 5, p. 138-150.
(Rel. poorly preserved Late Triassic neritic bivalves from Jurong Industrial Estate, SW Singapore. With 17 species, incl. Halobia ex. gr. verbeeki, Costatoria cf. myophoria and other spp., Cassianella cf. verbeeki, Pecten (Entolium?), Cardium scrivenori n.sp. (with affinities to Cardium martini of Sumatra), etc., probably of Early Norian age. Fauna similar to Katialo Fauna of Sumatra described by Krumbeck (1914) and also to Mount Faber, Singapore, fauna described by Newton (1923))

Koike, T. (1973)- Triassic conodonts from Kedah and Pahang, Malaysia. In: T. Kobayshi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 12, p. 91-113.
(Triassic conodonts from N Kedah, Bukit Kecil (probably Ladinian, with Epigondiella mungoensis, Paragondolella polygnathiformis, Neogondolella, etc.) and Bukit Kodiang (E Carnian?; mainly P. polygnathiformis). Also samples from chert of Semanggol Fm at Tawar (S Kedah; within late Ladinian- E Carnian) and 3 km NW of Kampong Awah (C Pahang; E Carnian))

Koike, T. (1982)- Triassic conodont biostratigraphy in Kedah, West Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 23, p. 9-52.

Kon'no, E. (1967)- Some younger Mesozoic plants from Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 3, p. 135-164.
(Nine fossil plants from 'Gagau Flora' from 'post-orogenic' Gagau/ Tebak Fm clastics from 3 areas in median zone of Malay Peninsula, incl. in Gunong Gagau area of N Pahang. Most likely age early E Cretaceous, possibly including Late Jurassic. Descriptions of Equisetites, Gleichenites, Ptilophyllum, Frenelopsis, etc. Floral affinity with East Asia, very different from India flora. See also Kon'no 1968, Smiley 1970)

Kon'no, E. (1968)- Addition to some younger Mesozoic plants from Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 4, p. 139-155.
(Nine fossil plants of E Cretaceous 'Gagau Flora', newly collected from Sungei Pertang, Kelantan, incl. Gleichenoides spp., Otazamites, Pelourdea, Cupressinocladus, Conites, etc.)

Kon'no, E. & K. Asama (1970)- Some Permian plants from the Jengka Pass, Pahang, West Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 8, p. 97-132.
(U Permian 'Cathaysian' flora with 24 species, incl. Bicoemplectopteris hallei (also common in Cathaysian Gigantopteris flora of S China)

Kon'no, E. & K. Asama (1975)- Younger Mesozoic plants from Ulu Endau, Pahang, West Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 16, p. 91-102.

Kon'no, E., K. Asama & S. Rajah (1970)- The Late Permian Linggiu flora from the Gunung Blumut area, Johore, Malaysia. Bull. Nat. Science Museum, Tokyo, 13, 3, p. 491-580.
(Rel. rich early Late Permian flora from C Johore, SE part of Malay Peninsula. In ~1000-2000' thick Linggiu Fm folded sand-shale-volcanics series. 35 species, many index fossils of North Cathaysian Gigantopteris-Lobatannularia spp. Fauna (correlative with Upper Shihhotse Series of N Cathaysia). Also Pecopteris, Rahajia, Taenioperis, etc.. Only 5 species in common with Jambi flora of Sumatra, which is deemed to be older (Artinskian; tied to Shansi series of N Cathaysia, but lacks some key taxa of that flora))

Kon'no, E., K. Asama & S. Rajah (1971)- The Late Permian Linggiu flora from the Gunung Blumut area, Johore, Malaysia. In: T. Kobayshi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 9, p. 1-85.
(Same paper as Kon'no et al. (1970). Linggiu flora from C Johore with 35 early Late Permian species characteristic of N Cathaysian Gigantopteris- Lobatannularia assemblage. Different from nearby, older Permian Jambi Flora)

Koopmans, B.N. (1965)- Structural evidence for a Palaeozoic orogeny in northwest Malaya. Geol. Magazine 102, p. 501-520.
(Lower Paleozoic rocks in Langkawi Islands subjected to late Silurian-Devonian 'Langkawi folding phase' (dynamo-metamorphic slates in SE with NNW cleavage; in unmetamorphosed N part of area cross-folding with NW trend superimposed on NNE trending folds). In U Paleozoic sediments such deformations are missing: Permian and Carboniferous only slightly warped around Jurassic granite batholith. Lack of Devonian strata in Thailand and incompleteness of Devonian sequence in Malaya may indicate Langkawi folding phase not restricted to Langkawi Islands (comparable to U Paleozoic unconformity in N Sumatra, described by Zwierzycki 1919, Klein 1917?) (see also critique of Burton (1966), who argues for ' Langkawi folding phase' of M-U Carboniferous age)

Koopmans, B.N. (1966)- Palaeozoic orogeny in North-West Malaya- a reply. Geol. Magazine 103, 6, p. 565-567.
(Reply to critique of Burton (1966))

Koopmans, B.N. (1968)- The Tembeling Formation- a litho-stratigraphic description (West Malaysia). Bull. Geol. Soc. Malaysia 1, p. 23-43.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1967003.pdf)
(Tembeling Fm 'molasse facies' fluviatile-deltaic lacustrine post-orogenic sediments in E Malay Peninsula. Thickness at type section in Pahang >3000m. Age probably late Triassic- Jurassic. Incl. thick polymict conglomerates, argillaceous red-beds, etc. Unconformably overlies Carboniferous, Permian and Triassic rocks. Folded Tembeling Fm unconformably overlain by flat-lying beds of Late Jurassic- E Cretaceous Gagau Gp)

Koraini, A.M., Z. Konjing & M. Malihan (2012)- Tertiary palynomorph assemblage from eastern Chenor, Pahang. Bull. Geol. Soc. Malaysia 58, p. 37-42.
(online at: www.gsm.org.my/products/702001-100353-PDF.pdf)
(Palynological assemblages from clastic sediments in outcrop in C Pahang dominated by Late Miocene or younger palynomorphs such as Lanagiopollis emarginatus, Stenochlaenidites papuanus, Discoidites borneensis, Taxodiaceae, etc.. Suggestive of ephemeral peat swamp and riparian fringe type environment)

Krahenbuhl, R. (1991)- Magmatism, tin mineralization and tectonics of the Main Range, Malaysian Peninsula: consequences for the plate tectonic model of Southeast Asia based on Rb-Sr, K-Ar and fission track data. Bull. Geol. Soc. Malaysia 29, p. 1-100.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1991010.pdf)
(Malaysian Peninsula divided by suture into 2 different magmatic provinces. Major magmatic event in Main Range Late Permian. Also common Later Triassic post-collision granites, with major tin mineralization. Apatite fission track data show rapid Oligocene (33-24 Ma) exhumation of Malay Peninsula Tin granites, etc.)

Kumar, S.C. (1981)- Gabbroic rocks from the southern Malay Peninsula and their relation to similar rocks of other orogenic zones. Geol. Soc. Malaysia, Bull. 14, p. 75-100
(online at: www.gsm.org.my/products/702001-101197-PDF.pdf)
(Linden (NW of Johore) and Gombak (Singapore) gabbroic stocks outcrop as two discrete bodies in S tip of Malay Peninsula. Together with gabbroic rocks in Billiton Island represent elements of Eastern volcanic-plutonic belt, active from Carboniferous- Late Triassic)

Kummel, B. (1960)- Anisian ammonoids from Malaya. Breviora 124, p. 1-8.
(online at: www.archive.org/details/breviora121178harv)
(M Triassic ammonites from folded dark grey shales 10.5 miles SSW of Kuala Lipis, Pahang, central Malay Peninsula (= E Malaya/ Indochina terrane?: JTvG). Contains Tethyan species Paraceratites trinodosus, Sturia sansovinii, Acrochordiceras and Ptychites)

Kwan, T. S., R. Krahenbuhl & E. Jager (1992)- Rb-Sr, K-Ar and fission track ages for granites from Penang Island, West Malaysia: an interpretation model for Rb-Sr whole-rock and for actual and experimental mica data. Contrib. Mineralogy Petrology 111, 4, p. 527-542.
(Penang Island NW extension of Peninsular Malaysia Western Magmatic Belt. Three granite emplacement episodes: ~307 Ma (Late Carboniferous), ~251 Ma (Permian-Triassic boundary) and ~211 Ma (Late Triassic). Late-Triassic hydrothermal system responsible for Rb-Sr and K-Ar biotite age resetting of older granites. Change in tensional regime since Oligo-Miocene, accompanied by SW tilting of island)

Kwan, T.S. & F.L. Yap (1986)- The pattern of K/Ar ages of biotites from the granites of Penang: its interpretation in the light of available Rb/Sr and U/Pb data. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 281-289.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986021.pdf)
(Rb/Sr whole-rock and zircon U/Pb data indicate granites of Penang Island emplaced in late Triassic between 222 Ma and 209 Ma. K/Ar analysis of 31 biotite samples show younger apparent ages, decreasing to SSE from 209 Ma to 160 Ma. Trend of younging apparent ages suggests rejuvenation on regional scale

Lane, H.R., K.J. Muller & W. Ziegler (1979)- Devonian and Carboniferous conodonts from Perak, Malaysia. Geologica et Palaeontologica 13, p. 213-222.
(Devonian and Carboniferous conodonts from J.K.R. quarry in S part Gunung Kanthan, Peral, NW Malay Peninsula)

Latiff, A.H.A. & A.E. Khalil (2018)- Crustal thickness and velocity structure of southern Peninsular Malaysia. Bull. Geol. Soc. Malaysia 66, p. 7-13.
(online at: https://gsm.org.my/products/702001-101761-PDF.pdf)
(Broadband seismometer station earthquake data suggest crust-mantle boundary at 34 km and 30 km beneath Kota Tinggi and Bukit Timah (Singapore) stations)

Latiff, A.H.A. & A.E. Khalil (2019)- Crustal thickness and velocity structure of Malay Peninsula inferred from joint inversion of receiver functions and surface waves dispersion. J. Asian Earth Sci. 169, p. 105-116.
(online at: https://www.sciencedirect.com/science/article/pii/S136791201830350X)
(Seismic inversion indicates Moho boundary shallower toN of Malay Peninsula: depth of crust-mantle boundary from 34 km in S to 26 km in S Thailand)

Laveine, J.P. & A.H. Hussin (2003)- The Carboniferous flora of Eastern Peninsular Malaysia. Revue Paleobiologie, Geneve, 22, 2, p. 811-830.
(Carboniferous floras of E Peninsular Malaysia and NE Thailand typical Euramerican aspect. Indochina Block (NE Thailand) and probably also E Malaya Block (E Peninsular Malaysia) in terrestrial connection with N Palaeotethyan land mass, most probably S China Block, at least since E Carboniferous)

Lee, C. (1980)- Two new Permian ammonoid faunas from Malaysia. In: T. Kobayashi, R. Toriyama et al. (eds.) Symposium on the geology and paleontology of SE Asia, Tsukuba 1978, Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 21, p. 63-72.
(Two new E-M Permian ammonoid occurrences on: (1) Prostacheoceras, Neocrimites and Adrianites from Lee Mines in Perak, NW Malay Peninsula (Artinskian), and (2) Agathiceras suessi, Adrianites eleans and Popanocera from S. Cheroh, Pahang, C Malay Peninsula (Wordian). Faunas transitional between those from Sicily and Bitauni-Basleo, Timor)

Lee, C.P. (1983)- Stratigraphy of the Tarutao and Machinchang Formations. In: P. Nutalaya (ed.) Proc. Workshop Stratigraphic correlation of Thailand and Malaysia, Haad Yai 1983, Geol. Soc. Thailand and Geol. Soc. Malaysia, p. 20-38.
(online at: https://gsmpubl.files.wordpress.com/2014/10/sctm_02.pdf)
Review of ~3000m thick mainly shallow marine clastic sections of age-equivalent Cambro-Ordovician Machinchang Fm (NW Malaysia, Langkawi island) and Tarutao Fm (SW Thailand, Ko Tarutao). Somewhat thicker and coarser in S. Overlain by Ordovician limestones of Setul Fm (part of 'Sibumasu Terrane'; similar to Arafura- W Papua stratigraphy?; JTvG))

Lee, C.P. (1993)- Fossil localities in Malaysia: their conservation and significance. Background Paper, Malaysan National Conservation Strategy, Economic Planning Unit, Kuala Lumpur, p. 1-35.

(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1995014.pdf)
(Two new Permian ammonoid localities in tuffaceous mudstones in Gua Musang Fm metasedimentary-pyroclastic sequence in Kuala Betis area, SW Kelantan. Fauna with Agathiceras cf. suessi, Adrianites, Popanoceras., Propinacoceras, Hoffmannia, etc. and small orthoconic cephalopods. Assemblages resemble M Permian Sg Cheroh cephalopod fauna and are associated with deep water sediment in Bentong (Paleotethys) suture zone. Similarities with Italian Socio, Timor Basleo fauna and other ammonoid occurrences in Europe, N Africa and W Asia indicate oceanic link between these pelagic faunas in M Permian)

Leman, M.S. (1996)- The occurrence of brachiopods from pebbly mudstone near Kilim, Langkawi: their age, paleobiogeography and paleoclimatic implication. Warta Geologi 22, 2, p. 100-102. *(Conference Abstract)*
(online at: www.gsm.org.my/products/702001-101460-PDF.pdf)
(Gondwanan cold water brachiopod assemblage of 8 species in upper Singa Fm in Kilim quarry, Langkawi islands (= Sibumasu terrane). Includes Spirelytha, Sulciplica, Bandoproductus, etc. Indicating late E Permian (Sakmarian) age. Same species also reported from Ko Muk (Thailand))

Leman, M.S. (1997)- The age and paleobiogeography of brachiopod fauna discovered in pebbly mudstone at Kilim, Langkawi. Bull. Geol. Soc. Malaysia 40, p. 233-240.
(online at: www.gsm.org.my/products/702001-100877-PDF.pdf)
(Rich, thick-shelled cold water brachiopod assemblage near top of pebbly mudstone of Singa Fm in Kilim area, E Langkawi, with Spirelytha buravasi, Sulciplica thailandica, Lamniplica cf sapa, Rhynchopora, Streptorhynchus, Arctitreta, etc. Similar to assemblage described by Waterhouse(1982) from Ko Muk, Thailand. Presence of Bandoproductus monticulus suggests E Permian (Late Asselian- Sakmarian) age. Kilim brachiopod fauna close affinity with other E Permian south temperate or peri-Gondwana fauna. Faunas support marine glacial diamictite origin for pebbly mudstone)

Leman, M.S. (1997)- Batuan Formasi Singa di Pulau Langkawi. In: I. Komoo et al. (eds.) Geological heritage of Malaysia: conservation geology for ecotourism, LESTARI UKM, p. 185-207.

(On preservation of famous 'Sibumasu' Paleozoic section outcrops of Langkawi island, off Malay Peninsula)

Leman, M.S., K.R. Mohamed & M. Sone (2000)- On the new Permian Bera Formation from the Bera District, Pahang, Malaysia. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conf. 2000, Pulau Pinang, p. 151-158.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2000_21.pdf)
(New Bera Formation introduced for M Permian strata exposed in Bera District, Pahang, C Malay Peninsula. Lithology mainly shale, siltstone and sandstone, deposited in shallow marine environment. With ammonoid Agathiceras, trilobite Pseudophillipsia, brachiopods incl. lyttoniid genus Gubleria (similar to Leptodus nobilis; see also Sone et al. 2001). Upper part of Bera Fm equivalent to limestones at Jengka Pass and Kampung Awah with late M Permian fusulinid foraminifera)

Leman, M.S., N. Ramli, S. Mohamed & C. Molujin (2004)- The discovery of Late Permian (early Changshingian) brachiopods from Penjom, Pahang Darul Makmur. Geol. Soc. Malaysia Bull. 48, p. 91-95.
(online at: www.gsm.org.my/products/702001-100582-PDF.pdf)
(Late Permian brachiopod fauna with Peitichia kwangtungensis and Semibrachythyrina rhombiformis in dark grey calcareous shale dipping ~45° to WSW, nearPenjom gold mine, SW of Kuala Lipis)

Leman, M.S. & G. Shi (1998)- The Permian of Langkawi Islands and North West Peninsular Malaysia with comments on the significance of the Kisap Thrust. In: G.R. Shi et al. (eds.) Strzelecki Int. Symp. Permian of Eastern Tethys: biostratigraphy, palaeogeography and resources, Proc. Royal Soc. Victoria 110, p. 405-418.
(W part of Peninsular Malaysia part of Shan-Tai/ Sibumasu block. Carboniferous- Permian sequences deposited in two paleogeographically distinct settings: (1) West Langkawi (with Carboniferous- Lw Permian Singa Fm glacio-marine pebbly mudstone) and (2) Perlis-Kedah (Carboniferous- Lw Permian shallow water Kubang Pasu Fm in W (with E Permian Monodiexodina fusulinid fauna) and deep-water Semanggol Fm in E, no well-defined glacial diamictites, transitional climate between typical cold Gondwana and warm Cathaysian faunas. Two terranes brought close to each other by post-Permian Kisap Thrust, thrusting E block (Perlis-Kedah) over W block (W Langkawi))

Leman, M.S. & M. Sone (2001)- Conglomerate from Setia Jasa near Temerloh, Pahang, Peninsular Malaysia: its stratigraphic position and depositional environment. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conference 2001, Pangkor Island, p. 115-119.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2001_19.pdf)
(Thick series of conglomerate, tuffaceous sandstone and shale in Setia Jasa area, E of Temerloh, C Malay Peninsula. Anisian (early M Triassic) age is indicated by presence of ammonoid Paraceratites sp. in lower shale bed. Also bivalves Costatoria and Neoschizodus and some plant fragments. Clasts mainly tuffaceous sandstone. Possibly deposited in deep marine environment and probably part of Semantan Fm)

Leman, M.S. & M. Sone (2002)- A Permian phillipsid trilobite from Peninsular Malaysia. Geosciences J. 6, 2, p. 125-129.
(Pygidia of trilobite Pseudophillipsia reported from M Permian Bera Fm sand-shale, Pahang, Central Malay Peninsula, with rich brachiopod fauna of E Capitanian age. Resembles slightly younger Capitanian species of N Laos, suggesting faunal link between Indochina and Peninsular Malaysia (E Malaya terrane) in Capitanian)

Leman, M.S. & A. Yop (2002)- Early Permian sequence from Sungai Itau quarry, Langkawi: its age, depositional environment and palaeoclimatic implication. In: G.H. Teh (ed.) GSM Annual Geological Conf., Kota Bharu 2002, Bull. Geol. Soc. Malaysia 45, p. 163-170.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2002025.pdf)
(Thick bedded sandstones and mudstones with fossiliferous calcareous horizons in quarry in Kampung Sungai !tau, Langkawi. Lower sandstone interbedded with black pebbly mudstone (diamictite), indicating glaciation. Deposition took place on outer shelf. Overlying silty shale yields E Permian (late Asselian- E Sakmarian) brachiopod assemblage of Gondwanan affinity with Spirelytha spp., Sulciplica, Spiriferella, etc.)

Leonova, T.B., M.S. Leman & G.R. Shi (1999)- Discovery of an Early Permian (Late Sakmarian) ammonoid from Langkawi Island, Malaysia. Alcheringa 23, p. 277-281.

(Ammonite Metalegoceras sp. from thin-bedded sands-shales in uppermost part of Singa Fm at Batu Asah, NW part of Kuah town, S Langkawi. Confirms Sakmarian (E Permian) age suggested by brachiopods)

Li, B., S.Y. Jiang, H.Y. Zou, M.Yang & J.Q. Lai (2015)- Geology and fluid characteristics of the Ulu Sokor gold deposit, Kelantan, Malaysia: implications for ore genesis and classification of the deposit. Ore Geology Reviews 64, p. 400-424.
(Ulu Sokor in Central Gold Belt one of largest gold deposits in Malaysia. Three major orebodies related to N-S and NE-striking fractures in fault zones in Permian-Triassic meta-sedimentary and volcanic rocks of E Malaya Block. Gold mineralization quartz-dominant vein systems with sulfides and carbonates. Hydrothermal alteration and mineralization during three stages. Classified as orogenic gold deposit)

Liew, T.C. (1983)- Petrogenesis of the Peninsular Malaysia granitoid batholiths. Ph.D. Thesis, Australia National University (ANU), Canberra, p. 1-291. *(Unpublished)*

Liew, T.C. & M.T. McCulloch (1985)- Genesis of granitoid batholiths of Peninsular Malaysia and implications for models of crustal evolution: evidence from Nd-Sr isotopic and U-Pb zircon study. Geochimica Cosmochimica Acta, 49, p. 587-600.
(Nd, Sr and U-Pb isotopic data for Late Triassic W Coast Province batholiths and Permian-Triassic E Coast Province batholiths of Peninsular Malaysia. U-Pb zircon inheritance ages interpreted to correspond to Mid-Proterozoic (~1300-1900 Ma) 'crust formation' ages of continental fragments represented by W Coast and E Coast batholithic provinces. Absence of Archean signatures)

Liew, T.C. & R.W. Page (1985)- U-Pb zircon dating of granitoid plutons from the West coast of Peninsular Malaysia. J. Geol. Soc., London, 142, p. 515-526.
(U-Pb zircon dating of granitoid plutons from W Coast Province of Malaysia yields ages of 198-220 Ma (Late Triassic), older than previous K-Ar mica ages. U-Pb zircon ages are considered to represent best estimate of intrusive ages of plutons. Zircons from some plutons yield ages of ~1500-1700 Ma, dating source-derived, inherited zircon components, suggesting W Coast Province S-type granitoids derived from sedimentary sources recycled, at least in part, from mid-Proterozoic crystalline basement sources)

Lim, K.K. & N.T. Abdullah (1994)-. Development of Permian volcaniclastics limestone succession at Gua Bama, Pahang Darul Makmur. Warta Geologi 20, 3, p. 243-244. *(Abstract only)*
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1994003.pdf)
(Late Permian volcanic and volcaniclastic facies interfingering with minor limestone reported to be ubiquitous from Padang Tengku to Terengan catchment area. Limestone sequence at Gua Bama underlain by stratified volcaniclastics (crystal tuffs). With Tubiphytes and colaniellid foraminifera, indicating Late Permian age)

Metcalfe, I. (1987)- Permian and Early Triassic conodonts from an olistostrome near Raub, Pahang and their implications. Laporan Teknik Fakulti Sains Fizis dan Gunaan, Universiti Kebangsaan Malaysia 1, p. 100-106.
(Diamictites in Raub area (Raub-Bentong Line), Pahang, with clasts up to several m (incl. limestones with Late Permian conodonts Neogondella, etc.) in sheared muddy matrix. Interpreted as olistostrome associated with active normal faults along W margin of Central graben of Malay Peninsula. 'Tethyan' conodonts in diamictite matrix late Early Triassic age (Neospathodus spp., etc), with reworked Permian and earliest Triassic species)

Metcalfe, I. (1987)- An occurrence of sheared diamictite near Genting Sempah. Warta Geologi 13, p. 97-103.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1987003.pdf)
(Diamictite along Kuala Lumpur- Karak highway, 2 km SW of Genting Sempah, turbiditic beds now in tectonic melange or sheared olistostrome. Similar diamictites also in Raub-Bentong-Karak area where they define narrow zone along Bentong-Raub line. Diamictites in Raub area dated as probably late E Triassic; Genting Sempah diamictite may form part of this E Triassic melange/olistostrome belt)

Metcalfe, I. (1989)- Triassic sedimentation in the central basin of Peninsular Malaysia. In: T. Thanasuthipitak & P. Onchanum (eds.) Proc. Int. Symposium Intermontane basins, geology and resources, Chiang Mai University, Department of Geological Sciences, p. 173-186.
(C Basin of Malay Peninsula extensional graben on E Malaya Block, bound in W by faults of Bentong-Raub Line and in E by Lebir fault zone. Triassic faulting along Raub-Bentong produced graben with 2-3 km of marine Triassic, followed by 1.5- 2 km of non-marine Jurassic- E Cretaceous Tembeling Gp. E Triassic includes olistostrome with Permian limestone clasts, etc. In C part of graben deeper marine Semanggol Fm with Claraia in E Triassic and Posidonia, Daonella, Halobia in pelagic interbeds in M-L Triassic volcanics-rich turbidites (no Triassic volcanics on adjacent Sibumasu Block). Basin margin shallow marine fauna with myophoriid bivalves (Costatoria). Triassic folded in single folding phase, with NNW-SSE trending folds)

Metcalfe, I. (1990)- Triassic conodont biostratigraphy in the Malay Peninsula. Bull. Geol. Soc. Malaysia 26, p. 133-145.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1990011.pdf)
(Conodonts representative for all Triassic stages, except Rhaetian, found in Malay Peninsula. Best known sequence of Triassic conodonts in Kodiang Lst of Kedah)

Metcalfe, I. (1990)- Lower and Middle Triassic conodonts from the Jerus Limestone, Pahang, Peninsular Malaysia. J. Southeast Asian Earth Sci. 4, 2, p. 141-146.
(Steeply dipping, dark grey Jerus Limestone, Cheroh, Pahang (just E of Raub-Bentong suture?), previously considered part of Permo-Carboniferous Raub Group yielded rich Lower and Middle Triassic conodont faunas (late Dienerian Neospathodus pakistanensis Zone, with common Neospathodus spp.))

Metcalfe, I. (1990)- Stratigraphic and tectonic implications of Triassic conodonts from Northwest Peninsular Malaysia. Geol. Magazine 127, p. 567-578.
(Chuping Lst of NW Malay Peninsula with Late Triassic (E Norian) conodonts and spans late E Permian- Late Triassic. Part equivalent to Kodiang Lst (Late Permian- Triassic) in Kedah and similar limestones in S Thailand and N Sumatra. Early Late Triassic (Carnian) conodonts also in pelagic limestones associated with bedded cherts of Semanggol Fm. Triassic of Malay Peninsula three regions: (1) elongate carbonate platform complex on Sibumasu block (Chuping Lst, Kodiang Lst); (2) pelagic/ turbidite basinal sequence (Semanggol Fm; foredeep or intracratonic pull-apart basin) and (3) volcanic-sourced volcaniclastic basinal sequence on E Malaya block (Semantan Fm and equivalents; forearc/ intra-arc or post-orogenic rift))

Metcalfe, I. (1992)- Lower Triassic (Smithian) conodonts from northwest Pahang Peninsular Malaysia. J. Micropalaeontology 11, 1, p. 13-19.
(online at: https://www.j-micropalaeontol.net/11/13/1992/jm-11-13-1992.pdf)
(Lower Triassic conodonts from limestones (possibly submarine slump) along new Kuala Lipis -Gua Musang highway, NW Pahang, NW Peninsular Malaysia. (in Central Basin, E of Bentong-Raub suture). Co-occurrence of Neospathodus triangularis, Platyvillosus costatus), Neospathodus dieneri and Platyvillosus hamadai indicates Scythian age. P. hamadai unknown from Peri-Gondwana, supporting pre-E Triassic rifting of W Malay Peninsula (Sibumasu) from Gondwana)

Metcalfe, I. (1992)- Upper Triassic conodonts from the Kodiang Limestone, Kedah, Peninsular Malaysia. J. Southeast Asian Earth Sci. 7, p. 131-138.
(Conodonts from Kodiang Lst at Kedah, NW corner of Peninsular Malaysia (= Sibumasu Terrane). Document presence of U Carnian- Lower Norian and conodonts, incl. Epigondolella spp. and Metapolygnathus spp. Faunas correlate with similar faunas from Chuping Lst of Perlis, Malaysia, and limestones from Lake Toba area and Sungei Kalue, N Sumatra)

Metcalfe, I. (1993)- Permian conodonts from the Raub Gold Mine, Pahang, Peninsular Malaysia. Warta Geologi 19, 3, p. 85-88.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1993003.pdf)
(Isoclinally folded sediments of 'Raub Group' at Raub Gold Mine, Pahang, with conodont Neogondolella rosenkrantzi, indicating Late Permian age. Overlain by less-deformed M-U Triassic Semantan Fm, suggesting structural discontinuity which may correspond to age of suturing of Sibumasu and East Malaya blocks)

Metcalfe, I. (1995)- Mixed Permo-Triassic boundary conodont assemblages from Gua Sei and Kampong Gua, Pahang, Peninsular Malaysia. In: Contr. First Australian Conodont Symposium (AUSCOS 1), Sydney 1995, Courier Forschunginstitut Senckenberg, Frankfurt, 182, p. 487-495.
(Merapoh Lst at Kampong Gua and Gua Sei, Pahang, C Peninsular Malaysia, previously assigned to Carboniferous, with E Triassic (Griesbachian) conodont assemblages (Clarkina changxingensis, Hindeodus spp., incl. H. latidentatus))

Metcalfe, I. (1999)- Geological origins and natural resources. In: A. Kaur & I. Metcalfe (eds.) The shaping of Malaysia, Macmillan Press Ltd, p. 11-41.
(online at:http://library.perdana.org.my/Digital_Content/NLM/pnm_bk/M959.5SHA.pdf)

Metcalfe, I. (2002)- Devonian and Carboniferous conodonts from the Kanthan Limestone, Peninsular Malaysia and their stratigraphic and tectonic implications. In: L.V. Hills et al. (eds.) The Carboniferous and Permian of the World, Canadian Soc. Petrol. Geol. Mem. 19, p. 552-579.
(Lower Devonian- Lower Permian Gunong Kanthan Lst in Kinta Valley area, Perak, formed in shallow passive margin sequence of Sibumasu block, when still attached to E Gondwana. Conodonts from Devonian Carboniferous part suggest E and M Devonian and Tournaisian and Visean ages (Polygnathus spp., Gnathodus spp., Tortodus, etc.. Color Alteration Index 5-8 suggest limestone has been heated to 300-400°C)

Metcalfe, I. (2003)- Colour and textural alteration of Paleozoic and Triassic conodonts from Peninsular Malaysia: implications for tectonic evolution and hydrocarbon generation. Courier Forschungsinstitut Senckenberg, Frankfurt 245, p. 261-280.
(Color Alteration Index of conodonts in Malay Peninsula ranges from 1.5- 8, with lowest values in NW Malay Peninsula, highest near granitoid intrusives. Paleozoic conodonts of Sibumasu terrane background CAI 5 (= 7500-10000m overburden?). Lowest Triassic values of 1.5-2.5 in Sibumasu Kodiang-Chuping Lst, equivalent to maturation in oil window. High Triassic values of CAI 5 from E-M Triassic limestones along W margin of Central Belt (reflecting heating by Main Range granitoids?) and M Triassic limestones-cherts from Semanggol Fm in Kedah (implying overburden of 7500- 10,000m, but unrealistic?))

Metcalfe, I. (2013)- Tectonic evolution of the Malay Peninsula. J. Asian Earth Sci. 76, p. 195-213.

(Malay Peninsula three N-S belts: (1) W Belt part of Sibumasu Terrane, derived from Gondwana margin in late E Permian, (2) C and E Belts represent Sukhothai Arc, built in Late Carboniferous- E Permian on margin of Indochina Block and separated from Indochina by back-arc spreading in E Permian. Bentong-Raub suture is boundary between Sibumasu Terrane in W and Sukhothai Arc in E, and preserves remnants of Devonian-Permian Paleo-Tethys ocean basin destroyed by subduction beneath Indochina Block/ Sukhothai Arc, which produced Permian-Triassic andesitic volcanism and I-Type granitoids of C and E Belts of Malay Peninsula. Collision between Sibumasu and Sukhothai Arc began in E Triassic times, completed by Late Triassic. Triassic cherts and turbidites of Semanggol Fm deposited in foredeep basin on leading edge of Sibumasu and uplifted accretionary complex. Collisional crustal thickening produced Main Range Late Triassic- E Jurassic S-type granitoids of W Belt and Bentong-Raub suture zone. Sukhothai back-arc basin closed in M-L Triassic. Jurassic- Cretaceous continental red beds cover sequence. Late Cretaceous tectono-thermal event affected Malay Peninsula with faulting, granitoid intrusions and re-setting of paleomagnetic signatures)

Metcalfe, I. (2016)- A new Lower Triassic (Induan) Jerus Limestone locality in northwest Pahang, Peninsular Malaysia: conodont fauna, depositional and tectonic settings. Island Arc 25, 2, p. 126-136.
(Limestones N of Raub, sandwiched between Bentong-Raub suture and W margin of Sukhothai Arc terrane, yield late Dienerian (late Induan) conodont fauna. With Neospathodus dieneri and Neospathodus pakistanensis. Interpreted as N-ward extension of Jerus Limestone, interpreted as hemipelagic deposit in foredeep or forearc on top of accretionary complex in E-M Triassic (see also Metcalfe 1990))

Metcalfe, I. (2017)- Devonian and Carboniferous stratigraphy and conodont biostratigraphy of the Malay Peninsula in a regional tectonic context. Stratigraphy 14, p. 259-283.
(Devonian- Carboniferous stratigraphy of Malay Peninsula tied to Sibumasu Terrane in W and Sukhothai Arc (Indochina) block in E . Bentong-Raub Suture is former Devonian-Triassic Paleo-Tethys Ocean. Devonian-Carboniferous sediments/ faunas of W belt support placement of Sibumasu Terrane on Paleozoic margin of Australian Gondwana until E Permian (Sakmarian). Carboniferous sediments of E Belt deposited on margin of equatorial Indochina Block, on which Sukhothai Arc was constructed)

Metcalfe, I. & K.R. Chakraborty (1988)- Diamictite along the eastern margin of the Central Basin of the Malay Peninsula. Warta Geologi 14, p. 191-198.
(online at: www.gsm.org.my/products/702001-101505-PDF.pdf)
(Diamictite unit of probable E Triassic age in E part of Central Basin, E of Bentong-Raub suture, with clasts on steeply dipping, sheared muddy matrix. Interpreted as olistostrome, formed along fault scarps of developing graben)

Metcalfe, I. & K.R. Chakraborty (1994)- A stratigraphic log of Semantan Formation along part of the Mentakab-Temerloh bypass, Pahang. Bull. Geol. Soc. Malaysia 35, p. 37-46.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1994005.pdf)
(Thickness of M-U Triassic Semantan Fm in Malay Peninsula central basin ~2km. Continuous stratigraphic sequence of 1.25 km logged along Mentakab bypass. Consistent W-ward dip, no evidence of isoclinal folding or imbricate thrusts, so not part of accretionary prism but part of forearc or intra-arc basin constructed over accretionary wedge. Horizons with bivalves (mainly Posidonia, some Daonella) and ammonite (Arpadites), all suggestive of M Triassic age. Interbedded tuffs and mudstones, deposited by turbidity currents; dominant flow to W?. Overall fining-upward indicates waning of coarser volcaniclastic material supply during M Triassic)

Metcalfe, I., K.R. Chakraborty, C.A. Foss & H.T. Samsudin (1985)- A Middle Triassic fauna from the Bt. Jeram Padang Ridge at Bahau, Negri Sembilan, Peninsular Malaysia. Warta Geologi 11, 3, p. 111-115.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1985003.pdf)
(Bukit Jeram Padang Ridge SE of Bahau with folded clastics with M Triassic 'Myophoria biofacies' bivalves, incl. Costatoria malayensis, C. chegarperahensis and Neoschizodus ovatus elongatus)

Metcalfe, I. & J.L. Crowley (2020)- Upper Permian and Lower Triassic conodonts, high-precision U-Pb zircon ages and the Permian-Triassic boundary in the Malay Peninsula. J. Asian Earth Sciences *(in press)*

(Conodont biostratigraphic and high-precision U-Pb isotope data for Permian-Triassic transition in limestone hills Gua Bama, Gua Panjang and Gua Sei in Malay Peninsula)

Metcalfe, I. & A.H. Hussin (1995)- Implications of new biostratigraphic data for stratigraphic correlation of the Permian and Triassic in Peninsular Malaysia. Bull. Geol. Soc. Malaysia 38, p. 173-177.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1995016.pdf)
(Review and correlation chart of Permian-Triassic sediments of Malay Peninsula. Western belt mainly Permian- Triassic Kodiang and Chuping limestones, Raub Bentong suture Permian bedded cherts, Central Belt mainly clastics, with Late Permian and Triassic limestones, Eastern Belt almost no limestones. Semanggol Fm usually considered to be entirely of Triassic age, but also contains Lw, M and U Permian radiolaria)

Metcalfe, I., M. Idris & J.T. Tan (1980)- Stratigraphy and palaeontology of the Carboniferous sediments in the Panching areas, Pahang, West Malaysia. Bull. Geol. Soc. Malaysia 13, p. 1-26.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1980008.pdf)
(New lithostratigraphy proposed for Carboniferous of Panching area, Pahang: (1) Charu Fm shallow marine clastics with Visean- basal Namurian brachiopods; (2) Panching Lst reefal limestone with Namurian fauna (believed to be Visean by Toriyama 1984; JTvG); (3) Sagor Fm ?Late Carboniferous shallow marine clastics with rare limestone lenses)

Metcalfe, I., S.P. Sivam & P.H. Stauffer (1982)- Stratigraphy and sedimentology of Middle Triassic rocks exposed near Lanchang, Pahang, Peninsular Malaysia. Bull. Geol. Soc. Malaysia 15, p. 19-30.
(online at: www.gsm.org.my/products/702001-101189-PDF.pdf)
(M Triassic Semantan Fm outcrops E of Lanchang in C Malay Peninsula NE of Kuala Lumpur. NW dipping tuffs, mudstones with locally common bivalves (Daonella lommeli, D. sakawana, Posidonia) and ammonoids, (Arpadites). Also locally common plant fragments (unidentifiable). Mainly marine gravity flows, derived entirely from volcanic source, with downslope transport directions to W or SW (contemporaneous shallow marine Myophoria sandstone ~5-10km E of Lanchang section))

Mohamed, K.R., N.A.M. Joeharry, M.S. Leman & C.A. Ali (2016)- The Gua Musang Group: a newly proposed stratigraphic unit for the Permo-Triassic sequence of Northern Central Belt, Peninsular Malaysia. Bull. Geol. Soc. Malaysia 62, p. 131-142.

(Late Triassic sandstone rich in bivalve shells in from Kuala Lipis, Pahang. Mainly Myophoria spp., also Chlamys valoniensis, Pteria (=Avicula) pahangensis, Gervillia. (Pteroperna malayensis Newton=also Gervillia?; JTvG)

Newton, R.B. (1906)- Notice on some fossils from Singapore. Geol. Magazine (5), 3, p. 487-496.
(First record of Mesozoic fossils from Singapore. Jurassic fauna dominated by marine bivalves, also fragments of land plants)

Newton, R.B. (1923)- On marine Triassic shells from Singapore. Ann. Mag. Natural History 9, p. 300-321.
(Discovery of Triassic fauna in Singapore by Scrivenor. Mainly bivalve molluscs in friable sandstone, a.o. with Myophoria spp., Palaeocardita, Gervillia. Fauna regarded as Late Triassic age. Singapore beds extension of Myophoria Sst of Pahang, first described by Newton in 1900)

Newton, R.B. (1925)- On marine Triassic fossils from the Malayan Provinces of Kedah and Perak. Geol. Magazine 62, p. 76-85.
(Triassic fauna from black shales in Kedah and Semanggol, Perak: small bivalves (Posidonomya, Halobia moussoni) and indeterminate ammonites (probably Juvavites or Anatomites and Hammoceras; Kummel 1960). Probably older than Myophoria fauna of Kedah)

Newton, R.B. (1926)- On *Fusulina* and other organisms in a partially calcareous quartzite from near the Malayan-Siamese frontier. J. Natural History, Ser. 9, 17, 97, p. 49-64.

Ng, S.W.P., S.L. Chung, L.J. Robb, M.P. Searle, A.A. Ghani, M.J. Whitehouse, G.J.H. Oliver, M. Sone, N.J. Gardiner & M.H. Roselee (2015)- Petrogenesis of Malaysian granitoids in the Southeast Asian tin belt: Part 1. Geochemical and Sr-Nd isotopic characteristics. Geol. Soc. America (GSA) Bull. 127, 9-10, p. 1209-1237.
(Malaysian granitoids of SE Asian tin belt traditionally divided into Permian- Late Triassic 'I-type'-dominated arc-related E Province (Indochina terrane) and Late Triassic 'S-type'-dominated collision-related Main Range province (Sibumasu terrane), separated by Bentong-Raub Paleo-Tethyan suture that closed in Late Triassic. This model is oversimplified. Incorporation of sedimentary-sourced melts in E Province is insignificant, but more common sedimentary protolith in melt ore in Main Range, leading to more significant tin endowment)

Ng, S.W.P., M.P. Searle, M.J. Whitehouse, S.L. Chung, L.J. Robb, A.A. Ghani & M. Sone (2012)- High-spatial resolution SIMS U-Pb zircon dating on Malay tin granites: new insights to crustal evolution of the Malaysian Peninsula. AGU Fall Mtg., San Francisco 2012, V23A-2794 *(Poster Abstract)*
(SE Asian tin granite province previously recognized as comprising three distinct granitic belts (1) M Permian-Late Triassic E Province with mainly subduction-related I-type granites with Cu-Au deposits, (2) Late Permian-E Jurassic Main Range Province mainly S-type granites with Sn-W deposits; (3) Late Triassic- Cretaceous W Province mixed I- and S-type granites with Sn-W deposits. Ages based mainly on Rb-Sr and K-Ar whole rock geochronology, no longer considered suitable for crystallization ages of granites due to unstable behaviour of

isotopes in hydrothermal systems. New SIMS dates reveal W-ward younging trend across Malay Peninsula: E Province granites in E Malaysia formed by subduction processes between 220-285 Ma; Main Range Province S-type granites ages between 206-226 Ma (Late Triassic). Some young Cretaceous zircon rim ages. Granites in Malaysia cannot be simply categorized as I, S or A-type. Tin mineralization not restricted to S-type granites)

Ng, S.W.P., M.J. Whitehouse, M.P. Searle, L.J. Robb, A.A. Ghani, S.L. Chung, G.J.H. Oliver, M. Sone, N.J. Gardiner & M.H. Roselee (2015)- Petrogenesis of Malaysian granitoids in the Southeast Asian tin belt: Part 2. U-Pb zircon geochronology and tectonic model. Geol. Soc. America (GSA) Bull. 127, 9-10, p. 1238-1258.
(New U-Pb zircon ages for 39 granitoids across Malay tin-bearing granite province. Two belts: (1) Mostly I-type granitoids from E Malay province span 289-220 Ma (pre-collisional, subduction-related Andean-type magmas formed during E-ward subduction of Paleo-Tethys beneath Indochina in Permian- M-L Triassic; General westerly younging magmatic trend across Malay Peninsula considered to reflect steepening and roll-back of Bentong-Raub subduction zone during closure of Paleo-Tethys); (2) W Main Range Province granitoids all Late Triassic (227-201 Ma; syn- and post-collisional crustal melting of Sibumasu crust in Late Triassic; Tin mineralization mainly associated with this phase). Two models for Triassic evolution: (1) with second Late Triassic- Jurassic or E Cretaceous E-dipping subduction zone W of Sibumasu; (2) W-ward underthrusting of Indochina beneath W Malaya Main Range province. Cretaceous granitoids reflect localized crustal melting)

Niko, S., M. Sone & M.S. Leman (2005)- A new Permian species of *Mooreoceras* (Cephalopoda: Orthocerida) from northwestern Peninsular Malaysia. Proc. Japan Academy 81, B, p. 329-333.
(online at: www.jstage.jst.go.jp/article/pjab/81/8/329/_pdf)
(New late E Permian (Kungurian?) orthocerid cephalopod species Mooreoceras sibumasuense from basal Chuping Fm in Bukit Tungku Lembu in Perlis, NW Malaysia. Associated with Monodiexodia fusulinids, and part of Sibumasu Terrane. Most Permian Mooreoceras species confined to Australian Gondwana- Sibumasu; also M. sp in Atahoc Fm of Timor)

Niko, S., M. Sone & M.S. Leman (2007)- Two new species of orthocerid cephalopods from the Carboniferous Panching Limestone, West Malaysia. Paleontological Research (Palaeont. Soc. Japan) 11, 4, p. 331-336.
(Two new species of orthocerid cephalopods Kionoceras and Dolorthoceras from Bashkirian (Late Carboniferous) Panching Lst in Pahang, NE Malay Peninsula)

Niko, S., M. Sone & M.S. Leman (2018)- Late Silurian cephalopods from Langkawi, Malaysia, with peri-Gondwanan faunal affinity. J. Systematic Palaeontology 16, 7, p. 595-610.
(online at: https://umexpert.um.edu.my/file/publication/00011532_136895.pdf)
(Nine species of latest Silurian orthocerid cephalopods from U Setul Lst of Langgun, Langkawi Islands, incl. orthoceratids (Michelinoceras cf. michelini, Kopaninoceras setulense n.sp., Mimogeisonoceras? langgunense n.sp., Kionoceras?, Orthocycloceras), arionoceratids (Arionoceras mahsuri n.sp., Caliceras mempelamense n.sp.) and geisonoceratid Murchisoniceras? sp.. Assemblage belongs to newly defined Kopaninoceras Fauna, widely distributed along N margin of Gondwana and around Prototethys Ocean)

Ogura, Y. (1972)- *Psaronius* from Linggiu, Johore, Malaya. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 10, p. 117-124.

('Influence of pre-existing structural fabric on rifting: example from the western margin of Sunda Plate')

Sautter, B., M. Pubellier, P. Jousselin, P. Dattilo, Y. Kerdraon, C.M. Choong & D. Menier (2017)- Late Paleogene rifting along the Malay Peninsula thickened crust. Tectonophysics 710-711, p. 205-224.
(Continental core of Malay Peninsula relatively undeformed after Triassic Indosinian orogeny. Thick crustal mega-horst bounded by shear zones (Ranong, Klong Marui, Main Range Batholith Fault Zones), initiated in latest Cretaceous and reactivated in Late Paleogene. Extension localized on sides with Late Cretaceous deformation. In W continental shelf three major crustal steps (crustal-scale tilted blocks bounded by deep-rooted normal faults; Mergui Basin). To E rift systems with large tilted blocks (W Thai, Songkhla, Chumphon) which may reflect large crustal boudins. Central domain extension limited to narrow N-S half grabens. Rifted basins resemble N-S en-echelon structures along large NW-SE shear bands. Deep Andaman, Malay and Pattani basins on weaker crust inherited from Gondwanan continental blocks (Burma, Sibumasu, Indochina))

Schwartz, M.O. & A.K. Askury (1989)- Geological, geochemical, and fluid inclusion studies of the tin granites from the Bujang Melaka pluton, Kinta Valley, Malaysia. Economic Geology 84, p. 751-779.
(Bujang Melaka pluton of Kinta Valley has area of 20x10 km, and belongs to Permo-Triassic Main Range batholith, or W granite belt of PeninsularMalaysia. Mainly S-type biotite granites, emplaced into Devonian-Lower Permian sediments.

Savage, H.E.F. (1938)- The geology of the neighbourhood of Sungai Siput, Perak, Federated Malay States, with an account of the mineral deposits. Geol. Survey Dept. Fed. Malay States, new ser., Mem. 1, p. 1-46.

Sharma, J.S., J. Chu & J. Zhao (1999)- Geological and geotechnical features of Singapore: an overview. Tunneling and Underground Space Technology 14, 4, p. 419-431.
(One-third of Singapore Island underlain by Triassic Bukit Timah granite and Gombak norite in center and N. In W common intensely folded (strike NW-SE), low-metamorphic Late Triassic or E-M Jurassic Jurong Fm sediments (incl. Late Triassic Pandan Limestone in borehole at Pandan Reservoir in lower part))

Shi, G.R., M.S. Leman & B.K. Tan (1997)- Early Permian brachiopods from upper Singa Formation of Langkawi Island, northwestern Peninsular Malaysia: biostratigraphical and biogeographical implications. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 62-72.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7641.pdf)
(Two assemblages of E Permian (Sakmarian) brachiopods from pebbly mudstones and associated bryozoan limestones of U Singa Fm of Langkawi island, incl. Kasetia, Bandoproductus, Stenoscisma, Sulciplica, Spinomartinia prolifica, etc.. Comparable to peri-Gondwanan assemblages now in Cimmerian terranes (S Thailand, Lhasa, Baoshan, SE Pamir). Transitional between cool Gondwanan and warm Cathaysian faunas)

Shi, G.R. & J.B. Waterhouse (1991)- Early Permian brachiopods from Perak, West Malaysia. J. Southeast Asian Earth Sci. 6, p. 25-39.
(New Permian brachiopod fauna of probable Sakmarian (E Permian) age from Nam Loong 1 Mine of Kinta Valley, W of Kampar, Perak, on Sibumasu Terrane. Material collected by Gobbett below fossiliferous H.S. Lee Beds (Pseudofosulina kraffti and Misellina claudiae fusulinid zones; Ishii 1966). Nam Loong beds ~150m thick, with crinoid limestone of at base, overlain by brachiopod limestone)

Shuib, M.K. (2000)- Synsedimentary tectonic control of the Permo-Triassic Central Basin sedimentation. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conf. 2000, Pulau Pinang, p. 45-49.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2000_07.pdf)
(Sediments in C basin 2 depositional sequences: (1) Permian-E Triassic continental sediments at base, grading into shallow marine to deeper marine at top, marking opening of basin; (2) (M - Late Triassic deep marine turbidites and volcaniclastics grading upward into shallow marine sediments, marking rifting of basin followed by closure. Evidences for syn-sedimentary tectonism: slumps, normal and strike-slip faults, syn-sedimentary folds and shale injection structures. Permo-Triassic Central Basin N-S graben-like configuration with Bentong-Raub Zone as W margin and Lebir Fault Zone in E. Deep basin in central areas represented by Semantan Fm. Dextral transpressive and transtensive faults suggest basin is strike-slip control basin)

Shuib, M.K. (2000)- The olistostromes in the Bentong Area, Pahang and their tectonic implications. In: G.H. Teh et al. (eds.) Proc. Geol. Soc. Malaysia Ann. Geol. Conf. 2000, Pulau Pinang, p. 51-55.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2000_08.pdf)
(Two types of (Permian?) olistostromes in Bentong area: (1) intercalated with cherts (deep marine gravity flow deposits) and (2) intercalated with sandstone/shale layers (may be shallow marine to continental sediments). Deformed by sub-vertical strike-slip faults. Interpreted as deep continental margin deposits along Bentong-Raub Zone suture zone, inverted by Late Triassic time (no mention of possibility of glacio-marine facies))

Shuib, M.K. (2000)- Syndepositional deformation in the Permo-Triassic and Latest Triassic to Cretaceous Central belt of Peninsular Malaysia. In: Proc. Geol. Soc. Malaysia Conf. Dynamic stratigraphy and tectonics of Peninsular Malaysia, Third Seminar, The Mesozoic of Peninsular Malaysia, Kuala Lumpur 2000, p. 30-47.

Shuib, M.K. (2000)- The Mesozoic tectonics of Peninsular Malaysia. In: Proc. Geol. Soc. Malaysia Conf. Dynamic stratigraphy and tectonics of Peninsular Malaysia, Third Seminar, The Mesozoic of Peninsular Malaysia, Kuala Lumpur 2000, p. 106-126.

Shuib, M.K. (2009)- Structures and deformation. In: C.S. Hutchison & D.N.K. Tan (eds.) Geology of Peninsular Malaysia, University Malaya and Geol. Soc. Malaysia, p. 271-308.

Shuib, M.K. & A.A. Ghani (1998)- 'Mantle plume' type magmatism in the Central Belt of Peninsular Malaysia and its tectonic implications. Bull. Geol. Soc. Malaysia 42, p. 365-371.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2003058.pdf)
(Central Belt granitoids just E of Bentong-Raub Line, with distinct geochemical characteristics. Late Jurassic-Lower Cretaceous K/Ar ages, but also more reliable Rb/Sr age of 207 Ma (latest Triassic) for Benom Pluton. High Ba and Sr values may result from penetration of lower lithosphere by mantle material ('mantle plume' type magmatism). Bimodal magmatism, with significant time (up to 30 Myrs) between first mafic magmatism and

later felsic magmatism. C Belt plutons post-orogenic and penecontemporaneus with rapid post-orogenic uplift and erosion with development of Jurassic-Cretaceous continental deposits of C Basin Model proposed involves oblique convergence of two tectonic provinces of Peninsular Malaysia, followed by slab breakoff leading to linear belt of single plutons characterized by high-K, shoshonitic granitoids with high Ba and Sr)

(online at: www.gsm.org.my/products/702001-101160-PDF.pdf)
(Stong Complex of plutonic and metamorphic rocks in NW Kelantan with three granitoid components. Earliest two phases Triassic or younger deformed; third phase undeformed Late Cretaceous (64, 67 Ma) pink granites)

Smiley, C.J. (1970)- Later Mesozoic flora from Maran, Pahang, West Malaysia, Part 1: Geological considerations. Bull. Geol. Soc. Malaysia 3, p. 77-88.
(online at: www.gsm.org.my/products/702001-101372-PDF.pdf)
(Plant fossils from Tembeling Fm 4 mi N of Maran, C Malay Peninsula. Include tree fern Gleichenoides spp., conifer Frenelopsis and others. Maran florules identical to Gagau flora from N Pahang (Kon'no 1967, 1968) and resemble Neocomian species from other areas. Probably represents open forest flora under climate with distinct dry season)

Smiley, C.J. (1970)- Later Mesozoic flora from Maran, Pahang, West Malaysia, Part 2: Taxonomic considerations. Bull. Geol. Soc. Malaysia 3, p. 89-113.
(online at: www.gsm.org.my/products/702001-101371-PDF.pdf)
(16 plant megafossil species in Maran area: 5 pteridophytes (Gleichenoides, Equisetites), 5 cycadophytes (Olozamites, Ptilophyllum, Zamites, 1 conifer (Frenelopsis). No records of Ginkgophytes or Angiosperms (Dicotyledons) in Neocomian floras of W Malaysia)

Snelling, N.J., J.D. Bignell & R.D. Harding (1968)- Ages of Malayan granites. Geologie en Mijnbouw 47, 5, p. 538-539.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0dzhzY3RmVEdvWFk/view)
(Summary of results of Rb-Sr whole rock age determinations on Malayan granites. Ages of intrusion Late Carboniferous (280-300 Ma), M Triassic and Late Cretaceous (~70 Ma). Triassic granites intruded in two episodes at ~230 Ma and 200 Ma. Most K-Ar ages on micas disturbed by younger intrusions and events)

Sone, M. & M.S. Leman (2000)- Some mid-Permian fossils from Felda Mayam, Central Peninsular Malaysia. Proc. Geol. Soc. Malaysia Ann. Conf. 2000, Pinang, p. 143-150.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2000_20.pdf)
(Small suites of early M Permian ammonoids (Agathiceras, Bamyaniceras), brachiopods (Dicystoconcha, Leptodus), bivalves, crinoids and plants (Taeniopteris) from Felda Mayam area, C Pahang. Represents N-most extent of Bera Fm. Permianellid brachiopod genus recorded in Malaysia for first time. Age Roadian-Wordian. Brachiopod assemblage suggests warm-water Tethyan affinities)

Sone, M. & M.S. Leman (2005)- Permian linoproductoid brachiopod *Permundaria* from Bera South, Peninsular Malaysia. J. Paleontology 79, 3, p. 601-606.

(Permundaria is uncommon genus confined to M- early Late Permian Tethys Sea. New species Permindaria perplexus in Wordian, Middle Permian Bera Fm, Pahang, Malay Peninsula (genus also recorded from Jambi, C Sumatra as Strophomena analoga; Meyer 1922))

Sone, M. & M.S. Leman & M. Ehiro (2001)- Middle Permian cephalopods from central Peninsular Malaysia: implications for faunal migration through the southern Tethys. J. Asian Earth Sci. 19, 6, p. 805-814.
(Wordian (early M Permian) cephalopod fauna in steeply dipping shales- tuffaceous sandstones at Bera South, S Pahang, dominated by Agathiceras. Also ammonoids Tauroceras, Bamyaniceras and Pronoritidae and nautiloids Tainoceras and Orthocerida. Presence of Tauroceras. aff. scrobiculatum suggests correlation with S Tethys strata of NE Iraq, N Oman and Sicily)

Sone, M., M.S. Leman & I. Metcalfe (2004)- Triassic nautiloid *Sibyllonautilus* from Gua Bama, Peninsular Malaysia and its regional stratigraphic implications. Alcheringa 28, 2, p. 477-483.
(Coiled nautiloid suggesting Late Permian- earliest Triassic (Lopingian- Anisian) age for Gua Bama sponge-algal reefal limestone section, just E of Bentong-Raub suture, NW Pahang, Peninsular Malaysia. Overlies Permian tuffaceous Leptodus brachiopod shales)

Sone, M., M.S. Leman & G.R. Shi (2001)- Middle Permian brachiopods from central Peninsular Malaysia- faunal affinities between Malaysia and west Cambodia. J. Asian Earth Sci. 19, p. 177-194.
(Moderately diverse M Permian brachiopod fauna from Bera District, C Pahang, 'Central Basin' of Peninsular Malaysia (on E Malaya Plate). In N Bera Fm associated with Late Permian andesitic volcanics. Near top of section fusulinids Sumatrina, Verbeekina, etc. and common Leptodus-like lyttonid brachiopods here called Gubleria. Brachiopods 19 species, typically warm-water Tethyan. Strong linkage to Yabeina beds of Sisophon Lst, W Cambodia. Possible E Capitanian (M Permian) age)

Sone, M., I. Metcalfe & M.S. Leman (2003)- Palaeobiogeographic implications of Middle Permian brachiopods from Johore (Peninsular Malaysia). Geol. Magazine 140, 5, p. 523-538.
(New M Permian brachiopods fauna from folded tuffaceous sandstone at Sermin, N Johore, with Pseudoleptodus, Neochonetes, etc., associated with ammonoid Agathiceras sp.. Fauna lacks diagnostic Cathaysian taxa, but has minor Sibumasu elements. Locality just E of Bentong-Raub suture on E Malaya terrane of Cathaysian province, suggesting species interchange between shallow waters of E Malaya and Sibumasu across Paleo-Tethys. Sibumasu, Timor (Bitauni) and W Irian Jaya dominantly Gondwanan affinity and cooler, higher latitude than E Malaya)

Tjia H.D. & S.S. Almashoor (1996)- The Bentong Suture in southwest Kelantan, Peninsular Malaysia. Bull. Geol. Soc. Malaysia, 39, p. 195-211.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1996017.pdf)
(Bentong Suture in SW Kelantan 18 km wide. W border is injection complex with Titiwangsa granitoids, E border consists of bedded chert. Seven imbricated tectonic units, each comprising schist, phyllite, olistostrome, mudstone and chert form suture zone. A single serpentinite body between two of tectonic units. Units stacked at moderate - vertical dips, with SW vergence. E border zone has younger, postdocking chaotic assemblage with common large Permian crystalline limestone clasts, probably also olistostrome. Interpreted as accretionary prism composed of suture rocks that originated in E-M Paleozoic marine or oceanic region that closed by E Triassic through NE-ward subduction of sliver of Gondwana plate in W with Cathaysian plate in E)

(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6405.pdf)
(Fission Track ages of extensional metamorphic core complexes in gneiss belt of NW Thailand (W of Chiang Mai) show mainly E Miocene (21-16 Ma) exhumation/ uplift/ cooling ages of Doi Inthanon complex, suggesting response to indentation of SE Asia by India. Zircon dates of ~200-212 Ma from gneiss regarded as igneous protolith ages))

Barr, S.M., A.S. Macdonald, P. Ounchanum & M.A. Hamilton (2006)- Age, tectonic setting and regional implications of the Chiang Khong volcanic suite, northern Thailand. J. Geol. Soc. London 163, p. 1037-1046.
(NE part of Tak-Chiang Khong volcanic belt in Sukhothai terrane of N Thailand mainly subaerial andesitic-rhyolitic tuffs, with Triassic U-Pb zircon age of 233 Ma (Carnian). Suite correlated with ~240 Ma Lampang volcanics to SW in Tak-Chiang Khong belt, and Lincang-Jinghong belt in Yunnan (W Simao block). Correlations support placement of Paleo-Tethys suture to W of Sukhothai terrane (see also Srichan et al 2009))

Barr, S.M., A.S. Macdonald & W. Yaowanoiyothin (1985)- Occurrence of blueschist in the Nan River mafic-ultramafic belt, northern Thailand. Warta Geologi (Newsl. Geol. Soc. Malaysia) 11, 2, p. 47-50.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1985002.pdf)
(Doi Phuk Sung area, Nan Province, N Thailand with crossite schists (blueschists), associated with metagabbro, hornblendite, pyroxenite, garnet amphibolite, and serpentinite in sequence of SSW-dipping sheet-like units, which may have been repeated by thrusting)

Barr, S.M., C. Tantisukrit, W. Yaowanoiyothin & A.S. Macdonald (1990)- Petrology and tectonic implications of Upper Palaeozoic volcanic rocks of the Chiang Mai belt, northern Thailand. J. Southeast Asian Earth Sci. 4, p. 37-47.
(Chiang Mai volcanics in N-C Thailand small areas of basaltic volcanic rocks in Permo-Carboniferous sediment sequences. No apparent relationship to plate margin (subduction) environment)

Bassoulet, J.P. (1988)- Preliminary note on some Jurassic microfossils (foraminifers, algae) from Thailand. In: H. Fontaine & V.Suteethorn (eds.) Late Paleozoic and Mesozoic fossils of West Thailand and their environments, Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 142-151.
(Marine Jurassic rel. widespread in N, W and NW Thailand M Jurassic Kanchanaburi Lst platform facies already described by Kemper (1976), with new species of foraminifera Lucasella and Haurania. Other species present include Gutnicella kaempferi, G. parva, Mesoendothyra, Timidonella sarda and dasyclad alga Holosporella siamensis Von Pia)

Bassoulet, J.P. (1994)- *Bosniella fontainei* nov. sp. (Foraminifere, Biokovinidae) du Jurassique moyen de Thailande. Geobios 27, 4, p. 403-411.
('Bosniella fontainei nov. sp. (Foraminifera, Biokovinidae) from the Middle Jurassic of Thailand'. New small benthic foram species from M Jurassic carbonate platform facies in Kanchanaburi Province near Myanmar border in NW Thailand. Associated with bivalve Parvamussium donaiense and foram Timidonella sarda (age probably Late Toarcian- Aalenian; Fontaine et al. 2009))

Bastin, H., E. Braun, A. Hess, K.E. Koch, V. Stein, D. Stoppel & R. Wolfart (1970)- Silurian and Early Devonian biostratigraphy in northwestern Thailand. Newsletters Stratigraphy 1, 2, p. 25-32.

(Silurian and E Devonian graptolites from Paleotethys suture zone melange between Shan-Tai (=Sibumasu) and Indochina terranes)

Baum, F. & K.E. Koch (1968)- Ein Beitrag zur stratigraphischen Neuordnung des Palaozoikums in Sud-Thailand. Geol. Jahrbuch 86, p. 879-884.
('A contribution to the stratigraphic revision of the Paleozoic of Thailand'. Incl. occurrences of E Devonian graptolites Monograptus spp.)

Baum, F., E. von Braun, A. Hess, K.E. Koch, G. Kruse, H. Quarch & M. Siebenhuner (1970)- On the geology of northern Thailand. Beihefte Geol. Jahrbuch, Heft 102, p. 1-23.
(Review of 1966-1968 work on Geologic Map of N Thailand by German Geological Mission. Summary of Precambrian- ?Jurassic stratigraphy. Precambrian gneiss overlain by ~500m Cambrian quartzites, ~100m Ordovician limestone, 500m Silurian- Devonian shale, sand and limestones. Lower Carboniferousin flysch facies, U Carboniferous intermediate volcanic and igneous rocks, Permian clastics and several 100m thick reefal limestones, etc.)

Beauvais, L. (1988)- Jurassic corals and coral-bearing limestones of Thailand and Burma. Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 152-203.
(Lower, Middle and Upper Jurassic limestones present in Thailand, but no true coral reef limestones; mainly of microbial origin. Corals from 4 levels, incl. Montlivaltia numismalis. Jurassic microfacies of Thailand and Sumatra similar but not identical. Incl. rare calcisponge Cladocoropsis miriabilis and algae Salpingoporella pygmaea at Pa La Tha, S of Umphang, Tak Province, W Thailand (Sibumasu Block))

Beauvais, L. (1988)- Revision of the corals from the Kamawkala Limestone (Burmo-Thai frontier) described in 1930 by J.W. Gregory. In: H. Fontaine & V.Suteethorn (eds.) Late Paleozoic and Mesozoic fossils of West Thailand and their environments, Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 204-210.
(Fossils from Kamawkala Lst in Thai- Myanmar border area previously interpreted as probable Triassic, but corals here re-identified as Thalamocoenia, Stereocoenia, Stylosmilia, etc. are M-L Jurassic taxa)

Beauvais, L. & H. Fontaine (1993)- *Montlivaltia numismalis* (DôOrbigny): a Middle Jurassic coral newly found in west Thailand. In: T. Thanasuthipitak (ed.) Proc. Int. Symp. Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 1, p. 63-70.
(Scleractinian coral species Montlivaltia numismalis in black shale S of Mae Sot, W Thailand. Well known from Bathonian (M Jurassic) of Europe (also known from Timor, Seram. Bangka, etc. and usually assigned Late Triassic age?))

Beckinsale, R.D., S. Suensilpong, S. Nakapadungrat & J.N. Walsh (1979)- Geochronology and geochemistry of granite magmatism in Thailand in relation to a plate tectonic model. J. Geol. Soc., London, 136, p. 529-537.
(Rb-Sr ages of granites in Thailand suggest phases at ~240 Ma (Lower Triassic), ~210 Ma (U Triassic), ~130 Ma (Lower Cretaceous) and ~90 Ma (U Cretaceous). K-Ar ages for mica separates commonly grossly discordant (up to 150 Ma younger than corresponding Rb-Sr whole rock age). Grouped into I-types or S-types, related respectively to subduction of oceanic lithosphere and continent-continent or continent-magmatic arc collisions. Major tin deposits of Thailand associated with Triassic and M Cretaceous S-type granites)

Benammi, M., Y. Chaimanee, J.J. Jaeger, V. Suteethorn & S. Ducrocq (1999)- Paleontology and magnetostratigraphy of the Eocene Krabi basin (Southern Thailand). In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA ô98), Kuala Lumpur 1998, Bull. Geol. Soc. Malaysia 43, p. 545-553.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1999055.pdf)
(Eocene Krabi basin in Peninsular Thailand with 6 reptile genera and 31 mammal species. Nearly all vertebrates from lignite levels, indicating tropical climate. Mammal fauna can be related to Late Eocene and/or E Oligocene forms from Europe, N Africa and Asia. Proposed age for mammal fauna Late Eocene (~37-34 Ma). Paleomagnetic work suggests probable correlation for Krabi section with chron C13r (33.5-34.7 Ma))

Benammi, M., Y. Chaimanee, J.J. Jaeger, V. Suteethorn & S. Ducrocq (2001)- Eocene Krabi basin (southern Thailand): paleontology and magnetostratigraphy. Geol. Soc. America (GSA) Bull. 113, 2, p. 265-273.
(Krabi section from Krabi basin ~105 m of siltstones, sandstones, claystones, lignites, and limestones. Mammalian biostratigraphy indicates Late Eocene age, but correlation of magnetostratigraphy to Geomagnetic Polarity Time Scale suggests age of section between 31-34 Ma (E Oligocene))

Benammi, M., Y. Chaimanee, J. Urrutia-Fucugauchi & J.J. Jaeger (2004)- Magnetostratigraphic study of the continental sedimentary sequence of Chiang Muan Basin, northern Thailand: implication for the age of the first Miocene hominoids from Thailand. Int. Geology Review 46, p. 646-654,

Benammi, M., J. Urrutia-Fucugauchi, L.M. Alva-Valdivia, Y. Chaimanee, S. Triamwichanon & J.J. Jaeger (2002)- Magnetostratigraphy of the middle Miocene continental sedimentary sequences of the Mae Moh Basin in northern Thailand: evidence for counterclockwise block rotation. Earth Planetary Sci. Letters 204, p. 373-383.
(Magnetostratigraphic study in Mae Moh basin, N Thailand, documents CCW vertical axis rotation of ~13° with respect to expected Miocene direction derived from Eurasian polar wander curve. Not consistent with previously reported paleomagnetic data and may be due to local tectonics. Polarity sequence of nine magnetozones correlated to chron C5ABn–C5An2n, between 13.5 and 12.1 Ma)

Bhongsuwan, T. & P. Ponathong (2002)- Magnetic characterization of the Thung-Yai Redbed of Nakhon Si Thammarat Province, Southern Thailand, and magnetic relationship with the Khorat Redbed. Science Asia 28, p. 277-290.
(online at: http://scienceasia.org/2002.28.n3/v28_277_290.pdf)
(Paleomag analysis of U Jurassic - Lower Cretaceous Thung-Yai redbeds. Paleopole position is at Plat/Plon = 57.8°N/184.6°E, which overlaps well with pole position derived from Khorat redbeds, indicating that S Thailand (Shan-Thai/ Sibumasu block) and Khorat Plateau (Indochina block) have not moved relative to each other since U Jurassic- Lower Cretaceous)

Blum, J.D., D.A. Papanastassiou, C. Koeberl & G.J.Wasserburg (1992)- Nd and Sr isotopic study of Australasian tektites: new constraints on the provenance and age of the target materials. Geochimica Cosmochimica Acta 56, 1, p. 483-492.
(Nd and Sr isotopic studies of Australites tektites suggest source material derived mainly from Proterozoic crustal terrane. Sr analyses of Muong Nong-type layered indochinite tektites from NE Thailand yield isochron age of ~170 Ma, possibly time of deposition of sedimentary target rocks. Compositional layering in Muong Nong-type tektites may reflect compositional variability of Jurassic sediments. Impact site may be in area of Jurassic sedimentary bedrock, near N Cambodia, S Laos or SE Thailand)

Boonchai, N., P.J. Grote & P. Jintasakul (2009)- Paleontological parks and museums and prominent fossil sites in Thailand and their importance in the conservation of fossils. In: J.H. Lipps & B.R.C. Granier (eds.) Paleoparks and the protection and conservation of fossil sites worldwide, Carnets de Geologie, Book 2009/03, Chapter 7, p. 75-95.

(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2007/12701.pdf)
(Review of Australasia Comet Impact event at ~0.8 Ma, which caused mass extinction, forest fires, floods, >12m thick 'catastroloess', etc., from SE Asia to Australia. Named 'Buntharik Event')

Bunopas, S., J.T. Wasson, P. Vella, H. Fontaine, S. Hada, C. Burrett, T. Suphajanya & S. Khositanont (1999)- Catastrophic loess, mass mortality and forest fires suggest that a Pleistocene cometary impact in Thailand caused the Australasian tektite field. J. Geol. Soc. Thailand, 1999, 1, p. 1-17.
(online at: http://library.dmr.go.th/Document/J-Index/1999/138.pdf)
(Common fires, local extinction of trees and mammals and presence of thick catastrophic loess all tied to Australasian tektite impact event at ~0.77 Ma. Sandpits at Udon in NE Thailand, possibly 300-500km from possible impact site, with piles of burnt and petrified logs and trees pushed down abruptly. Associated with mammal fossils and buildup of >12m thick 'catastroloess' (airfall sands/ debris))

Bunopas, S., J.T. Wasson, P. Vella, H. Fontaine, S. Hada, C. Burrett, T. Suphajanya & S. Khositanont (1999)- Early Quaternary global terrestrial impact of a whole comet in the Australasian tektite field, newest apparent evidences discovery from Thailand and East Asia. In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geology, Mineral Energy Resources SE Asia (GEOSEA ô98), Kuala Lumpur 1998, Bull. Geol. Soc. Malaysia 43, p. 533-575.
(online at: www.gsm.org.my/products/702001-100784-PDF.pdf)
(Additional evidence of ~0.77 Ma catastrophic comet impact event in Thailand and E Asia, linked to Pleistoceen Australasian tektite field, and here named Buntharik Event. Multiple impact craters in 800 x 1140 km wide impact center from Hainan, Vietnam, NE Thailand to Cambodia)

Bunopas, S., J.T. Wasson, P. Vella, H. Fontaine, S. Hada, C. Burrett, T. Suphajanya & S. Khositanont (1999)- Ancient analogs of burial alive extinction of the mastodons in catastroloess in Thailand, and of the last dinosaurs (in eggs) in Gobi desert: further on tektites. In: Symposium Mineral, energy and water resources of Thailand: towards the year 2000, Bangkok, p. 168-177.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1999/6614.pdf)
(Quaternary sudden mass extinction of mastodons, stegodons and other mammals and reptiles, buried alive under catastroloess in sandpits of Khorat, NE Thailand. Associated with common burnt and abruptly felled trees and tied to Buntharik Impact Event, which generated widespread tektites. Caused E Quaternary extinction across >1/4 of globe. Probably multiple impact craters in NE Thailand- E Cambodia-SE Laos- Hainan)

Bunopas, S., N. Yaemniyoun & S. Khositanont (1999)- Catastroloess and its derivatives, the life time sustainable contruction was originally high atmospheric settling in the Quaternary cometary impact in Thailand

and Asia. In: Proc. Symposium Mineral, energy and water resources of Thailand: towards the year 2000, Bangkok 1999, p. 142-151.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1999/6611.pdf)
(Widespread yellow fine construction sands across NE Thailand are derivatives of Pleistocene catastrophic loess that originally formed 10-50m thick blanket across Thailand (not windblown sands). With microtektites, formed at ~0.770 Ma, and tied to comet impact. Covers tektite horizons, burnt petrified trees, burnt trees, ancient elephants, etc., and also E Quaternary tin placers)

Bunpitaksakul, T., K. Jankae & S.Pisutha-Arnond (2009)- Geological study of oil sand from Lower Mae Sot Formation, Fang Basin, Changwat Chiang Mai. Bull. Earth Sci. Thailand (BEST), 2, p. 90-92.
(Brief paper on geochemical and petrological characteristics of oil sand in (Miocene?) Mae Sot Fm in Fang Song intermontane basin, N Chiang Mai province. Oils sourced from lacustrine and floodplain environments)

Buravas, S.C. (1952)- Preliminary notes on the geology of Thailand. Thai Science Bull. 7, p. 7-43

Buravas, S.C. (1957)- Age of the Mae Soon Oil Field of Fang Basin, Chiang Mai Province. In: Proc. Conference on the Geology of Thailand, 2, p. 61-65.
(Tertiary oil-bearing deposits of Fang Basin with freshwater molluscs Viviparus and Unio, and plant remains. Preliminary spores-pollen identifications suggest Oligocene age

Burrett, C.F., S.P. Carey & T. Wongwanich (1986)- A Siluro-Devonian carbonate sequence in northern Thailand. J. Southeast Asian Earth Sci. 1, 4, p. 215-220.
(220m thick Silurian-M Devonian calcarenites-calcisiltites at Mae Ping, S of Chiang Mai, NW Thailand. Overlie tentaculitid shale. Most common and abundant fossils orthoconic nautiloids similar to Parakionoceras, also known from S Europe and Australia. Conodont fauna near base with Ozarkodina excavata, indicating Lower Silurian-M Devonian age)

Burrett, C., H. Thassanapak & M. Udchachon (2015)- Upper Devonian (Famennian) conodonts from radiolarian cherts, Loei Terrane, Loei Province, Northeast Thailand. Research and Knowledge 1, 2, p. 26-32.
(online at: https://rk.msu.ac.th/wp-content/uploads/2016/02/rkv2-03-indd-5.compressed.pdf)
(Conodonts from radiolarian cherts in Loei Terrane, NE Thailand (W margin Indochina block), include Palmatolepis triangularis, P. minuta ssp and polygnathids, indicating Famennian crepida Zone age. Cherts ~20 My younger than Givetian reef limestones and unlikely deposited in major ocean, but rather in deep marine basin close to volcanic arc)

Burrett, C.; M. Udchachon, H. Thassanapak & A. Chitnarin (2015)- Conodonts, radiolarians and ostracodes in the Permian E-Lert Formation, Loei Fold Belt, Indochina Terrane, Thailand. Geol. Magazine 152, 1, p. 106-142.
(Conodonts rare in Permian carbonates of Indochina block, but abundant conodonts and ostracodes in carbonate turbidites of E-M Permian E-Lert Fm, deposited on margins of interplatform Nam Duk Basin, W side of Khorat Plateau. Conodonts typically Tethyan, incl. Hindeodus, Mesogondolella, Sweetognathus, etc., and indicating late Kungurian-Roadian age. Overlying siliceous shales and chert with radiolaria of latest Kungurian- earliest Roadian age. Ostracodes 23 species)

Burri, P. (1989)- Hydrocarbon potential of Tertiary intermontane basins of Thailand. In: T. Thanasuthipitak & P. Ounchanum (eds.) Int. Symposium on Intermontane basins: geology and resources, Chiang Mai, p. 3-12.

Caridroit, M., D. Bohlke, A. Lamchuan, D. Helmcke & P. de Wever (1993)- A mixed radiolarian fauna (Permian/Triassic) from clastics of the Mae Sariang area, northwestern Thailand. In T. Thanasuthipitak (ed.) Proc. Int. Symposium on Biostratigraphy of Mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai, 2, p. 401-413.
(online at: www.mnhn.fr/mnhn/geo/PDW/Caridroit%20et%20al%201993.pdf)
(Sequence of red conglomerates/ sandstones/shales unconformably over highly deformed U Paleozoic beds W of Amphoe Mae Sariang not of M Triassic age but latest Triassic or younger. Pebbles include metamorphic quartz and reworked chert clasts with M-L Permian and M Triassic radiolarian assemblages)

Caridroit, M., H. Fontaine, V. Suteethorn & D. Vachard (1990)- New paleontological data on the Carboniferous and Permian of NW Thailand. In: Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP, Spec. Vol., p. 337-351.
(Microfaunas from 40 new localities of Visean- Late Permian limestones in NW Thailand)

Caridroit, M., D. Vachard & H. Fontaine (1992)- Datations par radiolaires (Carbonifere, Permien et Trias) en Thailande nord-occidentale. Mise en evidence de nappes de charriage et d'olistostromes. Comptes Rendus Academie Sciences, Paris, ser. II, 315, 4, p. 515-520.
('Radiolarian age datings (Carboniferous, Permian and, Triassic) in NW Thailand; evidence of nappes and olisthostromes'. Paleozoic stratigraphy in NW Thailand described as single Ordovician- Permian marine succession, tectonized in Triassic time, but ages from radiolarite dating (Carboniferous- Triassic) demonstrate existence of separate sedimentary basin far from detrital sources and of Carboniferous- Triassic limestones. Present structural imbrication of radiolarites with limestones and detritic series interpreted in terms of tectonic nappes with considerable shortening, and olistostrome deposits)

Carter, A. & C.S. Bristow (2003)- Linking hinterland evolution and continental basin sedimentation by using detrital zircon thermochronology: a study of the Khorat Plateau Basin, eastern Thailand. Basin Research 15, p. 271-285.
(Khorat Plateau Basin, E Thailand, U-Pb and fission-track (FT) zircon data from Phu Kradung Fm age peaks at 141 ± 17 and 210 ±24 Ma (FT) and 2456, 2001, 251 and 168 Ma (U-Pb). FT data record post-metamorphic cooling, U-Pb data record zircon growth events. U-Pb zircon ages consistent with Qinling Orogenic Belt as source for Khorat Basin sediments. Zircon FT cooling peaks between 114 ±6 (Phra Wihan Fm) and 141 ±17 Ma (Phu Kradung Fm), corresponding to Late Jurassic-E Cretaceous reactivation event, which affected Qinling Belt. Early Cretaceous erosion from collision between Lhasa Block and Eurasia)

Carter, A., C.S. Bristow & A. Hurford (1995)- Constraints on the thermal history and provenance of the Khorat Group in Thailand using Fission Track Analysis. In: Proc. IGCP Symposium on Geology of SE Asia, Hanoi 1995, J. Geology B, 1995, 5/6, p. 342-353.
(Khorat Gp on Khorat Plateau up to 4000m thick redbed sequence of Cretaceous age. Zircon fission track data show two age peaks: major Late Triassic (~195 Ma), lesser ~109, 135, 158 Ma age peaks. Increase in zircon ages through Khorat Gp suggests progressive unroofing in foreland basin)

Cavin, L., E. Buffetaut, K. Lauprasert, J. Le Loeuff, P. Lutat, M. Philippe, U. Richter & H. Tong (2004)- A new fish locality from the continental Late Jurassic- Early Cretaceous of north-eastern Thailand. Revue Paleobiologie, Spec. Vol. 9, p. 161-167.
(Phu Nam Jun in Khorat Plateau of NE Thailand with 124 specimens of fish, all but two Lepidotes buddhabutrensis)

Cavin, L., U. Deesri & V. Suteethorn (2008)- The Jurassic and Cretaceous bony fish record (Actinopterygii, Dipnoi) from Thailand. In: L. Cavin et al. (eds.) Fishes and the break-up of Pangaea, Geol. Soc., London, Spec. Publ. 295, p. 125-139.

(16 species of bony fish in Jurassic and Cretaceous continental deposits of Thailand. e assemblages provide few paleogeographical indications at present, except for evidence of relationships with China and C Asia)*

Cavin, L., U. Deesri & V. Suteethorn (2013)- Osteology and relationships of *Thaiichthys* nov. gen.: A Ginglymodi from the Late Jurassic - Early Cretaceous of Thailand. Palaeontology 56, 1, p. 183-208
(Well-preserved freshwater fish Thaiichthys buddhabutrensis, n. gen., from Late Jurassic- E Cretaceous of Thailand)

Cavin, L., U. Deesri & V. Suteethorn (2014)- Ginglymodian fishes (Actinopterygii, Holostei) from Thailand: an overview. J. Science Technol. Mahasarakham University (MSU) 33, 4, p. 349-356.
(online at: http://research.msu.ac.th/msu_journal/upload/journal_file/jfile_no34_44342.pdf)
(Ginglymodian fishes are relatively common in Mesozoic of Thailand. Two genera and three species identified so far (Thaiichthys buddhabutrensis, Isanichthys palustris), but many more taxa present. Known Isanichthys species restricted to N margin of Tethys in M Jurassic- basal Cretaceous time)

Cavin, L. & V. Suteethorn (2006)- A new semionotiform (Actinopterygii, Neopterygii) from Upper Jurassic-Lower Cretaceous deposits of north-east Thailand with comments on the relationships of semionotiforms. Palaeontology 49, 2, p. 339-353.
(online at: http://onlinelibrary.wiley.com/doi/10.1111/j.1475-4983.2006.00539.x/epdf)
(New semionotiform freshwater fish, Isanichthys palustris, from Late Jurassic- E Cretaceous Phu Kradung Fm, NE Thailand)

Cavin, L., V. Suteethorn, E. Buffetaut, S. Chitsin, K. Lauprasert, J. Le Loeuff, P. Lutat, M. Philippe, U. Richter & H. Tong (2004)- A new fish locality from the continental Late Jurassicï Early Cretaceous of northeastern Thailand. Revue Paleobiologie 9, p. 160-167.

Cavin, L., V. Suteethorn, E. Buffetaut & H. Tong (2007)- A new Thai Mesozoic lungfish (Sarcopterygii, Dipnoi) with an insight into post-Palaeozoic dipnoan evolution. Zool. J. Linnean Society 149, 2, p. 141-177.
(online at: https://watermark.silverchair.com/j.1096-3....)
(New species of freshwater dipnoi/ lungfish (Ferganoceratodus martini) from Late Jurassic or basal Cretaceous upper Phu Kradung Fm of Phu Nam Jun, Kalasin Province, NE Thailand (Khorat Gp). Comprises almost complete skull roof, jaws and some postcranial remains)

Cavin, L., V. Suteethorn, S. Khansubha, E. Buffetaut & H. Tong (2003)- A new Semionotid (Actinopterygii, Neopterygii) from the Late Jurassic- Early Cretaceous of Thailand. Comptes Rendus Palevol, p. 291-297.
(New semionotid fish, Lepidotes buddhabutrensis n. sp., from continental Late Jurassic- E Cretaceous Phu Kradung Formation, Phu Nam Jun, Khorat Plateau, NE Thailand)

Cavosie, A.J., N.E. Timms, T.M. Erickson & C. Koeberl (2018)- New clues from Earth's most elusive impact crater: evidence of reidite in Australasian tektites from Thailand. Geology 46, 3, p. 203-206.
(Former presence of reidite (high-P polymorph of zircon) detected in zircon grains in Muong Nong-type tektites from Thailand. Preserved microstructures and dissociation of zircon to ZrO2 and SiO2 require pressure of >30 GPa and T >1673°C, the most extreme conditions reported for Australasian tektites so far)

Chakrabarti A.K. (1976)- The oil shale deposits of Thailand. Economic Geology 71, 4, p. 812-813.
(Brief discussion of Late Tertiary oil-shale deposits in several areas of Thailand. Most important deposit at Mae Sod in NW Thailand (20-25% oil by weight); others are Li (Lamphum Province), Ko Kha District (Lampang) and Krabi (S Peninsular region). Thickness up to 20'. With fish fossils of family Cyprinidae)

Chantong, W. & J. Booth (2007)- Is the Kuchinarai Group of the Khorat Plateau a good source of hydrocarbons? In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIõ07), Bangkok, Dept. Mineral Resources, p. 132 *(Abstract only)*
(Late Triassic Kuchinarai Gp synrift clastics and volcanoclastics in half-grabens/ grabens that formed after Indosinian Orogeny I (age based on palynology from exploration wells). Most rift basins bounded by NW-SE

and W-E faults to S. Graben fill three main sequences: (1) upper claystone- shale, (2) middle dark lacustrine shale with minor siltstone- sandstone, (3) lower basal conglomerates and volcanoclastics. Petroleum wells shows shales ofM Kuchinarai Gp have 1.0-3.7% TOC and are potentially good oil-gas source)

Chantong, W., P. Srisuwon, C. Kaewkor, C. Praipipan & S. Ponsri (2013)- Distributions of the Permo-Carboniferous rocks in the Khorat Plateau Basin. In: Proc. 2nd Lao-Thai Technical Conference on geology and mineral resources, Vientiane, p. 73-80.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2013/36770.pdf)
(Permian carbonate major petroleum reservoir in Khorat Plateau. 47 wells drilled, two producing gas fields (Nam Phong and Sin Phu Horm) from reservoirs in Permo-Carboniferous carbonate platform, with thrust fault resulting in fracture development. Dong Mun Gas field in development, in carbonate reef with karst topography. 18 separate isolated carbonate platforms identified from seismic)

Chaodumrong, P. (1992)- Stratigraphy, sedimentology and tectonic implications of the Lampang Group, central North Thailand. Ph.D. Thesis, University of Tasmania, p. 1-230.
(online at: http://eprints.utas.edu.au/18810/1/whole_ChaodumrongPol1992_thesis.pdf)
(Triassic Lampang Gp in Sukhothai foldbelt deposited on E side of Shan Thai terrane (= Sibumasu) in Lampang and Phrae forearc basins, above W-ward subduction of Indochina under Shan-Thai terrane. Collision in Late Triassic. Both sub-basins with similar deepening-upward megasequence, starting with fan-delta red beds, grading upward to ramp carbonates (with common oolites and oncolites) and submarine fan sediments with Halobia, etc.. Volcaniclastics dominate most Lampang sandstones. Source areas changed from active magmatic arc in Hong Hoi and Pha Daeng Fms to combination magmatic arc and recycled orogen in Wang Chin Fm as result of interaction between ShanThai and W-ward subducting Indochina terrane)

Chaodumrong, P. (1994)- Sedimentology and tectonic implication of Triassic submarine fans, Lampang group, central north Thailand. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok, 1994, Dept Mineral Resources and IGCP 306, p. 208-225.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1994/6948.pdf)
(Triassic Lampang Gp in central N Thailand deposited in two adjacent subbasins in fore-arc basin of Shan-Thai (= Sibumasu) terrane). Mainly mud-rich submarine fans, with Daonella, Halobia, etc. Provenance change from active magmatic arc in Hong Hoi Fm to combined active arc- recycled orogen during Wang Chin Fm, probably due to interaction of Shan-Thai Plate and W-ward subducting Indochina terranes, with collision ending in Late Triassic)

Chaodumrong, P. (2007)- Stratigraphy and tectonic evolution of Thailand. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIö07), Bangkok, Dept. Mineral Resources, p. 319-321. *(Extended Abstract*
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2007/12740.pdf)
(Thailand consists of two major Gondwana derived, Shan-Thai to W and Indochina to E, amalgamated along Nan-Uttaradit suture in Late Triassic. Indochina terrane drifted away from Gondwana in Late Devonian, as suggested by radiolarian assemblages from chert in suture zone. Shan-Thai terrane was adjacent to NW Australian part of Gondwana until E Permian, based on stratigraphic and faunal affinities from Cambrian- E Permian. Discovery of Devonian- M Triassic deep sea thin-bedded chert and Cathaysian fauna in Carboniferous-Permian limestones in N Thailand, formerly mapped as part of Shan-Thai terrane)

Chaodumrong, P. (2012)- Stratigraphy and tectonic subdivisions of Thailand. Proc. 12th Regional Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA 2012), Bangkok, p. 111-114. *(Extended Abstract)*
(Three tectonostratigraphic Gondwana-derived terranes in Thailand, from E to W: (1) Indochina (with Loei-Phetchabun fold belt on W margin), (2) North Thailand (Sukhothai fold belt + Inthanon zone; with Cathaysian Late Carboniferous- Permian seamount limestones)) and (3) Shan-Thai (=Sibumasu))

(online at: http://library.dmr.go.th/Document/J-Index/2005-2006/2848.pdf)
(Rare Earth minerals in Thaialnad mainly monazite, and also xenotime and microlite. Primary REE deposits associated with tin granitoids of S-type affinity and mainly in Cretaceous- Tertiary Western Granitoid Belt. Alluvial placersnear weathered granites may yield variable amounts of REE ores, mainly near granitoid terraces of western Gulf of Thailand, possibly also along Andaman Sea)

Charusiri, P., T. Rewbumroong , K. Rittidate & N. Srinak (2014)- Tectonic evolution of Cenozoic basins in Thailand with special emphasis on Mae Moh Basin, northern Thailand. In: Development of the Asian Tethyan Realm, Proc. 3rd Int. Symposium Int. Geosciences Program (IGCP) Project 589, Tehran 2014, p. 68-70. *(Abstract)*
(N-S trending Cenozoic basins of Thailand inferred to have developed in Late Eocene- E Oligocene as result of extrusion tectonics of SE Asian block, along major NE-SW trending fault zones. Most basins regarded as pull-apart basins. Deposition started with localized lacustrine and alluvial deposition in Oligocene, followed by fluvial and marginal marine deposits. Four main tectonic episodes: (1) pull-apart and transtensional rifting (55-30 Ma), marked at end by M Tertiary unconformity; (2) quiescent thermal subsidence event (30-15 Ma) involving widespread transpression and extensive delta progradation; (3) transpression wrenching event (15-7 Ma) due to on-going dextral shear along major NW-trending fault zones, with subsequent basin inversion and folding; end marked by late M Miocene unconformity; (4) post-rifting (7 Ma- Recent))

Charusiri, P., C. Sutthirat, C. Plathong & W. Pongsapich (2004)- Geology and petrochemistry of basaltic Rocks at Khao Kradong, Burirum, NE Thailand: implications for rock wool potentials and tectonic setting. J. Scientific Res. Chulalongkorn University 29, 2, p. 81-103.
(Khao Kradong in Burirum national park in NE Thailand is small basaltic volcanic cone in Cenozoic basaltic terrain of ~30 km2. Age from whole-rock Ar/Ar dating 1 Ma. Rocks transitional from hawaiite to alkali olivine basalt. Part of Cenozoic basalts of continental-rift origin of Laos-Cambodia- Vietnam)

Charusiri, P., C. Sutthirat & V. Daorerk (2009)- Introduction to Rare-Earth metal resources in Thailand. 6th Int. Conf. Materials Engineering for Resources (ICMR) 2009, Akita, Keynote Session, A1-3, p. 73-78.
(online at: www.eatgru.sc.chula.ac.th/Thai/research/pdf/paper/93.pdf)
(Monazite and xenotime significant rare earth minerals occurring with tin-tungsten deposits in granites and pegmatites and in Quaternary fluvial and beach deposits. Ilmenite- series granites more rare earth minerals than magnetite - series granites. Weathering crust of granites-pegmatites of important economic significance. In S Thailand highest RE metal contents 0.092%. Important secondary provinces in Songkhla and Yala of S Thailand with up to 0.045% monazite and 0.196% xenotime)

Chavasseau, O., Y. Chaimanee, C. Yamee, P. Tian, M. Rugbumrung, B. Marandat & J.J. Jaeger (2009)- New Proboscideans (Mammalia) from the Middle Miocene of Thailand. Zool. J. Linnean Soc. 155, 3, p. 703-721.
(online at: https://academic.oup.com/zoolinnean/article/155/3/703/2627128)
(M Miocene proboscidean fauna of NW Thailand E of Chiang Mai five taxa (4 elephantoids, 1 deinothere), dominated by Stegolophodon and Gomphotherium. Thai proboscidean asssemblage mainly endemic, although Gomphotherium cf. browni denotes faunal affinities with Pakistan)

Chen, Y. & V. Courtillot (1989)- Widespread Cenozoic(?) remagnetisation in Thailand and its implications for the India-Asia collision. Earth Planetary Sci. Letters 93, 1, 113-122.
(Paleomagnetic study of Devonian- Jurassic sites of Khorat plateau and reappraisal of published data from Triassic-Cretaceous show most of Indochina block suffered complete remagnetization after Triassic and possibly after Cretaceous, most likely during India- Eurasia collision. Paleodirections associated with remagnetization consistent with Thailand as part of Eurasia that suffered some 20° of CW rotation)

Cheneval, J., L. Ginsburg & C. Mourer-Chauvire (1984)- Discovery of an avifauna from the Miocene of Northern Thailand. Comptes Rendus Academie Sciences Paris 299, Serie II, 19, p. 1369-1372.

(Three deformation phases in Khorat Plateau, NE Thailand, from Landsat interpretation. Oldest N-S trending, tied to Late Cretaceous Shan Tai- Indochina collision; younger events NW-SE trending folds tied to E Tertiary India collision)

Chutakositkanon, V., P. Charusiri & K. Sashida (2000)- Lithostratigraphy of Permian marine sequences, Khao Pun area, Central Thailand: paleoenvironments and tectonic history. The Island Arc 9, p. 173-187.
(Thick marine Permian section in Saraburi Province, C Thailand (W side of Indochina Block), Permian transgressive-regressive trend from E Permian limestone dominated shelf to M Permian pelagic-abyssal environment. Late Permian again shallow marine facies)

Chutakositkanon, V. & K. Hisada (2008)- Tectono-stratigraphy of the Sa Kaeo-Chanthaburi accretionary complex, Eastern Thailand: reconstruction of tectonic evolution of oceanic plate- Indochina collision. In: Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok, p. 330-338.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/101.pdf)
(Sa Kaeo suture in E Thailand formerly proposed to be collision zone between Sibumasu and Indochina blocks. Redefined as Sa Kaeo-Chanthaburi Accretionary Complex: melange with Late Paleozoic blocks, characterized by oceanic plate materials of basalts and overlying chert with seamount-type limestone, subducted/accreted to W edge of Indochina in latest Permian, covered by turbidite deposits in M Triassic)

Chutakositkanon, V., K. Hisada, P. Charusiri & S. Arai (1999)- Detrital chromian spinels from the Nam Duk Formation: a key to elucidate the tectonic evolution of central mainland Southeast Asia and the Loei suture zone in Thailand. In: Proc. Int. Symposium Shallow Tethys 5, Chiang Mai, p. 450-456.

Chutakositkanon, V., K. Hisada, P. Charusiri, S. Arai. & T. Charoentitirat (1999)- Characteristics of detrital chromian spinels from the Nam Duk Formation: implications for the occurrence of mysterious ultramafic and volcanic rocks in central Thailand. In: Proc. Symposium Mineral energy and water resources of Thailand: towards the year 2000, Bangkok, p. 604-606.

Chutakositkanon, V., K.I. Hisada, P. Charusiri & S. Arai (2001)- Tectonic significance of detrital chromian spinels in the Permian Nam Duk Formation, central Thailand. Geosciences J. 5, p. 89-96.
(Detrital chromian spinels in turbiditic sandstones of Permian Nam Duk Fm suggest mafic- ultramafic volcanics and peridotites of arc origin were exposed in region in Permian. Loei-Phetchabun-Ko Chang volcanic belt, possible candidate for source of detrital Cr-spinels. Associated limestone beds with Pseudodoliolina pseudolepida and Verbeekina verbeeki suggest late M Permian age for Nam Duk Fm)

Circosta, G. (2011)- Gold (and copper) exploration and mining potential of the Loei- Phetchabun Volcanic belt. In: Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2011), Khon Kaen, p. 1-2. *(Abstract only)*
(online at: http://home.kku.ac.th/geoindo2011/A1-1-116.pdf)
(Loei-Phetchabun Volcanic Belt is N-S trending Permo-Triassic magmatic-volcanic arc which trends from Laos through C Thailand and into W Cambodia and hosts several world-class Au and Cu-Au deposits)

Claude, J., W. Naksri, N. Boonchai, E. Buffetaut, J. Duangkrayom, C. Laojumpon, P. Jintasakul, K. Lauprasert et al. (2011)- Neogene reptiles of northeastern Thailand and their paleogeographical significance. Annales Paleontologie 9, p. 113-131.
(M Miocene- Pleistocene turtles and crocodiles from Nakhon Ratchasima Province, NE Thailand. Incl. Pleistocene Gavialis aff. bengawanicus, giant land tortoises (Megalochelys), etc. Most from shallow temporary sandpits, with little or no stratigraphic context)

Claude, J., V. Suteethorn & H. Tong (2007)- Turtles from the late Eocene- early Oligocene of the Krabi Basin (Thailand). Bull. Soc. Geologique France 178, 4, p. 305-316.
(Two new species of geoemydid turtles from three lignite pits in latest Eocene- earliest Oligocene of Krabi Basin in SW Peninsular Thailand; early representatives of testudinoid turtles from SE Asia. Eocene turtle assemblage from Krabi different Eocene Pondaung Fm of Myanmar, dominated by highly aquatic taxa, while Krabi fauna mostly composed of smaller aquatic or more semi-terrestrial species)

Cobbing, E.J. (2011)- Granitic rocks. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 441-457.

Cobbing, J. (2004)- The gneissic granites of northern Thailand. In: V. Daorerk & M. Kimata (eds.) Int. Symposium on the geologic evolution of East and Southeast Asia: microcontinental accretion and formation of marginal sea, Chulalongkorn University, p. 28-31.

Cocks, L.R.M. & R.A. Fortey (1997)- A new *Hirnantia* fauna from Thailand and the biogeography of the latest Ordovician of South-East Asia. Geobios 30, Suppl. 1, p. 117-126.
(New occurrence of widespread latest Ashgillian Hirnantia brachiopod shelly fauna from Satun Province, S Thailand. Fauna similar to N Shan States, Myanmar and to S China, indicating that Sibumasu (Shan-Thai) palaeocontinent, on which Thailand and N Shan States were situated, in Ordovician and Silurian closer to S China than previously supposed. Incl. descriptions of trilobite Mucronaspis, brachiopods Hirnantia, etc.)

Coenraads, R.R., P. Vicht & F.L. Sutherland (1995)- An unusual sapphire-zircon-magnetite xenolith from the Chanthaburi Gem Province, Thailand. Mineralogical Magazine 59, p. 465-479.
(Sapphire, zircon and magnetite-bearing xenolith from Khao Wua, near Chanthaburi dated as ~2 Ma. This is within range of fission track ages for alluvial zircons (~2.57 Ma) from Chanthaburi-Trat gem fields and K/Ar ages of 0.44-3.0 Ma for alkali basaltic volcanism in Chanthaburi Province, with which Thailand's gemstones appear to be associated)

Cooper, M.A., R. Herbert & G.S. Hill (1989)- The structural evolution of Triassic intermontane basins in Northeastern Thailand. In: T. Thanasuthipitak & P. Ounchanum (eds.) Proc. Int. Symp. on Intermontane basins: geology and resources, Chiang Mai 1989, p. 231-242.
(Description of Khorat Plateau, NE Thailand, Late Triassic half-grabens filled with fluvial sediments. Basin and range type extension explained as collapse of thickened continental crust, 20 My after E Triassic 'Indosinian' collision of Shan Tai and Indochina plates. Overlain by sag-phase Jurassic- Cretaceous continental sediments of Khorat Gp. Basin system inverted during Late Cretaceous- E Tertiary compression caused by Kohistan Arc collision (=W Burma plate?). (Triassic grabens mainly on Indochina Block?; JTvG))

Coster, P., M. Benammi, Y. Chaimanee, C. Yamee O. Chavasseau, E.G. Emonet & J.J. Jaeger (2010)- A complete magnetic-polarity stratigraphy of the Miocene continental deposits of Mae Moh Basin, northern Thailand, and a reassessment of the age of hominoid-bearing localities in northern Thailand. Geol. Soc. America (GSA) Bull. 122, 7-8, p. 1180-1191.
(N Thailand has >40 Tertiary intermontane basins. Some contain hominoid fossils and rich Neogene mammal faunas. Magnetic-polarity stratigraphy used for age calibration in Mae Moh Basin, Lampang Province. 15 polarity zones recognized between 14-12 Ma. Correlation with nearby Chiang Muan basin suggest age of beds with large-bodied hominoid Khoratpithecus chiangmuanensis is between 12.4- 12.2 Ma)

Cronier, C & R.A. Fortey (2006)- Morphology and ontogeny of an Early Devonian phacopid trilobite with reduced sight from Southern Thailand. J. Paleontology 80, 3, p. 529-536.
(Development of reduced-eyed phacopid species Plagiolaria poothaii Kobayashi and Hamada 1968, from E Devonian of Pa Samed Fm, Satun Province (Sibumasu terrane). Associated with dacryoconarid tentaculites. Plagiolaria part of specialized group of phacopids inhabiting muddy, dark, deep water environment)

Crow, M.J. (2011)- Radiometric ages of Thailand rocks. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 593-614.

(On deformation and pressure solution in anticlinal structures of folded Permian limestones in Saraburi area. Tests of staffellid and schwagerinid (Nankinella) fusulinid foraminifera more susceptible to stress and solution than neoschwagerinid (Neoschwagerina simplex) types))

Dawson, O. (1993)- Fusiline foraminiferal biostratigraphy and carbonate facies of the Permian Ratburi Limestone, Saraburi, central Thailand. J. Micropalaeontology 12, 1, p. 9-33.
(online at: https://www.j-micropalaeontol.net/12/9/1993/jm-12-9-1993.pdf)
(Permian carbonates N of Saraburi, at S end of Phetchabun foldbelt in C Thailand. N-S trending carbonate platform with diverse E Permian (Sakmarian)- early Late Permian (Midian) fusulinid-algal assemblages. Archaeolithoporella and Tubiphytes form reef frameworks, similar to M Permian reefs of Austria and W Texas. Fusulinids of Arctic-Tethyan affinities in E Permian, of Tethyan affinity in M Permian. Tethyan verbeekinids dominate in late M Permian, together with cosmopolitan species of Parufusulina and Schwagerina, and can be correlated with S Pamirs, Afghanistan, S China, Johore and W Sumatra. Associated dasycladacean floras assignable to E Circum-Pacific Realm. Eight fusuline assemblage zones)

Dawson, O., A. Baird & D. Bosence (1993)- No reef-rimmed margins to the Permian carbonate platforms of Thailand. In: B.K. Tan et al. (eds.) Proc. 7th Conf. Geology, Mineral and Energy Res. SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 181-186.
(C Thailand E Permian platform, margins formed mainly by grainstones, with only small Archaelithoporella-Tubiphytes- calcisponges boundstone biostromes. In Ratburi area of Peninsular Thailand, small M Permian Tubiphytes bioherms on platform interior ridges, not in shelf marginal position)

Dawson, O. & A. Racey (1993)- Fusuline- calcareous algal biofacies of the Permian Ratburi Limestone, Saraburi, Central Thailand. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 49-65.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1993/7589.pdf)
E-M Permian Ratburi Lst of C Thailand (= W margin of Indochina terrane) folded sequence of Sakmarian- E Midian supratidal to outer platform biofacies. Subdivided with abundant fusuline and calcareous algal biota. Ratburi Lst transgressive-regressive carbonate platform sequence. Fusulinid distribution depth-controlled, with 6 main assemblages. With fusulinid facies distribution model)

Dawson, O., A. Racey & J.E. Whittaker (1993)- The palaeoecological and palaeobiogeographical significance of *Shanita* (foraminifera) and associated foraminifera/ algae from the Permian of peninsular Thailand. In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 2, Chiang Mai University, p. 283-295.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1993/6791.pdf)
(late M Permian (Midian) pillared miliolid foram Shanita amosi known from Ratburi Lst of peninsular Thailand and from platform carbonates in Tunisia, Turkey, Iran, E Burma. Associated with poor fusulinid assemblages (unlike high-diversity fusulinids in E Thailand. Appears to be restricted to W Tethys and Shan-Tai Block (Key marker genus for latest M-early Late Permian) of Sibumasu/ Cimmerian terranes; JTvG))

Dawson, O., A. Racey & J.E. Whittaker (1994)- Permian foraminifera from northeast and peninsular Thailand. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok 1994, Dept. Mineral Resources and IGCP 306, p. 323-332.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1994/6958.pdf)
(Permian carbonates of Peninsular Thailand originally deposited on Shan-Tai (Sibumasu) terrane. With mod. diverse foraminifera and algal assemblages mainly of M Permian (late Murgabian-Midian) age, locally

ranging down into Sakmarian. Localities with Shanita amosi and common Hemigordius and Hemigordiopsis restricted to peninsular Thailand, where fusulinid assemblage of low diversity. NE Thailand (Indochina terrane) age-equivalent fusulinids are abundant and diverse Tethyan assemblages with Colania douvilei, Lepidolina, Neoschwagerina, Verbeekina verbeeki, etc.))

De Broin, F., R. Ingavat, P. Janvier & N. Sattayarak (1982)- Triassic turtle remains from northeastern Thailand. J. Vertebrate Paleontology 2, 1, p. 41-46.
(Fragments of dermal plates of undetermined aquatic chelonian in Huai Hin Lat Fm near Chulabhorn Dam, NE Thailand. In same formation also ostracodes, semionotid actinopterygians, lungfishes, capitosaurids, and phytosaurs, all suggestive of Late Triassic (possibly Norian) age. Turtle remains first from Triassic of Asia)

(Simao Basin (Yunnan, S China) and Lampang-Phrae Basin (N Thailand) similar Triassic stratigraphy and parts of same tectono-paleogeographic unit. Triassic Lampang Gp with thin-shelled bivalves in E Triassic (Claraia) and Late Triassic (Daonella indica, Halobia). Part of Sukhothai Terrane, E of main Changning–Menglian Paleotethys suture, and belongs to W margin of Cathaysian domain)

Feng, Q.L., D. Helmcke, C. Chonglakmani, R. Ingavat-Helmcke & B. Liu (2004)- Early Carboniferous radiolarians from North-West Thailand: palaeogeographical implications. Palaeontology 47, 2, p. 377-393.
(middle E Carboniferous radiolarians from bedded cherts S of Mae Hong Son, NW Thailand, in melange zone composed of Silurian to Triassic slices. Signify pelagic basin at W side of Shan-Tai Terrane, between Shan-Thai and Gondwana, suggesting Shan-Thai terrane already rifted from Gondwana in E Carboniferous, earlier than commonly assumed)

Feng, Q., K. Malila, N. Wonganan, C. Chonglakmani, D. Helmcke, R. Ingavat-Helmcke & M. Caridroit (2005)- Permian and Triassic radiolaria from Northwest Thailand: paleogeographical implications. Revue Micropaleontologie 84, p. 237-255.
(Late Permian, late Ladinian and M Carnian radiolarians (51 species) from Mae Hong Son- Mae Sariang area, W of Chiang Mai, NW Thailand, represent part of Paleotethyan pelagic basin with E Carboniferous-early Late Triassic chert sedimentation. Main oceanic basin was within 'Shan-Thai Block' (= Sibumasu; JTvG), which was not single block, but composed of two continental terranes affiliated with Gondwana (Tengchong- Phuket) and Cathaysian (Simao- Lampang) domains, respectively, separated Paleotethyan Ocean, represented by remnant oceanic basins Changning-Menglian in SW China, Chiang Dao and Mae Yuan in NW Thailand)

Feng, Q.L., W.Q. Yang, S.Y. Shen, C. Chonglakmani & K. Malila (2008)- The Permian seamount stratigraphic sequence in Chiang Mai, North Thailand and its tectogeographic significance. Science in China, Ser. D, Earth Sciences, 51, 12, p. 1768-1775.
(online at: http://engine.scichina.com/downloadPdf/9TokmWFpbobQDqBz9)
(Widespread Permian carbonate outcrops in NW Thailand formerly considered as evidence for Late Paleozoic shallow Tethys, but are underlain by basalt comparable to oceanic island basalt in Three Rivers area, SW China. Permian carbonates in study area deposited on seamounts comparable to Late Paleozoic Paleotethys ocean of Changning-Menglian Belt in SW China. Seamounts in Chiang Mai-Fang area demonstrate oceanic basin in Late Paleozoic (Paleo-Tethys) between Shan Block of Myanmar and Lampang (= Suthothai) Block of Thailand, shows that in Late Paleozoic Shan and Thai blocks were two different microplates)

Feng, Q.L., Z. Zhang & M. Ye (2001)- Middle Triassic radiolarian fauna from Southwest Yunnan, China. Micropaleontology 47, 3, p. 173-204.
(Diverse Anisian radiolarian fauna in siliceous rocks with tuffs and mudstones in Paleo-Tethyan Changning-Menglian belt of SW Yunnan. 73 radiolarian species, 6 new (mainly Triassocampe spp.). Four zones: Triassocampe deweveri (late Anisian), T. coronata coronata (M Anisian), T. coronata inflata (M Anisian) and T. dumitricai (E Anisian). E Triassic radiolarian fauna in area low diversity, mainly Permian survivors)

Fenton, C.H., P. Charusiri, C. Hinthong, A. Lumjuan & B. Mangkonkarn (1997)- Late Quaternary faulting in northern Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution in Southeast Asia and the South Pacific, Bangkok, 1, p. 436-452.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1997/7646.pdf)
(N Thailand is intraplate Basin and Range province, with N-S trending grabens and half-grabens, developed in E-W oriented extensional stress regime initiated in Oligocene, with main phase of extension in Late Miocene- E Pliocene. Result of India- Eurasia collision and subsequent E-ward extrusion and rotation of S China and SE Asia along large strike-slip fault systems. Still some Quaternary activity on basin-bounding faults)

Ferrari, O.M. (2007)- Contribution to the geology of Thailand and implications for the geodynamic evolution of Southeast Asia. Doctoral Thesis, University of Lausanne, Lausanne, p. 1-179. *(Unpublished)*
(Study of Nan-Uttaradit suture and Chiang Mai Volcanic Belt. Proposes new location for Palaeotethys suture and new plate tectonic model of SE Asia, implying existence of new Orang Laut terranes (E Vietnam, W Sumatra, Kalimantan, Palawan, Taiwan) and redefined Shan-Thai terrane. Shan-Thai previously viewed as Cimmerian (when Nan-Uttaradit suture thought to be Paleotethys suture), but detached from Indochina with E Permian opening of Nan basin, which closed in M Triassic)

Ferrari, O.M., R. Martini, D. Vachard & G.M. Stampfli (2006)- Permian limestone blocks inside the Nan-Uttaradit Suture Zone (Northern Thailand): faunal affinities and palaeogeographic implications. EGU Geophysical Res. Abstracts, 8, 03423, 2p. *(Abstract only)*
(Nan ophiolite belt in E part of N Thailand separates Shan-Thai block from Indochina, and commonly interpreted as Paleotethys suture between Cimmerian domain and Indochina or closure of smaller basin at N Margin of Palaeotethys. Shan Thai may not be Cimmerian, but Indochina-derived. Oldest rocks in Nan belt Carboniferous-Permian Pha Som Metamorphic Complex, melange of blocks including three kinds of limestone blocks: M Permian grey limestone overlying ophiolite, U Permian bluish limestone as blocks inside schists and siliceous limestone as part of matrix. Closure of basin in two phases: (1) E-M Permian obduction induced greenschists metamorphism at 269 ± 12 Ma; (2) subduction between deposition of U Permian radiolarites and deposition of overlying Carnian-Norian molasse. True Paleotethys suture in region of Mae Hong Son)

Flint, S., D.J. Stewart, T. Hyde, C.A. Gevers, O.R.F. Dubrule & E.D. van Riessen (1988)- Aspects of reservoir geology and production behaviour of Sirikit Oil Field, Thailand: an integrated study using well and 3-D seismic data. American Assoc. Petrol. Geol. (AAPG) Bull. 72, p. 1254-1268.
(Onshore Thailand Sirikit oil field in intracratonic Phitsanulok half-graben basin that was subsequently deformed by sinistral strike-slip movement. 8 km thick Tertiary basin-fill includes fluvial-deltaic Lan Krabu Fm, which contains two main oil reservoirs (K, L sands). Formation intertongues with Chum Saeng Fm lacustrine claystones that form stratigraphic seals to both reservoirs)

Flint, S., D.J. Stewart & E.D. Van Riessen (1989)- Reservoir geology of the Sirikit oilfield, Thailand: lacustrine deltaic sedimentation in a Tertiary intermontane basin. In: M.K.G. Whateley & K.T. Pickering (eds.) Deltas: sites and traps for fossil fuels, Geol. Soc., London, Spec. Publ. 41, p. 223-235.
(Sirikit oilfield, ~400 km N of Bangkok, is fault-bounded structure in major half-graben basin. 8 km thick basin-fill succession includes alluvial fan-fluvial deposits overlain by fluvio-deltaic Lan Krabu Fm, which contains two main oil reservoirs)

Fontaine, H. (1988)- Permian corals of West Thailand. In: H. Fontaine & V.Suteethorn (eds.) Late Paleozoic and Mesozoic fossils of West Thailand and their environments, Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 112-127.

(Corals from W Thailand (Sibumasu Terrane) not abundant and mainly simple forms. Include Tabulata (mainly Sinopora, also Pseudofavosites, Michelinia), solitary rugosa (Lophophyllidium, Amplexocarinia, Pavastehphyllum) and rare compound rugosa (Paraipciphyllum, Waagenophyllum?))

Fontaine, H. (1990)- Some Devonian corals and stromatoporoids from Northeast Thailand. Geol. Jahrbuch B73, p. 57-79.
(NE Thailand (Loei Province) E-M Devonian limestones two facies belts: (1) E belt of thin limestone lenses with brachiopods and massive tabulate corals (Favosites, Heliotes, Michelinia) in marls, and (2) W belt with thicker limestones with rugose and tabulate corals (Phillipsastraea, Endophyllum, Heliolites porosus, Favosites, Cladopora, etc.) and stromatoporoids (Chlathrodictyon, Actinostroma, Amphipora). Most limestones probably Givetian age (Heliolites extict at end M Devonian))

Fontaine, H. (1990)- Carboniferous corals from Northeast Thailand (northeast of Loei). Geol. Jahrbuch B73, p. 81-89.
(NE of Loei in NE Thailand small outcrops of M Carboniferous(Visean- Bashkirian) limestones in two facies belts. Rel. poor coral assemblages of mainly solitary Rugosa, incl. Multithecopora, Chaetetes)

Fontaine, H. (1990)- Preliminary note on the Carboniferous corals of Thailand. In: H. Fontaine (ed.) Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP Techn. Publ. 20, p. 281-284.
(Many Carboniferous localities in NE Thailand, some with corals of Eurasian affinity, incl. Koninckophyllum)

Fontaine, H. (1999)- Diverse Permian coral faunas are widely distributed in Thailand. Permophiles 33, p. 36-38.
(online at: http://permian.stratigraphy.org/files/20121027151807120.pdf)
(Summary of Permian coral distribution in Thailand, known from >100 localities, from Lower to Upper Permian. Two distinct provinces (1) E and C Thailand, with high diversity assemblages similar to Cambodia, Laos, Vietnam and S China, and (2) Peninsular Thailand, extending into NW Malay Peninsula with low diversity corals, absence of corals in Lower Permian and no Ipciphyllum, Pseudohuangia, etc.). U Permian declining coral faunas)

Fontaine, H., Y. Almeras, L. Beauvais, J.P. Bassoulet, E. Cariou et al. (1989)- Jurassic of West Thailand. Proc. 24th Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok 1987, 2, p. 137-146.
(Marine Jurassic known only from W Thailand (E Thailand continental with only minor marine ingressions). No marine Cretaceous in Thailand or E Burma. Red beds at Triassic-Jurassic boundary above Triassic Halobia shale, overlain by Toarcian- Aalenian with ammonites. Bathonian- Callovian not found. M Jurassic and Oxfordian coral limestones and mudstones present)

Fontaine, H. & S. Bunopas (1990)- The Carboniferous and the Permian in Thailand: a complex palaeogeography. In: 4th Int. Symposium on Pre-Jurassic East Asia, IGCP Project 224, 1, Osaka, p. 65-76.

Fontaine, H., C. Chonglakmani, S. Piyasin, B.A. Ibrahim & H.P. Khoo (1993)- Triassic limestones within and around the Gulf of Thailand. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 83-95.
(Presence of Early- Late Triassic limestones at Peninsular Thailand and NW Peninsular Malaysia, generally associated with Permian 'Ratburi Lst' and previously all included in Permian. Similar to 'Chuping Lst' and 'Kodiang Lst' of NW Peninsular Malaysia. Post Triassic fracturing and karstification. Many contain Aulatortus, Tubiphytes, Thaumatoporella parvovesiculifera)

Fontaine, H. & S. Gafoer (1989)- The Carboniferous of Thailand: its fossils and sediments. In: Proc. 24th Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok 1987, 2, p. 125-129.
(Thailand Carboniferous 3 provinces: (1) Peninsular Thailand and Kanchanaburi: rare fossils and glacial? pebbly mudstones in upper part, (2) N and NW Thailand: more fossiliferous but poorly studied, and (3) E Thailand: fossiliferous limestones with fusulinids, corals, etc., throughout Carboniferous)

Fontaine, H., T.T. Hoang, S. Juanngam, S. Kavinate, S. Salyapongse, V. Suteethorn & D. Vachard (2009)- Paleontology and stratigraphy of the Northwest Thailand: paleogeographical implications. Department of Mineral Resources, Bangkok, p. 1-207.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/2009/22977.pdf0
(Major review of Lower Carboniferous- M Permian in Pang Mapha-Ban District near Myanmar border, NW Thailand (= within Inthanon Paleotethys suture zone?; area located W of 'Paleotethys' Chiang Dao cherts; JTvG). Rel. complete Carboniferous section, including limestones with corals. Widespread E-M Permian limestones, incl. rare Asselian with fusulinids (rel. high diversity and warm climate faunas, incl. presence of Neoschwagerina and Verbeekina and absence of Shanita, different from Peninsular Thailand, suggesting this is not typical Sibumasa fauna, despite being just W possible Paleotethys radiolarian cherts of 'Chiang Dao/ Fang'. Is in Inthanon zone with Paleotethyan seamounts/ microcontinents? (Ueno et al. 2008); JTvG)

Fontaine, H., T.T. Hoang, S. Salyapongse, V. Suteethorn & D. Vachard (2007)- Permian limestones of Surat Thani Province, Peninsular Thailand. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIõ07), Bangkok, Dept. Mineral Resources, p. 221-228.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2007/12726.pdf)
(Limestone widespread in Surat Thani Province of NE Peninsular Thailand, forming spectacular karst topography (= Ratburi Lst of Shan-Tai/ Sibumasu terrane; JTvG). Fossils rel. rare due to dolomitization/ recrystallization. Youngest well-dated Permian limestones of Surat Thani Province of Midian (M Permian) age. Some localities rich in Hemigordiopsis renzi, with smaller foraminifers (Sphairionia sikuoides, Geinitzina, Endothyra, Pachyphloia, Globivalvulina, Agathammina), rare Fusulinidae and solitary corals. Other samples rich in low-diversity Fusulinidae (Parafusulina spp., Yangchienia, Chusenella) with few, low diversity corals (mainly solitary Rugosa, rare massive). Peninsular Thailand oldest Permian limestone upper Lower Permian)

Fontaine, H., T.T. Hoang, S. Kavinate, V. Suteethorn & D. Vachard (2013)- Upper Permian (Late Changhsingian) marine strata in Nan Province, Northern Thailand. J. Asian Earth Sci. 76, p. 115-119.
(U Permian of NE Thailand (Loei Province) with land plants, and in Laos (Luang Prabang) with continental vertebrates (Dicynodon). M Permian represented only by marine sediments. W of these areas (Nan province) U Permian represented by marine sediments, with continental beds absent. Presence of marine U Permian with Colaniella and Palaeofusulina in N Thailand, locally extending to top U Permian and possibly Triassic)

Fontaine, H., T.T. Hoang, S. Kavinate, V. Suteethorn & D. Vachard (2013)- North Thailand 1-Very fossiliferous limestone belonging to the end of the Permian (Upper Changhsingian) in Wiang Sa Area; 2-Another Upper Permian limestone in Phrae Area. J. Science Technol. Mahasarakham University (MSU) 31, 1, p. 51-62.
(online at: http://journal.msu.ac.th/2012_/index.php/SCI/article/view/285/293)
(Occurrence of Upper Permian limestone in outcrop in N Thailand, W of Wiang Sa (close to localities mentioned by Hahn and Siebenhuner 1982, Sakagami and Hatta 1982), with abundant Colaniella and some Palaeofusulina (= characteristic of latest Permian of Indochina terrane?; JTvG))

Fontaine, H., T.T. Hoang, S. Kavinate, V. Suteethorn & D. Vachard (2013)- Wide extension of Carboniferous Limestone in Northwest Thailand with an interesting stratigraphy. J. Geol. Soc. Thailand, Spec. Issue, p. 1-65.
(online at: www.gst.or.th/sites/default/files/GST-Limestone-E-book.pdf)
(Carboniferous limestones in NW Thailand, N of Chiang Dao, near Myanmar border, more widespread than previously thought (usually assigned to Permian). Descriptions of localities and diverse assemblages of smaller foraminifera, algae (incl. Permocalculus, Tubiphytes), fusulinids (Schellwienia, Fusulinella, Pseudostaffella, Palaeofusulina, Profusulinella, etc.) and corals (mainly solitary Rugosa). Very different from Carboniferous of Peninsular Thailand)

Fontaine, H., Ibrahim B. Amnan & W. Tansathien (2002)- An overview of the Devonian of Malaysia and a comparison with the Devonian of Thailand. J. Geol. Soc. Thailand 1, p. 21-33.
(online at: http://library.dmr.go.th/library/J-Index/2002/135.pdf)

(In Malaysia Devonian known only from Peninsular region, in 3 facies: (1) clastic facies widely distributed in W, extending into Peninsular and W Thailand; (2) limestone facies restricted to small area of Perak, but more widespread and more fossiliferous in NE Thailand; (3) radiolarian chert facies at few localities of Peninsular Malaysia and Thailand)

Fontaine, H. & N. Jungyusuk (1995)- Permian corals from Chom Bung area West of Bangkok: their paleogeographic significance. CCOP Newsletter 20, 3-4, p. 70-79.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2538/6639.pdf)
(Corals from Permian Ratburi Limestone at Chom Bung, N Peninsular Thailand, 115 km WSW of Bangkok (= Sibumasu Terrane). Probably late M Permian (Murgabian-Midian). Common massive rugose corals (Iranophyllum, Paraipciphyllum spp., etc.), associated with low-diversity fusulinid assemblage. Also common Tubiphytes. Chombungia ratburina n.gen, n.sp. of massive rugose coral))

Fontaine, H. & N. Jungyusuk (1997)- Growth bands in Permian corals of Peninsular Thailand. In: Int. Conf. Stratigraphy and tectonics evolution of SE Asia and the South Pacific, p. 83-87.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7624.pdf)
(Massive rugose coral Paraipciphyllum from base of M Permian Ratburi/ Chuping Lst of Peninsular Thailand (= Sibumasu terrane, overlying pebbly mudstones) with growth bands, suggesting seasonal climate. Corals associated with M Permian foram assemblage with Sphairionia, Hemigordius, Pseudofusulina, Nankinella, Langella, etc. Absence of growth bands in mod. diverse M Permian coral assemblage from upper part of limestone (Sinopora, Paraipciphyllum, Chombungia, etc.) at Khao Lan suggests warming climate)

Fontaine, H., S. Kavinate, T.T. Hoang & D. Vachard (2012)- Permian limestone of Peninsular and Western Thailand in Khao Yoi, Cha-am and Thong Pha Phum areas. Natural History Bull. Siam. Soc. 58, p. 39-47.
(online at: www.siamese-heritage.org/nhbsspdf/vol051-060/NHBSS_058_1k_Fontaine_PermianLimestone.pdf)
(Paleontological study of limestones in N Peninsular Thailand (Khao Yoi, Cha-am, Petchaburi Province) and W Thailand. Khao Yoi localities rich in fusulines (Eopolydiexodina megasphaerica) indicating U Murgabian/ M Permian age. In Cha-am District M Permian corals (Paraipciphyllum, Sinopora asiatica) and fusulinids (Yangchienia iniqua). In Thong Pha Phum, Kanchanaburi Province, W Thailand, fossils similar to above, with Sinopora asiatica and Paraipciphyllum, also suggesting M Permian Shan-Thai fauna (=Sibumasu) Block)

Fontaine, H., S. Lovachalasupaporn & B. Sektheera (1990)- Distribution of corals and coral reefs in the Permian of Thailand. In: H. Fontaine (ed.) Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP Techn. Publ. 20, p. 271-280.
(Reprint of Fontaine et al. (1982) paper in CCOP Newsletter 9, 2. Thailand among richest countries in world in abundance of Permian corals. Coral-bearing Permian limestones common in Thailand, particularly Middle Permian of C Thailand, but not all represent reefs. Peninsular Thailand no reefs in E and Late Permian and only one possible locality in M Permian)

Fontaine, H., S. Lovachalasupaporn, N.D. Tien & D. Vachard (1990)- New data on the Lower Carboniferous in Thailand. In: H. Fontaine (ed.) Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP Techn. Publ. 20, p. 297-306.
(Reprint of Fontaine et al. 1983, CCOP Newsletter, 10, 1/2, p. 13-18)

Fontaine, H., B. Mistiaen, W. Tantiwanit & T. Tong-Dzuy (1990)- Devonian fossils from Northeast Thailand: some new data from Tabulata and Stromatoporoidea. In: H. Fontaine (ed.) Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP Techn. Publ. 20, p. 319-330.
(Devonian fossils from 5 areas in NE Thailand. Limestones commonly rich in tabulate and rugose corals (incl. Heliolites, Thamnopora, Phillipsastraea, Favosites, etc.) and Stromatoporoidea (Amphipora, Clathrodictyon))

Fontaine, H. & C. Poumot (1988)- The age of anthracite in Thailand. J. Southeast Asian Earth Sci.2, 1, p. 41-42.
(Anthracite from N of Na Duang, Loei Province, NE Thailand. Overlying shale with Lepidodendron-like plant fossils and palynomorphs Cirratriradites, Apiculatisporites and Cycadopites, suggesting Permian age. May be

equivalent of E Permian coals across Laos border, W of Vientiane, with Permian plants Asterophyllites longifolius and Sigillaria brardi)

Fontaine, H., C. Poumot & B. Songsirikul (1990)- Upper Palaeozoic formations of Northeast Thailand in Devonian and Lower Carboniferous. In: H. Fontaine (ed.) Ten years of CCOP research on the Pre-Tertiary of East Asia, CCOP Techn. Publ. 20, p. 289-296.
(Reprint of Fontaine et al. 1981 in CCOP Newsletter, 8, 4, p., 1-7. Presence of M Devonian- Lower Carboniferous shales, sandstones, limestones, along Mekong River in Loei Province, NE Thailand)

Fontaine, H. & S. Salyapongse (1997)- Unexpected discovery of Early Carboniferous (Late Visean-Serpukhovian) coarals in East Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 48-52.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1997/7620.pdf)
(First E Carboniferous coral fauna in limestones from E Thailand, with Tabulata (solitary Kueichouphyllum and compound Siphonodendron, Solenodendron), Rugosa and abundant Heterocorallia (Hexaphyllia). U Visean warm water fauna. Probably related to Indochina Block)

Fontaine, H. & S. Salyapongse (1997)- Biostratigraphy of East Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 73-82.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7623.pdf)
(Listing of 71 fossiliferous localities in E Thailand. Rel. complete Paleozoic section and possible Precambrian metamorphic rocks. Carboniferous rare. Permian mainly large bodies of limestone, a continuation of limestones in W Cambodia locally rich in fusulinids (Yabeina, Lepidolina). M-L Triassic coral limestones. Widespread Jurassic- Cretaceous continental sediments)

Fontaine, H. & S. Salyapongse (1999)- Oncolitic limestone is widespread in Klaeng area, East Thailand; distribution of this type of limestone in the Triassic of Southeast Asia. In: Proc. Int. Symp. Shallow Tethys 5, Chiang Mai, p. 282-286.
(On Triassic (Scythian - Anisian) limestones with abundant oncolites but few other fossils in E Thailand and SE Asia (overlie latest Permian limestones with Palaeofusulina, Colaniella, Dagmarita, in Klaeng zone = continuation of Sukhothai zone? (Ridd et al. 2011))

Fontaine, H. & S. Salyapongse (2001)- A Murgabian to Lower Triassic sequence exposed from Khao Tham Yai to Khao Pa Khi, Northeast Thailand: a preliminary report. J. Geol. Soc. Thailand 2001, 1, p. 43-47.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1993/7487.pdf)
(>700m thick late M Permian- early Late Permian limestones in Nam Nao district, NE Thailand, overlain by 300m of Late Permian (Lopingian) clastics (= Indochina Plate). Lower part (Murgabian- lower Midian) with fusulinids Colania douvillei, Sumatrina, Verbeekina verbeeki and coral Ipciphyllum. Upper part (U Midian) with fusulinids Lepidolina, Dunbarula, Sumatrina longissima, Kahlerina and common Mizzia algae)

Fontaine, H., S. Salyapongse, Nguyen D. Tien & D. Vachard (2002)- Permian fossils recently collected from limestones of Nan area, North Thailand. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 45-57.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6375.pdf)
(M Permian limestone around Nan, N Thailand, with rugose corals, smaller foraminifera and fusulinids (Pseudodoliolina pseudolepida, Nankinella?, Parawedekindellina?, Parafusulina gigantea, schwagerinids). Also Latest Permian with Colaniella and Paleofusulina? in area. Lower Permian (Asselian-Sakmarian) unknown in area. Of Cathaysian affinity, although Nan area is separated from Indochina block by Nan-Uttaradit suture.)

Fontaine, H., S. Salyapongse, Nguyen D. Tien & D. Vachard (2002)- The Permian of Khao Tham Yai area in Northeast Thailand. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 58-76.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6376.pdf)
(>700m thick, thick-bedded, 45° E-dipping M Permian limestone of Tham Yai hill cave in Nam Nao district, ~360km NNE of Bangkok. Typical Tethyan/ Indochina Block assemblages of fusulinids (incl. Lepidolina, Colania douvillei, Verbeekina verbeeki, Chusenella, Sumatrina, etc.) and mainly massive rugose corals (Ipciphyllum, Multimurinus) (Lower Midian Horizon 3 comparable to Guguk Bulat fauna of Sumatra?)(see also Fontaine & Salyapongse 2001))

Fontaine, H., S. Salyapongse & V. Suteethorn (2003)- Glimpses into fossil assemblages of Thailand: coral perspectives. Natural History Bull. Siam Soc. 51, 1, p. 37-67.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/2003/4927.pdf)
(Review paper of fossil corals of Thailand. Carboniferous, Permian and Triassic corals widespread; Devonian and Jurassic corals locally common; Ordovician and Silurian corals rare and poorly known. Includes Devonian limestone in NE Thailand area near Laos border (possibly Givetian- E Frasnian; affinities with Vietnam and S China) with rich coral faunas, incl. stromatoporoid Chlathrodictyon and tabulate coral Heliolites porosus (= same taxa as reported by Rutten 1940 from NE Kalimantan))

Fontaine, H., S. Salyapongse, V. Suteethorn, P. Tian & D. Vachard (2005)- Sedimentary rocks of the Loei Region, Northeast Thailand: stratigraphy, paleontology, sedimentology. Dept. Mineral Resources, Bangkok, p. 1-165.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/2005/409.pdf)
(Extensive review of Loei region in NE Thailand, near Laos border. Includes Silurian with Heliolites spp. corals. M Devonian limestone with corals Heliolites spp. (incl. H. porosus) and Favosites, common stromatoporoids, and with basalts. Late Devonian- E Carboniferous (Famennian- Tournasian) siliceous shales and chert with radiolaria. Includes overview of Carboniferous of all of Thailand (p. 33-89). Permian of Loei area in marine facies in E-M Permian, in Late Permian in continental facies with Gigantopteris plant fossils and vertebrates (Dicynodon) in nearby Laos. Permian limestones now called Sariburi Lst, with diverse fossil assemblages, incl. common Tubiphytes. E Permian clastics with Agathiceras ammonoid. M Permian limestones with Mizzia, Verbeekina, etc.)

Fontaine, H., S. Salyapongse, V. Suteethorn & D. Vachard (2000)- Widespread occurrence of Triassic limestones Northwest of Uthai Tani in West Thailand. Natural History Bull. Siam Soc. 48, 1, p. 7-19.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2543/6927.pdf)
(Two parallel N-S trending series of limestone hills associated with volcanic rocks in Nan region, NW of Uthai Thani near Laos border, NW Thailand, previously considered Silurian-Devonian and Permian in age, here assigned to Upper Triassic. Abundant coral. Foraminifera include locally common Aulatortus, suggesting likely Norian age)

Fontaine, H., S. Salyapongse, V. Tansuwan & D. Vachard (1997)- The Permian of East Thailand: biostratigraphy, corals, discussion about the division of the Permian system. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 109-127.

Fontaine, H., N. Sattayarak & V. Suteethorn (1994)- Permian corals of Thailand. CCOP Techn. Bull. 24, p. 1-108.
(Permian corals common and diverse assemblages in SE, Central and NE Thailand, with strong affinities to S China, Vietnam, Cambodia, E Malay Peninsula and Sumatra (Indochina- E Malaya terrane'; JTvG), but unknown in Australia. Peninsular Thailand (= Shan-Thai/ Sibumasu terrane) only rare corals belonging to Tabulata (Sinopora) and solitary Rugosa and with low diversity fusulinids (but absent in E Permian). Peak coral diversity in Thailand in late M Permian (Murghabian= Wordian to Midian= Capitanian), with locally abundant Ipciphyllum, after which coral species diversity dropped 90%. C Thailand coral fauna very similar to Guguk Bulat locality of C Sumatra (p. 38). W Papua Permian faunas, without compound corals, most similar to faunas from Peninsular Thailand (p. 39))

Fontaine, H. & V. Suteethorn (1988)- Late Paleozoic and Mesozoic fossils of West Thailand and their environments. Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 1-107.
(Descriptions of Devonian- Jurassic faunas of W Thailand (part of Shan-Thai/ Sibumasu Block). Incl. Toarcian-Aalenian limestones rich in forams, Toarcian limestones rich in Parvamussium donaiense, etc. Followed by 8 additional papers as Appendix 1-8)

Fontaine, H. & V. Suteethorn (1988)- Discovery of widespread Bashkirian limestone northeast of Loei. In: T. Silakul (ed.) Proc. Annual Techn. Mtg. Dept. Geological Sciences, Chiang Mai University, Special Publ. 8, p. 199-206.

Fontaine, H. & V. Suteethorn (1995)- Khao Tham Rusi Laat: Early Permian red limestone. CCOP Newsletter 20, 2, p. 13-18.
(Red limestone at Khao Tham Rusi Laat, W of Lam Narai- Phetchabun road, C Thailand with rel. diverse E Permian coral fauna, incl. solitary Rugosa (Pseudozaphrentoides, ?Caninophyllum), fasciculate Rugosa (Akagophyllum) and massive Rugosa (Chusenophyllum). Associated with few non- age diagnostic foraminifera)

Fontaine, H. & V. Suteethorn (2000)- Devonian and Lower Carboniferous corals found in Ban Na Klang Area, Loei Province, Northeast Thailand. J. Geol. Soc. Thailand 2000, 1, p. 27-33.
(online at: http://library.dmr.go.th/library/J-Index/2000/147.pdf)
(Devonian diverse stromatoporoids and corals and Lower Carboniferous corals in limestones previously mapped as Permian)

Fontaine, H. & V. Suteethorn (2000)- Moscovian to Gshelian coral assemblages in northeastern Thailand: field-relationship between Carboniferous and Permian strata. J. Geol. Soc. Thailand 2000, 1, p. 34-41.
(online at: http://library.dmr.go.th/library/J-Index/2000/148.pdf)
(New M-U Carboniferous (mainly Moscovian) coral limestone localities in Ban Na Duang area, Loei Province, NE Thailand. Overlain by Permian (Asselian) sandstones-limestones and M Permian fusulinid limestone)

Fontaine, H. & V. Suteethorn (2007)- Carboniferous corals of Pang Mapha District in northwest Thailand. Natural History Bull. Siam Society 55, 2, p. 199-221.

Fontaine, H., V. Suteethorn & Y. Jongkanjanasoontorn (1991)- Carboniferous corals of Thailand. CCOP Techn. Bull. 22, p. 1-73.
(Carboniferous corals abundant in C and NE Thailand. In SE and NW only rare solitary Rugosa. Absent or only rare tiny corals without dissipiments in Peninsular Thailand (=Sibumasu terrane; JTvG). Most diverse coral faunas in 'mid-Carboniferous' (Upper Visean- Lower Serpukhovian). Rugosa most common; Tabulata (Syringopora, Chaetetes) rel. rare))

Fontaine, H., V. Suteethorn & D. Vachard (1993)- Carboniferous and Permian limestones in Sop Pong area: unexpected lithology and fossils. In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 1, Chiang Mai University, p. 319-336.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1993/7487.pdf)
(On thick reefal E Carboniferous (Visean)- Late Permian Doi Chiang Dao Limestone in Inthanon Zone of NW Thailand, near Burma border. With diverse fusulinid foraminifera in Late Carboniferous (Triticites, Schubertella), E Permian (Sphaeroschwagerina, Rugofusulina), M Permian (Neoschwagerina, Verbeekina, Sumatrina, Afghanella, primitive Colaniella), more affinities to Indochina than Sibumasu. Also Hemigordius, Mizzia, Permocalculus, etc. Now considered to be Paleotethyan seamount carbonate)

Fontaine, H., V. Suteethorn & D. Vachard (1994)- The Carboniferous corals of Southeast Asia with new discoveries in Laos and Thailand. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok 1994, Dept. Mineral Resources and IGCP 306, p. 25-42.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1994/6937.pdf)
(Review of geographic and stratigraphic distribution of Carboniferous corals in SE Asia (generally rare). Sumatra only place in Indonesia with Carboniferous corals: Visean at Muara Gorge in C Sumatra, and Alas River in N Sumatra. W Sarawak lower Terbat Lst is of M-U Carboniferous age, very rare corals. No corals in Carboniferous of Peninsular Thailand or NW Peninsular Malaysia (Sibumasu))

Fontaine, H., V. Suteethorn & D. Vachard (1995)- The Carboniferous of northeast Thailand: a review with new data. J. Southeast Asian Earth Sci. 12, p. 1-17.

(All stages of Carboniferous represented in NE Thailand (Indochina Block), E of Loei. In parts of area overlain by Permian (mainly limestone). M-U Devonian limestone, shale and chert occur occasionally in C and N parts of area. U Tournaisian-Visean and U Carboniferous limestones rich in corals, algae, etc.. Carboniferous of N Thailand affinities with S China, Japan, W Europe, but differs from Peninsular Thailand/ NW Malaysia, where, as in NW Australia, limestone is rare and fusulinids and compound corals are absent)

Fontaine, H., V. Suteethorn & D. Vachard (1998)- Khao Yoi, a Permian limestone hill of the Ratburi area, Peninsular Thailand. CCOP Newslett. 23, 3, p. 12-14.
(Midian-age Ratburi Lst at Khao Yoi with Pseudoalgae (Tubiphytes), algae (Permocalculus), foraminifera (Dagmarita, Hemigordiopsis, Sphairionia, transitional form between Hemigordiopsis and Shanita), corals (Sinopora, fasciculate Waagenophyllidae) (= late M Permian 'Sibumasu Fauna'; JTvG))

Fontaine, H. & W. Tantiwanit (1987)- Discovery of widespread and very fossiliferous Devonian beds in Northeast Thailand. CCOP Newsletter 12, 3, p. 25-26. *(also in CCOP Techn. Publ. 20, p. 315-317)*
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/1987/9619.pdf)
(Brief paper on probably M Devonian (Givetian) outcrops of NE Thailand (= Indochina Plate). Composed of shales with brachiopods, chert and thin-bedded limestone with stromatoporoids and corals (Heliolites spp., Phillipsastraea, Favosites, etc.))

Fontaine, H. & W. Tansthein (1987)- The coral *Koninckophyllum* in the Early Carboniferous of Thailand. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 35-37.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6374.pdf)
(E Carboniferous rugose coral genus Koninckophyllum not common in Thailand. Second locality in C Thailand, in M Visean limestone 40 km SW of Phetchabun)

Fontaine, H. & D. Vachard (1981)- Decouvertes de microfaunes Scytho-anisiennes au sud-est de Bangkok: consequences paleogeographiques. Comptes Rendus somm. Soc. Geologique France 2, p. 63-66.
('Discoveries of Scythian-Anisian microfaunas in the SE of Bangkok: paleogeographic consequences')

Foopatthanakamol, A., B. Ratanasthien, H.I. Petersen, P. Wongpornchai & W. Utamo (2008)- Composition and petroleum potential of lake facies in the FA-MS-48-73 well, Mae Soon structure, Fang oilfield, northern Thailand. J. Petroleum Geol. 31, 3, p 317-326.
(Fang Basin Cenozoic rift structure in N Thailand. Fang oilfield includes Mae Soon anticline with well FAMS-48-73, with multiple oil-filled sandstone reservoirs. Organic petrography, etc., shows Type II and III kerogen, consisting mainly of telalginite (Botryococcus-type), lamalginite, etc., suggesting freshwater lacustrine environment. Vitrinite Reflectance values ~0.38- 0.66% Ro, thermally immature for petroleum generation)

Fortey, R.A. (1989)- An Early Devonian trilobite fauna from Thailand. Alcheringa 13, 4, p. 257-267.
(Well-preserved, small Devonian trilobite fauna from limestones in Satun Province, S Thailand (Shan-Tai/ Sibumasu Block). Early Devonian age, probably Emsian. Includes Decoroproetus, Cornuproetus, Platyscutellum and two species of Reedops)

Fortey, R.A. (1997)- Late Ordovician trilobites from southern Thailand. Palaeontology 40, 2, p. 397-449.
(online at: http://cdn.palass.org/publications/palaeontology/volume_40/pdf/vol40_part2_pp397-449.pdf)
(Rich, well-preserved trilobite fauna from U Ordovician (Caradoc)limestone in Satun Province, S Thailand (= Shan Thai/ Sibumasu terrane). Outer shelf assemblage of 39 species, dominated by Ovalocephalus, nileids and remopleuridids. Identical to faunas described from Pagoda Lst of S China, suggesting proximity in Late Ordovician. Two new speciesd: Sculptaspis pulcherrima and Ovalocephalus plewesae)

Fujikawa, M. & T. Ishibashi (1999)- Carboniferous and Permian ammonoids from North Thailand. Mem. Fac. Science, Kyushu University, D, 30, p. 91-110.
(Ammonoids from N Thailand in latest Permian of Lampang (Prototoceras, Paratirolites, Pseudogastrioceras, Pseudotirolites, Tapashanites floriformis, T. changxingensis, Xenodiscus) and Carboniferous from Loei and Sop Pong (Lower Pennsylvanian; Pseudoparalegoceras sp., Gastrioceras, Paralegoceras, Pronorites, etc.)

Fujikawa, M., T. Ishibashi & N. Nakornsri (1999)- Middle Carboniferous cephalopods from Loei area, northern Thailand. In: Ninth Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA '98), Kuala Lumpur, Bull. Geol. Soc. Malaysia 43, p. 467-475.
(online at: www.gsm.org.my/products/702001-100793-PDF.pdf)
(Abundant M Carboniferous cephalopods at 'Barite Mine', N Loei city, N Thailand. Five genera of ammonoids and 5 nautiloids: Branneroceras branneri, Diaboloceras involutum, Syngastrioceras, Neogastrioceras, Bisatoceras, Catastroboceras subsulcatifomae, Epidomatoceras doohylense, Gzheloceras, Temnocheilus and Epistroboceras, indicative of Namurian-Moscovian age. With brief overview of known Late Paleozoic ammonoid localities in Thailand)

Fujikawa, M., K. Ueno, A. Sardsud, W. Saengsrichan, Y. Kamata & K. Hisada (2005)- Early Permian ammonoids from the Kaeng Krachan Group of the Phatthalung-Hat Yai area, southern peninsular Thailand. J. Asian Earth Sci. 24, 6, p. 739-752
(Late E Permian (Kungurian/ Bolorian) small ammonoid fauna with Neocrimites, Agathiceras suessi, A. girtyi and Miklukhoceras from uppermost Kaeng Krachan Gp, ~15m below Ratburi Lst (with Monodiexidina in basal transition beds) on S Peninsular Thailand (= Sibumasu block) suggests these beds are of Kungurian/Bolorian age, slightly younger than previously considered. Environment of Sibumasu Block changed around this time from cool, clastic-dominant shelf to temperate- subtropical, carbonate platform. Ammonoid fauna much less diverse than probably coeval faunas of Timor)

Fukuchi, A., B. Ratanasthien, S. Tanaka, S. Nagaoka & S. Suzuki (2007)- Stratigraphy and sedimentary environment of late Middle‒early Late Miocene Chiang Muan Formation, Phayao Province, Thailand. Nature and Human Activities 11, p. 1-15.
(online at: www.hitohaku.jp/publication/r-bulletin/KiyouE_No11_1-1.pdf)
(Late M- early Late Miocene fluvial Chiang Muan Fm in Chiang Muan Basin of N Thailand ~300m thick and subdivided into five members, incl. two lignite members two mammalian fossil-bearing horizons)

Gabel, J. (1991)- Die marine Trias in Nordthailand: Sedimentation in expandierenden Halbgraben. Ph.D. Thesis, Universitat Gorringen, p. 1-99.
('The marine Trias in North Thailand: sedimentation in expanding half-grabens')

Gardiner, N.J., N.M.W. Roberts, C.K. Morley, M.P. Searle & M.J. Whitehouse (2016)- Did Oligocene crustal thickening precede basin development in northern Thailand? A geochronological reassessment of Doi Inthanon and Doi Suthep. Lithos 240-243, p. 69-83.
(Doi Inthanon and Doi Suthep metamorphic core complexes in N Thailand, exhumed through mobilization of low-angle detachment fault. Previous studies interpreted Late Triassic and Late Cretaceous metamorphic events, followed by ductile extension between Late Eocene- Late Oligocene (detachment at ~40 Ma, culminating in rapid unroofing in E Miocene. Zircon data from Doi Inthanon and Doi Suthep age ranges of 221-210 Ma, ~72 Ma, and 32-26 Ma. Monazite older ages. Data support view of Indosinian basement being reworked in Cretaceous, and indicate late Eocene- Oligocene tectonothermal event. Etc.)

Garson, M.S. & A.H.G. Mitchell (1970)- Transform faulting in the Thai Peninsula. Nature 228, 5266, p. 45-47.
(Angular feature in Phuket area of peninsular Thailand projecting into Andaman Sea is physiographic expression of two major transcurrent faults with total sinistral displacement of at least 200 km)

Garson, M.S., B. Young, A.H.G. Mitchell & B.A.R.Tait (1975)- The geology of the tin belt in Peninsular Thailand around Phuket, Phang Nga and Takua Pa. Inst. Geol. Science, Overseas Division, Mem. 1, Bangkok, p. 1-112.
(Ridd 2009: diamonds found while dredging for tin, presumed reworked into E Permian diamictite from kimberlite exposed on Gondwana)

Geard, A. (2008)- Geology of the Klaeng region (Southeast Thailand): lithology, structure and geochronology. B.Sc. Honours Thesis, University of Tasmania, Hobart, p. *(Unpublished)*

George, A.D., S. Lazar & J. Booth (2012)- Mounds and boundstone facies in the Late Carboniferous- Early Permian Pha Nok Khao Formation-equivalent of the Loei Syncline, Loei-Phetchabun foldbelt: implications for reservoir quality. Int. Petrol. Techn. Conf., Bangkok 2012, 4, IPTC 15256, p. 3026-3031. *(Extended Abstract)*
(Late Carboniferous- E-M Permian carbonate platforms major petroleum reservoirs in Khorat region of NE Thailand (Indochina Terrane). Carbonate platforms initiated on fault blocks formed during Late Carboniferous rifting. Outcrop analog study in N part of Loei-Phetchabun Foldbelt shows diverse platform-margin boundstones, incl. sandy shoal facies with Tubiphytes and phylloid algal mounds)

Getahun, B. & B. Ratanasthien (1993)- *Botryococcus* algae in oil source rocks, Fang Basin, northern Thailand. In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 2, p. 337-346.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1993/7488.pdf)
(Oligocene- E Miocene (pre-Florschuetzia) Mae Sot Fm in well IF 30 03S in intermontane Fang Basin, N Thailand, with basal lacustrine facies rich in Botryococcus algae and higher plant exinite. Botryococcus-rich layers occur between Nypa-rich palynological assemblages, suggesting brackish- deltaic influence)

Gibling, M. R. & B. Ratanasthien (1980)- Cenozoic basins of Thailand and their coal deposits: a preliminary report. Bull. Geol. Soc. Malaysia 13, p. 27-42.
(online: https://gsmpubl.files.wordpress.com/2014/09/bgsm1980009.pdf)
(Many N-S trending Cenozoic basins in Thailand, especially in N (43 named basins), in Chao Phraya basin and Gulf of Thailand. Tertiary in onshore basins generally <3000m thick, locally >4000m in Gulf of Thailand. Locally common coal (up to 35m thick seams) and lacustrine oil shales (up to 15m thick beds). Plant fossils suggest oldest rocks possibly Late Eocene in age)

Gibling, M.R., C. Tantisukrit, W. Uttamo, T. Thanasuthipitak & M. Haraluck (1985)- Oil shale sedimentology and geochemistry in Cenozoic Mae Sot Basin, Thailand. American Assoc. Petrol. Geol. (AAPG) Bull. 69, 5, p. 767-780.
(Intermontane Mae Sot basin, NW Thailand, with carbonate-rich oil shales. Laminated deposits with fish and plant fragments as main megafossils. Mappable oil shale sequences 10m thick, interstratified with marl-sandstone sequences 70m thick. Oil shales formed in perennial stratified lakes. Episodic deposition of oil shales reflects changes in lake level, probably due to climatic fluctuations on 24- 46kyr scale)

Gibling, M.R., Y. Ukakimaphan & S. Srisuk (1985)- Oil shale and coal in intermontane basins of Thailand. American Assoc. Petrol. Geol. (AAPG) Bull. 69, 5, p. 760-766.
(Mae Tip intermontane basin of NW Thailand contains Cenozoic oil shales in beds up to 1m thick, interbedded with coal and mudstone. Oil shales contain lamosite-type alginite. Beds laterally continuous for at least 1.5 km, but pass into mudstones toward basin margin. Oil shales originated when peat swamps were flooded by shallow lakes. Locally high geothermal gradients suggest potential for hydrocarbons)

Ginsburg, L. (1983)- The land vertebrates and plants of the Tertiary of Northern Thailand : stratigraphic and tectonic implication. In: Conf. Geology and Mineral Resources of Thailand, Bangkok, p. 198-201.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1983/10571.pdf)
(Tertiary lignites of N Thailand (Khon Khaen area) two groups: Li Gp and Mae Moh Gp. Both groups associated with mammal fossils and both appear to be of Late Miocene age)

Ginsburg, L. (1989)- The fossils mammals of Pong (Phayao) and the age of some intermontane basins of northern Thailand. In: T. Thanasuthipitak & P. Ounchanum (eds.) Proc. Int. Symposium Intermontane basins, Chiang Mai 1989, Chiang Mai University, p. 196-204.

(New otter species from M-L Miocene of Mae Moh lignite mine, N Thailand)

Ginsburg, L. & P. Mein (1987)- *Tarsius thailandica* nov. sp., first fossil Tarsiidae (Primate, Mammalia) of Asia. Comptes Rendus Academie Sciences, Paris, Serie 2, 304, 19, p. 1213-1215.

Ginsburg, L., P. Mein & P. Tassy (1991)- The Miocene of Li Basin, Changwat Lumphun, Thailand. In: Annual Techn. Meeting 1989 and IGCP-246, Chiang Mai University, p. 101-109.

Ginsburg, L. & P. Tassy (1985)- The fossil mammals and the age of the lignite beds in the intermontane basins of Northern Thailand: J. Geol. Soc. Thailand. 8, 1-2, p. 13-27.
(online at: http://library.dmr.go.th/Document/J-Index/1985/20.pdf)
(Lignite sequences in Tertiary intermontane basins of N Thailand traditionally divided in Eocene (Li Fm; based on study of poor flora by Endo (1963)) and Upper Miocene (Mae Moh Fm; based on mastodon molar identified as Stegolophodon by Von Koenigswald 1959. Also with fossil frogs, Siamogale (Thai otter)). New mammal discoveries suggest age in late part of M Miocene)

Ginsburg, L. & Y. Ukkakimaphan (1983)- A new cervid from the South Asia Miocene and the age of the intermontane basins of North Thailand. Comptes Rendus Academie Sciences, Paris 297, Ser. 2, p. 297-300.

Glenister, B.F., W.M. Furnish, Z. Zhou &M. Polahan (1990)- Ammonoid cephalopods from the Lower Permian of Thailand. J. Paleontology 64, 3, p. 479-780.
(Brief note on discovery of Lower Permian ammonoid fauna in 'Ratburi Lst' at Amphoe Muaglek, S-C Thailand,~150 km NE of Bangkok. Four species identified: Miklukhoceras cf. M. pamiricum, Agathiceras mediterraneum, Perrinites cf. P. hilli, Prostacheoceras cf. P. oshense. Advanced perrinitid suggestive of Late Artinskian (Baigendzhinian). Ecologically, Thai ammonoids close to assemblages of SW China and Pamir, and minimal similarities to faunas of S China or Boreal biogeographic assemblages of W Australia. No figures)

Glumglojit, S. & Akkhapun Wannakomol (2011)- Undiscovered hydrocarbon resources of Chonnabot Prospect, Northeast Thailand. Suranaree J. Science Technol. 18, 2, p. 89-97.
(online at: http://ird.sut.ac.th/e-journal/document/contents/Journal18(2)/vol.%2018%20no.2%20part%201.pdf)
(Assessment of undiscovered hydrocarbon resources in Permian carbonate prospect in NE Thailand. Probabilistic play analysis mean estimates 15 MMB Oil and 657 BCF of non-associated gas)

Gocht, W. & E. Pluhar (1982)- Types of Phuket pegmatites with special reference to Ta-rich ores. In: A.M. Evans (ed.) Mineralization associated with acid magmatism, Wiley, New York, p. 91-99.

Gocht, W. & C. Strobel (1982)- Classification of tin-bearing pegmatites in Phuket, Thailand. In: T. Thanasuthipak (ed.) Proc. Ann. Technical Meeting, Dept. Geol. Sci., Chiang Mai University, Spec. Publ. 4, p. 143-153.
(Kathu Valley on Phuket Island two types of tin-bearing pegmatites: Sn-Ta pegmatites (or albite-muscovite pegmatites) and Sn- Rare earth element (REE) pegmatities (or orthoclase-lepidolite pegmatites). Pegmatites intruded into Late Paleozoic (meta-) sediments of Phuket Group. Sn-Ta pegmatites in areas close to granite body; more complex Sn-REE pegmatites located further (2-4 km) from source granite)

Grant, R.E. (1976)- Permian brachiopods from southern Thailand. Palaeont. Soc. Memoir 9 (J. Paleontology 50, 3, Supplement), p. 1-269.
(Descriptions of 109 species/ 81 genera of silicified brachiopods from Permian 'Rat Buri Limestone' in 7 localities along S Peninsula of Thailand. Indicate late Artinskian (Baigendzinian) age and many similarities with Bitauni fauna of Timor. Paleogeographic setting of Thailand faunas interpreted to be near E end of Tethys Sea in fairly warm- shallow waters with access to cooler, Boreal regions (=Sibumasu Terrane; results questioned by Waterhouse (1981); characterized as Stereochia-Meekella fauna by Fang (1994) (JTvG))

Gregory, J.W. (1930)- Upper Triassic fossils from Burmo-Siamese frontier: the Thaungyin Trias and description of the corals. Records Geol. Survey India 63, p. 155-166.

(Fossils collected by Cotter from Late Triassic (Norian-Rhaetian) reefal Kamawkale Limestone on N Thailand-Myanmar border between Tak and Kanchanaburi Provinces. Corals revised by Beauvais (1988) and identified as M-L Jurassic species)

Griffin, W.L., T.T. Win, R. Davies, P. Wathanakul, A. Andrew, I. Metcalfe & P. Cartigny (2001)- Diamonds from Myanmar and Thailand: characteristics and possible origins. Economic Geology 96, p. 159-170.
(online at: http://www.ipgp.fr/~cartigny/2001-EconGeol-Griffinetal.pdf)
(No obvious primary sources for diamonds in modern alluvial deposits in Myanmar, Thailand and Sumatra. Rounded and polished surfaces of most diamonds reflect resorption in corrosive magma. Abrasion and brown radiation damage spots suggest long surface transport. Distribution within Sibumasu terrane and close association with Carboniferous-Permian glacial-marine sediments suggest diamonds derived from primary sources in NW Australia or within terrane)

Grote P. (2007)- Studies of fruits and seeds from the Pleistocene of northeastern Thailand. Courier Forschungsinstitut Senckenberg 258, p. 171-181.
(Middle (or Early?) Pleistocene fluvial deposits in Nakhon Ratchasiam provonce with plant remains(endocarp and dipterocarp fruits, seeds, leaves, wood, tubers, amber, pollen), suggestive of tropical mixed deciduous and dry evergreen forests. Also vertebrate fossils of fish, turtles, gavials, bovids, deer, Stegodon and hyena)

Hada, S., S. Khosithanont, H. Goto, H. Fontaine & S. Salyapongse (2015)- Evolution and extinction of Permian fusulinid fauna in the Khao Tham Yai Limestone in NE Thailand. J. Asian Earth Sci. 104, p. 175-184.
(Limestone unit within Khao Tham Yai Lst deposited in shelf setting on Indochina Block without clastic beds. Ranges in age from Wordian (middle M Permian)- Wuchiapingian (lower U Permian). Three fusulinid zones, in ascending order: Colania, Lepidolina (with abundant large fusulinids) and Codonofusiella. Boundary between Guadalupian (M Permian) and Lopingian (U Permian) defined by extinction of large Verbeekinids and Schwagerinids to domination of small Schubertellids (similar pattern evolution at Guadalupian-Lopingian boundary in shallow-water Tethyan shelf areas and mid-Panthalassa). Also common Mizzia algae)

Hagen, D. & E. Kemper (1976)- Geology of the Thong Pha Phum area (Kanchanaburi province, western Thailand). Geol. Jahrbuch B21, p. 53-91.
(On Paleozoic-Jurassic 'Sibumasu' rocks in W Thailand, including Permian limestone with fusulinids ('Polydiexodina'; but not as rich as other parts of Thailand), Hemigordius, Tubiphytes, etc. M Jurassic limestone with Thaumatoporella parvovesiculifera algae and foram Lucasella kaempferi)

Hahn, L. (1976)- The stratigraphy and palaeogeography of the nonmarine Mesozoic deposits in northern Thailand. Geol. Jahrbuch B21, p. 155-169.
(On 1750-2000m thick red, non-marine Upper Triassic (Norian)- M Jurassic clastics of N Thailand. With ms2 horizon (Rhaetian?) of abundant rhyolite, rhyodacite and andesite. Units can be correlated with continental red series of Khorat Plateau. Overlie U Triassic (Carnian) marine rocks with Juvavites, Halobia cf. comata, Paleocardita cf. buruca)

Hahn, L. (1982)- The Triassic in Thailand. Geol. Rundschau 71, 3, p. 1041-1056.
('Indosinian Orogeny' tectonics in Thailand between Permian and Jurassic. Strong orogenic movements in Norian. Two Triassic sedimentation cycles: Scythian- E Norian marine facies and Norian- Rhaetian/ Liassic terrestrial. Sediment facies and distribution of igneous rocks due to subduction of oceanic crust, starting in Carboniferous, and to collision of Eurasian and Indochina Plates in Norian)

Hahn, L. (1982)- Stratigraphy and marine ingressions of the Mesozoic Khorat Group in northeastern Thailand. Geol. Jahrbuch B43, 35, p. 7-35.
(Jurassic-Cretaceous of Khorat Gp of NE Thailand deposited in predominantly fluvio-lacustrine environment. Climate was semi-arid to arid, with subtropical humid intervals. Several horizons in M-U Jurassic with bivalves and plesiosaur and ichthyosaurus teeth evidence of episodic marine transgressions)

Hansen, B.T., K. Wemmer, M. Eckhardt, P. Putthapiban & S. Assavapatchara (2016)- Isotope dating of the potash and rock salt deposit at Bamnet Narong, NE Thailand. Open J. of Geology 6, p. 875-894
(online at: https://goedoc.uni-goettingen.de/handle/1/14086)
(Age determination of Cretaceous evaporite (halite, anhydrite) of Maha Sarakham Fm in samples from Bamnet Narong Asian Potash Mine, at W edge of Khorat Plateau/ Basin. Multiple isotopic approaches (K/Ar, K/Ca and Sr) suggest depositional age from ~93 Ma to <76 Ma (Cenomanian- Campanian), in agreement with Aptian-Albian ages from vertebrate fossils from underlying non-marine Khok Kruat Fm)

Hansen, B.T., K. Wemmer, P. Putthapiban, I.C. Kleinhanns & F. Wilsky (2014)- Do U/Pb-SHRIMP dating and Pb stepwise leaching (PbSL) analyses confirm the lack of Precambrian Basement outcrops in Thailand? Open Journal of Geology 4, 10, p. 505-517.
(online at: http://dx.doi.org/10.4236/ojg.2014.410037)
(Zircon dating and Pb stepwise leaching experiments on garnets suggest absence of Precambrian outcrops in crystalline basement of Thailand. High grade metamorphism show Indosinian ages (225-200 Ma) for vast majority of outcrops in NW Thailand, and small group of ages of ~445 Ma (~Ordovician-Silurian boundary) in Lampang Province. Age of thermal imprint at ~60 Ma confirmed near Surat Thani, Peninsular Thailand)

Hanta, R., B. Ratanasthien, Y. Kunimatsu, H. Saegusa, H. Nakaya & P. Chintasakul (2005)- Description of the Tha Chang *Merycopotamus* and its preserved condition. In: L. Wannakao et al. (eds.) Proc. Int. Conf. Geology, Geotechnology and Mineral Resources of Indochina (GEOINDO 2005), Khon Kaen, p. 600-605.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2005/9383.pdf)
(Well-preserved anthracothere skull from sandpit in NE Thailand assigned to Merycopotamus. Related to Late Miocene M. medioximus from Pakistan)

Hanta, R., B. Ratanasthien, Y. Kunimatsu, H. Saegusa, H. Nakaya & P. Jintasakul (2008)- A new species of Bothriodontinae, *Merycopotamus thachangensis* (Cetartiodactyla, Anthracotheriidae) from the Late Miocene of Nakhon Ratchasima, northeastern Thailand. J. Vertebrate Paleontology 28, 4, p. 1182-1188.
(online at: http://www.khoratgeopark.com/kgp/researchs/2008_Hanta%20et%20al.pdf)
(Merycopotamus thachangensis n.sp.(Cetartiodactyla, Anthracotheriidae) from sand pit in Tha Chang. Nearly complete cranium of first known Merycopotamus in Thailand. Mixture of derived and primitive features, most likely Late Miocene age, possibly late late Miocene)

Hara, H., Y. Kon, T. Usuki, Y.L. Ching, Y. Kamata, K. Hisada, K. Ueno, T. Charoentitira & P. Charusiri (2013)- U-Pb ages of detrital zircons within the Inthanon Zone of the Paleo-Tethyan subduction zone, northern Thailand: new constraints on accretionary age and arc activity. J. Asian Earth Sci. 74, p. 50-61.
(U-Pb dating of detrital zircons in lithic and basaltic sandstones from Inthanon Zone melange in N Thailand (W margin of Sukhothai Arc). Peak ages 3400-3200, 2600-2400, 1000-700, 600-400, and 300-250 Ma, similar to zircons in other circum-Paleo-Tethys subduction zones. Two types of sandstone:(1) with Late Carboniferous youngest zircon ages of ~300, 308 Ma, older than associated radiolarian chert blocks in same outcrop; (2) with youngest zircon ages of ~238 Ma, suggesting M Triassic maximum depositional age and peak magmatism in Sukhothai Arc. Youngest detrital zircons in Type 1 sandstones from Late Carboniferous- E Permian 'missing' arc, suggesting Sukhothai Arc was active during sedimentation. Significant M Triassic arc magmatism inferred from zircon age peaks in Type 2 sandstones and igneous rock record of Sukhothai Arc)

Hara, H., M. Kunii, K. Hisada, K. Ueno, Y. Kamata, W. Srichan, P. Charusiri, T. Charoentitirat et al. (2012)- Petrography and geochemistry of clastic rocks within the Inthanon zone, northern Thailand: implications for Paleo-Tethys subduction and convergence. J. Asian Earth Sci. 61, p. 2-15.
(Two types of clastic rocks in Paleo-Tethys convergence zone at Inthanon Zone, N Thailand: (1) lithic sst-shale in Permo-Triassic accretionary complex (35% from Sukhothai Zone volcanic rocks, 65% Indochina

craton sst); and (2) Carboniferous quartzose sst- mudstone in Sibumasu Block (continental margin). Paleo-Tethys subduction caused continental island arc in Sukhothai Zone, with Late Permian-Triassic forearc basins and M- early Late Triassic volcanism and accretionary complex formation)

Hara, H., M. Kunii, Y. Miyake, K. Hisada, Y. Kamata, K. Ueno, Y. Kon, T. Kurihara, H. Ueda, S. Assavapatchara, A. Treerotchananon, T. Charoentitirat & P. Charusiri (2017)- Sandstone provenance and U-Pb ages of detrital zircons from Permian-Triassic forearc sediments within the Sukhothai Arc, northern Thailand: record of volcanic-arc evolution in response to Paleo-Tethys subduction. J. Asian Earth Sci. 146, p. 30-55.
(Provenance analysis and U-Pb dating of detrital zircons in Permian-Triassic forearc sediments from Sukhothai Arc in N Thailand clarify evolution of missing arc system associated with Paleo-Tethys subduction. Turbidite-dominated forearc sediments include Permian- Late Triassic formations. Initial Sukhothai Arc (Late Carboniferous- E Permian) developed as continental island arc. Magmatic quiescence in M- early Late Permian. Latest Permian- early Late Triassic Sukhothai Arc activity with E-M Triassic I-type granites, evolution of accretionary complex, and abundant supply of volcanic sediments to trench through forearc basin. Sukhothai Arc became quiescent as Paleo-Tethys closed after Late Triassic)

Hara, H., T. Kurihara, J. Kuroda, Y. Adachi, H. Kuritae, K. Wakita, K. Hisada, P. Charusiri, T. Charoentitirat & P. Chaodumrong (2010)- Geological and geochemical aspects of a Devonian siliceous succession in northern Thailand: implications for the opening of the Paleo-Tethys. Palaeogeogr. Palaeoclim. Palaeoecology 297, p. 452-464.
(Opening of Paleo-Tethys reconstructed, using radiolarian fossils and geochemistry of Devonian siliceous succession in Chiang Dao area of N Thailand. Rock types: black shale (Lower Devonian), siliceous shale (M Devonian), tuffaceous chert and tuff (M-U Devonian), and chert (U Devonian). Succession deposited in continental margin and pelagic environments between Sibumasu and Indochina-North China blocks. Initial Paleo-Tethys developed as small, closed anoxic-suboxic oceanic basin in E-M Devonian, close to continental margin. Opening of Paleo-Tethys started around M-U Devonian boundary, marked by voluminous volcanic activity. Ash and pumice in chert derived from continental source. After Late Devonian, Paleo-Tethys developed as deep, broad ocean in which pelagic chert was deposited)

Hara, H., J. Kuroda, T. Kurihara, K. Wakita & P. Chaodumrong (2008)- Depositional environment related to Paleo-Tethys opening during Devonian: new insights from Total Organic Carbon analysis of siliceous rocks in the Chiang Dao Area, Northern Thailand. Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok, p. 339-340. *(Extended Abstract)*
(online at: www.geo.sc.chula.ac.th/Geology/English/News/Technique/GREAT_2008/PDF/102.pdf)
(Devonian siliceous rocks in Chiang Dao area, N Thailand, with basal organic black shale with E Devonian graptolites, brachiopods and conodonts. Upward decrease of TOC values indicates opening history of Paleo-Tethys during Devonian, with change from anoxic conditions in E-M Devonian to oxic siliceous rocks in Late Devonian. Late Devonian mud, organic matter and pumice tuff still derived from continental margin. After Carboniferous pelagic chert was distributed in deep ocean with development of Paleo-Tethys Ocean)

Hara, H., T. Tokiwa, T. Kurihara, T. Charoentitirat, A. Ngamnithiporn, K. Visetnat, K.Tominaga, Y. Kamata & K. Ueno (2018)- Permian-Triassic back-arc basin development in response to Paleo-Tethys subduction, Sa Kaeo-Chanthaburi area in Southeastern Thailand. Gondwana Research 64, p. 50-66.
(Sa Kaeo Back-arc Basin in SE Thailand developed behind Sukhothai Arc along W margin of Indochina Block during Permian-Triassic subduction of Paleo-Tethys. Two lithologic units:(1) Thung Kabin Melange, of back-arc basin basalts, chert, limestone and sandstone, along with melange; (2) Pong Nam Ron Fm thick clastic sediments, deposited over oceanic rocks of TKK melange. Detrital zircons youngest grain early Late Triassic, youngest cluster latest Permian- earliest Triassic, also Paleozoic and Proterozoic zircon ages. Tectonic evolution: (1) E Permian spreading,with basaltic magmatism, (2) subsidence during inactive period of Sukhothai Arc into M Triassic, with formation of Permian cherts- limestones and M Triassic cherts; (3) Triassic clastic sedimentation and eventual closing of basin. Clastics sourced from back-arc basin basalts, felsic volcanics of Sukhothai Arc and continental Indochina Block (Paleozoic and Proterozoic zircons))

Hara, H., K. Wakita, K. Ueno, Y. Kamata, K. Hisada, P. Charusiri, T. Charoentitirat & P. Chaodumrong (2009)- Nature of accretion related to Paleo-Tethys subduction recorded in northern Thailand: constraints from melange kinematics and illite crystallinity. Gondwana Research 16, 2, p. 310-320.
(Reconstruction of accretion process of Paleo-Tethys subduction in N Thailand shows trend of Paleo-Tethys subduction zone was N80°E, indicating Paleo-Tethys subducted N-ward beneath Indochina Block from Permian- Triassic)

(Conformable basalt-chert succession of Noen Po Fm in SE Thailand in zone between Indochina and Sibumasu Terranes. With M Triassic age bedded chert, deposited directly on oceanic crust with MORB geochemical signature, suggesting formation in oceanic area remote from volcanic arc or continental domain (not part of Sukhothai Arc Domain))

Kamata, Y., M. Kato, K. Ueno, A. Miyahigashi, T. Charoentitirat & A. Sardsud (2012)- Middle to Late Devonian radiolarians from Klaeng of Rayong Province, Southeast Thailand. Proc. First Int. Symposium of IGCP-589, Xi'an, China 2012, Acta Geoscientica Sinica 33, Suppl.1, p. 33-35. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/pdf/17-Kamata%20et%20al%201.pdf)
(Tightly folded Silurian-Devonian bedded siliceous rocks in Kanchanaburi Fm SW of Klaeng with M-L Devonian radiolarians. Dark shales with quartz- mica sandstones, probably from felsic plutonic rocks. This shows environment not pelagic Paleo-Tethys ocean floor, but continental margin, probably Sibumasu block)

Kamata, Y., M. Kato, K. Ueno, A. Miyahigashi, T. Charoentitirat & A. Sardsud (2014)- Middle-Late Devonian radiolarians from Klaeng District, Rayong Province, southeastern Thailand: geotectonic significance of the Rayong area as a continental margin of the Sibumasu Block. J. Asian Earth Sci. 104, p. 197-204.
(Fine clastics-siliceous succession at Laem Krabang Phet, ~20 km SW of Klaeng, SE Thailand with thin bedded chert intercalated with carbonaceous shale, tuffaceous shale, brown glassy tuff and quartz-rich sandstones. One chert horizon with poorly preserved M-L Devonian radiolarians, incl. Palaeoscenidium cladophorum, Stigmosphaerostylus cf. pusilla and Entactiniidae. Succession coeval with Devonian part of Fang chert, N Thailand. Depositional environment of section deep water continental margin of E Sibumasu Block)

Kamata, Y., A. Maezawa, H. Hara, K. Ueno, K. Hisada, A. Sardsud, T. Charoentitirat & P. Charusiri (2012)- Basaltic activity preserved in an Upper Permian radiolarian chert from the Paleo-Tethys in the Inthanon Zone, northern Thailand. J. Asian Earth Sci. 61, p. 51-61.
(Basaltic sandstone below and intercalated with U Permian radiolarian chert in Inthanon suture zone, NW Thailand (Wuchiapingian Follicucullus charveti- Albaillella yamakitai and E Changhsingian Neoalbaillella ornithoformis zones). Deposition in pelagic realm of Paleo-Tethys. Gravity currents of basaltic fragments in radiolarian chert and presence of fusulinid foraminifera tests indicate source from oceanic seamount)

Kamata, Y., K. Sashida, K. Ueno, K. Hisada, N. Nakornsri & P. Charusiri (2002)- Triassic radiolarian faunas from the Mae Sariang area, northern Thailand and their paleogeographic significance. J. Asian Earth Sci. 20, 5, p. 491-506.
(Early to Late Triassic (Spathian-Carnian) radiolaria from bedded cherts of Mae Sariang Gp in NW Thailand. Similar fauna and rocks to E continental margin of Sibumasu Block. E (?) Carnian radiolarian assemblage from bedded chert shows closure of Paleotethys Ocean between Sibumasu- Indochina blocks after E Carnian)

Kamata, Y., A. Shirouzu, K. Ueno, A. Sardsud, T. Charoentitirat, P. Charusiri, T. Koike & K. Hisada (2014)- Late Permian and Early to Middle Triassic radiolarians from the Hat Yai area, southern peninsular Thailand: implications for the tectonic setting of the eastern margin of the Sibumasu Continental Block and closure timing of the Paleo-Tethys. Marine Micropaleontology 110, p. 8-24
(Hat Yai area, SE Peninsular Thailand with two kinds of radiolarian-bearing fine-grained sediments: Middle-early Late Permian lower shale unit and E-M Triassic upper chert unit. Triassic chert interpreted as continental slope sediments overlying Permian clastic-calcareous facies, rather than abyssal plain pelagic deep-water sediments)

Kamata, Y., K. Ueno, M. Fujikawa, H. Hara, K. Hisada, K. Uno, T. Charoentitirat & P. Charusiri (2005)- Siliceous sedimentary rocks distributed in the Loei area, northeastern Thailand, lithological description and geological ages. In: L. Wannakoe et al. (eds.) Proc. Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2005), Khon Kaen, p. 417-420.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2005/9358.pdf)
(Paleozoic cherts and siliceous shales from 'Loei-Petchabun flodbelt', also viewed as Loei suture zone that was Paleotethys suture at E margin of Indochina Block. With black cherts with Late Devonian- E Carboniferous radiolarians. Also thin-bedded Permian shales with radiolaria and calcareous microfossils, deposited closer to continental margin)

Kamata, Y., K. Ueno, A. Miyahigashi, H. Hara, K.I. Hisada, T. Charoentitirat & P. Charusiri (2016)- Geological significance of the discovery of Middle Triassic (Ladinian) radiolarians from the Hong Hoi Formation of the Lampang Group, Sukhothai Zone, northern Thailand. Revue Micropaleontologie 59, 4, p. 347-358.
(Newly found Ladinian (M Triassic) radiolarians from Hong Hoi Fm of Lampang Group, Sukhothai Zone, N Thailand. Concords with age previously determined by molluscs. Radiolarian-bearing siliceous beds intercalated with volcanics-rich lithic sandstone -shale in lower part of lower Hong Hoi Fm. Probably deposited in forearc basin close to Sukhothai Arc, during time of intensive volcanic activity)

Kamata, Y., K. Ueno, W. Saengsrichan, A. Sardsud, T. Charoentitirat, P. Charusiri & K. Hisada (2008)- Stratigraphy and geological ages of siliceous sedimentary rocks distributed in the Hat Yai Area, Southern Peninsular Thailand. Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok, p. 349-352.
(online at: www.geo.sc.chula.ac.th/Geology/English/News/Technique/GREAT_2008/PDF/104.pdf)
(Permian- Triassic Kaeng Krachan and Yaha Fms deep marine clastics of Peninsular Thailand, 20km W of Hat Yai, probably continental margin sequence at E side of Sibumasu Plate. Incl. dark shale with Late Permian radiolaria (Follicucullus scholasticus). M Triassic radiolarians in bedded chert (Triassocampe coronata, T. deweveri, Pseudostylosphaera japonica, Eptingium, etc.), suggesting closure of Paleo-Tethys after M Triassic in Peninsular Thailand (see also Kamata et al. 2014))

Kamvong, T. & K. Zaw (2005)- Geology and genesis of the Phu Lon copper-gold skarn deposit, northeast Thailand. In: L. Wannakao (ed.) Proc. Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2005), Khon Kaen, Thailand, p. 310-318.

Kamvong, T. & K. Zaw (2009)- The origin and evolution of skarn-forming fluids from the Phu Lon deposit, northern Loei Fold Belt, Thailand: evidence from fluid inclusion and sulfur isotope studies. J. Asian Earth Sci. 34, 5, p. 624-633.
(Phu Lon skarn Cu-Au deposit in Triassic N Loei Fold Belt along W margin of Indochina terrane. Hosted by Devonian volcano-sedimentary sequences intercalated with limestone and marble units. Intruded by diorite and

quartz monzonite porphyries of *calc-alkaline affinities; U-Pb dating of zircon from quartz monzonite phases indicates age of 244 ± 4 Ma (earlyM Triassic))*

Kamvong, T., K. Zaw, S. Meffre, R. Maas, H. Stein, C.K. Lai (2014)- Adakites in the Truong Son and Loei fold belts, Thailand and Laos: genesis and implications for geodynamics and metallogeny. Gondwana Research 26, p. 165-184.
(Phu Kham adakites Truong Son Belt emplaced in Late Carboniferous (~306-304 Ma; subduction of Ailaoshan-Song Ma plate). Puthep adakites in Loei Fold Belt of SE Thailand formed in M Triassic (~244-241 Ma; main Paleotethys subduction))

Kanjanapayont, P. (2009)- Structural analysis and geochronology of the Khlong Marui Fault, Southern Thailand. Ph.D. Thesis Universitat Wien, p. 1-137.
(online at: http://othes.univie.ac.at/6871/1/2009-09-07_0648134.pdf)
(Khlong Marui Fault cuts ~150 km across Thai peninsula trending NNE-SSW from Gulf of Thailand to Andaman Sea. Three deformation phases. Two early dextral ductile deformation phases influenced by Late Cretaceous W Burma-Shan-Thai collision and/or subduction along Sunda Trench. Major exhumation period of ductile core in Eocene, influenced by early India-Asia collision)

Kanjanapayont, P. (2016)- Strike-slip ductile shear zones in Thailand. In: Soumyajit Mukherjee, Kieran F. Mulchrone (eds.) Ductile shear zones: from micro- to macro-scales, Chapter 15, Wiley Blackwell, p. 250-269.

Kanjanapayont, P., M.A. Edwards & B Grasemann (2009)- The dextral strike-slip Khlong Marui Fault, southern Thailand. Trabajos de Geologia, Universidad de Oviedo, 29, p. 393-398.
(online at: www.geol.uniovi.es/TDG/Volumen29/TG29-72.PDF)
(Khlong Marui Fault is S-most of four major strike-slip faults in Thailand. NNE-SSW-trending dextral strike-slip fault zone from Gulf of Thailand to Andaman Sea. No clear age-constraints, but likely related to escape tectonics arising from India-Asia collision)

Kanjanapayont, P., B. Grasemann, M.A. Edwards & H. Fritz (2012)- Quantitative kinematic analysis within the Khlong Marui shear zone, southern Thailand. J. Structural Geol. 35, p. 17-27.
(NNE trending Khlong Marui shear zone at least two deformation phases. Rocks metamorphosed at amphibolite and greenschist facies by first deformation. No clear age-constraints, but early dextral strike-slip displacement of KM shear zone related to W Burma and Shan-Thai collision and subduction along Sunda Trench in Late Cretaceous, while main exhumation influenced by early India-Asia collision)

Kanjanapayont, P., P. Kieduppatum, U. Klotzli, E. Klotzli & P. Charusiri (2013)- Deformation history and U-Pb zircon geochronology of the high grade metamorphic rocks within the Klaeng fault zone, eastern Thailand. J. Asian Earth Sci. 77, p. 224-233.
(online at: www.eatgru.sc.chula.ac.th/Thai/research/pdf/paper_2/133.pdf)
(In SE Thailand Nong Yai Gneiss high-grade metamorphic assemblage extends ~30 km in NW-SE direction along Klaeng fault zone. Three episodes of deformation:D1 NW–SE-trending isoclinal folds;D2 NE–SW shortening during Triassic Indosinian orogeny, cross-cut by Late Cretaceous (~79 Ma) leucogranite (effects of W Burma and Shan-Thai/Sibumasu collision or development of Andean margin). Sinistral ductile movement D3 coeval with Eocene peak metamorphism during early phases of India-Asia collision)

Kanjanapayont, P., U. Klotzli, M. Thoni, B. Grasemann,& M.A. Edwards (2012)- Rb-Sr, Sm-Nd, and U-Pb geochronology of the rocks within the Khlong Marui shear zone, southern Thailand. J. Asian Earth Sci. 56, p. 263-275.
(Khlong Marui shear zone in S Thailand E Eocene dextral ductile deformation phase suggested by U-Pb ages of zircon rims; Late Eocene dextral transpression indicated by mica Rb-Sr ages. Rb-Sr, Sm-Nd and U-Pb dating correlation implies major exhumation period of ductile lens in Eocene. Tied to early India-Asia collision?)

Kanmera, K. & R. Toriyama (1968)- Fusulinacean fossils from Thailand, Part III. *Maklaya*, new generic designation for Neoschwagerinids of the group *Cancellina pamirica* LEVEN. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 5, p. 31-46.
(On group of neoschwagerinid fusulinids from M Permian of Sara Buri/ Rat Buri Lst, C Thailand. Maklaya evolved from Misellina)

Kawakami, T., N. Nakano, F. Higashino, T. Hokada, Y. Osanai, M. Yuhara, P. Charusiri et al. (2014)- U-Pb zircon and CHIME monazite dating of granitoids and high-grade metamorphic rocks from the Eastern and Peninsular Thailand- a new report of Early Paleozoic granite. Lithos 200-201, p. 64-79.
(U-Pb zircon dating of igneous and metamorphic rocks in 4 areas of E, NW and Peninsular Thailand. E Thailand, SE of Bangkok (Sukhothai Arc): gneiss from Khao Chao area crystallization age 229 Ma (Carnian), metamorphic age 193 Ma (E Jurassic). Peninsular Thailand Khao Dat Fa granite 477 Ma (E Ordovician; second oldest granite pluton from Thailand, suggesting Sibumasu block basement formed during Pan-African Orogeny). Khao Pret granite 67.5 Ma. NW Thailand metamorphic rocks in Doi Inthanon area similar plutono-metamorphic history with Peninsular Thailand, suggesting all belong to Sibumasu block)

Kemper, E. (1976)- The foraminifera in the Jurassic limestone of West Thailand. Geol. Jahrbuch B21, p. 129-153.
(Early to Late Jurassic limestones with 'Tethyan' larger foraminifera from few-100m thick limestones in Kanchanaburi Province, W Thailand: Orbitopsella (M Lias/ E Jurassic), Lucasella (E-M Dogger/ M Jurassic), Haurania (M Lias-M Dogger) and Kurnubia (Late Jurassic). Little or no locality information)

Kemper, E., H.D. Maronde & D. Stoppel (1976)- Triassic and Jurassic limestone in the region northwest and west of Si Sawat (Kanchanaburi Province, Western Thailand. Geol. Jahrbuch B21, p. 93-127.
(200-300m thick Triassic with Anisian and Norian (with Boueina- Involutina) limestone, overlain by red and violet clastics and limestone of Rhaetian- E Jurassic age (mainly non-marine; uplift event?). Overlain by 200-300m thick Jurassic (M Lias- Malm) limestones with Lucasella, Orbitopsella, Haurania, etc. (U Triassic halimediform alga Boueina redescribed by Flugel (1988) as Boueina marondei n.sp.))

Kerrich, R. & R.D. Beckinsale (1988)- Oxygen and strontium evidence for the origin of granites in the tin belt of southeast Asia. Canadian Inst. Mining Metallurgy, Spec. Vol. 39, p. 114-123.

Ketmuangmoon, P., A. Chitnarin, M.B. Forel & P. Tepnarong (2018)- Diversity and paleoenvironmental significance of Middle Triassic ostracods (Crustacea) from northern Thailand: Pha Kan Formation (Anisian, Lampang Group). Revue Micropaleontologie 61, 1, p. 3-22.
(online at: https://www.sciencedirect.com/science/article/pii/S0035159817300727)
(Pha Kan Fm of Lampang Gp S of Lampang city, N Thailand, with 29 species of ostracods (4 new), dominated by Bairdiidae. First report of M Triassic (Anisian) ostracods from Sukhothai terrane)

Ketwetsuriya, C., A. Nutzel & P. Kanjanapayont (2014)- A new Permian gastropod fauna from the Tak Fa Limestone, Nakhonsawan, Northern Thailand- a report of preliminary results. Zitteliana A 54, p. 137-146.
(New silicified M Permian gastropod fauna from Tak Fa Lst from shallow water carbonates rich in fusulinids in N Thailand. 22 gastropod species, one of richest Permian gastropod faunas from SE Asia. Presence of Bellerophontidae, Pleurotomarioidea, Meekospiridae and Goniasmatidae)

Khamloet, P., V. Pisutha-Arnond & C. Sutthirat (2014)- Mineral inclusions in sapphire from the basalt-related deposit in Bo Phloi, Kanchanaburi, western Thailand; indication of their genesis. Russian Geol. Geophysics 55, 9, p. 1087-1102.
(Bo Phloi gem field in Kanchanaburi Province, W Thailand, closely associated with Cenozoic basalts. Blue and yellow sapphire, black spinel, and minor zircon mined for >3 decades. Most sapphires crystallized from high-alkali felsic melt, probably in lower crust)

Khositanont, S., P. Ounchanum, Y. Panjasawatwong, T. Thanasuthipitak, Khin Zaw & S. Meffre (2007)- U-Pb zircon ages and geochemical characteristics of Lampang-Phrae granites; implications for plate tectonic

interpretation. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIö07), Bangkok, Dept. Mineral Resources, p. 367-372.
(Lampang-Phrae granites isolated plutons in N-S trending volcanic rocks in Sukhothai Fold Belt, N Thailand. Zircon ages of ~224 Ma and 228 Ma suggest formation in early Late Triassic (~Carnian). Granites of I type affinity and may have emplaced in transition of subduction-collision environments in Late Triassic)

Khositanont, S., Y. Panjasawatwong, P. Ounchanum, T. Thanasuthipitak, Khin Zaw & S. Meffre (2008)- Petrochemistry and zircon age determination of Loei-Phetchabun volcanic rocks. Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516, 5th APSEG, Bangkok, p. 272-278.
(Loei-Phetchabun Fold Belt volcanic and plutonic rocks characteristics suggesting formation in ocean floor in Paleozoic and back arc environment in Late Permian- E Triassic)

Khositanont, S., K. Zaw, S. Meffre, Y. Panjasawatwong, P. Ounchanum & T. Thanasuthipitak (2013)- Geotectonic and geochronology of volcano-plutonic rocks in the Loei-Phetchabun fold belt. In: C. Senebouttalath et al. (eds.) Proc. 2nd Lao-Tai Conf. Geology and Mineral resources, Vientiane, p. 81-95.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2013/36771.pdf)
(Late Permian- E Triassic volcanic-plutonic rocks in Loei-Phetchabun Fold Belt three types: basic volcanics, intermediate volcanics and intermediate-acid plutonic rocks. Formed in mid oceanic and subduction-related volcanic arc environments. Jurassic red beds of Khorat Gp show Tethys sea closed before Jurassic)

Khummongkol, D. & A. Suwannathong (2007)- Aspect of oil shale in Thailand. In: In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIö07), Bangkok, Dept. Mineral Resources, p. 399-403.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2007/12755.pdf)
(Largest oil shale reserves in Thailand in M-U Miocene of Mae Sot Fm in Mae Sot Basin in NW Thailand. Measured reserves ~952 Mtons and oil yield is 183 million barrels)

Kromkhun, K., G. Baines, P. Satarugsa & J. Foden (2013)- Petrochemistry of volcanic and plutonic rocks in Loei Province, Loei-Petchabun fold belt, Thailand. In: 2nd Int. Conf. Geological and environmental sciences, IPCBEE vol.52, Singapore, p. 55-59.
(online at: www.ipcbee.com/vol52/011-ICGES2013-G041.pdf)
(Permo-Triassic intermediate volcanic-plutonic rocks of Loei-Phetchabun foldbelt in Amphoe Wang Sa Phung and Maung areas, Loei Province, have calc-alkaline affinities and indicate magmatism at E-dipping subduction zone, where former ocean between Indochina-Sibumasu blocks subducted beneath Indochina block. Subduction active from at least 244-230 Ma (Middle- early Late Truassic). Subduction-derived melts probably contaminated by overlying continental crust)

Klompe, Th.H.F. (1962)- Igneous and structural features of Thailand. In: G.A.Macdonald & H. Kuno (eds.) The crust of the Pacific Basin, American Geophys. Union (AGU) Geophys. Monograph Ser. 6, p. 122-134.
(Thailand 3 groups of igneous rocks: (1) mafic-ultramafics in N Thailand, intrusive in Silurian- Lw Carboniferous; (2) U Triassic hornblende-biotite granite in E and younger two-mica tin-bearing granite in W Thailand, considered to be post-Triassic, possibly same as 145-155 Ma (Late Jurassic) ages of tin granites from Billiton and Singkep; (3) various U Tertiary- Pleistocene effusives and some dioritic intrusions. W Thailand conformable Paleozoic sequence, locally capped by Triassic deposits. Regularity of this sequence, age of granites and unconformable contact between folded beds and overlying Late Jurassic- E Cretaceous in adjacent areas (Malaya, Borneo, Sumatra) favor Late Jurassic phase of mountain building. To E, Khorat Plateau folded Paleozoic sequence unconformably overlain by near-horizontal Rhaetian-Liassic, suggesting Late Triassic (old Cimmerian) phase of diastrophism in E part of country. Gulf of Thailand result of faulting)

Klompe, Th.H.F. (1962)- Igneous and structural features of Thailand. Geologie en Mijnbouw 41, 6, p. 290-302.
(Same paper as above)

Knox, G.J. & L.L. Wakefield (1983)- An introduction to the geology of the Phitsanulok Basin. In: Proc. Conf. Geology and Mineral Resources of Thailand, Bangkok, Dept. Mineral Resources, 9p.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/1983/8734.pdf)
(Phitsanulok Basin N-S trending Tertiary basin, with Sirikit oilfield producing from Miocene fluvio-lacustrine Lan Krabu Fm. Oligocene- Recent sediment fill ~8 km, E-W extension ~15 km)

Kobayashi, F., R. Martini, R. Rettori, L. Zaninetti, B. Ratanasthien, H. Saegusa & H. Nakaya (2006)- Triassic foraminifers of the Lampang Group (Northern Thailand). J. Asian Earth Sci. 27, 3, p. 312-325.
(Four Triassic foraminiferal limestone localities in Lampang Gp of Sukhothai foldbelt, N Thailand, between Sibumasu (Shan-Thai) Terrane in W and Indochina in E. Characterized by: (1) Glomospirella lampangensis n. sp. (E Triassic ?), (2) Pilammina densa (Anisian), (3) endothyroid foraminifers- Diplotremina astrofimbriata (Ladinian) and (4) Aulotortus sinuosus (Carnian). Taxa of these associations common to S China and SE Asia, also Europe (unlike M- Late Permian provincial/ endemic foram assemblages)

Kobayashi, T. (1957)- Upper Cambrian fossils from peninsular Thailand. J. Fac. Science, University of Tokyo, Sect. 2, 10, 3, p. 367-382.

(Same paper as Kobayashi et al. (1963). Generally poorly preserved fossils from several localities in Jurassic-Cretaceous Khorat series of NE Thailand, incl. Jurassic Ichthyosauria and pleisiosauria teeth, E Jurassic bivalves, silicified wood (Araucaryoxylon))

Kobayashi, T. & A. Tokuyama (1959)- The Halobiidae from Thailand. J. Fac. Science, University Tokyo, sect. 2, 12, 1, p. 27-30.
(online at: http://umdb.um.u-tokyo.ac.jp/DKoseibu/pdf/Ref_0211_.pdf)
(Late Triassic bivalves previously reported from Chiang Rai and Lampang areas. New faunas with Daonella sumatrensis Volz (originally described from N Sumatra) from Na Thawi at Thai-Malay border area. Also Daonella cf. pichleri, Halobia cf. styriaca Krumbeck (originally described from Timor) and Halobia cf. comata from E of Lampang. All species related to Carnian of Alpine-Himalayan region)

Koch, K.E. (1973)- Geology of the region Sri Sawat-Thong Pha Phum- Sangkhlaburi (Kanchanaburi Province/Thailand). Bull. Geol. Soc. Malaysia 6, p. 177-185.
(online at: www.gsm.org.my/products/702001-101347-PDF.pdf)
(Review of area in NW-most Thailand near Myanmar border, mapped by German Geological Mission in 1968-1971. Stratigraphy ~3000m of Cambrian- Jurassic (meta-)sediments, part of geosynclinal tract which extends from Yunnan in N to W Malay Peninsula in S (= Sibumasu terrane; JTvG). Include Ordovician limestone, Siurian graptolite shale, basal Devonian Tentaculites- graptolite shale, Carboniferous flysch-type clastics with pebbly shale, Permian carbonate, Triassic conglomerates ('Triassic orogeny'), Jurassic limestone, etc.)

Komalarjun, P. & T. Sato (1964)- Aalenian (Jurassic) ammonites from Mae Sot, Northwestern Thailand. Japan. In: T. Kobayashi (ed.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 237-251.
(Three ammonites from marly limestone localities of Mae Sot Basin, NW Thailand: Tmetoceras dhanarajatai n.sp., T. regleyi, Erycites and Graphoceras concavum. Generally accepted as index species for Aalenian of Mediterranean and Pacific provinces)

Konigshof, P., N.M. Savage, P. Lutat, A. Sardsud, J. Dopieralska, Z. Belka & G. Racki (2012)- Late Devonian sedimentary record of the Paleotethys Ocean- The Mae Sariang section, northwestern Thailand. J. Asian Earth Sci. 52, p. 146-157.
(11 m thick condensed sequence of Late Devonian grey pelagic limestones in Mae Sariang section of NW Thailand, with hardgrounds and Fe/Mn crusts. Ranges from Late rhenana to praesulcata conodont biozones. Probably belongs to Inthanon Zone, comprising remnants of Paleotethys Ocean)

Konishi, K. (1953)- New *Boultonia* and other microfossils from North Thailand. Trans. Proc. Palaeontological Soc. Japan, N.S., 12, p. 103-110.
(Late Permian fusulinid forams from Burmo-Thai borderland, incl. Boultonia trancata n.sp., Triticites, Rugofusilina, Schwagerina, etc.).)

Kon'no, E. (1963)- Some Permian plants from Thailand. Contributions to the geology and palaeontology of Southeast Asia, 5. Japanese J. Geology Geography 34, p. 139-159.
(Same paper as Kno'no (1964). Includes record of Permian 'Gondwanan'? Glossopteris cf. angustifolia among mainly 'Cathaysian' Alethopteris thailandica n.sp., Sphenophyllum, Cordaites, Taeniopteris from black shale at Khlong Wang Ang in Phetchabun province)

Kon'no, E. (1964)- Some Permian plants from Thailand. In: T. Kobayashi (ed.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 1, p. 89-111.
(Same paper as Kon'no (1963). Eight species of Permian plants from Khlong Wang Ang, 50km SSW of Phetchabun, C Thailand. Incl. Bowmanites, Sphenophyllum, Alethopteris thailandica n.sp., Glossopteris cf. angustifolia, Palaeovittaria, Taeniopteris hallei and Poacordaites. Probable age Kungurian- Kazanian. Remarkable presence of Gondwanan Glossopteris in assemblage otherwise 'Cathaysian' (although without Gigantopteroids))

Kon'no, E. & K. Asama (1973)- Mesozoic plants from Khorat, Thailand. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 12, p. 149-171.
(Description of Late Triassic (E Norian?) flora dominated by Equisetites arenaceus, also with Chlathropteris meniscoides, Todites goeppertianus, etc., in Huai Hin Lat Fm, which lies unconformably over Permian limestone in Khorat Plateau, NE Thailand. Flora similar to 'Tonkin flora' of N Vietnam and belongs to Dictyophyllum- Clathropteris flora of SW Pacific floral province)

Kosuwan, S. & P. Charusiri (1997)- Structure geology of the Khanom gneissic complex, Nakhon Si Thamamarat Province, southern Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 2, p. 727-739.

Koysamran, S. & N. Comrie-Smith (2011)- Basin modeling of Block L26/50, Eastern Khorat Plateau, Northeast Thailand. Proc. 4th Petroleum Forum: Approaching to the 21st Petroleum concession bidding round, Bangkok 2011, Department of Mineral Fuels, p. 5-12.
(online at: www.dmf.go.th/cms/assets/1/The%204th%20(DMF)%20Petroleum%20Forum%20Proceeding.pdf)
(E Khorat Plateau experienced a number of tectonic events. First was in M Carboniferous, followed by Indosinian events I, II, and III. Permian Pha Nok Khao carbonate primary reservoir target. Late Jurassic-Cretaceous Khorat Group deposited during extended period of regional subsidence and represents overburden for petroleum system. Structuring during Indosinian orogenies and amplified by uplift in Late Cretaceous and Tertiary. Permian source rocks mature for gas in Triassic; Triassic source rocks mature in Cretaceous)

Kozai, T., F. Hirsch, K. Ishida & A. Meesook (2006)- Faunal affinity of Toarcian-Aalenian (Early Jurassic) bivalves from Mae Sot and Umphang (Tak Province), Northwestern Thailand. Geosc. J. 10, 3, p. 205-215.
(NW Thailand Mae Sot- Umphang areas E-M Jurassic (Toarcian-Aalenian) beds overlie Permian-Triassic substratum of Shan-Thai (=Sibumasu) terrane with brecciated conglomerate. Pliensbachian- Early Bajocian shallow marine strata in partly terrestrial Jurassic sequence. 35 bivalve species (incl. Parvamussium donaiense) mainly endemic and defining Toarcian-Aalenian SE Asian Province of Tethys. Associated corals of Tethyan affinity)

Kozai, T., L. Perelis-Grossowicz, A. Bartolini, C. Yamee, J. Sandoval, F. Hirsch, K. Ishida, T. Charoentitirat, A. Meesook & J. Guex (2011)- New palaeontological investigations in the Jurassic of western Thailand. Gondwana Research 19, 1, p. 37-46.
(Jurassic of Mae Sot and Umphang districts, W Thailand, provide age constraints for marine Jurassic inundation of Sundaland after Paleotethys closure. Basal conglomerate of Jurassic derived from pelagic Triassic substratum. Ammonites (Tethyan Catulloceras perisphinctoides, Riccardiceras longalvum, Malladaites spp., Abbasites, Spinammatoceras schindewolfi, etc.), bivalves, large benthic forams (Timidonella sarda) and algae (Cladocoropsis mirabilis) suggest Toarcian-Bajocian ages. Faunas partly endemic, with N Tethyan

(Eurasian/ Sundaland) affinity. Bivalves mainly endemic fauna with pectinoid bivalve Parvamussium donaiense and Bositra ornate in Toarcian- Early Bajocian)

(online at: http://eprints.utas.edu.au/20552/7/whole_LimtrakunPhisit2003_thesis_ex_pub_mat.pdf)
(Sapphires from alluvial placer deposits in Denchai gem fields of Phrae Province, N Thailand, generally interpreted as derived from late Cenozoic Denchai basalts, with olivine, clinopyroxene and common mantle-derived xenoliths. New evidence suggests sapphires crystallised from melts formed in continental lithosphere)

Limtrakun, P., Y. Panjasawatwong & J. Khanmanee (2013)- Petrochemistry and origin of basalt breccia from Ban Sap Sawat area, Wichian Buri, Phetchabun, central Thailand. Songklanakarin J. Sci. Technol. 35, 4, p. 469-482.
(online at: http://rdo.psu.ac.th/sjstweb/journal/35-4/35-4-13.pdf)
(Miocene Wichian Buri basalts and basalt breccias in Loei-Phetchabun Volcanic Belt similar petrography and chemical compositions. Both formed from same continental within-plate, transitional tholeiitic magma)

Limtrakun, P., Khin Zaw, C.G. Ryan & T.P. Mernagh (2001)- Formation of the Denchai gem sapphires, northern Thailand: evidence from mineral chemistry and fluid/melt inclusion characteristics. Mineralogical Magazine 65, 6, p. 725-735.
(Denchai gem sapphire deposits in Phrae Province, N Thailand, closely associated with late Cenozoic high CO2/ high K alkaline basaltic rocks. Sapphires in alluvial placer deposits in paleo-channels at shallow depths)

Lin, Y.L., M.W. Yeh, T.Y. Lee, S.L. Chung, Y. Iizuka & P. Charusiri (2013)- First evidence of the Cambrian basement in Upper Peninsula of Thailand and its implication for crustal and tectonic evolution of the Sibumasu Terrane. Gondwana Research 24, p. 1031-1037.
(First radiometric date of Cambrian crystalline basement of Sibumasu: zircon U/Pb age of Khao Tao orthogneiss in Thailand Upper Peninsula 501.5 ± 7.5 Ma (Late Cambrian). Chemical similarity and spatial continuity of Khao Tao orthogneiss with other pre-Neotethys marginal Eurasian and Sibumasu granitoids indicate similar magmatic arc regime along Gondwana India-Australia margin)

Linnen, R.L. (1998)- Depth of emplacement, fluid provenance and metallogeny in granitic terranes: a comparison of western Thailand with other tin belts. Mineralium Deposita 33, p. 461-476.
(Tin mineralization may occur at shallow and deep levels of emplacement, but greater tendency for cassiterite-bearing pegmatites to form at depth)

Linnen, R.L. & A.E. Williams-Jones (1994)- The evolution of pegmatite-hosted tin-tungsten mineralization at Nong Sua, Thailand: evidence from fluid inclusions and stable isotopes. Geochimica Cosmochimica Acta 58, p. 735-747.
(Maximum pressure for emplacement of Nong Sua pegmatite 3.8 kbar corresponding to depth of <12-14 km)

Linnen, R.L. & A.E. Williams-Jones (1995)- Genesis of a magmatic metamorphic hydrothermal system: The Sn-W polymetallic deposits at Pilok, Thailand. Economic Geology 90, p. 1148-1166.
(Cassiterite, wolframite and base metal mineralization in Pilok area, 250km NW of Bangkok, W Thailand, are hosted by veins and stockworks in apical portion of Late Cretaceous leucocratic granite stocks (Ar-Ar ages 72-77 Ma), close to contacts with pelitic metasedimentary rocks)

Linnen, R.L., A.E. Williams-Jones & R.F. Martin (1992)- Evidence of magmatic cassiterite mineralization at the Nong Sua aplite-pegmatite complex, Thailand. Canadian Mineralogist 30, p. 739-761.
(online at: http://rruff.info/doclib/cm/vol30/CM30_739.pdf)
(Nong Sua intrusive complex in N Peninsular Thailand, 180 km S of Bangkok, is layered aplite-pegmatite with Sn-W mineralization. Muscovite from pegmatite with Ar/Ar age of 63.9± 0.6 Ma. Nearby biotite granite with biotite Ar/Ar age of 53.2 Ma. Cassiterite crystallized at ~95% crystallization, or prior to vapor saturation)

Lockley M.G,. M. Matsukawa, Y. Sato (2006)- A distinctive new theropod dinosaur track from the Cretaceous of Thailand: Implications for theropod track diversity. Cretaceous Research 27, 1, p. 139-145.
(Well-preserved, three-toed dinosaur footprints with bilobed heel impressions from Cretaceous of Thailand are assigned to new ichnotaxon Siamopodus khaoyaiensis. Represent gracile theropods. Also theropod tracks with bulbous heel impressions from a new locality, similar to Lower Cretaceous tracks from elsewhere in Asia)

Loffler, E. & J. Kubiniot (1996)- Landform development and bioturbation on the Khorat Plateau, Northeast Thailand. Natural History Bull. Siam Society 44, p. 199-216.
(online at: www.thaiscience.info/Article%20for%20ThaiScience/Article/61/10001833.pdf)
(Khorat Plateau erosional surface developed in two main phases: (1) E Tertiary formation of extensive plain, with deep weathering under humid tropical conditions (red Yasothon ferralsols and gravels of 'upper terrace'); (2) Pliocene or E Pleistocene relief rejuvenation after tectonic uplift, dissecting and stripping much of weathered mantle, with development of yellow sandy xanthic ferralsols on new land surfaces under more seasonal climate. Modifying factor in landform/ soil development is post-depositional bioturbation by termites, capable of reworking a few m of soil profile in several 1000 yrs, transporting fine material upward and causing coarse material like tektites to move down profile like a lag deposit)

Long, J.A. & C. Burrett (1989)- Fish from the Upper Devonian of the Shan-Thai terrane indicate proximity to East Gondwana and South China terranes. Geology 17, 9, p. 811-813.
(Coronodontid shark tooth, new species of Phoebodus and occurrence of chondrichthyan Harpagodens in Late Famennian of Thailand, Australia, and S China suggests Late Devonian proximity of these terranes, in accord with recent paleomagnetic data)

Long, J.A. & C.F. Burrett (1989)- Early Devonian conodonts from the Kuan Tung Formation, Thailand: systematics and biogeographic considerations. Records Australian Museum, Sydney, 41, 2, p. 121-133.
(online at: http://australianmuseum.net.au/Uploads/Journals/17706/140_complete.pdf)
(Conodonts from limestone horizon in Kuan Tung Fm, Satun Province, S Thailand, show E Devonian (Emsian) age. Many conodont species cosmopolitan, some restricted to E Gondwana- ShanThai- S China Terranes)

Luddecke, S., C. Chonglakmani & D. Helmcke (1991)- Analysis of pebble associations from the marine Triassic of northern Thailand. J. Thai Geoscience 2, p. 91-101.
(Carnian-Norian age 'molasse' overlying Permian ophiolitic melange in N Thailand. Three types: (1) M Triassic Lampang/ Hong Hoi conglomerate mainly pebbles of M Triassic limestones and acid volcanic rocks (from nearby carbonate platform on Permo-Triassic volcanic arc or rift?); (2) U Triassic Rong Kwang conglomerate mainly siliciclastic sediments and low-grade metamorphic rocks; (3) Nam Pat conglomerate 38% volcanic, 26% metamorphic, 10% plutonic (from continental crust with Triassic volcanic arc?))

Lumjuan, A. (1993)- Permo-Carboniferous of northern Nakhon Si Thammarat. In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 1, p. 219-224.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1993/6788.pdf)
(Carboniferous- Permian series in N part of Peninsular Thailand. ~500m+ of Carboniferous quartzitic sandstones and shales, overlain by ~200m of Late Carboniferous- earliest Permian pebbly mudstones (with granitic and other clasts) With Posidonomya. Capped by E-M Permian Ratburi Limestone)

Macdonald, A.S. & S.M. Barr (1978)- Tectonic significance of a Late Carboniferous volcanic arc in northern Thailand. In: P. Nutalaya (ed.) Proc. Third Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA III), Bangkok, p. 151-156.
(Remnants of Late Carboniferous volcanic arc through central N Thailand, W of younger andesitic arcs and (Nan-Uttaradit) ultramafic belt. Mainly tholeiitic basalts, possibly from island arc environment. Associated with Late Carboniferous sediment, below base of Rat Buri Limestone. Distribution of volcanics and granites implies convergence along W-dipping subduction zone)

Macdonald, A.S. & S.M. Barr (1984)- The Nan River mafic-ultramafic belt, northern Thailand: geochemistry and tectonic significance. Bull. Geol. Soc. Malaysia 17, p. 209-217.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1984010.pdf)
(Nan River suture in N Thailand with mafic and ultramafic rocks (mainly metabasalt and metabasaltic andesite flows) and tuffs overlying metagabbro. Ultramafic rocks along SE side metahornblendite, metapyroxenite and serpentite lenses within garnet amphibolite. Mafic rocks resemble calc-alkali basalts formed in volcanic arc, rather than in oceanic environment. Should probably be termed volcanic arc suite with associated fault-emplaced ultramafic bodies. If belt marks suture between Shan-Thai and Indosinian cratonic blocks no significant obduction of intervening oceanic basin onto Shan-Thai block)

Macdonald, A.S., S.M. Barr, G.R. Dunning & W. Yaowanoiyothin (1993)- The Doi Inthanon metamorphic core complex in NW Thailand: age and tectonic significance. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 117-125.
(Doi Inthanon complex in NW Thailand part of 400km belt of high-grade gneissic rocks along W mountain ranges of Thailand. Orthogneiss dome looks like Cordilleran-type metamorphic core complex, Zircon ages suggest gneiss derived from Late Triassic- E Triassic granitic protolith; high-grade metamorphism probably in Late Cretaceous. Large scale extension to form core complex sometime between Late Cretaceous and Miocene)

Macdonald, A.S., S.M. Barr, B.V. Miller, P.H. Reynolds, B.P. Rhodes & B. Yokart (2010)- P-T-t constraints on the development of the Doi Inthanon metamorphic core complex domain and implications for the evolution of the western gneiss belt, northern Thailand. J. Asian Earth Sci. 37, p. 82-104.
(Western gneiss belt in N Thailand exposed in Doi Inthanon metamorphic core complex (W of Chiang Mai basin), and in Mae Ping strike-slip fault domain W of Tak batholith. Doi Inthanon gneiss experienced: (1) high-

grade, medium-P metamorphism in Late Triassic- E Jurassic (~210 Ma); (2) Late Cretaceous (84, 72 Ma) thermal overprint; (3) Late Eocene mylonite age (40 Ma) is early stage of development of core complex by low-angle extension; (4) Miocene (~26-15 Ma) late-stage development of core complex. Similarities with N Vietnam, Laos, Yunnan, and C Myanmar suggest regional response to indentation of SE Asia by India)

Mahawat, C., M.P. Atherton & M.S Brotherton (1990)- The Tak Batholith, Thailand: the evolution of contrasting granite types and implications for tectonic setting. J. Southeast Asian Earth Sci. 4, p. 11-27.
(Tak Batholith, W Central Thailand at boundary of E and C granitoid belts. Four zoned plutons, with youngest of Late Triassic age (210 Ma). Composition changes from granodioritic in oldest, through monzonitic and monzogranitic to syenogranitic in youngest. Changes in composition with time similar to increasing K volcanic series at active continental margin. Due to change from subduction to strike-slip and then uplift)

Makel, G., B. Ainsworth, S. Chuenbunchom, M. Harvey, S. Kaewla-Iad & R. Pal (1997)- The Sirikit Field- improved structural interpretation and reservoir architecture and its impact on further field development. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 2, p. 541-542. *(Abstract only)*

(Mid-Permian Lonsdaleia-type colonial tabulate coral from limestone in N Thailand. Species originally described by Huang (1932) from S China, and closely resembles Wentzelella timorica (Gerth 1921) from Basleo, Timor. Pseudoschwagerina fusulinids from nearby localities described by Toriyama (1944))

Minezaki, T. & K.I. Hisada (2016)- The tectono-stratigraphy and the Upper Paleozoic petroleum systems of the Khorat Plateau Basin in onshore NE Thailand. In: Development of the Asian Tethyan Realm: genesis, process and outcomes, 5th Int. Symposium Int. Geoscience Program (IGCP) Project 589, Yangon, p. 7-11. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/5th%20Symposium/Abstract%20Volume.pdf)
(Khorat Plateau and surrounding NE Thailand underlain by Permian carbonates, which host two commercial gas fields. Intense deformation of Carboniferous- Permian sections below Indosinian I Event, which may be caused by closure of back-arc basin between Sukhothai arc and Indochina terrane at end of Permian along Nan-Uttaradit suture, before (Triassic) collision between Sibumasu block and Indochina)

Minezaki, T., K.I. Hisada, H. Hara &| Y. Kamata (2019)- Tectono-stratigraphy of Late Carboniferous to Triassic successions of the Khorat Plateau Basin, Indochina Block, northeastern Thailand: initiation of the Indosinian Orogeny by collision of the Indochina and South China blocks. J. Asian Earth Sci. 170, p. 208-224.

(Khorat Plateau Basin in NE Thailand covers much of Indochina Block. Mesozoic gently folded non-marine sediments unconformably over faulted U Paleozoic sequence (Indosinian I unconformity) with, in some areas ~2000m of erosion. Result of collision of Indochina and S China blocks during late Permian- M Triassic)

Mitchell, A.H.G., B. Young & W. Jantaranipaa (1970)- The Phuket Group, Peninsular Thailand: a Palaeozoic ?geosynclinal deposit. Geol. Magazine 107, 5, p. 411-428.
(Phuket Group in Phuket- Takua Pa- Krabi region of Peninsular Thailand, two folded formations: (1) >3 km thick Ordovician (Cambrian?)- Lower Permian deep marine, quartz-rich continental margin clastics (with common pebbly mudstones in lower formation with clasts of quartzite, vein quartz, limestone and biotite granite; probably also diamonds); (2) 100-200m thick shallow marine- deltaics of E Permian age, overlain by Permian Ratburi Lst. Continental source lay to E (Burton, Ridd had proposed clastic source from West; JTvG). Phuket Group continues N into S Burma as Mergui Series. See also comment and reply by Ridd 1971)

Miyahigashi, A., K. Ueno & T. Charoentitirat (2009)- Late Permian (Lopingian) foraminifers from the Doi Chiang DaoLimestone in the Inthanon Zone of Northern Thailand. Acta Geoscientica Sinica 30, Suppl. 1, p. 40-43.
(online at: www.cagsbulletin.com/dqxben/ch/reader/create_pdf.aspx?file_no=2009S123)
(Late Permian foraminifers from massive Visean-latest Permian (earliest Triassic) Doi Chiang Dao Lst in Inthanon Zone of N Thailand, N of Chiang Mai. Considered to be Paleotethyan seamount carbonate, deposited on basalts, and surrounded by shales and bedded 'Fang Chert', which represent M Devonian- M Triassic deep-sea sediments. Three Late Permian fusulinid foram assemblages, which can be compared with Shifodong Fm of Paleo-Tethyan mid-oceanic carbonates in Changning-Menglian Belt of W Yunnan, SW China)

Miyahigashi, A., K. Ueno & T. Charoentitirat & Y. Kamata (2012)- Foraminiferal assemblage and depositional environment of the Doi Long Formation (Triassic Lampang Group), Northern Thailand. Proc. First Int. Symposium of IGCP-589, Xi'an, China 2012, Acta Geoscientica Sinica 33, Suppl. 1, p. 45-49.
(online at: http://igcp589.cags.ac.cn/pdf/24-Miyahigashi.pdf)
(Doi Long Fm Triassic limestone NE of Lampang in Sukhothai Zone of N Thailand, believed to be Permian-Triassic island arc system along margin of Indochina Block. Rich foraminiferal assemblage with abundant Aulotortus sinuosus, Alpinophragmium perforatum, Agathammina austroalpina, etc., suggesting Carnian age, consistent with age estimated by ammonoids. Also with Shamovella (formerly Tubiphytes). Lagoon, reef and shoal facies recognized)

Miyahigashi, A., K. Ueno & T. Charoentitirat & Y. Kamata (2014)- Foraminiferal fauna and depositional environment of the Lower Permian Kiu Lom Formation in the Sukhothai Zone, Northern Thailand. In: Development of the Asian Tethyan Realm, Proc. 3rd Int. Symposium Int. Geosciences Program (IGCP) Project 589, Tehran 2014, p. 152-153. *(Abstract)*
(Lampang area in N Thailand belongs to Sukhothai Zone island arc, developed along margin of Indochina Block during Permian-Triassic. E Permian Kiu Lom Fm ~500m thick volcanoclastics with bedded limestone rel. rich in fusulinid foraminifera (Darvasites, Chalaroschwagerina, Praeskinnerella, Levenella, etc.). Volcanism of Sukhothai Arc active from latest Carboniferous - late E Permian (Yakhtashian), ceased, followed by major arc volcanism in M Triassic)

Miyahigashi, A., K. Ueno & T. Charoentitirat, Y. Kamata & A. Sardsud (2013)- Foraminiferal fauna and depositional environment of the Late Triassic Kang Pla Formation (Song Group), Northern Thailand. In: 2nd Int. Symposium Int. Geoscience Programme Project 589, Borocay, Philippines, p. 76-78. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/2nd%20Symposium/Abstract%20volume.pdf)
(Triassic clastics with subordinate limestones widely distributed in Lampang-Phrae area, N Thailand. Kang Pla Fm ~100-500m thick with foraminifera Aulotortus sinuosus, A. communis, A. tumidus, Pilamminella gemerica, P. grandis, Diplotremina subangulata, Agathammina austroalpina, etc., suggesting Carnian age)

Miyahigashi, A., K. Ueno & T. Charoentitirat, Y. Sera, Y. Kamata & A. Sardsud (2010)- Late Carboniferous-Early Permian foraminiferal assemblages from the Doi Chiang Dao Limestone in the Inthanon Zone, Northern

Thailand. 6th Symp. Int. Geological Correlation Programme Project 516 (IGCP516) Geological Anatomy of East and South Asia, Kuala Lumpur 2010, p. 94-97.
(Late Carboniferous-E Permian foraminiferal fauna of Doi Chiang Dao Lst (Paleo-Tethyan mid-oceanic seamount with basaltic rocks at base), shows similarities to Cathaysian blocks (incl. Sukhothai Zone), suggesting mid-oceanic Paleo-Tethys domain where Doi Chiang Dao Lst formed was paleobiogeographically in tropical Tethyan region. Faunal diversity generally lower than in Cathaysian region)

Mongkoltip, P. (1986)- Metamorphic mineral assemblages of gneisses along Doi-Inthanon Highway, Northern Thailand. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 2, Bull. Geol. Soc. Malaysia 20, p. 473-485.

(Precambrian?metamorphic rocks of Chiang Mai -Tak gneiss belt include mica-K-feldspar-sillimanite gneiss and biotite gneiss with intercalating marble and calc-silicate. Gneiss units separated by Carboniferous and M Triassic biotite-granite intrusions)

Moonpa, K. & K. Motanated (2018)- Basin classification and tectonic framework of the Nam Pat Group, Uttaradit Province, Thailand: implications for the Nan Suture Zone. Heliyon 4, 1, e00517, 24p.
(online at: https://www.sciencedirect.com/science/article/pii/S2405844017327214)
(Late Triassic Nam Pat Gp of Nam Pat Basin in Nan-Uttaradit Suture Zone, NW Thailand. Clastics dominated by volcanic arc detritus. Paleocurrents to SE and derived from underlying E-M Triassic Pak Pat andesitic magmatic arc volcanics. Basin best interpreted as short-lived back-arc basin rather than forearc basin)

Morley, C.K. (2009)- Geometry and evolution of low-angle normal faults (LANF) within a Cenozoic high-angle rift system, Thailand: implications for sedimentology and the mechanisms of LANF development. Tectonics 28, 5, TC5001, p. 1-30.
(At least 8 examples of large (5–35 km heave), low-angle normal faults (20-30° dip) in Cenozoic rift basins of Thailand, laterally passing into high-angle extensional fault systems. Low-angle dips appear to follow pre-existing low-angle fabrics developed during Late Paleozoic and E Paleogene episodes of folding-thrusting)

Morley, C.K. (2014)- The widespread occurrence of low-angle normal faults in a rift setting: review of examples from Thailand, and implications for their origin and evolution. Earth-Science Reviews 133, p. 18-42.
(Many low-angle (<35° dip), high-displacement (>1km) Cenozoic normal faults identified on seismic onshore and offshore Thailand. In areas like Mergui Basin dominant east-dips suggest pre-existing fabrics control on fault dip direction. Low angles may also be caused by reactivation of pre-existing basement fabric)

Morley, C.K. (2015)- Five anomalous structural aspects of rift basins in Thailand and their impact on petroleum systems. In: F.L. Richards et al. (eds.) Industrial structural geology: principles, techniques and integration, Geol. Soc., London, Spec. Publ. 421, p. 143-168.
(Late Eocene- Miocene intra-cratonic Thailand rift basins caused rifts evolved differently from other intra-cratonic rifts: (1) widespread low-angle normal faults; (2) basin inversion alternating with rifting; (3) diachronous initiation and cessation of rifting (general younging to N with time; also E to W shift in Gulf of Thailand); (4) rapid post-rift subsidence (6km in Pattani, 8 km in Malay Basin) and (5) extensive, low-displacement post-rift faults. Differences may be related to hot, weak continental lithosphere of Sundaland, rapid evolution of plate boundaries and stresses during Cenozoic, and history of subduction and accretion)

Morley, C.K. (2017)- The impact of multiple extension events, stress rotation and inherited fabrics on normal fault geometries and evolution in the Cenozoic rift basins of Thailand. In: The geometry and growth of normal faults, Geol. Soc., London, Spec. Publ. 439, p. 413-445.
(Rift basins of Thailand with remarkable diversity of fault displacement patterns. Oblique extension, influence of pre-existing trends and stress rotation in multi-phase rifts more comprehensive explanation than strike-slip interpretation of previous studies)

Morley, C.K., P. Ampaiwan, S. Thanudamrong, N. Kuenphan & J. Warren (2013)- Development of the Khao Khwang fold and thrust belt: implications for the geodynamic setting of Thailand and Cambodia during the Indosinian Orogeny. J. Asian Earth Sci. 62, p. 705-719.
(Indosinian Orogeny in Thailand often viewed as developed between linear terranes, now ~N-S trending, and subsequently disrupted by NW-SE Cenozoic strike-slip faults, but may be more complex. Indochina Terrane probably series of continental blocks, separated by Permian rifting. In E Triassic early stage collision (S China-Cathaysian Terrane collision with Vietnam/Indochina) resulted in amalgamation of Indochina Terrane by closure along rifts. Rift basins thrusted and inverted during early stages of Indosinian orogeny, with minor reactivation when Sibumasu collided with Sukhothai Zone- Indochina Terrane margin in Late Triassic)

Morley, C.K., F. Arboit, R. Hansberry, A. Collins, R. King, K. Amrouch & J. Warren (2015)- Style, timing, stratigraphic development and structural evolution of the Khao Khwang Fold and Thrust Belt. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 52-53. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(Triassic basins interpreted as syn-kinematic basins (piggy back or foreland) to episodes of thrusting from ~245- 205 Ma (M-L Triassic). Late Triassic deformation suggests later, more intense contraction history for Khao Khwang Foldbelt than adjacent Khorat Plateau area, with development of Norian- continental extensional basins unconformably overlain by Rhaetian. Detrital zircons with common age peak at ~450 Ma. Detrital zircon age spectra of siliciclastics of Saraburi Group resembles Permian-Triassic in Khorat Plateau, Vietnam and SE China, suggesting shared sediment source areas (Indosinan basement))

Morley, C.K., P. Charusiri & I.M. Watkinson (2011)- Structural geology of Thailand during the Cenozoic. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, Chapter 11, p. 273-334.
(Comprehensive review of Cenozoic deformation of Thailand. Two dominant styles: (1) strike-slip faulting (mainly in W half of onshore Thailand and Andaman Sea; incl. Sagaing, Three Pagodas Faulst) and extension. Folds-thrusts and inversion structures also present. Cenozoic rifts mainly N-S trending with E-dipping half-graben boundaries and located predominantly in Sukhothai and Inthanon zones of Indosinian orogeny (mobile belts between stronger Sibumasu and Indochina blocks, reactivating E-dipping thrust faults?) Between Late Miocene and present tectonic setting changed from dominantly extension to increased strike-slip activity)

Morley, C.K., S. Gabdi & K. Seusutthiya (2007)- Fault superimposition and linkage resulting from stress changes during rifting: examples from 3D seismic data, Phitsanulok Basin, Thailand. J. Structural Geol. 29, p. 646-663.
(Phitsanulok basin, Thailand, example of changing fault displacement patterns with time, associated with faults of different orientations. In N Phitsanulok basin three main phases associated with Late Oligocene-Recent fault development: (1) Late Oligocene- Late Miocene E-W extension, 'main rift' stage; (2) Late Miocene- Pliocene transtension to transpression(?), 'late rift' stage; (3) Pliocene- Recent minor faulting, E-W extension)

Morley, C.K., C. Haranya, W. Phoosongsee, S. Pongwapee, A. Kornsawan & N. Wonganan (2004)- Activation of rift oblique and rift parallel pre-existing fabrics during extension and their effect on deformation style: examples from the rifts of Thailand. J. Structural Geol. 26, p. 1803-1829.
(online at: http://it.geol.science.cmu.ac.th/gs/staff/nutthawut/Webpage%20data/Structural%20Geology.pdf)
(Tertiary rift basins of Thailand previously interpreted in terms of strike-slip faulting, but many trends oblique to N-S orientation of rift system appear to be inherited passive fabrics in pre-rift. Fabrics from Paleozoic and Mesozoic orogenies exerted influence on Tertiary strike-slip and normal faults)

Morley, C., Y. Ionnikoff, N. Pinyochon & K. Seusutthiya (2007)- Degradation of a footwall fault block with hanging-wall fault propagation in a continental-lacustrine setting: how a new structural model impacted field development plans, the Sirikit Field, Thailand. American Assoc. Petrol. Geol. (AAPG) Bull. 91, 11, p. 1637-1661.
(Sirikit oil-gas field large field (~800 MMBO IP) in Phitsanulok Basin in footwall of complex tilted fault block. Main reservoir horizons Lower Miocene fluvio-deltaic sands of Lan Krabu Fm, sourced and sealed by interbedded lacustrine shales. Stratigraphy on tilted block flank difficult to trace onto fault block crest, caused

by features associated with degradation of footwall (low-angle detachment faulting, multiple episodes of erosion at tilted block crest, E-ward onlap onto eroded footwall surface)

Morley, C.K. & A. Racey (2011)- Tertiary stratigraphy. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 223-271.

Morley, C.K., N. Sangkumarni & T.B. Hoon (1998)- Structural evolution of Rift Basins in northern Thailand: new constraints from paleostress analysis. In: Offshore South East Asia Conference 1998 (OSEA98), Singapore, SE Asia Petroleum Expl. Soc. (SEAPEX), p. 79-81. *(Extended Abstract)*
(Tertiary rift basins of Thailand form N-S trending string of depressions from Gulf of Thailand in S to hill country in N. Southern basins larger, longer and deeper. Extension primarily in Oligocene and Miocene. Li basin data shows episodic compressional or strike-slip events through its evolution, inconsistent with simple pull-apart origin and suggesting strike-slip motions more complex than simple prevalent strike-slip models indicate. Thai basins may have evolved under two separate deformation mechanisms (escape tectonics from India collision and Indian Ocean subduction rollback) that may have alternated in importance with time)

Morley, C.K., N. Sangkumarni, T.B. Hoon, C. Chonglakmani & J. Lambiase (2000)- Structural evolution of the Li Basin, northern Thailand. J. Geol. Soc., London, 157, 2, p. 483-492.
(Oligo-Miocene sections of coal mines in Li Basin of N Thailand show basins formed under E-W extension. At least 5 episodes of mainly NNW-SSE to NE-SW oriented compression interrupted extensional development of basin, probably related to escape tectonics of Himalayan orogeny. Episodic nature of compression and extension inconsistent with either simple strike-slip related opening of basins or simple extension)

Morley, C.K., M. Smith, A. Carter, A. P. Charusiri & S. Chantraprasert (2007)- Evolution of deformation styles at a major restraining bend, constraints from cooling histories, Mae Ping fault zone, western Thailand. In: W.D. Cunningham & P. Mann (eds.) Tectonics of strike-slip restraining and releasing Bends, Geol. Soc., London, Spec. Publ. 290, p. 325-349.
(On ~150km-long, restraining bend in ~500km-long Mae Ping fault zone, a NW-SE trending fault zone across onshore Thailand and E Myanmar with >150 km sinistral motion during Cenozoic)

Morley, C.K. & N. Wonganan (2000)- Normal fault displacement characteristics, with particular reference to synthetic transfer zones, Mae Moh Mine, Northern Thailand. Basin Research 12, 3/4, p. 307-327.
(Study of normal faults in M Miocene sediments of the Mae Moh mine, E of Lampang, N Thailand)

Morley, C.K., N. Wonganan, N. Sankumarn, T.B Hoon, A. Alief & M. Simmons (2001)- Late Oligocene-Recent stress evolution in rift basins of Northern and Central Thailand: implications for escape tectonics. Tectonophysics 334, p. 115-150.
(Tertiary rift basins of Thailand generally evolved under E-W extension. Extension episodically interrupted by inversion events. Rift basins from N. Thailand and Laos into Gulf of Thailand different evolutions, but common trends: (1) widespread Oligocene- E Miocene extension; (2) In C and N Thailand also M Miocene extension, persisting into the Upper Miocene-Pliocene; (3) In S (W. Natuna, Penyu, Malay basins) extension ceased in earliest Miocene; (4) In N Gulf of Thailand extension ceased in M Miocene; (5) Thermal subsidence greatest (up to 4 km) in S (Malay, Pattani, W. Natuna, Penyu basins) and least in N Thailand; (6) Intense E-M Miocene inversion in S Gulf of Thailand; mild E-M Miocene inversion in N Gulf of Thailand. Most widespread inversion in N, in Plio-Pleistocene. Evolution more complex than can be explained by simple escape tectonic models)

Mouret, C. (1994)- Geological history of northeastern Thailand since the Carboniferous. Relations with Indochina and Carboniferous- Early Cenozoic evolution model. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok 1994, Dept. Mineral Res.and IGCP 306, p. 132-158.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1994/6945.pdf)
(Phu Phan Range of NE Thailand result of strong E Cenozoic inversion. Khorat Plateau area major regional M Carboniferous unconformity('Hercynian compression'). Post-collisional M-U Carboniferous half-grabens with clastic fill, followed by Permian carbonate-dominated deposition. M Triassic 'Indosinian I' and Latest Triassic/

Rhaetian 'Indosinian II' thrusting events. Jurassic- Cretaceous Khorat Gp mainly fluvial redbeds, with thick evaporites in Albian- Cenomanian, followed by eolian sandstones. Around 65 Ma major uplift, erosion (folding/ inversion of pre-Rhaetien depocenters. Etc.))

Mouret, C., H. Heggemann, J. Gouadain & S. Krisadasima (1993)- Geological history of the siliciclastic Mesozoic strata of the Khorat Group in the Phu Phan Range area, northeastern Thailand. In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and palaeontology (BIOSEA), Chiang Mai, 1, p. 23-49.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1993/7484.pdf)
(On stratigraphy of Khorat Group of NE Thailand part of widespread Mesozoic non-marine deposits over E Thailand, Laos, Cambodia and Vietnam. Deposition starts in latest Triassic (Rhaetian) and continues with up to 5000m of redbeds before final uplift and erosion at 65 Ma (tied to plate collision in W, in Myanmar), resulting in erosion of up to 3500m of post M Jurassic sediments. Evaporitic conditions in Albian-Cenomanian. Paleocurrents mainly to WSW, possibly from Annamitic Mountain belt or farther NE)

Mukasa, S.B., G.M. Fischer & S.M. Barr (1996)- The character of the subcontinental mantle in Southeast Asia: evidence from isotopic and elemental compositions of extension-related Cenozoic basalts in Thailand. In: Earth processes: reading the isotopic code, American Geophys. Union (AGU) Geophys. Monograph 95, p. 233-252.
(Central Valley of Thailand and its flanks sites of basaltic volcanism due to extensional deformation since at least 10 Ma. Isotopic compositions of basalts most closely resemble post-spreading lavas in S China Sea Basin)

Nachtergaele, S., S. Glorie, C. Morley, P. Charusiri, P. Kanjanapayont, P. Vermeesch, A. Carter, G. Van Ranst & J. de Grave (2020- Cenozoic tectonic evolution of southeastern Thailand derived from low-temperature thermochronology. J. Geological Society, London, 177, 2, p. 395-411.
(online at: https://jgs.lyellcollection.org/content/jgs/177/2/395.full.pdf)
(Apatite thermal histories indicate late Eocene- Oligocene regional exhumation of exposed granitic and metamorphic basement rocks in SE Thailand. Exhumation contemporaneous with late Eocene- E Oligocene sinistral fault activity along Mae Ping and Three Pagodas Faults. Exhumation coeval with synrift phase of intracontinental offshore rift and half-graben development in E Gulf of Thailand. Exhumation ended in E Miocene, as result of changing plate-tectonic forces along plate boundaries of Sundaland)

Panjasawatwong, Y. & W. Yaowanoiyothin (1993)- Petrochemical study of post-Triassic basalts from the Nan Suture, northern Thailand. J. Southeast Asian Earth Sci. 8, p. 147-158.
(Nan Suture metagabbros/ amphibolites and serpentinite melange represent Late Triassic collision suture between Shan-Thai and Indo-China cratons. With Carboniferous- Permo-Triassic ocean-island basalts, backarc basin and island-arc basalts and andesites, etc. Post-collisional, possibly Cenozoic, continental intraplate basalts form discontinuous narrow belt, disconformably above melange)

Panjasawatwong, Y., K. Zaw, S. Chantaramee, P. Limtrakun & K. Pirarai (2006)- Geochemistry and tectonic setting of the Central Loei volcanic rocks, Pak Chom area, Loei, northeastern Thailand. J. Asian Earth Sci. 26, p. 77-90.
(C Loei basalts and microgabbro are Late Devonian-E Carboniferous MOR Basalts and oceanic island-arc lavas, erupted on oceanic basement in same ocean basin as Chiang Rai- Chiang Mai volcanic belt)

Patience, R.L., S.L. Rodrigues, A.L. Mann & I.J.F. Poplett (1993)- An integrated organic geochemical and palynofacies evolution of a series of lacustrine sediments from Thailand. Proc. ASCOPE 93 Conference, Bangkok, p. 75-84.

Peigne, S., Y. Chaimanee, J.J. Jaeger, V. Suteethorn & S. Ducrocq (2000)- Eocene nimravid carnivorans from Thailand. J. Vertebrate Paleontology 20, p. 157-163.
(Dental remains of nimravid (sabre-toothed) carnivores from U Eocene Krabi Basin are among oldest known Nimravidae and attributed to Nimravus cf. intermedius and Hoplophoneus sp. Occurrence of nimravid carnivores in SE Asia implies exchanges between Asia and N America in Late Eocene)

Peigne, S., Y. Chaimanee, J.J. Jaeger, C. Yamee, P. Srisuk & B. Marandat (2006)- A new member of the Mustelida (Mammalia: Carnivora) from the Paleogene of Southern Asia. J. Vertebrate Paleontology 26, p. 788-793.
(New mustelid rodents from Late Oligocene in Nong Ya Plong lignite mine in C Thailand)

Perez-Huerta, A., C. Chonglakmani & A. Chitnarinc (2007)- Permian brachiopods from new localities in northeast Thailand: implications for paleobiogeographic analysis. J. Asian Earth Sci. 30, p. 504-517.
(Small E-M Permian brachiopod faunas from Khao Khwang limestone, Nam Duk Basin and Khao Khwang Platform confirm Cathaysian affinities for brachiopods and fusulinids in NE Thailand. Fossils in Nam Duk Fm molasse facies, also show possible Gondwanan relationships with brachiopod taxa described in Australia)

Petersen, H.I., A. Foopatthanakamol & B. Ratanasthien (2006)- Petroleum potential, thermal maturity and the oil window of oil shales and coals in Cenozoic rift-basins, central and northern Thailand. J. Petroleum Geol. 29, 4, p. 337-360.
(C and N Thailand Oligocene- E Miocene rift basins with oil shales deposited in fresh-brackish lakes, with TOC up to 44%. With abundant lamalginite and algal-derived amorphous organic matter, liptodetrinite and telalginite (Botryococcus-type). Coals dominated by huminite and formed in freshwater mires. Exposed coals thermally immature. Steep Vitrinite Reflectance curves from oil basins reflect high geothermal gradients of ~62°C/km and ~92°C/km. Depth to top oil window for oil shales (VR ~0.70%) between ~1100-1800m depending on gradient. Kerogen composition and high T gradients result in narrow oil windows)

Petersen, H.I. & A. Mathiesen (2007)- Determination of the temperature history for the U Thong oilfield area (Suphan Buri Basin, Central Thailand) using a realistic surface temperature. J. Petroleum Geol. 30, 3, p. 289-296.
(BP1-W2 well in oil-producing Suphan Buri Basin with likely geothermal gradient of ~42ºC/km. Predicts that onset of oil generation at 107ºC post-dated reservoir and trap formation in M-L Miocene times)

Petersen, H.I., H.P. Nytoft, B. Ratanasthien & A. Foopatthanakamol (2007)- Oils from Cenozoic rift-basins in central and northern Thailand: source and thermal maturity. J. Petroleum. Geol. 30, 1, p. 59-78.
(Oil produced from Suphan Buri (U Thong, Sang Kajai fields), Phitsanulok (Sirikit field) and Fang Basin (Fang field) in C and N Thailand. Most Cenozoic rift-basins 2-4 km deep, but Phitsanulok Basin deepest, with up to 8km basin-fill. Sirikit oil most mature. Oils highly waxy, generated from freshwater lacustrine source rocks with common algal material. Presence of cadalene, tetracyclic C24 compounds, oleanane, lupane, bicadinane, etc., indicate contributions from higher land plants, either disseminated in lacustrine facies or from associated coal seams. Thermally immature oil shales (lacustrine mudstones) and coals exposed in many Thai basins)

Petersen, H.I. & B. Ratanasthien (2011)- Coal facies in a Cenozoic paralic lignite bed, Krabi Basin, southern Thailand: changing peat-forming conditions related to relative sea-level controlled watertable variations. Int. J. Coal Geology 87, p. 2-12.
(Cenozoic Krabi Basin in S part of peninsular Thailand contains about 112 MTons proven coal reserves. Production from Bang Mark mine in S part of basin, where main lignite bed is 7-20m thick. Lignite low rank and dominated by huminite, indicating generally oxygen-deficient conditions in precursor mire. Lower part of lignite bed topogenous fresh water peat mire, subjected to periodic inundations and deposition of siliciclastics. Upper part of lignite bed represents slightly domed fresh water ombrogenous peat mire)

Phajuy, B., Y. Panjasawatwong & P. Osataporn (2005)- Preliminary geochemical study of volcanic rocks in the Pang Mayao area, Phrao, Chiang Mai, northern Thailand: tectonic setting of formation. J. Asian Earth Sci. 24, p. 765-776.
(Permian mafic volcanic rocks from Pang Mayao, Chiang Rai- Chiang Mai volcanic belt, are mid-ocean ridge and ocean-island basalts, possibly remnants of consumed Paleotethys Ocean)

Philippe, M., N. Boonchai, D.K. Ferguson, Hui Jia & W. Songtham (2013)- Giant trees from the Middle Pleistocene of Northern Thailand. Quaternary Science Reviews 65, 1, p. 1-4.

(Giant silicified trees in M Pleistocene gravel terraces of Ping River, 20 km N of Tak, N Thailand, with longest log 72.2m. Most trees belong to Koompassioxylon elegans. Part of >100m tall tropical- subtropical rainforest Lannathaian pebble tools (presumably from Homo erectus) from coeval beds in same area. Overlying basalts K/Ar dated at 0.6± 0.2 and 0.8 ±0.2 Ma)

Philippe, M., G. Cuny, V. Suteethorn, N. Teerarungsigul, G. Barale, F. Thevenard et al. (2005)- A Jurassic amber deposit in Southern Thailand. Historical Biol. 17, p. 1-6.
(First Jurassic deposit with cm-sized pieces of amber, in M-L Jurassic paralic Khlong Min Fm of S Peninsular Thailand. Associated wood fossils Agathoxylon and Brachyoxylon, leaves of genus Cupressinocladus (not Frenelopsis as suggested by Asama et al. 1981). Amber from dense forest surrounding coastal lake dominated by resin-producing Agathoxylon trees)

Philippe, M., V. Daviero-Gomez & V. Sutheethorn (2009)- Silhouette and palaeoecology of Mesozoic trees in Thailand. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia. Geol. Soc., London, Spec. Publ. 315, p. 85-96.
(Large M Jurassic- E Cretaceous conifer logs from forest environments with different types of architecture)

Philippe, M., V. Sutheethorn & E. Buffetaut (2010)- Revision de *Brachyoxylon rotnaense* Mathiesen, description de *B. serrae* n. sp. et consequences pour la stratigraphie du Cretace inferieur d'Asie du Sud-Est. Geodiversitas 33, 1, p. 25-32.
(online at: http://sciencepress.mnhn.fr/sites/default/files/articles/pdf/g2011n1a2.pdf)
('Reappraisal of Brachyoxylon rotnaense Mathiesen, description of B. serrae n. sp. and stratigraphical implications for SE Asia Early Cretaceous stratigraphy'. Mesozoic beds of Muang Phalan basin in S Laos continuation of Thailand Khorat Gp. (Khok Kruat Fm). With wood fossils formerly assigned to Brachyoxylon rotnaense, known from E Jurassic of Denmark, but associated vertebrate fossils indicate Aptian age. Laos material not same as European species and here described as B. serrae n. sp.. In Thailand B. serrae associated with endemic SE Asian E Cretaceous flora, with indicators of tropical climate with seasonal rainfall)

Philippe, M., V. Sutheethorn, P. Lutat, E. Buffetaut, L. Cavin, G. Cuny & G. Barale (2004)- Stratigraphical and palaeobiogeographical significance of fossil wood from the Mesozoic Khorat Group of Thailand. Geol. Magazine 141, p. 319-328.
(Fossil wood common in poorly dated continental sediments of Khorat Gp, NE Thailand. Agathoxylon (formerly Araucarioxylon), Brachyoxylon, etc., suggest relationships with Indochina, especially Vietnam, and suggest M Jurassic- E Cretaceous age. Trees grew along streams in arid climate, becoming wetter during deposition of upper formations of Khorat Gp)

(Four different granite suites at Phuket, W side of Peninsular Thailand. Rb/Sr ages ~83-94 Ma (Late Cretaceous). Age of tin-tungsten mineralization rel. late, ~84 Ma)

Qian, X., Q.L. Feng, C. Chonglakmai & D. Monjai (2013)- Geochemical and geochronological constrains on the Chiang Khong volcanic rocks (northwestern Thailand) and its tectonic implications. Frontiers of Earth Science 7, p. 508-521.
(M Triassic volcanic rocks in Chiang Khong area at NW Thailand- Laos border genetically linked to tectonic evolution of Paleo-Tethyan Ocean. Mainly of andesitic to rhyolitic rocks. Andesitic samples of Doi Yao volcanic zone with zircon U-Pb ages of ~241 Ma and of arc volcanic affinity. Rhyolitic sample ~239 Ma and transitional arc-syncollisional chemistry. Most samples comparable to Lampang area in N Thailand and Jinghong area of SW Yunnan, indicating Chiang Rai arc-volcanic zone might link to Lancangjiang volcanic zone, SW China)

Qian, X., Q. Feng, Y. Wang, T. Zhao, J.W. Zi, M. Udchachon & Y. Wang (2017)- Late Triassic post-collisional granites related to Paleotethyan evolution in SE Thailand: geochronological and geochemical constraints. Lithos 286-287, p. 440-453.
(Chonburi, Rayong-Bang Lamung and Chanthaburi granite plutons in SE Thailand similar crystallization ages of 222-218 Ma (Norian, Late Triassic). Geochemically classified into S-type (Group 1; mainly from ancient greywackes) and I-type (Group 2; from juvenile mafic crust with input of meta-sediments) granites. Formed in post-collisional thickened crust after assemblage of Indochina and Sibumasu blocks. Linked to N with Late Triassic granitoids in NW Thailand (Sukhothai zone), to S with East Malay Peninsula granites)

Qian, X., Y. Wang, Q. Feng, J.W. Zi, Y. Zhang & C. Chonglakmani (2016)- Petrogenesis and tectonic implication of the Late Triassic post-collisional volcanic rocks in Chiang Khong, NW Thailand. Lithos 248-251, p. 418-431.

('Post-collisional' Late Triassic Chiang Khong volcanics of ~220-229 Ma, younger than continental-arc and syn-collisional volcanic rocks (~238-242 Ma). Equivalent to volcanic rocks in Lancangjiang igneous zone in SW China and possibly related to upwelling of asthenospheric mantle shortly after slab detachment, which induced melting of metasomatized mantle wedge)

Qian, X., Y. Wang, Q. Feng, J.W. Zi, Y. Zhang & C. Chonglakmani (2017)- Zircon U-Pb geochronology, and elemental and Sr-Nd-Hf-O isotopic geochemistry of post-collisional rhyolite in the Chiang Khong area, NW Thailand and implications for the melting of juvenile crust. Int. J. Earth Sciences 106, 4, p. 1375-1389.
(Widespread Triassic volcanic rocks Chiang Khong-Lampang-Tak igneous zone in NW Thailand (part of Sukhothai Arc). Rhyolite with zircon U-Pb age of 230.7 ± 1.1 Ma. Rhyolites formed by partial melting of juvenile mafic lower crust in post-collisional setting. Deep crustal anatexis probably induced by upwelling asthenospheric mantle, shortly after slab detachment subsequent to closure of Paleo-Tethys)

Qian, X., Y. Wang, B. Srithai, Q. Feng, Y. Zhang, J.W. Zi & H. He (2017)- Geochronological and geochemical constraints on the intermediate-acid volcanic rocks along the Chiang Khong-Lampang-Tak igneous zone in NW Thailand and their tectonic implications. Gondwana Research 45, p. 87-99.
(*Lampang-Den Chai area volcanic suite in NW Thailand intermediate- acid rocks with zircon U-Pb ages of ~240-242 Ma (M Triassic). Sequence dominated by calc-alkaline andesites, dacites and rhyolites. Formed in response to slab roll-back during transition from subduction to continental collision between Sibumasu and Indochina blocks. Constitute part of Chiang Khong- Lampang- Tak igneous zone, extending N to Lancangjiang igneous zone and S to Chanthaburi, Malaysia and Singapore areas)*

Qian, X., H. Wei, Y. Wang & Q.L. Feng (2012)- Zircon U-Pb age and geological significance of arc-volcanic rocks in Chiang Khong, northern Thailand. J. China University of Geosciences 37, p. 195-203.
(Common Permian- Triassic volcanic rocks in Chiang Khong area of N Thailand. Zircon ages of basaltic andesite samples from Doi Yao zone 241 ±6 Ma. Rhyolite from Doi Khun Ta Khuan zone 238± 9Ma. M Triassic ages comparable to arc-volcanic rocks in Lampang area, N Thailand (Chiang Rai Arc) and Jinghong area, SW Yunnan (Lancangjiang arc). Also zircons of 1885- 1323 Ma, indicating Proterozoic-Mesoproterozoic basement)

Racey, A. (2009)- Mesozoic red bed sequences from SE Asia and the significance of the Khorat Group of NE Thailand. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia. Geol. Soc., London, Spec. Publ. 315, p. 41-67.
(Much of Khorat Gp of NE Thailand is Early Cretaceous age, rather than Late Triassic- E Cretaceous. Jurassic absent. Khorat Gp deposited in foreland basin, not thermal sag following Late Triassic rifting. Two 'Indosinian' orogenies recognized, one in Late Permian- Triassic (along Nan-Uttaradit suture/ Petchabun foldbelt/ Bentong-Raub suture), followed by Late Triassic rifting, followed by second tectonic event near end-Triassic)

Racey, A. (2011)- Petroleum geology. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 351-392.

Racey, A. (2011)- Petroleum geology of Thailand- an overview. Proc. 4th Petroleum Forum: Approaching to the 21st Petroleum concession bidding round, Bangkok 2011, Department of Mineral Fuels, p. 61-63.
(online at: www.dmf.go.th/cms/assets/1/The%204th%20(DMF)%20Petroleum%20Forum%20Proceeding.pdf)
(Petroleum geology of Thailand four main areas (1) Gulf of Thailand, 13 basins, 4 with hydrocarbons (Pattani, Malay, Chumphon, Songkhla) in E-M Miocene fluvial sands, sourced from Oligocene lacustrine shales and E-M Miocene coals and lacustrine mudstones; (2) Onshore C- N Thailand Tertiary Basins: apart from Phitsanulok Basin small basins; (3) NE Thailand Khorat Plateau: principal exploration targets faulted Permian carbonates-sandstones and Late Triassic non-marine siliciclastics; (4) W Offshore Thailand Mergui Basin: no commercial discoveries yet, gas prone, stratigraphy similar to N Sumatra Basin but thicker Late Miocene-Pleistocene)

Racey, A., I.R. Duddy & M.A. Love (1997)- Apatite fission track analysis of Mesozoic red beds from northeastern Thailand and western Laos. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 1, p. 200-209.

(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7641.pdf)
(AFT analyses on Early Cretaceous fluvial sandstones from NE Thailand and SW Laos (incl. Khorat Plateau). Max. paleo-T before cooling >120° during burial. Cooling started at ~55 Ma for most samples, with possible final cooling to present outcrop between 35-25 Ma (Oligocene))

Racey, A. & J.G.S. Goodall (2009)- Palynology and stratigraphy of the Mesozoic Khorat Group of NE Thailand. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia, Geol. Soc., London, Spec. Publ. 315, p. 67-81.
(Most of NE Thailand Khorat Group redbeds of (Late Jurassic?-) Cretaceous age; Jurassic mostly absent. Khorat Gp overlies Late Triassic Nam Phong Fm and is unconformably overlain by continental evaporitic Maha Sarakham Fm, palynologically dated as M Albian-Cenomanian. Khorat Gp palynomorphs dominated by gymnosperm pollen Corollina (= Classopollis) spp. and Dicheiropollis, indicating warm, seasonally dry subtropical climate)

Racey, A., J.G.S. Goodall, M.A. Love, S. Polachan & P.D. Jones (1994)- New age data for the Mesozoic Khorat Group of Northeast Thailand. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok 1994, Dept. Mineral Res.and IGCP 306, p. 245-252.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1994/6950.pdf)
(Age of much of Khorat Gp (Late Jurassic?-) Early Cretaceous, not Jurassic). Lowermost formation of Khorat Gp (Nam Phong Fm) dated as latest Norian- Rhaetian (Ovalipoliis ovalis))

Racey, A., P.J.C. Highton, T. Lekuthai, A. Alderson & S. Polachan (1997)- Mesozoic oils and source rocks from Peninsular Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 2, p. 511-524.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7651.pdf)
(Oil-gas source rocks of mainly of E Cretaceous age at several localities in S Peninsular Thailand. Variety of fluvial, lacustrine, restricted marine and open marine environments. TOC 0.22-30%, S2 values 0.35-298 mg/g and HI 50-928 mg/g TOC. Tmax data indicate many samples are in oil window. Oil extracted from seep in E Cretaceous limestone near Phru Toei with biomarker profiles of lacustrine source. Absence of oleanane suggests oil from pre M Cretaceous source rock. Gulf of Thailand oils studied do contain oleanane)

Racey, A., M.A. Love, A.C. Canham, J.G.S. Goodall, S. Polachan & P.D. Jones (1996)- Stratigraphy and reservoir potential of the Mesozoic Khorat Group, NE Thailand: Part 1: Stratigraphy and sedimentary evolution. J. Petroleum Geol. 19, 1, p. 5-39.
(Nam Phong Fm dated for first time as Late Norian- Rhaetian, while overlying Khorat Gp reassigned to Early Cretaceous (Berriasian- Aptian). Age of intervening Phu Kradung Fm probably Late Jurassic or E Cretaceous. Changes in provenance between Nam Phong and overlying Phu Kradung Fm suggest possible sedimentary hiatus. Paleocurrent data suggest main source from N and E. Part 2 of series see Canham et al. 1996)

Racey, A., A.B. Smith & O. Dawson (1994)- Permian echinoderms from Peninsular Thailand. In: P. Angsuwathana et al. (eds.) Proc. Int. Symp. Stratigraphic correlation of Southeast Asia, Bangkok 1994, IGCP 306, Dept. Mineral Resources, p. 106-114.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1994/6941.pdf)
(Four species of crinoid (Trimerocrinus, Parabursacrinus, Timorocidaris, etc.) and one blastoid (Deltoblastus permicus) described for first time from Ratburi Lst of Peninsular Thailand. All taxa previously known mainly or only from E-M Permian of Basleo, Timor, suggesting Peninsular Thailand and Timor (Maubisse Lst) were in same faunal province around Artinskian time. Associated with Tubiphytes and 'mid-Permian' foraminifera, including Shanita amosi, Hemigordiopsis renzi, Hemigordius reicheli, Parafusilina sp., etc.)

Racey, A., R.B. Stokes, P. Lovatt Smith & M.A. Love (1997)- Late Jurassic collision in northern Thailand and the significance of the Khorat Group. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 412-413. *(Extended Abstract)*

(Khorat Gp of NE Thailand commonly assumed to be of Late Triassic- E Cretaceous age, but here argued to include only Late Triassic and E Cretaceous sediments. Possibly reflects Late Jurassic collisional event (Sibumasu- Indochina collision)

Racki, G., P. Konigshof, Z. Belka, J. Dopieralska & A. Pisarzowska (2019)- Diverse depositional and geochemical signatures of the Frasnian-Famennian global event in western Thailand reveal Palaeotethyan vs. Western Australian geotectonic affinities. J. Asian Earth Sci. X, 2, 20p.
(online at: https://www.sciencedirect.com/science/article/pii/S2590056019300064)
(Two sections of Frasnian-Famennian (Devonian) boundary sections in W Thailand differ in depositional and geochemical characteristics, confirming different paleogeographic settings. Condensed Mae Sariang limestone succession (Inthanon Zone; Paleotethys) corresponds to event-chemostratigraphic pattern of F-F biocrisis, based primarily on German sections. Thong Pha Phum site (Sibumasu terane) with peculiar W Australian biogeochemical signature. Provenance in MS succession from continental margin, in TPP section from older, continental sedimentary-metasedimentary terrains)

Remus, D., M. Webster & K. Keawkan (1993)- Rift architecture and sedimentology of the Phetchabun intermontane basin, central Thailand. J. Southeast Asian Earth Sci. 8, p. 421ï 432.
(Phetchabun Basin, onshore C Thailand is one of >30 Tertiary intermontane basins in Thailand. Composite of several N-S trending half and full graben, 1100-2500m deep, formed through transtensional dextral shear along Mae Ping fault zone. Oligocene syn-rift fluvial deposits and associated rift volcanics, followed by Oligocene-M-Miocene fluvial and lacustrine deposits. E and Late M Miocene intrusives reflect periods of igneous activity. M Miocene tectonic episode. Waxy oils and dry gas in thin bedded sandstones and igneous sills)

Reynolds, N.A., T.W Chisnali, K. Kaewsang, C. Keesaneyabutr & T. Taksavasu (2003)- The Padaeng supergene nonsulfide zinc deposit, Mae Sod, Thailand. Economic Geology 98, p. 773-785.
(Padaeng deposit near Mae Sod in NW Thailand first commercial supergene non-sulfide zinc deposit in world. Hosted by M Jurassic mixed carbonates-clastics. Formed when substantial body of sulfide ore was uplifted on margin of Mae Sod Tertiary intermontane basin, starting in M-L Miocene)

Rhodes, B.P., J. Blum & T. Devine (2000)- Structural development of the mid-Tertiary Doi Suthep Metamorphic Complex and Western Chiang Mai Basin, Northern Thailand. J. Asian Earth Sci. 18, p. 97-108.
(Doi Suthep Metamorphic Complex near Chiang Mai part of 400km long N-S trending crystalline complex, likely metamorphosed, deformed, and intruded by granitoids during Permo-Triassic collision of Shan Thai terrane with Indosinian Craton. With mylonitic gneisses and major low-angle normal faults. Complex developed between Triassic- E Miocene, with detachment and uplift during Oligocene-Miocene. Stretching lineations trend N80°W)

Rhodes, B.P., J. Blum, T. Devine & K. Ruangvataasirikul (1997)- Geology of the Doi Suthep metamorphic complex and adjacent Chiang Mai Basin. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution in Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok 1997, Dept. Mineral. Res., 1, p. 305-313.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7640.pdf)
(Doi Suthep metamorphic complex of amphibolite-grade gneisses and granitic rocks previously mapped as Precambrian, but now viewed as part of Cenozoic metamorphic core complex. Nearly uni-directional stretching lineations in complex with average N80°W trend. Zircon ages suggest likely Late Triassic granites as protoliths for orthogneiss (Dunnig et al. 1995). Peak metamorphism probably Late Cretaceous)

Rhodes, B.P., P. Charusiri, S. Kosuwan & A. Lamjuan (2005)- Tertiary evolution of the Three Pagodas Fault, Western Thailand. In: L. Wannakao et al (eds.) Proc. Int. Conf. Geology, Geotechnology and Mineral Resources of Indochina (GEOINDO 2005), Khon Kaen University, p. 498-505.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2005/9366.pdf)
(Three Pagodas Fault Zone developed as consequence of Indian-Asian collision. As NE syntaxis of India migrated N-ward, stresses rotated >100° clockwise)

Rhodes, B.P., R. Conejo, T. Benchawan, S. Titus & R. Lawson (2005)- Palaeocurrents and provenance of the Mae Rim Formation, Northern Thailand: implications for tectonic evolution of the Chiang Mai basin. J. Geol. Soc., London, 162, p. 51-63.
(Chiang Mai basin is largest of series of Tertiary rift basins in N Thailand. Several phases of extension from Late Oligocene -Quaternary, with at least two periods of basin inversion. Paleocurrent and clast-composition data from Mae Rim Fm. alluvial fans and lacustrine deposits suggest provenance from W, from low-grade metasedimentary rocks of W Ranges metamorphic complex. Most of Mae Rim Fm accumulated during uplift of Western Ranges but before erosion had breached detachment fault)

Rhodes, B.P., R. Perez, A. Lamjuan & S. Kosuwan (2002)- Kinematics of the Mae Kuang fault, northern Thailand Basin and Range Province. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 298-308.

(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6409.pdf)
(N-S tending basins characterize 'basin and range' province in N Thailand. One model for Tertiary deformation involves regional simple shear between set of sinistral faults. Newly discovered SW-NE trending Mae Kuang Fault may accommodate transfer of extension between two basins; not a throughgoing fault. Same paper as Rhodes et al. (2004) below)

Rhodes, B.P., R. Perez, A. Lamjuan & S. Kosuwan (2004)- Kinematics and tectonic implications of the Mae Kuang Fault, northern Thailand. J. Asian Earth Sci. 24, p. 79-89.
(NE trending Mae Kuang strike-slip fault does not accommodate mid-Tertiary E-W extension in N Thailand. Fault probably initiated between 20- 5 Ma, simultaneous with slip inversion on Mae Ping and Red River Faults)

Ridd, M.F. (1971)- The Phuket Group of Peninsular Thailand. Geol. Magazine 108, 5, p. 445-446.
(Brief commentary on Mitchell et al. 1970 paper on Phuket Group. Phuket Group of S Thailand stands out by great thickness and presence of pebbly mudstone. Source area was W of present-day Thailand. Numerous limestone clasts in Phuket Gp tilloids lithologically like Ordovician-Silurian Thung Song Lst)

Ridd, M.F. (2007)- A geological traverse across Peninsular Thailand. Geol. Soc. Thailand, Bangkok, Spec. Issue 1, p.

Ridd, M.F. (2008)- Khao Thalai red-beds, a Lower Triassic or older formation in Chanthaburi and Rayong Provinces, SE Thailand. In: Proc. Int. Symp. Geoscience resources and environments of Asian terranes (GREAT 2008), Bangkok, p. 36-41.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/007.pdf)
(Unfossiliferous red sandstone and conglomerate ('Khao Thalai Redbeds') on Gulf of Thailand coast SW of Chanthaburi, SE Thailand. Underlie limestone with Scythian-Anisian foraminifera, so redbeds are older than-E-M Triassic)

Ridd, M.F. (2009)- The Phuket Terrane: a Late Palaeozoic rift at the margin of Sibumasu. J. Asian Earth Sci. 36, p. 238-251.
(Kaeng Krachan Gp of Peninsular Thailand identified as infill of rift between Sibumasu and Gondwana, and given name Phuket Terrane. Rift-infill several km thick, with glacially-influenced diamictites similar to >3 km pre-M Permian rift-fill of Carnarvon Basin, W Australia. Khlong Marui Fault E boundary of rift, Three Pagodas Fault zone also rift margin. Rifting ceased in E Permian and passive margin formed as Mesotethys ocean widened. U Kaeng Krachan Gp and overlying Ratburi Lst part of post-rift)

Ridd, M.F. (2009)- Geological history of the Sibumasu Block in Peninsular Thailand: report of a Geologistsô Association Field Meeting in 2007. Proc. Geologists Assoc. 120, p. 163-174.
(Thailand two main terranes, both of Gondwana origin: Sibumasu in W, Indochina in E, which collided in Late Triassic. Cambrian-Miocene Sibumasu sediments crop out in Peninsular Thailand, as well as two N-S chains of granite plutons: Cretaceous-Paleogene age in W, Triassic further E)

Ridd, M.F. (2011)- Lower Palaeozoic. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 33-51.

Ridd, M.F. (2012)- The role of strike-slip faults in the displacement of the Palaeotethys suture zone in Southeast Thailand. J. Asian Earth Sci. 51, p. 63-84.
(Six N-S tectono-stratigraphic belts in SE Thailand: (1) W-most Belt part of Sibumasu Block, while E-most belt (5) is Permian accretionary complex on W flank of Indochina. Belt (3) volcanics and Carboniferous- Triassic sediments with distinctive faunas, interpreted to be volcanic arc; Belt (4) Triassic rocks of back-arc basin origin; Belt (6) is unconformable cover of Jurassic-Cretaceous red-beds. Triassic Indosinian Orogeny led to cratonization of SE Thailand by end-Triassic. Apparent absence of Devonian-Triassic Paleotethys Ocean (Inthanon Zone of N Thailand) in SE due to post-Indosinian sinistral strike-slip faulting)

Ridd, M.F. (2013)- A Middle Permian- Middle Triassic accretionary complex and a Late Triassic foredeep basin: forerunners of an Indosinian (Late Triassic) thrust complex in the Thailand- Malaysia border area. J. Asian Earth Sci. 76, p. 99-114.
(Semanggol Fm of NW Peninsular Malaysia is N-S belt of imbricately-thrust, deep-water, M Permian- Late Triassic sediments (radiolarian chert, sandstone, mudstone, conglomerate), and extends into Thailand. In M Permian Paleotethys began subducting beneath Indochina/ E Malaya, until end of M Triassic collision with Sibumasu. Crustal shortening continued into Late Triassic, forming foredeep basin in front of inactive subduction zone/ accretionary complex, depositing youngest part of Semanggol Fm)

Ridd, M. (2015)- A second Tethyan plate-boundary in southern Thailand: the medial Myanmar-Thai Peninsula suture. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 62-68. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(Sibumasu Block of Metcalfe (1984) and later papers subdivided into two blocks, 'Sibuma' and 'Irrawaddy', probably amalgamated in Early Cretaceous. Irrawaddy Block W of Medial Myanmar (Mitchell et al., 2012, 2015) and Thai Peninsula sutures contains (1) E part of W Burma Block, E of Sagaing Fault; (2) Karen-Tenasserim Unit with Phuket terrane; (3) N-S strip E of Khlong Marui Fault, and (4) NE Sumatra (Bohorok, Mentulu Fms). Similar boundary in SW Yunnan between Tengchong and Baoshan blocks, in Tibet between Lhasa and Qiangtang Blocks. Sumatran diamictites more closely resemble Phuket Gp than Singa Fm)

Ridd, M.F., A.J. Barber & M.J. Crow (2011)- Introduction to the geology of Thailand. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The Geology of Thailand, Geol. Soc., London, p. 1-32.

Ridd, M.F., A.J. Barber & M.J. Crow (eds.) (2011)- The geology of Thailand. Geol. Soc., London, p. 1-614.
(Comprehensive overview of geology of Thailand, including tectonic evolution, stratigraphy, petroleum, coal, minerals, igneous rocks, etc.)

Ridd, M.F. & C.K. Morley (2011)- The Khao Yai Fault on the southern margin of the Khorat Plateau, and the pattern of faulting in Southeast Thailand. Proc. Geologists Assoc. 122, p. 143-156.
(Khao Yai fault ~E-W trending fault at SW margin of Khorat Plateau probably part of strike-slip duplex of bigger Mae Ping Fault belt. Part of Paleogene transpressional deformation that affected N part of Gulf of Thailand and surrounding land areas. Deformation from ~50-60 Ma, continuing in some places to ~30 Ma)

Ridd, M.F. & I. Watkinson (2013)- The Phuket- Slate Belt terrane: tectonic evolution and strike-slip emplacement of a major terrane on the Sundaland margin of Thailand and Myanmar. Proc. Geologists Assoc. 124, 6, p. 994-1010.
(online at: http://searg.rhul.ac.uk/pubs/ridd_watkinson_2013%20Phuket%20Thailand.pdf)
(Phuket-Slate Belt terrane can be traced for 1700 km in Peninsular and W Thailand (W side of Sibumasu continental terrane). Thick Carboniferous-Lower Permian series with diamictites, interpreted as glacio-marine rift-infill, deposited when Sibumasu block separated from Gondwana. It was emplaced in Late Cretaceous-Paleogene by dextral strike-slip along Khlong Marui/ Panlaung fault system. To S, bounding-fault postulated to extend to Sumatra where it aligns with restored proto-Indian Ocean location of India- Australia transform. Emplacement of Phuket-Slate Belt terrane was result of coupling with N-going India plate, resulting in up to 450 km of dextral shift on bounding fault system)

Rigby, S.M., A.A. Bal, H.M. Burgisser, D.K. Harris, M.A. Herber, S. Thumprasertwong & S. Winkler (1992)- The Phitsanulok lacustrine basin, onshore Thailand. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015. *(Abstract only)*
(Phitsanulok basin is N-S trending intra-cratonic rift with up to 8 km of Tertiary sediments. Early rifting in Oligocene and E Miocene. Later compressional phase accompanied by basic volcanism. Lake Phitsanulok was 1000-4000 km2 body of fresh water, with up to 400m of organic-rich claystones. Lake margins coarser deltaic deposits constitute main reservoirs of Sirikit oilfield. Sukhothai Depression main kitchen, first generating oil in M Miocene. Crudes are light (40° API) and waxy, with low sulfur and a high pour point)

Roberts, T.R. & J. Jumnongthai (1999)- Miocene fishes from Lake Phetchabun in North Central Thailand, with description of new taxa of Cyprinidae, Pangasiidae and Chandidae. Natural History Bull. Siam Soc. 47, 2, p. 153-189.
(online at: www.thaiscience.info/journals/Article/NHB/10439370.pdf)
(Miocene lacustrine beds at 2-4m depth in Phetchabun intermontane basin at Ban Nong Pia, N-C Thailand with 11 species of teleosts or bony fishes)

Robinson, K. (1984)- Assessment of undiscovered conventionally recoverable petroleum resources in Tertiary sedimentary basins of Thailand. U.S. Geol. Survey (USGS), Open-File Report 84-330, p. 1-14.

Ronghe, S. & K. Surarat (2002)- Acoustic impedance interpretation for sand distribution adjacent to a rift boundary fault, Suphan Buri basin, Thailand. American Assoc. Petrol. Geol. (AAPG) Bull. 86, p. 1753-1771.
(Suphan Buri basin N-S trending onshore Tertiary non-marine rift basin in Central Plain of Thailand, between two NW-SE trending strike-slip fault zones, Mae Ping and Three Pagodas fault zones. Seismic impedance used to image water-saturated sands in producing interval of half graben. Two styles of sand distribution: axial deposits comprising delta lobes and boundary fault-induced fan deltas and feeder canyons deposits)

Saegusa, H., B. Ratanasthien & H. Nakaya (2000)- A new Miocene mammalian locality, Mae Soi and the occurrence of partial skeletons of rhinocerotids and gomophotheres from northern Thailand. Asian Paleoprimatology 1, p. 137-147
(online at: https://repository.kulib.kyoto-u.ac.jp/dspace/bitstream/2433/199736/1/aspp_01_137.pdf)
(New E or M Miocene vertebrate fossil locality in Mae Soi, Chiang Mai Province, with nearly complete gomphothere (Archaeobelodon or Gomphotherium) (elephant-like proboscideans))

Saengsrichan, W, T. Charoentitirat, A. Meesook, K. Hisada & P. Charusiri (2011)- Paleo-environments and tectonic setting of the Mesozoic Thung Yai Group in Peninsular Thailand, with a new record of *Parvamussium donaiense* Mansuy. Gondwana Research 19, 1, p. 47-60.
(online at: www.eatgru.sc.chula.ac.th/Thai/research/pdf/paper_2/107.pdf)
(300m thick late E Jurassic- E Cretaceous Thung Yai Gp along E margin of Shan Thai (=Sibumasu) block, unconformable between Triassic marine and Tertiary non-marine sediments. Dominantly brackish- non-marine clastics with few limestone beds. First record in peninsular S Thailand of pectinoid bivalve Parvamussium donaiense in Khlong Min Fm, representing Toarcian- Bajocian (E-M Jurassic) inundation after Late Triassic closure of Paleotethys (species common in NW Thailand, Vietnam, Tibet))

Saengsrichan, W., J. Sha, A. Meesook & K. Hisada (2009)- Lithostratigraphy and petrography of marine Jurassic rocks in the Mae Sot area, Tak Province, western Thailand: implications for depositional environment and tectonics. Geologiska Foren. Forhandlingar (GFF) 131, p. 83-103.
(online at: www.tandfonline.com/doi/pdf/10.1080/11035890902857895)(
(Marine Jurassic rocks from the Mae Sot area of W Thailand (near Myanmar border; part of Shan-Thai/ Sibumasu terrane): 200-832m thick, Toarcian- Bajocian age, shallow marine clastics with occasional carbonate platforms and reef flats. Three assemblages of ammonites: (1)late Toarcian (Pseudolioceras, Lytoceras and Onychoceras); (2) late Aalenian- E Bajocian (Erycites, Tmetoceras, Eumetoceras, Docidoceras); (3) M-L Oxfordian (Epimyaites, Phylloceras). Also bivalve Parvamussium donaiense)

Saesaengseerung, D. (2009)- Devonian to Triassic radiolarian biostratigraphy and depositional environments of these radiolarian-bearing rocks in Thailand. Ph.D. Thesis University of Tsukuba, p. 1-220. *(Unpublished)*

Saesaengseerung, D., S. Agematsu, K. Sashida & A. Sardsud (2009)- Discovery of Lower Permian radiolarian and conodont faunas from the bedded chert of the Chanthaburi area along the Sra Kaeo suture zone, Eastern Thailand. Paleont. Research, Palaentological Soc. Japan, 13, 2, p. 119-138.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2009/30936.pdf)

(Lower Permian (Asselian- Sakmarian) radiolarians and conodonts from bedded chert blocks in Thung Kabin melange of Chanthaburi area, SE Thailand (Sra Kaeo suture zone). Probably deposited in pelagic environment at low latitudes of S Hemisphere in Paleotethys or Paleotethyan back-arc basin)

Saesaengseerung, D. & A. Sardsud (2013)- Summary of the Devonian to Triassic radiolarian faunas from northern and northeastern Thailand along the Laos-Thai Border. In: C. Senebouttalath et al. (eds.) Proc. 2nd Lao-Tai Conf. Geology and Mineral resources, Vientiane, p. 247-252.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2013/36797.pdf)
(M Devonian- M Triassic 'Paleotethys' radiolaria along Laos-Thai border in pelagic and hemipelagic chert, and siliceous shales Assemblages: Stigmosphaerostylus variospina (M Devonian- E Carboniferous), Follicuculus scholasticus-Albaillella levis (M-L Permian) and Triassocampe deweveri (M Triassic))

Saesaengseerung, D., K. Sashida & A. Sardsud (2007)- Late Devonian to Early Carboniferous radiolarian fauna from the Pak Chom area, Loei Province, northeastern Thailand. Paleontological Research 11, 2, p. 109-121.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2007/30935.pdf)
(Famennian- Tournaisian radiolarian fauna in chert-clastic section along Khong River, Pak Chom area, NE Thailand, near Laos border. Deposited in pelagic- hemipelagic environment within E-most margin of Paleotethys Ocean/ Indochina Block in Late Devonian- E Carboniferous, probably on Nakhon Thai Block, subducted beneath Indochina Block. This suggests subduction and accretion of Naknon Thai Block continued through E Carboniferous)

Saesaengseerung, D., K. Sashida & A. Sardsud (2007)- Devonian to Triassic radiolarian faunas from Northern and Northeastern Thailand. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIǿ07), Bangkok, Dept. Mineral Resources, p. 54-71.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2007/12703.pdf)
(Radiolarian biostratigraphy of Devonian-Triassic deep marine sequences in N and NE Thailand. Twelve radiolarian zones proposed. Paleo-Tethys ocean probably existed between Shan-Thai (=Sibumasu) and Indochina terranes at least since E Devonian. Timing of collision between Shan-Thai and Indochina later than E? Carnian (early Late Triassic))

Saesaengseerung, D., K. Sashida & A. Sardsud (2008)- Discovery of Middle Triassic radiolarian fauna from the Nan area along the Nan-Uttaradit suture zone, northern Thailand. Paleontological Research 12, 4, p. 397-409.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/2009/30937.pdf)
(M Triassic radiolaria of Anisian Triassocampe deweveri fauna with Cenosphaera igoi, Annulotrassocampe, etc., in siliceous rocks at Nan area along Nan-Uttaradit suture zone, N Thailand. Deposited in pelagic environment in Nan-Uttaradit back-arc basin between Simao and Indochina blocks, suggesting this basin was connected with Paleo-Tethys and Panthalassa oceans and closed after M Triassic)

Saesaengseerung, D., K. Sashida, A. Sardsud & S. Salyapongse (2008)- Paleozoic and Mesozoic radiolarian faunas in Thailand. In: Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 186-188 *(Extended Abstract)*
(Fourteen M Devonian- M Triassic radiolarian zones identified in pelagic- hemipelagic rocks of Thailand)

Saesaengseerung, D., T. Kawinate & C. Pothichaiya (2015)- Discovery of Devonian to Carboniferous radiolarians from Central Thailand and its significance of these fauna in Thailand and Laos. Proc. 3rd Thai-Lao Techn. Conf. Geology and Mineral Resources, 2015, p. 115-134.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2015/10914.pdf)
(14 species of Late Devonian (Frasnian)- E Carboniferous (Tournasian) radiolaria in siliceous shale from E of Ban Rai, western C Thailand. With Trilonche spp., Stigmasphaerostylus spp., Albailella paradoxa, etc. Deposited on passive continental margin of Sibumasu terrane, facing Paleo-Tethys ocean)

Saifuddin, F., S. Phaungphuak, S. Matha, W. Ratawessanun & I Nengah Nuada (2012)- Recent step-out exploration in the Greater Sirikit East Area, Sirikit Oil Field, Onshore Thailand, a model for overlooked area. Inter. Petrol. Techn. Conf. (IPTC), Bangkok 2012, IPTC 14465, 17p.

(Main Sirikit oil-gas field is faulted anticline in Oligocene-Miocene Phitsanulok Basin ~400km N of Bangkok is 1981 discovery and is surrounded by smaller fields Sirikit West, Thap Raet, Sirikit East and Nong Jig. New step-out exploration in Greater Sirikit East area, including some stratigraphic trap models (updip pinchouts))

Sakagami, S. (1966)- The Permian bryozoan fauna of Ko Muk, Peninsular Thailand, with the description of the Cyclostomata. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 2, p. 255-2727.
(28 species of Permian (Artinskian) bryozoa from Ratburi Lst of Ko Muk island, W coast of Thailand, most of them new. Several species in common with Timor (Goniacladia timorensis, G. laxa, Fistulipora simillina, F wanneri, Penniretepora scalaris) and W Australia)

Sakagami, S. (1966)- The cryptostomatous bryozoa from Ko Muk, Peninsular Thailand. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 2, p. 273-287.

Silaratana, T., B. Ratanasthien K. Takayasu, W.S. Fyfe, P. Asnachinda et al. (2004)- Sulfur Isotopic implication of Middle Miocene marine incursion in Northern Thailand. Science Asia 30, p. 43-58.
(online at: www.scienceasia.org/2004.30.n1/v30_043_058.pdf)
(Sulfur isotopic study in M Miocene of Mae Moh and Chiang Muan coal fields in N Thailand suggest marine incursion occurred during deposition of the U2 coal)

Sinclair, G. (1997)- A study of the Pranburi Formation and Khao Tao Formation. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 337-345.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1997/7643.pdf)
(Metamorphic formations at E side of Upper Peninsula of Thailand near Khao Tao. Pranburi Fm paragneiss and schist, marble and quartzite originally shallow marine island arc sediments. Khao Tao Fm orthogneiss originally granite. Since peak metamorphism in Late Triassic uplifted by ~10km. Several deformation episodes. N-S to NNE-SSW trending folds and schistosity. Tied to Sibumasu- Indochina collision)

Singharajwarapan, S. (1994)- Deformation and metamorphism of the Sukhothai Fold Belt, Northern Thailand, Ph.D. Thesis, University of Tasmania, Hobart, p. 1-385.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/1994/566.pdf)
(Sukhothai foldbelt area E of Lampang in N Thailand, close to Nan Suture. Sirikit Dam area stratigraphy:(1) Permo-Carboniferous? Pha Som Metamorphic complex (intensely deformed melange with ultramafics and

metasediments with M-U Permian radiolarian chert, W-dipping), structurally juxtaposed against (2) Permian-Triassic Pak Pat Volcanics (mainly basaltic andesite lavas, minor dacites, tuffs;1500m thick?; geochemistry suggestive of rifting of intra-oceanic arc to form back arc basin), (3) unconformably overlain by Triassic Nam Pat Gp (with volcanics-rich basal conglomerates and turbiditic series with Halobia/ Daonella in upper part; >3000m?)) and (4) unconformably covered by Phra Wihan Fm non-marine sst redbeds with M Jurassic plants. Also brief study of Doi-Inthanon metamorphic complex W of Lampang)

Singharajwarapan, S. (1994)- Provenance and tectonic setting of deposition of metagreywackes in the Nan River Suture, Northern Thailand. In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA ô98), Kuala Lumpur 1998, Bull. Geol. Soc. Malaysia 43, p. 113-129.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1999012.pdf)
(Metagreywackes from Sirikit Dam area in N Thailand cover part of Nan River Suture between Shan-Thai terrane in W and Indochina in E. Belong to Pha Som Metamorphic Complex of Carboniferous-Permian pumpellyite-actinolite facies metasediments and tectonic slices of ophiolitic mafic-ultramafic rocks. Interpreted as accretionary complex on W dipping subduction zone. Metagreywacke derived from (1) quartz-rich continental island arc source, probably deposited in submarine fan setting and (2) quartz-poor oceanic island arc source. Suggests accretionary complex older than Late Triassic Shan-Thai- Indochina amalgamation)

Singharajwarapan, S. & R.F. Berry (1993)- Structural analysis of the accretionary complex in Sirikit Dam area, Uttaradit, Northern Thailand. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 233-245.
(Complexly folded Late Carboniferous- Permian metagreywakes and phyllites with enclosed mafic-ultramafic rocks in Sirikit Dam area are part of 'Nan River Ophiolite Belt', interpreted as suture between Shan-Tai in W and Indochina terrane in E. Tight isoclinal folding, S2 slaty cleavage, stretching lineations and metamorphism related to E-directed (W-dipping) accretionary thrusting)

Singharajwarapan, S. & R. Berry (2000)- Tectonic implications of the Nan Suture Zone and its relationship to the Sukhothai Fold Belt, Northern Thailand. J. Asian Earth Sci. 18, p. 663-673.
(Nan Suture and Sukhothai Fold Belt mark Shan-Thai -Indochina collision zone. Shan-Thai Terrane rifted from Gondwana in E Permian. As it drifted N, subduction complex developed along N margin. Nan serpentinitic melange is Late Permian accretionary complex with offscraped blocks from subducted Carboniferous and Permian oceanic crust. Deformational style supports W-dipping subduction zone. Late Permian-Late Triassic fore-arc basin sediments preserved in Sukhothai Fold Belt. Sequence folded and complexly thrust in Late Triassic as result of collision. Post-orogenic sediments prograded across suture in Jurassic)

Singtuen, M. & B. Phajuy (2016)- Geochemistry and tectonic significance of andesitic rocks in Tak Province, Thailand. In: Proc. 52nd Annual Session Coord. Comm. Geoscience Programmes E and SE Asia (CCOP), Bangkok, p. 65-74.
(online at: www.ccop.or.th/download/as/52as2.pdf)
(Geochemistry of M-L Triassic mildly calc-alkalic andesite porphyry from Chiang Kong- Lampang- Tak volcanic belt of NW Thailand. Erupted in volcanic arc setting)

Sinhabaedya, P. & Y. Ionnikoff (2008)- Integrating high resolution sequence stratigraphy, sedimentology and structuration in complexly faulted thin-bedded fluvio-lacustrine reservoirs, Sirikit oil fields, onshore Thailand. Proc. Int. Symp. Geoscience resources and environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 387-394.
(Sirikit oilfields in Phitsanulok basin, Thailand, started production in 1982 and reached peak production of 26,740 BOD in 2000. Over 400 wells. Field geology complex, particularly deltaic reservoir architecture)

Sitthithaworn, E. & P. Wasuwanich (1992)- Metallogenic map of Thailand. In: C. Piancharoen (ed.) Proc. Nat. Conf. Geologic Resources of Thailand-potential for future development, Dept. Mineral Resources, Bangkok, p. 1-15.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1992/6199.pdf)

(Thailand three metallogenic provinces, NE, Central (A, Cu, etc.) and West (Sn, Pb, Zn, etc.) representing continental and subduction system settings)

Smith, M., S. Chantraprasert, C.K. Morley & I. Cartwright (2007)- Structural geometry and timing of deformation in the Chainat duplex, Thailand. In: W.D. Cunningham & P. Mann (eds.) Tectonics of strike-slip restraining and releasing bends, Geol. Soc., London, Spec. Publ. 290, p. 305-323.
(Chainat N-S trending strike-slip duplex ~100 km long, developed along sinistral Mae Ping fault zone, which was active during Cenozoic. Probably began to develop towards end of main phase of escape tectonics in Thailand, i.e. around 33-30 Ma. E and Late Miocene inversions in adjacent rift basins suggests possible activity in duplex. Possible minor episodic dextral motions in Late Oligocene-Miocene and/or Pliocene-Recent)

Sone, M. (2010)- A new species of the rare neritopsid gastropod *Magnicapitatus* from the Guadalupian (Middle Permian) of East Thailand (the Indochina Terrane). Alcheringa 34, 1, p. 1-6.
(Neritopsid gastropod genus Magnicapitatus from fusulinoid-rich limestone of Khao Taa Ngog Fm (Capitanian, M Permian) at Khao Makha in E Thailand near Cambodia border, in Indochina Terrane)

Sone, M., C. Chonglakmani & A. Chitnarin (2009)- Middle Permian productidine brachiopods from Central Thailand (the Indochina Terrane) with paleobiogeographic implications. J. Paleontology 83, 5, p. 804-810.
(Assemblage of productid brachiopods Haydenella, Paraplicatifera and Compressoproductus from Wordian of U Saraburi Limestone Gp of C Thailand (W margin Indochina Terrane) suggests endemism for M Permian marine faunule of Indochina Terrane)

Sone, M., I. Metcalfe & P. Chaodumrong (2012)- The Chanthaburi terrane of southeastern Thailand: stratigraphic confirmation as a disrupted segment of the Sukhothai Arc. J. Asian Earth Sci. 61, p. 16-32.
(Chanthaburi terrane interpreted as S segment of Permo-Triassic Sukhothai Arc. In SE Thailand, extending into Cambodia, between Indochina and Sibumasu continental blocks. Klaeng tectonic line is boundary between Chanthaburi Terrane- Sibumasu block. Late Permian- Triassic largely absent due to Indosinian I unconformity (W Indochina) or mainly carbonates (Sibumasu). Brachiopod, previously reported as Leptodus, re-identified as Oldhamina, previously known elsewhere in SE Asia, in Thailand confined to Sukhothai Arc. Marine stratigraphy of Sukhothai Arc Permian-Triassic carbonates and siliciclastics with common volcanic material. Marine conditions on Sukhothai Arc terminated by end-Triassic, later than Indochina block (Late Permian) but earlier than Sibumasu block (Jurassic/ Cretaceous))

Songtham, W., J. Duangkrayom & P. Jintasakul (2012)- An Australasian tektite from the Yasothon soil series, Noen Sa-nga, Chaiyaphum, Northeastern Thailand. In: Proc. First Int. Symposium of IGCP-589, Acta Geoscientica Sinica 33, Suppl. 1, p. 59-64.
(Quarries N of Noen Sa-nga, Khorat Basin, NE Thailand, with lower fluvial gravel unit (with thin ferricrete layer at top) and upper bright reddish brown structureless sand unit with fining-upward basal portion (Yasothon soil series). Black glassy tektite (4x2 cm) found at contact between two units.Tektite deposition followed by larger-sized sediments and angular quartz fragments forming fining-upward sedimentary series. Finer sediments gradually settled down, forming Yasothon structureless sand deposit. Meteoritic impact event occurred at ~0.77 Ma)

Songtham, W., D.C. Mildenhall, P. Jintasakul & J. Duangkrayom (2011)- Evidence of sedimentary deposits generated by an Early Pleistocene meteor impact in Northeastern Thailand. In: Int. Conf. Geology, Geotechnology and Mineral Resources of Indochina (GEOINDO 2011), Khon Kaen, p. 66-71.
(Yasothon soil horizon wide distribution in Khorat basin, NE Thailand. Probably 'loess', catastrophically generated by Pleistocene meteor impact in Buntharik, Ubon Ratchathani, at ~0.7-0.8 Ma, as dated by tektites (Bunopas 1990; part of Australasian strewnfield). Yasothon soils with 10-30 cm thick basal breccia, with sharp angular rock fragments (incl. tektites at base, fining upward into structureless silt -fine sand, interpreted as

airfall deposit. Size of basal breccia coarser in E than in W, suggesting impact site in E, possibly circular raised ridge 13km across, W of Phanom Phrai)

Srichan, W. (2008)- Petrochemistry, geochonology and tectonic implication of the Chiang Khong-Lampang-Tak Volcanic belt, Northern Thailand. Ph.D. Thesis, University of Tasmania, p. 1-284. *(Unpublished)*
(Chiang Khong-Lampang-Tak volcanic belt part of Sukhothai Fold Belt in N Thailand, between Chiang Mai (lnthanon) and Nan-Sra-Kaeo sutures. Here suggested to form in post-collisional, extensional Basin and Range-type setting (crustal thickening due to late M Triassic collision between Shan-Thai and Indochina terranes, followed by rifting led to post-collisional magmatism). Zircons U-Pb ages mainly late M-early Late Triassic (220-230 Ma). Permian zircons in Late Triassic igneous rocks possibly inherited from Permian granites. Detrital zircons in belt's sediments indicate Late Devonian-E Carboniferous, Permian and Late Triassic rocks exposed in provenance areas. Thin-skinned, mainly E-directed fold-thrust deformation. Unconformably overlain by Latest Triassic- E Jurassic Khorat Gp molasse)

Srichan, W. (2011)- Petrology and geochronology of igneous rocks from Thoen District, Lampang Province, Northern Thailand. Proc. Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2011), Khon Kaen, p. 54-57.
(Granites and andesitic mafic dykes from Thoen District, Lampang, in S part of Chiang Khong-Lampang-Tak volcanic belt (= C part of Sukhothai Fold Belt; 240-220 Ma). Mafic rocks evolved from basalt- andesite and have calc-alkalic composition, erupted in continental margin arc environment associated with subduction zone. U-Pb zircon ages of felsic igneous rocks 231 Ma (late M Triassic); dykes are younger)

Srichan, W. (2015)- Age dating of rocks in the Chiang Khong-Lampang-Tak Volcanic belt, northern Thailand. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 77-78. *(Abstract only)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(U-Pb-Th zircon ages of igneous and sedimentary rocks in Chiang Khong-Lampang-Tak volcanic belt in middle part of Sukhothai Fold Belt. Most volcanic belt igneous rocks crystallized in late M- early Late Triassic (216-237 Ma) and show zircon age groups of ~ 220 Ma and ~230 Ma. Permian zircons (261-280 Ma) possibly inherited from Permian granites. Detrital zircons in sedimentary rocks in belt indicate Devonian-Carboniferous, Permian and Late Triassic rocks in provenance areas)

Srichan, W., A.J. Crawford & R.F. Berry (2009)- Geochemistry and geochronology of Late Triassic volcanic rocks in the Chiang Khong region, Northern Thailand. Island Arc 18, 32-51.
(Chiang Khong segment of Chiang Khong-Lampang-Tak Volcanic Belt (part of Sukhothai volcanic arc) in NW Thailand composed of three meridional sub-belts of mafic-felsic volcanic, volcaniclastic, and associated intrusive rocks. Associated sedimentary rocks mainly non-marine red beds. Late Triassic (223-220 Ma; Norian) zircon ages of lavas. E Sub-belt dominated by mafic lavas transitional between E-mid-oceanic ridge basalt and back-arc basin basalts. Dominance of felsic lavas and mainly non-marine associated sediments suggest post-collisional extensional setting)

Srinak, N., K. Hisada, Y. Kamata & P. Charusiri (2007)- Stratigraphy of the Mae Sariang Group of Northwestern Thailand:implication for paleoenvironments and tectonic setting. Natural History J. Chulalongkorn University 7, 2, p. 87-108.
(online at: www2.biology.sc.chula.ac.th/web%20of%20NHJCU%20PDF/7-2,%2087-108.pdf)

(M-L Triassic deep marine clastics of Mae Sariang Gp of NW Thailand in narrow N-S belt and ~900m thick, conformably over deformed Permian marine clastics and unconformably below subhorizontal Jurassic clastics. Conglomerate-lithic sandstone near base with Halobia and Daonella cf. sumatrensis bivalves, mainly mudstone and radiolarian chert in middle and with abundant Halobia and Posidonia bivalves near top of section. Interpreted as deposits of Permian-Triassic intra-cratonic basin (branch of Paleotethys?), within Shan-Tai Terrane, which closed in Late Triassic (Ishida et al. 2006 proposed this belt as main Paleotethys suture; JTvG))

(Khao Khad Fm of Saraburi Group in C Thailand is sequences of limestone, dolomitic limestone and silty shale with nodular and banded cherts. Fifteen rock units distinguished. Deposited during major transgressive-regressive cycle in Lower- M Permian)

Thanasuthipitak, T. (1978)- Geology of Uttaradit area and its implications on tectonic history of Thailand. Proc. 3rd Regional Conf. Geology and Mineral Resources of SE Asia (GEOSEA III), Bangkok, p. 187-197.
(Suture zone in NW Thailand between Indochina- Sibumasu plate, with ophiolites, etc., reflecting W-dipping Permo-Carboniferous subduction/ continental collision zone)

Thanasuthipitak, T. (1978)- A review of igneous rocks of Thailand. In: P. Nutalya (ed.) Proc. 3rd Regional Conf. Geology and Mineral Resources of SE Asia (GEOSEA III), Bangkok, p. 775-782.
(Brief review of Late Carboniferous- Cretaceous granitic rocks of N, W and SE Thailand and Thai Peninsula, ultramafic-mafic rocks of NW Thailand and volcanics)

Thanasuthipitak, T. & T. Sirinawan (1986)- Petrochemistry of gem-bearing basalt in the Nong Bon area, Trat Province, Eastern Thailand. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 2, Bull. Geol. Soc. Malaysia 20, p. 503-521.
(Gem deposits of Thailand (ruby, sapphire, zircon, garnet) associated with three belts of weathered Late Cenozoic basalt deposits)

Thanomsap, S. (1983)- Stratigraphic sequences and facies distributions in the Mae Sot Basin. In: Conf. Geology and Mineral Resources of Thailand, Bangkok, p. 367-376.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1983/10619.pdf)
(Late Tertiary Mae Sot intramontane basin in W Thailand with >2000m of fluvial-lacustrine sediments unconformably over Triassic-Jurassic limestones)

Thanomsap, S. & S. Sitahirun (1992)- The Mae Sot oil shale. In: C. Piencharoen (ed.) Proc. Nat. Conf. Geologic resources of Thailand: potential for future development, Bangkok, Dept. Min. Resources, p. 676-691.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1992/6258.pdf)
(On Miocene lacustrine oil shale in Mae Sot Basin, Tak Province, W Thailand. Oil shale beds 5- 100' thick. Generally low quality (average oil yield 5% by weight), minor quantities of higher quality (>10% oil). Explored since 1939, but no viable commercial development yet)

Thasod, Y., P. Jintasakul & B. Ratanasthien (2012)- Proboscidean fossil from the Tha Chang sand pits, Nakhon Ratchasima Province, Thailand. J. Science Technol. Mahasarakham University (MSU), 31, p. 33-44.
(online at: ttps://www.khoratgeopark.com/kgp/researchs/2012_Thasod_283-293-1-PB.pdf)
(Eight genera of Proboscidean fossils in sand pits in Nakhon Ratchasima province, NE Thailand, of families Dienotheriidae (Prodeinotherium, Gomphotherium, Tetralophodon, Sinomastodon, Protanancus), Stegodontidae (Stegolophodon, Stegodon) and Elephantiidae (Elephas). Ages M Miocene- Pleistocene)

Thassanapak, H., C. Chonglakmani, Q. Feng, J. Grant-Mackie & N. Thanee (2007)- Middle Triassic radiolarians from Den Chai Area, Northern Thailand. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: towards sustainable development and sufficiency economy (GEOTHAIœ07), Bangkok, Dept. Mineral Resources, p. 180-186.
(Den Chai area at S edge of Cenozoic Phrae basin in NW Thailand with Lampang Gp marine Triassic, incl. Wang Chin Fm with Halobia, Paleocardita, Posidonia. M Triassic (Anisian-Ladinian) radiolarians extracted from maroon siliceous rocks, S of Den Chai, incl. Triassocampe deweveri, T. coronata, T. scalaris, Muelleritortis spp., etc. Interpreted as deposited offshore of extensional continental margin)

Thassanapak, H. Q.L. Feng, J. Grant-Mackie, C. Chonglakmani & N. Thanee (2011)- Middle Triassic radiolarian faunas from Chiang Dao, Northern Thailand. Palaeoworld 20, 2, p. 179-202.
(64 species of Late Anisian radiolarians from 9m thick thin-bedded chert sequence N of Chiang Dao indicates deep marine environment in NW Thailand (seaway between E and W Paleotethys). Beds probably from tectonic slice in Carboniferous- M Triassic sequence overlain by Triassic igneous rocks. Can be correlated with E zone of Changning-Menglian Belt in SW Yunnan, China)

Thassanapak, H., M. Udchachon & C. Burrett (2012)- Devonian conodont, radiolarian, and tentaculitid assemblages in the Indochina Terrane. Proc. First Int. Symposium of IGCP-589, Xi'an, China 2012, Acta Geologica Sinica 33, Suppl. 1, p. 65-66 *(Abstract)*
(online at: http://igcp589.cags.ac.cn/pdf/29-THASSANAPAK,%20UDCHACHON%20et%20al.pdf)
(In E margin of Indochina Terrane along Troungson Foldbelt in C Laos, localities in Lak Xao and Sepon districts contain radiolarians (Trilonche spp.) and tentaculitids (Homoctenus ultimus, Costulatostylionina vesca), indicating Frasnian age. In W margin of Indochina Terrane Pak Chom in Loei, Thailand, Late Devonian radiolarian cherts)

Thassanapak, H., M. Udchachon, C. Burrett & Q. Feng (2017)- Geochemistry of radiolarian cherts from a Late Devonian continental margin basin, Loei fold belt, Indo-China terrane. J. Earth Science (China) 28, 1, p. 29-50.

(online at: http://en.earth-science.net/PDF/20170110101143.pdf)
(>42 species of U Devonian (Frasnian-Famennian) radiolaria in cherts-siliceous shales in NE Thailand sector of Loei fold belt (Indochina terrane). Geochemistry suggests continental margin environment near volcanic arc, different from U Devonian cherts from N Thailand, Truong Son foldbelt (Laos) and S China. U Devonian deep marine sequences in Loei fold belt deposited in rifted continental margin basin, possibly back-arc basin, not in large oceanic basin)

Thassanapak, H., M. Udchachon, C. Chonglakmani & Q. Feng (2011)- Geochemistry of Middle Triassic radiolarian cherts from northern Thailand: implication for depositional environment. J. Earth Science (China) 22, 6, p. 688-703.
(M Triassic radiolarian cherts from N Thailand (Chiang Dao, Lamphun, Den Chai) of biogenic origin. Geochemistry suggests M Triassic radiolarian cherts deposited in deeper part of residual basin. Main Paleotethys which closed during Late Triassic should be located further to W)

Thassanapak, H., M. Udchachon, Q. Feng & C. Burrett (2017)- Middle Triassic radiolarians from cherts/siliceous shales in an extensional basin in the Sukhothai Fold Belt, Northern Thailand. J. Earth Science (China) 28, 1, p. 9-28.
(online at: http://en.earth-science.net/PDF/20170110100741.pdf)
(>30 species of Late Ladinian radiolaria from red chert- siliceous shales in E of Sukhothai fold belt, incl. Muelleritortis cochleata, M. expansa, Triassocampe deweveri, T. coronata, T. scalaris, Annulotriassocampe companilis, A. multisegmantatus, A. sulovensis, Pseudostylosphaera spp., Canoptum inornatus, C. levis, Corum kraineri, Spongoserrula rarauana, Orbiculiforma karnica and others. Assemblages correlated with Fang-Chiang Dao and Lumphun areas in N Thailand and Changning-Menglian belt of W Yunnan. Interpreted deposited in extensional continental margin in Sukhothai fold belt/ Lampang-Phrae Basin, not in Devonian-Permian back-arc basin of Nan suture)

Thienprasert, A. & M. Raksaskulwong (1984)- Heat flow in northern Thailand. Tectonophysics 103, p. 217-233.
(Heat flow in N Thailand highly variable. Four regions with high heat-flow, over 100 mW/m2: Fang oil fields, San Kamphaeng geothermal area, Mae Sot and W margin of Khorat plateau)

Thongboonruang, C. (2008)- Petroleum source rock potential of NE Thailand. Proc. 2nd Petroleum Forum: Blooming era of Northeastern Thailand, Bangkok 2008, Department of Mineral Fuels, p. 33-50.

Tien, Nguyen D. (1988)- Note on two "Incertae sedis" from the Permian of West Thailand. In: H. Fontaine & V.Suteethorn (eds.) Late Paleozoic and Mesozoic fossils of West Thailand and their environments, Comm. Co-Ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok, Techn. Bull. 20, p. 109-111.
(Two organisms of uncertain affinity relatively common in Permian of W Thailand: (1) Rectostipulina quatrata, a small tube, square in section; also known from Turkey, Cyprus, Iran, Afghanistan, etc.; (2) Sphairionia sikuoides n.gen., n.sp., a small bubble that may be foraminifer or fossil of algal affinity; known from Cambodia, Thailand, Malay Peninsula (= also 'Sibumasu fossil' subsequently reported from Oman, etc.?; JTvG))

Tingay, M.R.P., C.K. Morley, R.R. Hillis & J. Meyer (2010)- Present-day stress orientation in Thailand's basins. J. Structural Geol. 32, p. 235-248.
(Borehole breakouts in wells from 6 basins indicate N-S Smax in S Thailand and Gulf of Thailand, inconsistent with those predicted from India- Eurasia collision. Stresses from Sumatran-Andaman subduction zone may have resulted in significant deformation in offshore Thailand)

Tofke, T., A. Lumjuan & D. Helmcke (1993)- Triassic syn-orogenic siliciclastics from the area of Mae Sariang (northwestern Thailand). In: T. Thanasuthipitak (ed.) Int. Symposium Biostratigraphy of mainland Southeast Asia: facies and paleontology (BIOSEA), Chiang Mai 1993, 1, Chiang Mai University, 2, p. 391-400.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1993/7490.pdf)

(In Mae Sariang area of NW Thailand, dissecting 'Shan-Tai craton' is zone of oceanic Permian and E-M Triassic radiolarian ribbon cherts overlain by M-L Triassic syn-orogenic siliciclastics with Ladinian- Carnian Posidonia and Halobia. Coarse grained beds with pebbles of chert, metamorphic and plutonic rocks)

Tong, H., E. Buffetaut & V. Suteethorn (2002)- Middle Jurassic turtles from southern Thailand. Geol. Magazine 139, 6, p. 687-697.
(New cryptodiran turtle, from M Jurassic Mab Ching locality, in S peninsula of Thailand (Sibumasu Block). Closely resembles species M- L Jurassic of China and C Asia)

Tong, H., J. Claude, E. Buffetaut, V. Suteethorn, W. Naksri & S. Chitizing (2006)- Fossil turtles of Thailand: an updated review. In: J.C. Lu et al. (eds.) Papers from the 2005 Heyuan International dinosaur symposium, Geological Publishing House, Beijing, p. 183-194.

Tong, H., J. Claude, W. Naksri, V. Suteethorn, E. Buffetaut, S. Khansubha, K. Wongko & P. Yuangdetkla (2009)- *Basilochelys macrobios* n. gen. and n. sp., a large cryptodiran turtle from the Phu Kradung Formation (latest Jurassic-earliest Cretaceous) of the Khorat Plateau, NE Thailand. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia, Geol. Soc., London, Special Publ. 315, p. 153-173.

Tong, H., J. Claude, V. Suteethorn, W. Naksri & E. Buffetaut (2009)- Turtle assemblages of the Khorat Group (Late Jurassic-Early Cretaceous) of NE Thailand and their palaeobiogeographical significance. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia, Geol. Soc., London, Spec. Publ. 315, p. 141-152.
(Late Jurassic- E Cretaceous turtle assemblages from Khorat Gp mainly trionychoids (Basilochelys, Isanemys srisuki, Kizylkumemys, Shachemys sp., etc.) (Aptian). Some faunal links between turtle faunas from Khorat Group and those from peripheral regions of Asia)

Tong, H., W. Naksri, E. Buffetaut, V. Suteethorn, S. Suteethorn, U. Deesri et al. (2014)- A new primitive eucryptodiran turtle from the Upper Jurassic Phu Kradung Formation of the Khorat Plateau, NE Thailand. Geol. Magazine 152, 1, p. 166-175.
(Phunoichelys thirakhupti n.sp. is nearly complete primitive xinjiangchelyid turtle shell from Tithonian/ Berriasian fluvial deposits of Phu Kradung Formation, Khorat Gp., at Phu Noi, NE Thailand. Xinjiangchelyid turtles are dominant components in turtle faunas of U Jurassic of China and C Asia. Formation previously considered of Late Jurassic age, but palynology favors E Cretaceous age (Racey & Goodall 2009))

Tong, H., V. Suteethorn, J. Claude, E. Buffetaut & P.Jintasakul (2005)- The turtle fauna from the Khok Kruat Formation (Early Cretaceous) of Thailand. In: Proc. Int. Conf. Geology, Geotechnology and Mineral Resources of Indochina (GEOINDO 2005), Khon Kaen, p. 610-614.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2005/9385.pdf)
(Two fresh water turtle species from Cretaceous non-marine beds of Khorat Plateau, resembling Aptian-Albian forms of Laos and C Asia. Associated with Aptian-Albian hybodont sharks and Aptian palynomorphs)

Tongtherm, K., J Nabhitabhata, P. Srisuk. T. Nutadhira & D. Tonnayopas5 (2016)- New records of nautiloid and ammonoid cephalopod fossils in peninsular Thailand. Swiss J. Palaeontology 135, 1, p. 153-168.
(30 species of nautiloids and ammonoids identified from peninsular Thailand (+Shan-Thai/ Sibumasu). Ordovician nautiloids, Devonian-Carboniferous ammonoids, Triassic nautiloids (Michelinoceras, Tienoceras and syringonautilid nautiloids. Etc.))

Toriyama, R. (1944)- On some fusulinids from Northern Tai. Japanese J. Geology Geography 19, p. 243-247.
(Mid-Permian Pseudoschwagerina-dominated fusulinid assemblage from N Thailand)

Toriyama, R. (1965)- Fusuline fossils from Thailand, Part I, Fusulines of the Rat Buri Limestone of Thailand. Mem. Fac. Science Kyushu University, ser. D, 27, 1, p. 1-69.

Toriyama, R. (1975)- Fusuline fossils from Thailand. Part IX. Permian fusulines from the Rat Buri Limestone in the Khao Phlong Phrab area, Sara Buri, Central Thailand. Mem. Fac. Science, Kyushu University, Ser. D, 23, p. 1-116.
(Systematic descriptions and vertical distribution of 91 species/26 genera of fusulinid forams from 225m thick late Early- M Permian Ratburi Limestone section in C Thailand. Overall assemblage 'of Tethyan aspect', with Verbeekina, Neoschwagerina, also Parafusulina, rare Monodiexodina (but is on Sibumasu Plate?; JTvG). No locality maps, but described earlier in Toriyama, Kanmera et al. 1974; vol. 14 of this series)

Toriyama, R. (1976)- Fusuline fossils from Thailand. Part IX. Permian fusulines from the Rat Buri Limestone in the Khao Phlong Phrab area, Sara Buri, Central Thailand. In: T. Kobayashi & W. Hashimoto (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 17, p. 1-116.
(Same paper as Toriyama 1975, Mem. Fac. Science Kyushu University, above. Systematic descriptions and vertical distribution of 91 species/26 genera of fusulinid forams from 225m thick late Early- M Permian Ratburi Limestone section in C Thailand)

Toriyama, R. (1984)- Summary of the fusuline faunas in Thailand and Malaysia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 137-146.
(Brief review of localities with Carboniferous- Permian fusulinid forams in Ratburi Lst and equivelents in Thailand and Malaysia: 265 species belonging to 70 genera)

Toriyama, R. & K. Kanmera (1968)- Fusulinacean fossils from Thailand, Part II: Two new Permian genera from Thailand. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 4, p. 29-44.
(Two new fusulinid genera Thailandina and Neothailandina described from rich fusulinid assemblages in 275m thick Rat Buri Limestone section at Phao Phlong Phrab, NE Thailand (names deemed invalid by Kobayashi et al. 2010). Section ranges from Misellina zone to lower part of Neoschwagerina zone (upper Lower- lower M Permian))

Toriyama, R. & K. Kanmera (1977)- Fusuline fossils from Thailand. Part X. The Permian fusulines from the Limestone Conglomerate Formation in the Khao Phlong Phrab area, Sara Buri, Central Thailand. In: T. Kobayashi, R. Toriyama & W. Hashimoto (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 18, p. 1-28.

Toriyama, R. & K. Kanmera (1979)- Fusuline fossils from Thailand. Part XII. Permian fusulines from the Rat Buri Limestone in the Khao Khao area, Sara Buri, Central Thailand. In: T. Kobayashi, R. Toriyama & W. Hashimoto (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 20, p. 23-93.
(Limestone quarries at Khao Khao hill, N of Saraburi, N Thailand, expose ~360m thick Permian Ratburi Limestone section. Abundant fusulinid foraminifera, 34 species, representing only part of Middle Permian, in four zones: Afghanella megaspherica to Neoschwagerina haydeni)

Toriyama, R., K. Kanmera & R. Ingavat (1969)- Fusulinacean fossils from Thailand. Part V. *Neofusulinella* from Thailand. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 7, p. 15-32.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/1969/24353.pdf)
(E-M Permian fusulinids Neofusulinella sarburiensis n.sp., N. praecursor and N. lantenoisi from lower part of 'Ratburi Lst' in Khao Phlong Khrab section, Changwat Sara Buri, C. Thailand. Genus ranges from Misellina zone to Neoschwagerina simplex zone and is good indicator of upper Lower- lower Middle Permian. New species Neofusulinella sariburiensis n.sp.)

Toriyama, R., K. Kanmera, S. Kaewbaidhoam & A. Hongnushonthi (1974)- Biostratigraphic zonation of the Rat Buri Limestone in the Khao Phlong Phrab area, Sara Buri, Central Thailand. In: T. Kobayshi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 14, p. 25-48.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/1974/10.pdf)
(late Early-Middle Permian 'Ratburi Lst' at Khao Phlong Phrab Hill section, NE Thailand, ~250m thick and very rich in fusulinids (81 species, 26 genera). Subdivided into 7 zones (Misellina - Maklaya- Neoschwagerina-Presumatrina zones). High affinity of fauna with SE Pamir, S China and Japan)

Toriyama, R. & K. Pitakpaivan (1973)- Fusulinacean fossils from Thailand, Part VII: Middle Permian fusulines from Wat Kirinakratanaram, Central Thailand. In: T. Kobayshi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 12, p. 43-61.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/1973/12082.pdf)
(lower M Permian fusulinids from Ratburi Lst near Kirinakratanaram Temple, Changwat Lop Buri, C Thailand. With Neofusulinella lantenoisi, Parafusulina gigantea, Verbeekina verbeeki, Sumatrina annae, Pseudodoliolina pseudolepida, etc.)

Toriyama, R., K. Pitakpavan & R. Ingavat (1978)- The paleogeographic characteristics of fusuline faunas of the Rat Buri Group in Thailand and its equivalent in Malysia. In: P. Nutalaya (ed.) Proc. 3rd Regional Conf. Geology and Mineral Resources of SE Asia (GEOSEA III), Bangkok 1978, p. 128-132.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_3/2521-2530/9492.pdf)
(Permian 'Ratburi Lst' (s.l.) of Thailand with 238 species of fusulinids. Subdivided in 3 paleogeographic zones (1) Western zone with 41 species; in M Permian with Verbeekina verbbeki, Sumatrina annae, Neoschwagerina, etc.; U Permian fusulinds (Paleofusulina, Colaniella) only found in W; belt appears to extend into Malay Peninsula and N Kalimantan; (2) Central zone: little known fusulinids; (3) Eastern zone in Loei, etc., with 197 M Carboniferous- M Permian species. Fusuline faunas of Thailand and Malaysia close relationship to W Tethys in M-U Carboniferous. In Permian stronger affinity to E Tethys. No maps)

Toriyama, R. & T. Sugi (1959)- Permian fusulinids from Central Thailand. Mem. Fac. Science., Kyushu University, Series D, 9, 1, p. 17-32.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/1959/12083.pdf)
(Fusulinids from 4 samples of Permian Rat Buri limestones and cherts in Sara Buri district of C Thailand. All referable to Neoschwagerina zone. With Neoschwagerina spp., Parafusulina gigantea, Pseudofusulina crassa, Verbeekina and Sumatrina)

Tsubamoto, T., B. Ratanasthien, Y. Kunimatsu, H. Nakaya, B. Udomkan, T. Silaratana et al. (2003)- A report on the paleontological excavation in the primate-bearing Krabi basin (late Eocene; Thailand). In: Research Report III on 'Evolution of the apes and the origin of the human beings', Primate Research Institute, Kyoto University p. 180-219.
(Vertebrate fossils from Late Eocene lignite beds of Krabi coal mine in S Thailand 6 genera of reptiles and 28 genera of mammals, incl. two primates (Wailekia, Siamopithecus). Krabi fauna dominated by artiodactyl mammals, particularly anthracotheres (Anthracotherium, etc.). Paleoenvironment tropical forests with swamps)

Tulyatid, J. & J.D. Fairhead (1999)- Tectonic development of Central Thailand: new evidences from airborne geophysical data. In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geol. Min. Energy Res. SE Asia (GEOSEA '98), Kuala Lumpur 1998, Geol. Soc. Malaysia 43, p. 63-76
(online at: www.gsm.org.my/products/702001-100833-PDF.pdf)
(Review of Thailand structural geology and aeromagnetic maps of C Thailand)

Tumpeesuwan, S., Y. Sato & S. Nakhapadungrat (2010)- A new species of *Pseudohyria (Matsumotoina)* (Bivalvia: Trigonioidoidea) from the Early Cretaceous Sao Khua Formation, Khorat Group, Northeastern Thailand. Tropical Natural History 10, p. 93-106.
(online at: www.biology.sc.chula.ac.th/TNH/v10%20no1/8%20Tumpeesuwan%2093-106.pdf)
(New freshwater bivalve species, P. (Matsumotoina) somanai n. sp. from E Cretaceous Sao Khua Fm of NE Thailand. Interpreted as fluvial species, probably of Late Barremian age)

Udchachon, M., C. Burrett, H. Thassanapak, C. Chonglakmani, H. Campbell & Q. Feng (2014)- Depositional setting and paleoenvironment of an alatoconchid-bearing Middle Permian carbonate ramp sequence in the Indochina Terrane. J. Asian Earth Sci. 87, p. 37-55.
(M Permian carbonate sequence in S of Khao Khwang Platform, C Thailand (= tropical Tethyan shelf of Indochina Terrane). With common large alatoconchid bivalves. Nine main microfacies types. Platform evolved from rimmed platform in E Permian to ramp in M Permian. Abrupt negative shift in d 13C in late Wordian and late Capitanian indicate significant changes in paleoenvironment, probably contemporaneous with Kamura event and related to global cooling and sea-level lowstand)

Udchachon, M., C. Chonglakmani, H. Campbell & N. Thanee (2007)- Late Middle Permian alatoconchid-bearing limestones from the south of the Khao Khwang platform, central Thailand. In: W. Tantiwanit (ed.) Proc. Int. Conf. Geology of Thailand: towards sustainable development and sufficiency economy, Bangkok, p. 169-176.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2007/12718.pdf)
(Thick-shelled, alatoconchid tropical bivalves in M Permian Khao Khwang platform Permian limestones, exposed in Phetchabun fold-thrust belt along W edge of Khorat Plateau, C Thailand (W side of Indochina Block). Midian-age limestone with fusulinids (Colania, Lepidolina, Verbeekina, Neoschwagerina), and smaller forams (Hemigordius, Agathammina, Pachyphloia, Tuberitina, Tetrataxis) and algae (incl. Mizzia velebitana). Six main microfacies and facies model. Alatoconchids prefer soft substrate with peloidal wackestone texture of lagoon facies)

Udchachon, M., H. Thassanapak & C. Burrett (2017)- Palaeoenvironment and palaeogeography of Middle and Upper Devonian strata from the Loei fold belt, Indochina terrane (northeast Thailand). Palaeobiodiversity and Palaeoenvironments 97, 3, p. 497-516.
(Limestone-chert sections from Loei foldbelt, NE Thailand, yielded M-L Devonian (Givetian- Famennian) conodonts and Late Devonian radiolarian faunas. M Devonian siliciclastics interbedded with volcaniclastics and locally replaced by pillow basalts. Conformably overlain by argillaceous limestones and U Givetian reefal stromatoporoid-coral limestone. Drowning of bioherms and deposition of condensed continental margin oozes with radiolarians Trilonche spp and Famennian conodonts Palmatolepis spp.. Transgressive M-U Devonian series broadly similar to sections in S China and in Germany. Continental margin series)

Udchachon, M., H. Thassanapak, Q. Feng & C. Chonglakmani (2011)- Geochemical constraints on the depositional environment of Upper Devonian radiolarian cherts from Loei, north-eastern Thailand. Frontiers Earth Sci. 5, 2, p. 178-190.
(Late Devonian radiolarian chert sequences on Indochina terrane of NE Thailand exposed in narrow belt E of Loei province. Characterized by high silica content, high aluminum, low iron, etc. Results indicate cherts deposition in continental margin environment)

Ueno, K., M. Arita, S. Meno, A. Sardsud & D. Saesaengseerung (2015)- An Early Permian fusuline fauna from southernmost Peninsular Thailand: discovery of Early Permian warming spikes in the peri-Gondwanan Sibumasu Block. J. Asian Earth Sci. 104, p. 185-196.
(late Early Permian fusuline fauna from Tarn To Fm of Yala area in S-most Peninsular Thailand (=E margin of Sibumasu Block, near base Ratburi Lst). Fauna consists of Pseudofusulina spp. and Praeskinnerella? sp., including forms resembling Tethyan and Panthalassan Pseudofusulina fusiformis and P. ex gr. kraffti. Likely Yakhtashian-Bolorian (=late Artinskian- E Kungurian) age. Similar Tethyan-affinity shallow marine fauna in Sibumasu in E Permian of Kinta Valley area in W Peninsular Malaysia. Yala fauna almost coeval with Monodiexodina fauna known elsewhere on Sibumasu Block. Interpreted as warming spikes during late Yakhtashian-Bolorian transgression)

Ueno, K. & T. Charoentitirat (2011)- Carboniferous and Permian. In: M.F. Ridd, A.J. Barber & M.J. Crow (eds.) The geology of Thailand, Geol. Soc., London, p. 71-136.

(Extensive review of Carboniferous and Permian of Thailand. Stratigraphy and tectono-sedimentary development of five main domains: Indocina, Nan back-arc basin, Sukhothai Arc, Palaeotethyan (Inthanon Zone) and Sibumasu)

Ueno, K., T. Charoentitirat, Y. Sera, A. Miyahigashi, J. Suwanprasert et al. (2008)- The Doi Chiang Dao Limestone: Paleo-Tethyan mid-oceanic carbonates in the Inthanon Zone of North Thailand. In: Proc. Int. Symp. Geoscience resources and environments of Asian Terranes (GREAT 2008), Bangkok 2008, p. 42-48.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/008.pdf)
(Doi Chiang Dao Lst in Inthanon zone of N Thailand >1000m thick continuous Carboniferous (Visean)- latest Permian (= 90 My) succession of mid-oceanic shallow marine carbonates without clastics, formed on seamount basalt base in Paleo-Tethys Ocean. Rich in fusulinids, some corals, paleo-tropical Tethyan affinities. Comparable in origin to carbonate bodies in Central zone of Changning-Menglian Belt of SW China and Panthalassan seamount carbonates in accretionary complexes in Japan)

Ueno, K., M. Ejima, Y. Kamata, T. Charoentitirat & A. Sardsud (2005)-Stratigraphy and sedimentary cycles of the Permian Kaeng Krachan Group of Phi Phi Island southern Thailand. In: Proc. Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2005), Khon Kaen, p. 555-557.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2005/9376.pdf)
(E Permian Kaeng Krachan Gp on Phi Phi Island off Krabi, S Peninsular Thailand, part of Sibumasu Block. Cyclic, ~350m thick quartz-rich marine clastics, including sparse dropstones, overlain by temperate-subtropical Ratburi Limestone. Formed in glaciation-influenced basin. No figures)

Ueno, K. & K. Hisada (2001)- The Nan-Uttaradit-Sa Kaeo Suture as a main Paleo-Tethyan suture in Thailand: is it real? Gondwana Research 4, p. 804-806. *(Extended Abstract)*
(In Thailand Nan-Uttaradit-Sa Kaeo Suture believed to be main Paleo-Tethyan suture between Cathaysian Indochina Block and Gondwana-derived Sibumasu Block of E Cimmerian continent, but is best interpreted as remnant of Nan back-arc basin. Paleotethys is represented by Chiang Rai tectonic line)

Ueno, K. & H. Igo (1993)- Upper Carboniferous foraminifers from Ban Na Din dam, Changwat Loei, Northeastern Thailand. Trans. Proc. Palaeont. Soc. Japan, N.S., 171, p. 213-228.
(online at: www.palaeo-soc-japan.jp/download/TPPSJ/TPPSJ_NS171.pdf)
(Limestone outcrops at Ban Na Din Dam, E of Loei, NE Thailand. Previously assigned to Lower Permian Nam Mahoran Fm, but with fusulinids Triticites samaricus and Jigulites grandis n.sp., indicating Gzhelian (latest Carboniferous) age. Also descriptions of smaller foraminifera)

(Mid-Tertiary palynology from 9 basins in Thailand. Zonation based on key species like Inaperturopollenites dubius, Alnipollenites verus, etc.. Paleoclimate in Thailand temperate in Late Oligocene, warming to more tropical conditions in E-M Miocene)

Watanasak, M. (1989)- Palynological zonation of Mid-Tertiary intermontane basins in northern Thailand. In: T. Thanasuthipitak & P. Ounchanum (eds.) Proc. Int. Symposium Intermontane basins, geology and resources, Chiang Mai University, Chiang Mai, p. 216-223.

Watanasak, M. (1990)- Mid-Tertiary palynostratigraphy of Thailand. J. Southeast Asian Earth Sci. 4, 3, p. 203-218.
(Late Oligocene- E Miocene palynological assemblages from nine basins in Thailand. Basis for zonations is first or last appearances of species incl. Inaperturopollenites dubius, Alnipollenites verus and Echiperiporites cf. estelae. Correlation between terrestrial and dated marine sequences)

Waterhouse, J.B. (1981)- Age of the Rat Buri Limestone of southern Thailand. In: J.B. Waterhouse et al. (eds.) The Permian stratigraphy and palaeontology of Southern Thailand, Geological Survey Mem. 4, Dept. Mineral Resources, Bangkok, p. 1-42.
(Mainly critical evaluation of Grant (1976). Brachiopods from basal part of Rat Buri Limestone in S Thailand likely of Kungurian (late E Permian) age, not Baigendzinian (= Artinskian) as reported earlier, and in agreement with fusulinid data. Several specific links with Kungurian Bitauni fauna of Timor. No stratigraphy)

Waterhouse, J.B. (1981)- Age of the brachiopod faunas from Kaeng Krachan Formation of southern Thailand. In: M.J. Hambrey & W.B. Harland (eds.) Earth's pre-Pleistocene glacial record, Cambridge University Press, p. 336. *(Abstract only)*
(Brachiopods above earliest Permian glacial pebbly mudstone in S Thailand 40 species, mainly new species of Orthotetes, Chonetinella, Neospirifer, Sririferrella, etc. Most common is new form of Spinomartinia. Probably of mid-Sakmarian age suggested by Brachythyrina rectangulus and Neospirifer sterlitamakensis. Small fauna from pebbly mudstones at Ko Muk could be Asselian or Sakmarian age. Overlain by Rat Buri Lst with rich brachiopods of Kungurian age)

Waterhouse, J.B. (1982)- An Early Permian cool-water fauna from pebbly mudstones in south Thailand. Geol. Magazine 119, 4, p. 337-354.

(E Permian (Asselian) small brachiopod fauna from above E Permian pebbly mudstones- sandstones of Phuket Gp at Ko Muk and Ko Phi Phi islands, Andaman Sea. With Komukia, Cancrinelloides, Rhynchopora, Sulciplica, etc. At one locality associated with solitary coral Euryphyllum. Most genera are found in temperate-high paleolatitudes, suggesting pebbly mudstones are cool water deposits, contemporaneous with Late Asselian Gondwana glacial deposits (=Sibumasu terrane'; JTvG))

Waterhouse, J.B. (1982)- New Carboniferous brachiopod genera from Huai Bun Nak, North-east Thailand. Palaontol. Zeitschrift 56, 1-2, p. 39-52.
(Five new brachiopod genera and species are described from brown silty mudstone near Huai Bun Nak, NE Thailand)

Waterhouse, J.B. (1983)- A late Permian lyttoniid fauna from Northwest Thailand. Papers Dept. of Geology, University of Queensland, 10, 3, p. 113-153.
(25 Lopingian (Late Permian) brachiopod species in marine shale in Huai Tak Fm of Lampang Province, NW Thailand. With common lyttoniid brachiopod Oldhamina squamosa and new taxa Lampangella lata, Transennatia pitakpaivani, Acosarina antesulcata, etc.)

Waterhouse, J.B., K. Pitakpaivan & N. Mantajit (1981)- Early Permian brachiopods from Ko Yao Noi and near Krabi, southern Thailand. In: J.B. Waterhouse et al. (eds.) The Permian stratigraphy and palaeontology of Southern Thailand, Geol. Survey Mem. 4, Dept. Mineral Resources, Bangkok, p. 43-213.
(40 brachiopod species from SW Peninsular Thailand near Krabi and NE of Phuket, in U Kaeng Krachan Gp just below Rat Buri Lst and mostly above pebbly mudstones (= Sibumasu stratigraphy). Likely age Sakmarian (E Permian). Most common species Spinomartinia prolifica, also common Retimarginifera, Brachythyrina, Stenoscisma, Stereochia, etc. No obvious correlation with SE Asian faunas outside Thailand)

Waterhouse, J.B. & S. Piyasin (1970)- Mid-Permian brachiopods from Khao Phrik, Thailand. Palaeontographica, Abt. A, 135, 3-6, p. 83-197.
(40 species of silicified brachiopods from limestone at Khao Phrik, W of Bangkok, S Thailand. Incl. Neospirifer, Marginifera, Hustedia, Leptodus and Waagenites speciosus n.sp., close to W. molengraaffi (Broili) from Timor Bitauni beds. Fauna lacks cool water elements. Some species in common with Basleo fauna of Timor)

Wathanakul, P., S. Nakapudungaat, S. Sakkaravej & P. Lomthong (2001)- Diamonds from the eastern offshore of Phuket island, Thailand. 28th Int. Gemmological Conference, Madrid, p. 101-104.

Wathanakul, P., T.T. Win, R.M. Davis, S. Sakkaravej, A. Andrew & W.I. Griffin (1998)- Characteristics of diamonds, southern Thailand. In: Ninth Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA '98), Kuala Lumpur, p. 101-102. *(Extended Abstract)*
(Diamonds found in on- and offshore alluvial deposits in tin dredger samples in Takuapa-Phang Nga and Phuket areas, S Thailand. Source unknown. Area mainly covered with Carboniferous-Tertiary granites. Inclusions include graphite, sulfides, olivine, Cr-pyrope and chromite, indicating predominantly harzburgitic paragenesis)

Watkinson, I. (2009)- The kinematic history of the Khlong Marui and Ranong Faults, Southern Thailand. Ph.D. Thesis Royal Holloway, University of London, p. 1-505. *(Unpublished)*

Watkinson, I., C. Elders, G. Batt, F. Jourdan, R. Hall & N.J. McNaughton (2011)- The timing of strike-slip shear along the Ranong and Khlong Marui faults, Thailand. J. Geophysical Research, Solid Earth, 116, 9, B09403, 26p.
(Ranong and Khlong Marui faults experienced major ductile dextral shear in M Eocene (48-40 Ma), which followed two phases of dextral shear along Ranong Fault: before Late Cretaceous (>81 Ma) and Late Paleocene- E Eocene (59-49 Ma). Many sheared rocks part of pre-kinematic crystalline basement, which partially melted and was intruded by Late Cretaceous (81-71 Ma) and E Eocene (48 Ma) tin granites. Late Eocene (<37 Ma) faults reactivation as curved sinistral branches of Mae Ping and Three Pagodas faults, accommodating lateral extrusion during India-Asia collision and Himalayan orogenesis)

Watkinson, I., C. Elders & R. Hall (2008)- The kinematic history of the Khlong Marui and Ranong Faults, southern Thailand. J. Structural Geol. 30, p. 1554-1571.
(Khlong Marui (KMF) and Ranong Fault (RF) NNE-trending strike-slip faults dissecting peninsular Thailand. Two phases of ductile dextral shear, separated by Campanian magmatism. Paleocene-Eocene post-kinematic granites date end of this phase. Brittle sinistral phase deforms granites, and exhumed ductile fault rocks. Faults formed near S margin of Late Cretaceous-Paleocene orogen, and may have been influenced by variations in rate of subduction. N-S compression prior to reactivation of subduction around southern Sundaland in Eocene caused widespread deformation in overriding plate, including sinistral transpression on KMF and RF)

Wolfart, R. (2003)- Ordovician faunas (Trilobita, Ostracoda, Cystoidea, Crinoidea) from West Thailand. their significance for biostratigraphy and palaeobiogeography. Geol. Jahrbuch B94, p. 1-265.
(Descriptions of Ordovician faunas from Khanchanaburi, Tong Pha Phum and Bo Noi regions and their meaning for biostratigraphy and paleogeography)

Wonganan, N. (2005)- Radiolaria and radiolarites of Northern Thailand- paleontology, tectonic and palaeogeographic implications. Ph.D. Thesis, Universite Sciences Technologies de Lille, Villeneuve d'Ascq, p. 1-577. *(Unpublished)*

Wonganan, N. (2012)- The youngest radiolarians from Mae Hong Son region, Northern Thailand; implication for the tectonic of Southeast Asia. In: Proc. 13th Interrad Conf., Cadiz 2012, Radiolaria Newsletter 28, p. 196-197. *(Abstract only)*
(Rich Triassic radiolaria in ~100m thick section of bedded siliceous rocks N of Mae La Noi, Mae Hong Son province, NW Thailand, representing Paleo-Tethys Ocean deposits. 55 species, including Palaeosaturnalis triassicus, Vinassaspongus subsphaericus, Capnuchosphaera crassa, etc., indicating U Ladinian- Carnian age. Top of section of E-M Norian age (Capnuchosphaera crassa, Multimonilis, etc). Chert in uppermost part of section with significant siliciclastics and carbonate minerals, indicating gradual change from deep oceanic environment to continental marginal realm. Therefore, Paleo-Tethys almost closed in middle Late Triassic)

Wonganan, N. & M. Caridroit (2005)- Middle and Upper Devonian radiolarian faunas from Chiang Dao area, Chiang Mai province, northern Thailand. Micropaleontology 51, 1, p. 39-58.

(Diverse Devonian radiolarians in ribbon-bedded chert in accretionary complex N of Chiang Dao, Chiang Mai, N Thailand, part of newly described (Paleotethys) suture zone. M Devonian- M Permian (and younger?) 'Chiang Dao chert series' is (imbricated?) oceanic sequence ~300m thick. Rich radiolarian assemblages with 43 species, Entactinaria dominant. Trilonche minax (lower Frasnian) assemblage from Australia recognized in area. Radiolarian cherts evidence for presence of wide paleo-ocean between Shan-Thai and Indochina continental terranes)

Wonganan, N. & M. Caridroit (2005)- Devonian radiolarians from Pai District, Mae Hong Son, northern Thailand. In: Int. Conf. Geology, geotechnology and general resources of Indochina (GEOINDO 2005), Khon Khaen 2005, p. 637-648.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2005/9389.pdf)
(Late Devonian radiolaria in highly folded cherts between Pai and Mae Hong Song, NW Thailand (Paleotethys oceanic deposit) (partly same localities as Sashida et al. 1998))

Wonganan, N. & M. Caridroit (2006)- Middle to Upper Permian radiolarian faunas from chert blocks in Pai area, northwestern Thailand. Eclogae Geol. Helvetiae 99, Suppl. 1, p. 133-139.
(Well-preserved Permian radiolarians in chert blocks in Mae Hong Son province, NW Thailand, recently mapped as Carboniferous. Twenty-four taxa, incl. Follicucullus charveti, believed to define Equatorial warm water province. In N Thailand Devonian- Triassic was zone of deep marine sedimentation, one of longest records of continuous deposition in oceanic setting)

Wonganan, N., M. Caridroit & C. Randon (2003)- The ''Chiang Dao radiolarian chert' in the Chiang Dao area, Northern Thailand: a witness of a 150 My (at least ?) of oceanic deposit. In: 10th Meeting Int. Assoc. Radiolarian Paleontologists (Interrad X), Lausanne, Program and Abstracts, p. 116-117. *(Abstract only)*
(Big M Devonian- Permian chert body rich in radiolarians crops out for 2 km along N107 near Chiang Dao city. Also called 'Fang Chert'. Thickness ~300m, including ~50m volcanic bed. Overlies several m of black siliceous shale with graptolites (Monograptus) of early Lower Devonian age)

Wonganan, N., C. Randon & M. Caridroit (2009)- Mississippian (Early Carboniferous) radiolarian biostratigraphy of northern Thailand (Chiang Dao area). Geobios 40, 6, p. 875-888.
(Five E Carboniferous radiolarian assemblage zones recognized in ribbon-bedded radiolarites N of Chiang Dao, N Thailand. About 300m thick series of M Devonian- M-L Triassic distal oceanic deposits present in N Thailand, reflecting long-lived (150-200 My) Paleotethys oceanic realm between Indochina and Shan-Thai continental terranes)

Wongpornchai, P. (1997)- Origin of the formations in Nong Bua Basin, Central Thailand. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 1, p. 210-217.

(Ordovician conodont biostratigraphy of Sibumasu terrane in Thailand- Langkawi- N Malaysia. Faunal affinity of conodonts suggest Sibumasu was close to both Australia and N China, at that time located in low paleolatitudes)

Agematsu, S., K. Sashida & A. Sardsud (2008)- Early and Middle Paleozoic conodont paleobiogeography and paleoenvironments on the Sibumasu Block. Proc. Int. Symp. Geoscience resources and environments of Asian terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 1753-1760.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/060.pdf)
(Ordovician- E Devonian sea-level curve of Sibumasu Block in Thailand and NW Malaysia shows five regressions. Conodonts reflect tropical domain and closely related to Australia and N China in Tremadocian-Dapingian (E-M Ordovician), changing to middle- high-latitudes before Katian (Late Ordovician))

Aitchison, J.C., G.L. Clarke, T.R. Ireland, K. Lokho, A. Ao, S.K. Bhowmik, T. Roeder et al. (2016)- New age constraints on the evolution of the Naga Hills: radiolarians and radiometric. In: Development of the Asian Tethyan Realm: genesis, process and outcomes, 5th Int. Symposium Int. Geoscience Program (IGCP) Project 589, Yangon, p. 54. *(Abstract only)*
(online at: http://igcp589.cags.ac.cn/5th%20Symposium/Abstract%20Volume.pdf)
(Naga Hills in Indo-Myanmar Ranges dominated by Cenozoic sediments structurally overlying Indian passive-margin sequence. Near India-Myanmar border imbricate thrust stack also contains sheets of ophiolitic melange. Ophiolite disrupted and overlain by Eocene shallow marine sediments of Phokphur Fm. Further E high-grade metamorphic units thrust W-wards over ophiolite. Well-preserved Jurassic, Cretaceous and Paleo-Eocene radiolarians together with U/Pb data from ophiolitic and metamorphic units. New detrital zircon ages suggest derivation of some units from Sibumasu rather than Lhasa or Qiangtang terranes)

Ali, J.R., H.M.Z. Cheung, J.C. Aitchison & Y. Sun (2013)- Palaeomagnetic re-investigation of Early Permian rift basalts from the Baoshan Block, SW China: constraints on the site-of-origin of the Gondwana-derived eastern Cimmerian terranes. Geophysical J. Int. 193, 2, p. 650-663.
(online at: https://academic.oup.com/gji/article-pdf/193/2/650/1772194/ggt012.pdf)

(Paleomagnetic data from E Permian Woniusi Fm rift basalts of Baoshan block (SW China) suggest this part of E Cimmerian terrane detached from E Gondwana at ~42°S (34.2-51.2°S) (similar to Huang & Opdyke 1991 results on paleolatitude). Gondwana estoration: Baoshan fits against in narrow longitudinal belt close to NE Greater India and NW Australia; Sibumasu lay directly to E, off Australia; Qiangtang and Lhasa sat to W, off N Greater India- SE Arabia (see also Xu et al. 2015, who arrive at slightly lower paleolatitudes))

Ali, J.R., G.M. Thompson, M.F. Zhou & X. Song (2005)- Emeishan large igneous province, SW China. Lithos 79, p. 475-489.
(Emeishan large igneous province of SW China volcanic and upper-intrusive portion of province is relatively small. Most reliable age dates (zircon U-Pb SHRIMP) from intrusive body indicate generation at ~259 Ma, consistent with end-Guadalupian (end M Permian) age. Magnetostratigraphic data and field observations suggest bulk of volcanic sequence formed within 1-2 My. Geochemistry of volcanics and studies of underlying Maokou Fm suggests mantle plume generated province)

Ali, J., J. Fitton & C. Herzberg (2010)- Emeishan large igneous province (SW China) and the mantle-plume up-doming hypothesis. J. Geol. Soc., London, 167, p. 953-959.
(M Permian (~262 Ma) Emeishan Basalts of SW China commonly cited example of large igneous province that formed as result of mantle plume generating large regional-scale up-doming prior to volcanism. Support idea that ELIP was generated by plume that originated in mantle, but amount and lateral extent of uplift significantly less than predicted by conventional deep-mantle plume models. Large-scale doming may not be diagnostic feature of mantle plumes)

Allen, R., Y. Najman, A. Carter, D. Barfod, M.J. Bickle, H.J. Chapman, E. Garzanti, G. Vezzoli, S. Ando & R.R. Parrish (2008)- Provenance of the Tertiary sedimentary rocks of the Indo-Burman Ranges, Burma (Myanmar): Burman arc or Himalayan-derived? J. Geol. Soc. London, 165, p. 1045-1057.
(Indo-Burman Ranges in W Myanmar extend along Sunda Arc subduction zone and may be divided into W part of Neogene and E part of Paleogene sediments, separated by fault. Paleogene Indo-Burman Ranges contain significant arc-derived material from Burmese portion of Mesozoic-Tertiary arc to E. U-Pb dating on detrital zircons shows dominant zircon populations of (~55-150 Ma) in Paleocene; also Cambro-Ordovician and Precambrian age. Old populations possibly sourced from Himalaya or Burmese margin. Neogene Indo-Burman Ranges dominant derivation from Himalaya; minor arc-derived component may have been sourced from Trans-Himalaya, or recycled from arc-derived Paleogene Indo-Burman Ranges)

Amos, B.J. (1975)- Stratigraphy of some of the Upper Palaeozoic and Mesozoic carbonate rocks of the Eastern Highlands, Burma. Newsletters Stratigraphy 4, p. 49-70.
(Stratigraphy of Permian- Triassic 'Plateau Limestone' from E Myanmar Highlands (Sibumasu/ Shan-Tai block). Permian with fusulinids Yangchienia, Verbeekina, Parafusulina, etc. Locally extensive diagenetic dolomitisation; incomplete dolomitisation in some areas. Permian. Triassic carbonates at least 2500m thick)

Anderson, M.M., A.J. Boucot & J.G.Johnson (1969)- Eifelian brachiopods from Padaukpin, northern Shan States, Burma. Bull. British Museum (Natural History), Geology, 18, 4, p. 107-163.
(online at: http://ia600708.us.archive.org/4/items/bulletinofbritis18brit/bulletinofbritis18brit.pdf)
(M Devonian articulate brachiopods from weathered 'Lower Plateau Limestone' in Padaukpin area, NE of Maymyo area, E of Mandalay, associated with colonies of tabulate corals and stromatoporoids. Brachiopod fauna 32 species, similar to West Yunnan faunas and with marked affinity with Eifelian of W Europe (stronger affinity with Europe than USSR))

Ao, A. & S.K. Bhowmik (2014)- Cold subduction of the Neotethys: the metamorphic record from finely banded lawsonite and epidote blueschists and associated metabasalts of the Nagaland Ophiolite Complex, India. J. Metamorphic Geol. 32, p. 829-860.
(Thermal history of subducting Neotethys, using metabasalts from serpentinitic melange in segment of Nagaland Ophiolite Complex. Tectonically disturbed Cretaceous? metamorphic sequence, from W to E: (1) greenschist, (2) pumpellyite- diopside and (3) lawsonite/ glaucophane and epidote/glaucophane blueschist facies. Low T gradient of 8°C/km, corresponding to 40 km max. burial depth, suggest cold intra-oceanic

subduction zone setting for Nagaland blueschists. Metamorphics suggest presence of intra-oceanic subduction systems within Neotethys also between Indian and Burmese plates)

Ariffin, M.M.M., Kyaw Linn Oo, M.H.B.A. Wahab, Nyunt Shwe & M Khairil (2017)- Lower Miocene carbonate play in the Pyay sub-basin, onshore Myanmar: Reservoir characterization for prospectivity de-risking. AAPG/EAGE/MGS 3rd Oil & Gas Myanmar Geosciences Conf., Yangon, 11p. *(Extended Abstract)*
(Underexplored Lower Miocene carbonate play in Pyay sub-basin of C Myanmar, with Htantabin oil field (1979-1987))

Aung, A.K. (1995)- New Middle Devonian (Eifelian) rugose corals from Myanmar. J. Southeast Asian Earth Sci. 11, p. 23-32.
(Eight new species of M Devonian (Eifelian) rugose corals from Padaukpin and Pwepon areas in N Shan State, N Myanmar. Genera Phacellophyllum, Peripaedium, Pterorrhiza, Dohmophyllum, Temnophyllum and Puanophyllum reported for first time from Myanmar. Some Myanmar forms resemble species from Eifelian of SW China and E Australia)

(First record of U Devonian sediments and ammonoids (goniatite Beloceras and Tornoceras) in Myogyi area, Sino-Burman Ranges, E Myanmar, so far unknown from all of SE Asia (= Precambrian- Mesozoic shelf series of 'Sibumasu Terrane'))

Aung, A.K. & L.R.M. Cocks (2017)- Cambrian-Devonian stratigraphy of the Shan Plateau, Myanmar (Burma). In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 14, p. 317-342.
(Sibumasu (Shan-Thai) Terrane of Shan Plateau with common limestone-dominated Cambrian - Devonian rocks, which, before Permian were part of N Gondwana margin. By M Cambrian (~510 Ma) Myanmar part of Sibumasu sector of Gondwana straddled equator and was close to NW Australian sector. Some acidic Cambrian volcanics, but passive margin setting from E Ordovician- end Carboniferous)

Aung, A.K. & K. Min (2011)- Stratigraphy of the Lower Devonian sediments in the northwestern Shan Plateau, Myanmar. Bull. Geol. Soc. Malaysia 57, p. 55-67.
(online at: http://geology.um.edu.my/gsmpublic/BGSM/bgsm57/bgsm2011008.pdf)
(Lower Devonian sediments in NW Shan Plateau of C Myanmar with rich micro- and macrofauna, including graptolites (Monograptus atopus, M. helmckei), trilobites (Cornuproetus), tentaculids (Nowakia acuaria), conodonts) (*Eognathodus sulcatus), rugose corals, etc. Can be correlated with neighboring regions in NW Malay Peninsula, Thailand and China (= part of Sibumasu stratigraphy; JTvG))*

Aung, H.H. (2009)- Recognition of Paleo-Tethys Suture Zone in eastern Myanmar. Acta Geoscientica Sinica 30, Suppl.1, p. 1-3.
(Closure of Paleo-Tethys Ocean marked by collision between Shan Massif and Indochina plate in E Myanmar. Now complex zone of suturing and deformation along Than Lwin River, extending N to Yunnan (Changning-Menglian belt) and S into West Thailand (Inthanon Zone). Also large complex of Late Triassic granites)

Aung, H.H. (2015)- Delineation of western boundary of Paleo-Tethys suture zone in Myanmar. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 1-3. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf))
(On western boundary fault of Paleo-Tethys suture zone in E Myanmar)

Aung, N.S., O. Chavasseau, Y. Chaimanee, C. Sein, J.J. Jaeger, X. Valentin & S. Ducrocq (2017)- New remains of *Siamotherium pondaungensis* (Cetartiodactyla, Hippopotamoidea) from the Eocene of Pondaung, Myanmar: paleoecologic and phylogenetic implications. J. Vertebrate Paleontology 37, 1, p.
(Well preserved skull of small anthracothere from late M Eocene of Pondaung Fm, attributed to Siamotherium pondaungensis. New material confirms it is anthracothere and not helohyid. Most likely terrestrial, open-forest animal with an omnivorous diet. Both species of Siamotherium confirms basal position in Hippopotamoidea)

Aung, N.S., Myitta, S.T. Tun, A.K. Aung, T. Thein, B. Marandat, S. Ducrocq & J.J Jaeger (2002)- Sedimentary facies of the late Middle Eocene Pondaung Formation (central Myanmar) and the palaeoenvironments of its anthropoid primates. Comptes Rendus Palevol 1, p. 153-160.

Aung, P.S., C. Satirapod & C.O. Andrei (2016)- Sagaing Fault slip and deformation in Myanmar observed by continuous GPS measurements. Geodesy and Geodynamics 7, 1, p. 56-63.
(GPS stations along dextral Sagaing Fault suggest E side of fault moves SE at ~32-40 mm/yr, whereas W side moves NE at ~31-35 mm/yr)

Aung Zaw Myint, Khin Zaw, Ye Myint Swe, K. Yonezu, Yue Cai, T. Manaka & K. Watanabe (2017)- Geochemistry and geochronology of granites hosting the Mawchi Sn-W deposit, Myanmar: implications for tectonic setting and emplacement. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 17, p. 385-400.
(Mawchi Mine in Myanmar is historic world-class Sn-W deposit in SE Asia tin province (world's largest tin–tungsten quartz vein system exploited before WW II). M Eocene (~43 Ma) Mawchi granite small pluton at W side of Shan Plateau with biotite granite and tourmaline granite, derived from melting of crustal rocks. Part of Cretaceous-Paleogene Western granite province (with nearby granites generally older: ~48-60 Ma)

Aung Zaw Myint, K. Yonezu, A.J. Boyce, D. Selby, A. Schersten, T. Tindell, K. Watanabe & Ye Myint Swe (2018)- Stable isotope and geochronological study of the Mawchi Sn-W deposit, Myanmar: implications for timing of mineralization and ore genesis. Ore Geology Reviews 95, p. 663-679.
(World-class Mawchi Sn-W mineralization in N-S trending steeply dipping quartz veins, hosted by Eocene granite and Carboniferous- E Permian metasediments. Three stages of ore formation; (1) tourmaline-cassiterite stage (2) main ore stage and (3) sulfide stage (with 40Ar/39Ar magmatic biotite age of ~41.5 Ma and zircon U-Pb age of 42.7 Ma. Sn-W mineralization synchronous with late Eocene granitic magmatism)

Ba Maw, R.L. Ciochon & D.E. Savage (1979)- Late Eocene of Burma yields earliest anthropoid primate *Pondaungia cotteri*. Nature 282, p. 65-67.

Bannert, D. & D. Helmcke (1981)- The evolution of the Asian plate in Burma. In: Alfred Wegener Symposium, Berlin 1980, Geol. Rundschau 70, 2, p. 446-458.
(Post-Cretaceous evolution of Asian Plate in Burma strongly influenced by spreading of E Indian Ocean and N-ward movement of 'Greater India'. During end of Mesozoic E part of Burma emerged from ocean; W part formed shelf area with slowly W-wards migrating Indoburman geosyncline to W (U Cretaceous flysch). Emergence of Indoburman Ranges in Miocene, generating Outer Island Arc and forming Bay of Bengal. Approach of continental Indian crust led to thrusts in N part of Indoburman Ranges. Today subduction active only S of 18°N in E Bay of Bengal)

Bannert, D., A. Sang Lyen & T. Htay (2011)- The geology of the Indoburman Ranges in Myanmar. Geol. Jahrbuch B101, p. 5-101.
(Indoburman Ranges are W-most unit in Myanmar and represent accretionary wedge formed by Late Mesozoic-Paleogene-Neogene marine sediments with transitions into molasse-type sediments. Four geological units. Most rocks Tertiary age, with widespread units of U Cretaceous, Albian and Cenomanian. Triassic (Carnian-Norian) flysch part of E Indoburman Ranges; Jurassic sediments absent. C Chin Hills of E Indoburman Ranges with U Cretaceous- Paleocene Kanpetlet Schists (metamorphosed Triassic flysch); Naga metamorphic rocks possibly similar, but age still undetermined. Common serpentinised ultrabasics, especially along continental splinter of W Burma Plate. Docking of W Burma Plate onto Eurasia margin at 83 Ma, followed by continent- continent collision of India Plate. During Late Himalayan collision, many young strike-slip faults developed, hampering reconstruction of original sedimentary regions. Tectonic contacts very steep)

Barber, A.J., K. Zaw & M.J. Crow (eds.) (2017)- Myanmar: geology, resources and tectonics. Geol. Soc., London, Memoir 48, p. 1-759.
(Major, modern review of geology of Myanmar by collective of expert authors)

Barber, A.J., K. Zaw & M.J. Crow (2017)- The pre-Cenozoic tectonic evolution of Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 31, p. 687-712.
(Myanmar 7 N-S tectonic units, from W to E: (1) Indo-Myanmar Ranges (accretionary prism); (2) W Myanmar (Burma) Block (metamorphic basement overlain by Cenozoic C Myanmar Basins); (3) Mogok Metamorphic Belt (high-grade metamorphic core complex with Late Oligocene- E Miocene exhumation age, and granitoids); (4) Slate Belt (Mergui Gp with Late Carboniferous- Permian diamictites and intruded by Late Jurassic- E Cretaceous granodiorites); (5) Paunglaung Mawchi zone (isoclinally folded Shan Plateau margin rocks), (3,4,5 = Shan Scarps area) and (7) Shan Plateau (Paleozoic- Triassic stratigraphy, part of Sibumasu Terrane). Indochina Block does not extend into Myanmar. Mt Victoria/ West Burma Block identified in literature, but E margin of this block against Sibumasu, conventionally identified as Sagaing Fault, not clearly defined. Cenozoic development of Myanmar profoundly affected by N-ward movement of India and collision with Eurasia at ~50 Ma, resulting in ~70° rotation of whole country)

Barley, M.E., A.L. Pickard, K. Zaw, P. Rak & M.G. Doyle (2003)- Jurassic to Miocene magmatism and metamorphism in the Mogok metamorphic belt and the India-Eurasia collision in Myanmar. Tectonics 22, 3, 1019, p. 1-11.
(Mogok metamorphic belt at W margin of Shan-Thai terrane. Deformed granitic orthogneisses contain Jurassic (~170 Ma) zircons, partly recrystallized during ~43 Ma high-grade metamorphism. Syenite from Mandalay Hill also with Jurassic zircons with evidence of Eocene metamorphic recrystallization rimmed by thin zones of ~31 Ma magmatic zircon. Abundance of Jurassic zircons consistent with Andean-type margin at S Eurasia at that time. Mid-Cretaceous- E Eocene (120-50 Ma) I-type granitoids in MMB and W Myanmar confirm up to 200 km wide magmatic belt along Eurasian margin from Pakistan to Sumatra (K-Ar cooling ages 79-100 Ma; Allen et al. 2008))

Basu, P., R. Verma, R. Paul & K. Viswanath (2010)- Deep waters of Rakhine Basin - a new frontier? Proc. 3rd Biennial Int. Conf. Petroleum Geophysics, Hyderabad 2010, P-160, 7p.
(online at: https://www.spgindia.org/2010/160.pdf)

(Offshore Rakhine frontier basin in E part of Bay of Bengal, off Myanmar, with Shwe (2003) and Shwe Phyu and Mya subsequent gas discoveries, all three with biogenic gas in deep marine Lower Pliocene sandstones. Also postulated thermogenic petroleum system in Cretaceous sequence. Rakhine Basin merges with Andaman Nicobar-Sunda- Java foredeep basins system to South)

Baxter, A.T., J.C. Aitchison, S.V. Zyabrev & J.R. Ali (2011)- Upper Jurassic radiolarians from the Naga Ophiolite, Nagaland, northeast India. Gondwana Research 20, p. 638-644.
(Cherts from ophiolitic melange near Salumi, Nagaland, NE India, part of Naga- Andaman suture (Neotethys/Mesotethys oceanic material?) with U Jurassic (Kimmeridgian- lower Tithonian) radiolaria. Significantly older than fossils previously reported from this melange, but similar to radiometric ages from associated igneous units)

Beard, K.C., L. Marivaux, Y. Chaimanee, J.J. Jaeger, B. Maranda, P. Tafforeau, A.N. Soe, S.T. Tun & A.A. Kyaw (2010)- A new primate from the Eocene Pondaung Formation of Myanmar and the monophyly of Burmese amphipithecids. Proc. Royal Society, Biological Sciences, 276, p. 3285-394.
(online at: http://rspb.royalsocietypublishing.org/content/royprsb/276/1671/3285.full.pdf)

(Sandstone petrographic and U-Pb detrital zircon geochronologic data from Ordovician- Jurassic of Sibumasu terrane in Shan State. Ordovician-Silurian sandstones dominated by 567-470 Ma and 982-917 Ma zircons, sourced from E Gondwana continent. Carboniferous meta-sandstones strong 1165-1070 Ma zircon age peak, likely derived from Albany-Fraser Province in SW Australia and Maud Province in Antarctic. U Triassic- Lower Jurassic Loi-an Gp clastics over Permian- M Triassic Plateau Limestone Gp, with abundant Permian-Triassic detrital zircons (215 Ma and older) from Sukhothai Arc in E. Sibumasu terrane juxtaposed against NW Australia until E Permian time. Late Triassic change in provenance to Sukhothai Arc)

Cao, R.G. (1986)- Discovery of Late Carboniferous glacial-marine deposits in Western Yunnan. Geol. Rev. 32, 3, p. 236-242.
(U Carboniferous Dingjiazhai Fm in W Yunnan represented by glacio-marine strata. Lower part littoral diamictite, middle part glacio-marine strata with cold-water fauna of Stepanoviella and Eurydesma, upper part with fusulinids such as Triticites, of Late Carboniferous age. Similar to strata in India, Nepal, Bhutan, Tibet, Burma, Thailand, Malaysia and Australia. Baoshan and Tengchong areas belong to Gondwanaland (NB: age more likely E Permian; see Ueno et al. 2003))

Carter, P. (2015)- Exploration potential of the Rakhine Basin/Bengal Fan, Offshore Myanmar. Proc. 2015 SE Asia Petroleum Expl. Soc. (SEAPEX) Conf., Singapore, 2.1, p. 1-27 *(Abstract + Presentation)*
(Myanmar large number of oil fields discovered, but most are small. Bulk of production from five fields: Yenangyaung, Chauk/Lanywa, Myanaung, Pyay and Mann. Onshore/offshore Cretaceous- Pliocene Rakhine Basin along W coast of Myanmar part of M Eocene- Recent accretionary prism in front of colliding India. N part of basin thick Pliocene- Recent Bengal Fan sediments, which extend from mouths of Brahmaputra and Ganges rivers to oceanic crust in Bay of Bengal. At least 10 onshore and 17 offshore exploration wells. Two proven petroleum systems: nearshore oil and offshore biogenic gas)

Catlos, E.J., E. Reyes, M. Brookfield & D.F. Stockli (2016)- Age and emplacement of the Permian-Jurassic Menghai batholith, Western Yunnan, China. Int. Geol. Review 59, 8, p. 919-945.
(Menghai batholith in W Yunnan is S extension of ~370km long Lincang granite body that syntectonically intruded Paleotethys collision zone between Gondwanan Baoshan block and Laurasian Simao block. Crustal anatexis of Menghai granodiorites related to post-collisional lithosphere delamination and upwelling of hot asthenosphere, forming large-volume melts. Zircon ages from ~3234 to 172 Ma. Inherited zircons Carboniferous (~318 Ma) and older. Crystallization ages Permian- E Jurassic, with ages decreasing from centre of batholith to E perimeter from ~227- 211 Ma to 212- 171 Ma respectively. Collision and closure of branch of Paleotethys here over ~100 Myr period (Permian (281 Ma)- Jurassic (172 Ma))

Chaimanee, Y., O. Chavasseau, K.C. Beard, A.K. Aung, N.S. Aung, C. Sein V. Lazzari, L. Marivaux, B. Marandat, M. Swe et al. (2012)- Late Middle Eocene primate from Myanmar and the initial anthropoid colonization of Africa. Proc. National Academy Sciences USA (PNAS) 109, 26, p. 10293-10297.
(online at: www.pnas.org/content/109/26/10293.full.pdf)
(Earlier hypotheses supported African origin for anthropoids, but recent discoveries of older and phylogenetically more basal fossils in China and Myanmar indicate group originated in Asia. New fossil primate from late M Eocene Pondaung Fm of Myanmar (Afrasia djijidae) remarkably similar to, but dentally more primitive than roughly contemporaneous N African anthropoid Afrotarsius. Members of this clade may have dispersed from Asia to Africa in M Eocene, shortly before first appearance in African fossil record)

Chatterjee, N. & N.C. Ghose (2010)- Metamorphic evolution of the Naga Hills eclogite and blueschist, Northeast India: implications for early subduction of the Indian plate under the Burma microplate. J. Metamorphic Geology 28, p. 209-225.
(Tectonic slices of eclogite and blueschist in E Cretaceous-Eocene Naga Hills ophiolite belt. Part of accretionary wedge, reflecting E-ward subduction of Indian plate under Burma microplate prior to India-Eurasia collision. Glaucophane and epidote represent post-peak assemblage)

(Oilfields of Burma almost all in elongated N-S Tertiary basin, bordered on W by Arakan Yoma and on E by the ancient plateau of Shan Hills. Most oil from fields in single line of folding and in belt 50 miles long between latitudes 20° 20' and 21° 10'. Remainder in small fields between 19° 25' and 23° 45')

Fan, J.J., C. Li, M. Wang, C.M. Xie & W. Xu (2015)- Features, provenance, and tectonic significance of Carboniferous- Permian glacial marine diamictites in the Southern Qiangtang-Baoshan block, Tibetan Plateau. Gondwana Research 28, 4, p. 1530-1542.
(Edge of S Qiangtang- Baoshan block, Tibetan Plateau, with glacial marine diamictite in Gangmaco-Dabure area. Four distinct Carboniferous- E Permian glacial cycles. Gravel assemblages of diamictites similar to rock assemblages of Indian Gondwana basement. Detrital zircons from matrix of glacial marine diamictite similar between S Qiangtang-Baoshan block, Lhasa block, Tethys Himalaya and India-Nepal areas, with peak ages mainly at 576, 788, 1026, 1512 and 2518 Ma. Provenance of diamictite Indian Gondwana. Diamictites deposited on passive continental margin)

Fan, P. & K. Ko (1994)- Accreted terranes and mineral deposits of Myanmar. J.Southeast Asian Earth Sci. 10, p. 95-100.
(Three terranes in Myanmar: (1) Shan-W Malaysia-Sumatra in E (three subterranes: W Kachin continental fragment, E Kachin-Shan= Baoshan, and Karen-Tenasserim); (2) C Burma Basin, and (3) Arakan Yoma in W (W Ranges or Indo-Burman ranges subduction system, uplifted by collision of India plate in Eocene). Volcanic arc divides C Myanmar Basin terrane into forearc and back-arc basins; oil-bearing fields in forearc basin. In Arakan-Yoma terrane, chromium and nickel of Late Cretaceous- E Tertiary age in ultramafic belts)

Fan, W., Y. Wang, A. Zhang, F. Zhang, Y. Zhang (2010)- Permian arc-back-arc basin development along the Ailaoshan tectonic zone: geochemical, isotopic and geochronological evidence from the Mojiang volcanic rocks, Southwest China. Lithos 119, p. 553-568.

(Wusu and Yaxuanqiao basalts in S China with affinities to both MORB- and arc-like sources, together with other geological observations, support development of Permian arc-back-arc basin along Ailaoshan- Song Ma tectonic zone in response to N-ward subduction of Paleotethys main Ocean. Final closure of basin in uppermost Triassic due to diachronous amalgamation between Yangtze and Simao- Indochina Blocks)

Fang, N., Q. Feng, S. Zhang & X. Wang (1998)- Paleo-Tethys evolution recorded in the Changning-Menglian Belt, western Yunnan, China. Comptes Rendus Academie Sciences, Paris, Earth Planetary Sci., 326, p. 275-282.
(Changning-Menglian Belt of W Yunnan 400km in N-S direction, 50-70km wide. Represents part of Paleotethys Ocean, with volcano-sedimentary record from E Devonian to M-L Triassic and several types of oceanic plateaus. Flanked by Lincang-Simao massif with Cathaysian flora-fauna in E and Gengma-Baoshan massifs with Permo-Carboniferous glacial deposits in W)

Fang, N. & Y. Niu (2003)- Late Palaeozoic ultramafic lavas in Yunnan, SW China, and their geodynamic significance. J. Petrology 44, 1, p. 141-157.
(online at: https://academic.oup.com/petrology/article/44/1/141/1408585)
(Ultramafic pillow lavas from Late Palaeozoic marine sequences in Yunnan have >26% MgO, olivine phenocrysts, clinopyroxenes with or without plagioclase in devitrified glassy matrix. Termed high-Mg picrites. Chemistry consistent with mantle plume origin. Chert interbes with Carboniferous radiolaria)

Fang, W., R. van der Voo & Q. Liang (1989)- Devonian paleomagnetism of Yunnan Province across the Shan Thai-South China Suture. Tectonics 8, 5, p. 939-952.
(Contrasting paleolatitudes for Devonian sediments in E Yunnan (equatorial; part of Yangtze/S China Block) versus W Yunnan (paleolatitude of ~42°; part of Gondwanan Shan-Thai Block). Majority of samples overprinted by present-day field magnetization. Blocks separated by Red River and Lancang (Mekong) River fault zones, one of which inferred to be ancient suture)

Fang, W., R. van der Voo & Q. Liang (1990)- Ordovician paleomagnetism of Eastern Yunnan, China. Geophysical Research Letters 17, 7, p. 953-956.
(Ordovician formations of Yangtze Paraplatform (South China Block) show paleolatitude of 48°S, supporting Ordovician position of South China adjacent to Gondwana)

Fang, X., X. Ma, W. Li, Y. Zhang, Z. Zhou, T. Chen, Yong Lu & S Yu & J. Fa (2018)- Biostratigraphical constraints on the disconformity within the Upper Ordovician in the Baoshan and Mangshi regions, western Yunnan Province, China. Lethaia, 51, 2, p. 312-323.
(Ordovician- Silurian of Baoshan and Mangshi regions in W Yunnan regarded as parts of Sibumasu terrane. Significant disconformity in U Ordovician, possibly related to sea-level drop during Late Ordovician glaciations or, less likely regional tectonic uplift in N Sibumasu)

Fang, Z.J. & J.C.W. Cope (2008)- Affinities and palaeobiogeographical significance of some Ordovician bivalves from East Yunnan, China. Alcheringa 32, 3, p. 297-312.
(Restudy of four poorly known Ordovician bivalve genera from Lw Ordovician Hongshiya Fm of E Yunnan. Similarities between cycloconchids suggest proximity of E Yunnan and Australia, although no species in common. Eastern W Yunnan fauna lay at much higher paleolatitude than E Yunnan fauna)

Fareeduddin & Y. Dilek (2015)- Structure and petrology of the Nagaland-Manipur Hill ophiolitic melange zone, NE India: A fossil Tethyan subduction channel at the India- Burma plate boundary. Episodes 38, 4, p. 298-314.
(online at: www.episodes.org/index.php/epi/article/viewFile/82426/65474)
(Nagaland-Manipur Hill ophiolite belt in IndoMyanmar Ranges in NE India represents S extension of Neotethyan Yarlung-Zhangbo suture in S Tibet, and connects late Mesozoic collision front in N with modern trench-arc system in Andaman Sea region in S. Ophiolites occur as blocks or thrust sheets within melange and are associated with eclogitic and blueschist rock assemblages. Ophiolitic melange tectonically sandwiched between Triassic- E Cretaceous accretionary prism complex (Nimi Flysch, overlying Burma Plate) in E and Late Cretaceous-Miocene accretionary wedge (Disang Flysch; on India Plate) to W. Melange represents subduction channel of fast subduction of Neotethys oceanic lithosphere beneath Asia- Sundaland. U Eocene-

Miocene Pokhpur Fm uncomformably over melange and accretionary prism metasediments constitute wedge-top or slope-basin sequence, rather than postcollisional molasse. Nagaland-Manipur Hill ophiolites represent accretionary-type ophiolite, mainly from downgoing plate, not Penrose-type complete ophiolite sequence)

Feng, Q. & D. Helmcke (2001)- Late Paleozoic compressional deformation in the Simao Region, Southern Yunnan, P.R. of China. Newsletters on Stratigraphy 39, 1, p. 21-31.
(In Yunxian anticline, 40 km NW of Simao, strongly deformed Carboniferous- Lower Permian sediments, deposited in deep basin, separated by angular unconformity from shallow marine strata of upper M Permian and U Permian age. Existence of Triassic island arc along Lancang Jiang must be questioned)

Gaillot, J. & D. Vachard (2007)- The Khuff Formation (Middle East) and time-equivalents in Turkey and South China: biostratigraphy from Capitanian to Changhsingian times (Permian), new foraminiferal taxa, and palaeogeographical implications. Coloquios de Paleontologia, 57, p. 37-223.
(Middle- Late Permian foraminiferal biostratigraphy for 'Cimmerian Plates' of Middle East (can be applied to to Sibumasu plates in SE Asia; JTvG). Paleobiogeographically significant M-L Permian foraminifera for Cimmerian/ Sibumasu blocks incl. W Thailand, Baoshan) include Shanita, 'Lysites', Hemigordiopsis renzi, Eopolydiexodina ex gr. persica. Indochina- S China plates (e.g. E Thailand) characterized by presence of Lepidolina, Paleofusulina, Colaniella)

Gaillot, J., D. Vachard, T. Galfetti & R. Martini (2009)- New latest Permian foraminifers from Laren (Guangxi Province, South China): palaeobiogeographic implications. Geobios 42, p. 141-168.
(Latest Permian limestones of Yangtze carbonate platform at Laren, S China, with rich small foram fauna. Paleogeographic distribution interpreted to be Neo-Tethyan, ranging from S Turkey to S China and Japan)

Gaillot, J., T. Galfetti, R. Martini & D. Vachard, & (2007)- Latest Permian calcisponges of Laren, Guangxi Province, South China. In: E. Vennin et al. (eds.). Facies from Palaeozoic reefs and bioaccumulations. Mem. Museum Nat. Histoire Naturelle 195, Paris, p. 321-324.
(Latest Permian Wujiaping Fm limestones of Paleozoic- M Triassic Yangtze carbonate platform at Laren with rare fusulinids (Nankinella cf. inflata, Reichelina simplex) and low diversity calcisponges)

Gao Lianda (1998)- On the discovery of a Gondwana affinity microflora from Baoshan, West Yunnan and its geologic significance. Acta Geoscientica Sinica 1998, 1, p.
(First record of palynomorphs from E Permian Dingjiazhai Fm in Baoshan, W Yunnan. 55 species. Miospore assemblages assigned to Parasaccites distinctus-Microbaculispora fentula zone, dominated by Gondwana microfloral elements (up to 80%, incl. Parasaccites distinctus, Brakarites rotatus, Potonieisporites spp., Microbaculispora, Interradispora, Horriditriletes, etc.). Asselian-Sakmarian in age)

Gardiner, N.J., L.J. Robb, C.K. Morley, M.P. Searle, P.A. Cawood, M.J. Whitehouse, C.L. Kirkland, N.M.W. Roberts & Tin Aung Myint (2016)- The tectonic and metallogenic framework of Myanmar: a Tethyan mineral system. Ore Geology Reviews 79, p. 26-45.
(Myanmar highly prospective but little explored minerals province, with deposits of tin, tungsten, copper, gold, zinc, lead, nickel, silver, jade and gemstones. MyanmarMesozoic-Recent geological history dominated by orogenic events representing closing of Tethys Ocean. Genesis of much of Myanmar's mineral deposits in single, evolving, mineral system: subduction and suturing of Neo-Tethys. Nine metallogenic provinces: (1) Late Cretaceous- Eocene granites with Sn-W, (2) skarn Au-Ag linked to Kabaing Granite (~17 Ma); (3) porphyry Cu-Au (Eocene/ 40 Ma intrusion, (4) epithermal Au-Cu (latest Cretaceous or younger), (5) ultramafic-hosted nickel, jade, (6) orogenic Au, (7) sediment-hosted Pb-Zn in U Paleozoic carbonates of Shan Plateau, (8) gemstones (9) Sediment-hosted epithermal Au. Two sub-parallel magmatic belts: Wuntho-Popa Arc magmatism (mainly 80-110 Ma, also younger, with Cu-Au) and Mogok-Mandalay-Mergui Belt granitoids (~170 Ma, Late Cretaceous- Eocene with Sn-W mineralisation)

Gardiner, N.J., L.J. Robb & M.P. Searle (2014)- The metallogenic provinces of Myanmar. Applied Earth Science (Trans. Inst. Mining Metallurgy B), 123, 1, p. 25-38.

(Myanmar contains important deposits of tin, tungsten, copper, gold, gemstones, zinc, lead, nickel and silver. Three world class deposits: Bawdwin (lead-zinc-silver), Monywa (copper) and Mawchi (tin-tungsten). Three principal metallotects: (1) Late Cretaceous Wuntho-Popa Arc of subduction-related granites with associated porphyry-type copper-gold and epithermal gold; (2) Late Cretaceous and younger Mogok-Mandalay-Mergui Belt with Sn-W (tin-tungsten) associated with crustal melt granites; (3) Shan Plateau with massive sulphide-type lead-zinc deposits)

Gardiner, N.J., L.J. Robb & M.P. Searle, K. Htun & K. Zaw (2017)- The Bawdwin Mine, Myanmar: a review of its geological setting and genesis. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 30, p. 669-686.
(Bawdwin Mine Pb-Zn-(Cu-Ag-Ni) world-class mineral deposit in N Shan State, NE Myanmar, with near-continuous mining since 1412. E Paleozoic (Late Cambrian- E Ordovician) exhalative marine siliciclastic-felsic volcanogenic massive sulphide (VMS) deposit. Originally exploited as silver deposit, redeveloped in early 1900's as mainly lead-zinc producer (largest lead mine before WWII). Thermal overprint in Late Triassic, linked to Indosinian orogeny)

Gardiner, N.J., M.P. Searle, C.K. Morley, L.J. Robb, M.J.Whitehouse, N.M.W. Roberts, C.L.Kirkland & C.J. Spencer (2018)- The crustal architecture of Myanmar imaged through zircon U-Pb, Lu-Hf and O isotopes: tectonic and metallogenic implications. Gondwana Research 62, p. 27-60.
(Myanmar at least 4 major magmatic belts. Eastern and Main Range Provinces associated with Late Permian-E Triassic closure of Paleo-Tethys;Mogok- Mandalay- Mergui Belt and Wuntho- Popa Arc response to Eocene closure of Neo-Tethys. Mogok-Mandalay-Mergui Belt divided into Tin Province (~77-50 Ma magmatism) and Mogok Metamorphic Belt (complex magmatic- metamorphic history). Tagaung-Myitkyina Belt magmatic age of 172 Ma. New tectonic model for Myanmar: Baoshan and Greater Sibumasu likely assembled on or before Triassic, then sutured onto Indochina margin in Late Triassic. Tengchong Block within Myanmar southerly termination of Meso-Tethys suture immediately N of Mogok area. Tengchong Block sutured onto Greater Sibumasu before Late Cretaceous, after which Neo-Tethys subduction drove magmatism of Wuntho-Popa Arc)

Gardiner, N.J., M.P. Searle, L.J. Robb & C.K. Morley (2015)- Neo-Tethyan magmatism and metallogeny in Myanmar- an Andean analogue? J. Asian Earth Sci. 106, p. 197-215.
(In Myanmar two (U Cretaceous- Paleogene) granite belts with significant metal deposits: (1) Late Cretaceous (mainly 80-110 Ma) Wuntho-Popa Arc with I-type granitoids with Cu-Au mineralization; (2) Mogok-Mandalay-Mergui Belt with S-type granites with Sn-W deposits. Represent subduction of Neo-Tethys below W side of Sibumasu Terrane (W Birma). Belts are parallel, reminiscent of metallogenic belts of C Andes)

Gardiner, N.J., J.P. Sykes, A. Trench & L.J. Robb (2015)- Tin mining in Myanmar: production and potential. Resources Policy 46, 2, p. 219-233.
(online at: www.burmalibrary.org/docs22/Tin_Mining_in_Myanmar.pdf)
(In 2014, Myanmar became World's third biggest tin producer, after China and Indonesia. Likely contributed to drop in tin prices in 2015. Production increase from new Man Maw mining district in Wa State, E Myanmar, not far from traditional tin-producing areas in S)

Garson, M.S., B.J. Amos & A.H.G. Mitchell (1976)- The geology of the area around Neyaungga and Yengan, southern Shan states, Burma. Inst. Geol. Science, London, Overseas Memoir 2, 2, p. 1-70.

Ghose, N.C., O.P. Agrawal & N. Chatterjee (2010)- A geological and mineralogical study of eclogite and glaucophane schists in the Naga Hills Ophiolite, Northeast India. Island Arc 19, p. 336-356.
(Low- to high-P metamorphic assemblages in metabasic rocks and metachert inU Cretaceous- Eocene ophiolite belt of Naga Hills, N Indo-Myanmar Ranges, in Indo-Eurasian collision zone. Metabasic rocks high-grade barroisite/ glaucophane epidote eclogite and glaucophane schist, also low-grade greenschist and prehnite-clinochlore schist, associated with lava flows and ultramafic cumulates at W thrust contact. Peak P-T conditions of ~20 kb/ 525°C. Retrogression/ uplift marked by replacement of barroisite and omphacite by glaucophane, followed by secondary actinolite, albite and chlorite. Mylonite in garnet lherzolite and 'mica fish' in glaucophane schist indicate ductile deformation in shear zone along which ophiolite was emplaced)

Ghose, N.C., O.P. Agrawal & R.N. Singh (1986)- Geochemistry of the ophiolite belt of Nagaland, N.E. India. In: N.C. Ghose & S. Varadarajan (eds.) Ophiolites and Indian plate margin, Sumna Publishers, Patna, p. 241-294.

Ghose, N.C., N. Chatterjee & Fareeduddin (2014)- A petrographic atlas of ophiolite: an example from the eastern India-Asia collision zone. Springer India, p. 1-232.
(Extensive review of Naga Hills ophiolite, with ultramafic rocks, plagiogranite, glaucophane schist, eclogite, chert, etc.)

Ghose, N.C. & Fareeduddin (2011)- Textural fingerprints of magmatic, metamorphic and sedimentary rocks associated with the Naga Hills Ophiolite, northeast India. In: J. Ray et al. (eds.) Topics in igneous petrology, Springer, p. 321-354.

Ghosh, S., B. Chattapadhyay, D.K. Roy & P. Venkataramana (1984)- On the radiolarian bearing rocks of Naga Hills ophiolite. Geol. Survey India Records 113, 4, p. 89-97.
(U Cretaceous- Lower Eocene age inferred for ophiolite rocks and associated cherts based on radiolarians (however: Baxter et al. (2011) also reported Late Jurassic radiolaria))

Gonguet, C., T. Kelly, F. Mohammad, U.K. Win &, N. Hlaing (2017)- MOGE4 exploration block- Prome Embayment- Central Burma Depression - Learnings from new 2D seismic acquisition. AAPG/EAGE/MGS 3rd Oil & Gas Myanmar Geosciences Conf., Yangon, 7p. *(Extended Abstract)*

(In Baoshan (W Yunnan) and Peninsular Thailand(Sibumasu) block onset of (mid-latitude) oolitic carbonates in late M Permian (Wordian- Capitanian) (see also Huang et al. 2017))

Huang, H., X. Jin, F. Li & Y. Shen (2017)- Permian oolitic carbonates from the Baoshan Block in western Yunnan, China, and their paleoclimatic and paleogeographic significance. Int. J. Earth Sciences 106, 4, p. 1341-1358.
(M-L Permian ooids in Hewanjie Fm (N Baoshan) and Shazipo Fm (S Baoshan Block). Diachronous onset of Permian ooids among Gondwana-derived Cimmerian blocks: (1) mostly Sakmarian in Cl Taurides- C Pamir-Karakorum Block versus (2) Wordian-Capitanian in Baoshan Block, Peninsular Thailand and S Qiangtang (these also with Asselian- Sakmarian glaciomarine diamictite). Baoshan Block at higher paleolatitude during

Asselian- Sakmarian than blocks with Sakmarian ooids. Marine ooids virtually absent near equator, so Baoshan Block interpreted to drift to warm-water southern mid-latitudes during Wordian- Capitanian)

Huang, H., X. Jin & Y. Shi (2008)- Middle Permian fusulinids from Southern Baoshan Block, Western Yunnan, China. Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), Bangkok 2008, p. 169. *(Abstract only)*
(online at: www.geo.sc.chula.ac.th/Geology/English/News/Technique/GREAT_2008/PDF/056.pdf)
(41 M Permian fusulinid species of 9 genera from lower Shazipo Fm in of SE Baoshan Block, W Yunnan, China (= Cimmerian/Sibumasu Block). Three biozones in ascending order (1) Verbeekina inflata Range Zone (9 species of Schwagerina, Roadian-Wordian in age, with Verbeekina inflata, V. grabaui, Pseudodoliolina pulchra and P. chinghaiensis, (2) Eopolydiexodina Abundance Zone (high diversity, commn Eopolydiexodina, Roadian-Wordian and (3) Sumatrina annae Range Zone (5 species of Sumatrina, incl. Sumatrina longissima and S. annae (Wordian- E Capitanian))

Huang, H., X. Jin & Y. Shi (2015)- A *Verbeekina* assemblage (Permian fusulinid) from the Baoshan Block in western Yunnan, China. J. Paleontology 89, 2, p. 269-280.
(Newly discovered M Permian (~Capitanian) Verbeekina assemblage from Xiaoxinzhai Section in Baoshan Block. Fusulinid assemblage of 11 species/ 6 genera, incl. Verbeekina verbeeki, Pseudodoliolina pseudolepida, Sumatrina annae, Yangchienia, Xiaoxinzhaiella, and ?Rugosochusenella. Two unusual attributes: dominance of Verbeekina and relatively low diversity compared with coeval fusulinids from paleo-tropical S China, indicating Baoshan Block probably in subtropical setting in M Permian (NB: several of these species were first described from W Sumatra; JTvG))

Huang, H., X. Jin & Y. Shi (2015)- Mid-Permian fusulinids of the Bawei Section in southern Baoshan Block of western Yunnan, China with a discussion on paleogeographic implications. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 28-30. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(Permian fusulinids and carbonates of Baoshan Block in W Yunnan show dramatic switch from cool, Gondwana-affinity to warm, Tethyan affinity. M Permian carbonates in some areas have diverse verbeekinids and neoschwagerinids and rare staffellids (and ooid grainstones), others no verbeekinids/ neoschwagerinids but abundant staffellids (and dolomitic peloidal/skeletal wackestone-packstones). This reflects local sedimentary factors (open vs. restricted platform), not large-scale paleolatitude changes)

Huang, H., X. Jin, Y. Shi, H. Wang, J. Zheng & Pu Zong (2020)- Fusulinid-bearing oolites from the Tengchong Block in western Yunnan, SW China: Early Permian warming signal in the eastern peri-Gondwana. J. Asian Earth Sciences 193, 104307, p.
(Oolites with E Permian (Sakmarian-Artinskian) Eoparafusulina fusulinids from Cimmerian Tengchong Bloc, W Yunnan, probably reflect short-term warming pulse during demise of late Paleozoic glaciation in Gondwana)

Huang, H., X. Jin, Y. Shi & X. Yang (2009)- Middle Permian Western Tethyan fusulinids from southern Baoshan Block, Western Yunnan, China. J. Paleontology 83, 6, p. 880-896.
(New fusulinid collections from SE Baoshan Block in SW China necessitate paleobiogeographic re-evaluation of M Permian fusulinids in region. 32 fusulinid species, 9 genera, 3 Murgabian- Midian biozones (Schwagerina yunnanensis Range Zone, Eopolydiexodina Abundance Zone, and Sumatrina annae Range Zone). Assemblages belong to W Tethyan Province: presence of 'W Tethyan' genera Eopolydiexodina (but also 'Tethyan' Verbeekina, Sumatrina and Pseudodoliolina) and low diversity suggests rel. high latitudinal region within Tethyan Realm (N.B.: This 'Cimmerian' Baoshan Block includes 'Sumatran' species Verbeekina, Sumatrina annae Volz 1904, Schwagerina padangensis Lange 1925, Pseudodoliolina, etc.; JTvG))

Huang, H., Y. Shi & X. Jin (2015)- Permian fusulinid biostratigraphy of the Baoshan Block in western Yunnan, China with constraints on paleogeography and paleoclimate. J. Asian Earth Sci. 104, p. 127-144.
(Gondwana-derived Baoshan Block in W Yunnan, China, yields poor Sakmarian-Yakhtashian fusulinids with Eoparafusulina and Pseudofusulina, signifying temperate-water conditions. M Permian fusulinids more diversified warm-water assemblages (Schwagerina, Eopolydiexodina, Sumatrina and Verbeekina; also small

foram Shanita in Midian). Baoshan block in Murgabian-Midian probably located between equatorial region to N and majority of Sibumasu areas lacking Verbeekinids and Neoschwagerinids with temperate water to S)

Huang, H., Y.K. Shi & X.C. Jin (2016)- Permian (Guadalupian) fusulinids of Bawei Section in Baoshan Block, western Yunnan, China: biostratigraphy, facies distribution and paleogeographic discussion. Palaeoworld 26, 1, p. 95-114.
(online at: www.sciencedirect.com/science/article/pii/S1871174X16300026?via%3Dihub)
(Bawei Section in Shazipo Fm of S Baoshan Block (part of Sibumasu) in W Yunnan, with 31 species of M Permian fusulinids, in two late Murgabian- Midian assemblages: (1) Yangchienia-Nankinella and (2)overlying Chusenella-Rugosofusulina. Overlain by Shanita-bearing limestone. Dominance of staffellids and paucity of neoschwagerinids and verbeekinids differs from coeval fusulinids in Nansan-Hewai area in S Baoshan Block with common neoschwagerinids and verbeekinids. Interpreted as due to different depositional environments. (Nansan-Hewai area high-energy open platform))

Huang, H., X. Yang & X. Jin (2005)- The *Shanita* fauna (Permian foraminifera) from Baoshan area, western Yunnan Province, China. Acta Palaeontologica Sinica 44, 4, p. 545-555. *(In Chinese; translated in Frontiers of Biology in China 2, 1, p. 114-124 (2007))*
(online at: http://article.geobiology.cn/)
(Permian Shanita foram fauna good marker of N peri-Gondwana tectonic blocks. Shanita fauna from Baoshan area in W Yunnan suggest characteristic genera Shanita and Hemigordiopsis here comprised 8 species and 10 genera of other nonfusulinid foraminifera. Age probably late Maokouan- Wuchiapingian. Fauna comparable to Shanita faunas from Burma, Thailand and Tibet, but lower diversity and absence of fusulinids)

Huang, K. & N.D. Opdyke (1991)- Paleomagnetic results from the Upper Carboniferous of the Shan-Thai-Malay block of western Yunnan, China. Tectonophysics 192, p. 333-344.
(Upper Carboniferous basaltic Woniusi Fm from near Baoshan (= now viewed as E Permian age basalts; part of Shan-Thai-Malay microplate). Paleomagnetic inclinations similar to Devonian rocks from area, indicating paleolatitude of ~41.9° S for Baoshan in Devonian-E Permian time)

Huang, K. & N.D. Opdyke (1993)- Paleomagnetic results from Cretaceous and Jurassic rocks of South and Southwest Yunnan: evidence for large clockwise rotations in the Indochina and Shan-Thai-Malay terranes. Earth Planetary Sci. Letters 117, p. 507-524.
(Paleomag studies of Jurassic-Cretaceous redbeds from S and SW Yunnan, China, indicate Xiaguan area on Red River fault, has not rotated relative to stable Eurasia since at least Late Cretaceous. Jinggu-Mengla area 200-400 km farther S rotated CW by 46-65°. Comparison with Mesozoic paleomagnetic data from C Yunnan, N Thailand and NW Borneo suggests Red River fault not demarcation between unrotated and significantly rotated regions, and that Sundaland did not respond to India-Asia collision as single coherent unit)

Hughes, R.W., O. Galibert, G. Bosshart, F. Ward, Thet Oo, M. Smith, Tay Thye Sun & G.E. Harlow (2000)- Burmese jade: the inscrutable gem. Gems and Gemology. 36, 1, p. 2-26.
(N Myanmar remains primary source of top-grade jadeite. Primary jadeite in dikes, secondary jadeite in serpentinite boulder conglomerates)

Hurukawa, N., Pa Pa Tun & B. Shibazaki (2012)- Detailed geometry of the subducting Indian Plate beneath the Burma Plate and subcrustal seismicity in the Burma Plate derived from joint hypocenter relocation. Earth Planets Space 64, p. 333-343, 2012
(online at: https://www.terrapub.co.jp/journals/EPS/pdf/2012/6404/64040333.pdf)
(Geometry of subducting Indian Plate under Burma Plate from relocated subduction earthquakes at depths of 30-140 km. Strikes of contours oriented ~N-S, and show 'S' shape in map view)

Ito, T., X. Qian & Q.L. Feng (2016)- Geochemistry of Triassic siliceous rocks of the Muyinhe Formation in the Changning-Menglian belt of Southwest China. J. Earth Science (China) 27, 3, p. 403-411.
(online at: http://en.earth-science.net/PDF/20160612014127.pdf)

(Triassic siliceous rocks of Muyinhe Fm in Changning-Menglian belt (Paleotethys suture). Triassic radiolaria Triassocampe, Pseudostylosphaera, Eptingium and Paroertlispongus observed on etched surfaces. Geochemistry suggests unlikely to be oceanic pelagic deposits; possibly represent closure stage of Paleotethys)

Iyer, L.A.N. (1953)- The geology and gemstones of the Mogok stone tract, Burma. Mem. Geol. Survey India, 82, p. 1-100.
(Mogok stone tract in upper Myanmar known for ruby gemstones for centuries. Rocks intensely folded, ENE and NE striking with dips to SE and SSE. Mogok gneiss associated with common crystalline limestone. Granite, syenite intrusions, etc. Ruby and spinel generally derived from crystalline limestone, sapphire from pegmatite)

Jaeger, H. (1983)- Unterdevonische Graptolithen aus Burma. Geol. Jahrbuch 126, 2, p. 245-257.

('Lower Devonian graptolites from Burma'. Two monograptids M. atopus and M. thomasi helmckei n.subsp., described from northern Shan states, indicative of mid-Early Devonian age)

Jaeger, J.J., A. Naing Soe, A.K. Aung, M. Benammi, Y. Chaimanee, R.M. Ducrocq, C.T. Tun, T. Thein & S. Ducrocq (1998)- New Myanmar middle Eocene anthropoids. An Asian origin for catarrhines? Comptes Rendus Academie Sciences, Paris, ser. 3, 321, p. 953-959.
(New lower jaw fragments of primates Amphipithecus and Pondaungia in Eocene Pondaung Fm in C Myanmar Together with Siamopithecus from Late Eocene of Peninsular Thailand resemblance some African relatives)

Jaeger, J.J., O. Chavasseau, V. Lazzari, A. Naing Soe, C. Sein, A. Le Maitre, H. Swe & Y. Chaimanee (2019)- New Eocene primate from Myanmar shares dental characters with African Eocene crown anthropoids. Nature Communications 10, 3531, p. 1-10.
(online at: https://www.nature.com/articles/s41467-019-11295-6.pdf)
(Recent discoveries of older and more primitive basal anthropoids in China and Myanmar (eosimiiforms) support Asia was place of origins of anthropoids,rather than Africa. Similar taxa of eosimiiforms in the late M Eocene of Myanmar and North Africa, reflecting a colonization event in M Eocene)

Jaeger, J.J., A. Naing Soe, O. Chavasseau, P. Coster, E. Emonet, F. Guy, R. Lebrun, Aye Maung et al. (2011)- First hominoid from the Late Miocene of the Irrawaddy Formation (Myanmar). PLos ONE 6, 4, e17065, p. 1-14.
(online at: http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0017065)
(First hominoid found in Myanmar (Khoratpithecus ayeyarwadyensis sp. nov.), together with Hipparion and other mammal fauna from Irrawaddy Fm, dated between 10.4- 8.8 Ma. Fauna and stable isotope data indicate evergreen forest environment)

Jaeger, J.J., T. Thein, M. Benammi, Y. Chaimanee, A.N. Soe, T. Lwin, T. Tun, S. Wai & S. Ducrocq (1999)- A new primate from the Middle Eocene of Myanmar and the Asian early origin of anthropoids. Science 286, 5439, p. 528-530.
(New anthropoid primate, Bahinia pondaungensis from late M Eocene Pondaung Fm. Part of Eosimiidae now known from three M Eocene localities in Asia, supporting hypothesis of Asian origin of anthropoids)

Jerram, D.A., M. Widdowson, P.B. Wignall, Y. Sun, X. Lai, D.P.G. Bond & T.H. Torsvik (2016)- Submarine palaeoenvironments during Emeishan flood basalt volcanism, SW China; implications for plume-lithosphere interaction during the Capitanian, Middle Permian ("end Guadalupian") extinction event. Palaeogeogr. Palaeoclim. Palaeoecology 441, 1, p. 65-73.
(M Permian platform carbonate deposition terminated by rapid subsidence, with onset of late M Permian Emeishan volcanism during deepening (with widespread losses amongst fusulinacean foraminifera and calcareous algae). Lower two thirds of 4-5 km thick lava pile erupted at or below sea level, with terrestrial lava flows only in later stages. Late Permian of SW China at time of Emeishan was extended area of thinned lithosphere with epeiric seas, sustained through onset of LIP emplacement. Geochemical support of plume origin for Emeishan volcanism, but LIP emplacement not associated with regional pre-eruption uplift)

Jian, P., D. Liu, A. Kroner, Q. Zhang, Y. Wang, X. Sun & W. Zhang (2009)- Devonian to Permian plate tectonic cycle of the Paleo-Tethys Orogen in southwest China (I): Geochemistry of ophiolites, arc/back-arc assemblages and within-plate igneous rocks. Lithos 113, p. 748-766.
(Study of Paleo-Tethys ophiolites, incl. Ailaoshan ophiolite (NMORB-type; ~387-374 Ma= Late Devonian), Jinshajiang ophiolite (EMORB-type; 346-341 Ma= M Carboniferous) and Changning-Menglian ophiolite (~270-264 Ma= M Permian; marks main Paleo-Tethys suture between Gondwana-derived Sibumasu terrane and Yangtze-derived Simao terrane and formed at supra-subduction zone))

Jian, P., D. Liu, A. Kroner, Q. Zhang, Y. Wang, X. Sun & W. Zhang (2009)- Devonian to Permian plate tectonic cycle of the Paleo-Tethys Orogen in southwest China (II): Insights from zircon ages of ophiolites, arc/back-arc assemblages and within-plate igneous rocks and generation of the Emeishan CFB province. Lithos 113, p. 767-784.
(Ophiolites in SW China are remnants of Paleo-Tethys ocean, which was divided by Simao terrane into two tracts (1) main ocean in W (Changning-Menglian ophiolite with metagabbro crystallization age of 267 Ma= M-L Permian) and (2) oceanic branch in E (Ailaoshan- Jinshajiang ophiolites with sea-floor spreading ages from zircons ~383, 376, 343 Ma = Late Devonian- E Carboniferous). With reconstruction of Devonian-Permian plate tectonic cycle: Simao Block rifted off Yangtze margin in Carboniferous, etc.)

Jin, X. (1998)- A comparison between Permo-Carboniferous sequences of the Baoshan Block and the Lhasa Block, China. In: G.R. Shi et al. (eds.) Permian of Eastern Tethys: biostratigraphy, palaeogeography and resources, Strzelecki Symposium, Proc. Royal Soc. Victoria 110, 1-2, p. 401-404.
(Baoshan and Lhasa Block in SW China and Tibet both have Permo-Carboniferous glacio-marine deposits and Gondwana affinity fauna and palynomorph assemblages, indicating Gondwana origin. Both blocks with Early Permian basalts/ red beds above glacial deposits, and overlain by M-U Permian- Triassic limestones)

(Zircon dating shows basement of Myanmar contains Proterozoic and E Paleozoic zircons. Igneous event of ~490 Ma ties basement to Gondwana. Shan Plateau of E Myanmar lacks Cenozoic-Cretaceous magmatism; Triassic event links it to Qiangtang block of C Tibet. Jurassic- E Cretaceous magmatism ties Mogok metamorphic belt to Gangdese belt of Tibet (Lhasa block) and Neotethys subduction. Both belts also share Late Cretaceous- Paleocene magmatism. Late Eocene- Oligocene high-grade metamorphism dominates Mogok belt; rapid cooling started at ~17 Ma and terminated before 10 Ma)

Mitchell, A.H.G. (1989)- The Shan Plateau and Western Burma: Mesozoic-Cenozoic plate boundaries and correlation with Tibet. In: A.M.C. Sengor (ed.) Tectonic evolution of the Tethyan region, Kluwer, Dordrecht p. 567-583.
(Four suture zones in Myanmar. E Burma- Chiang Rai- medial Malaya suture resulted from closure of ocean I (=Paleotethys) in E Triassic. Ocean II, N of Lhasa block, closed in end-Jurassic, but suture buried in Burma. Mount Victoria Land block (= W Burma block of Hutchison, 1989) rifted from Gondwanaland in Jurassic and collided with Burma after NE-ward subduction of ocean III in E Cretaceous. Contains metamorphic rocks overlain by Triassic turbidites, overthrust by ophiolite nappe (may correlate to W Sumatra block; Barber (2005). Shan Plateau in E Myanmar with thick Precambrian- Mesozoic succession similar to W and SW Thailand (= Sibumasu; JTvG). With U. Carb- Lower Permian diamictites only in W part)

Mitchell, A.H.G. (1992)- Late Permian-Mesozoic events and the Mergui Group nappe in Myanmar and Thailand. J. Southeast Asian Earth Sci. 7, 2, p. 165-178.
(Continental Shan-Thai Block (= Sibumasu) accreted to Indochina block to E by closure of two Tethyan ocean basins, terminating in Late Norian collision with generation of anatectic granites. Lower Permian Mergui Gp diamictites and associated rocks not part of Shan-Thai until Late Triassic-E Jurassic, when they were emplaced as nappe from present W, perhaps part of E Mesozoic arc system. Subsequent emplacement of ophiolite and overlying E-facing mafic magmatic arc onto W margin of Shan-Thai-Mergui Group block in E Cretaceous was followed by polarity reversal and development of W-facing M Cretaceous- Recent Myanmar arc)

Mitchell, A.H.G. (1993)- Cretaceous- Cenozoic tectonic events in the western Myanmar (Burma)- Assam region. J. Geol. Soc., London, 150, p. 1089-1102.
(Correlation of Late Mesozoic ophiolitic rocks suggests that in Late E Cretaceous a NE-facing mafic arc was emplaced onto SE Borneo, W Sumatra, Mogok belt of W Myanmar and farther W, all then on SW margin of Asia. Reversal in tectonic polarity and E-ward subduction generated Late Cretaceous magmatic arc in W Myanmar and Sumatra. Magmatism, interrupted in latest Cretaceous, probably resumed in W Myanmar-Tibet and Sumatra arc segments in E Paleogene, again interrupted in M Eocene when E-vergent ophiolite nappe overrode Indo-Burman Ranges, deforming Lw Eocene turbidites derived from magmatic arc to E. Following renewed N and E-ward subduction of ocean floor in latest Eocene, India collided with N Myanmar and Tibet. 450km of post-E Miocene dextral displacement on Sagaing Fault and related spreading in Andaman Sea)

Mitchell, A.H.G. (2011)- Very high-grade orogenic quartz-gold vein deposits in the Permo-Carboniferous Slate belt, Central Myanmar: indications of a regional gold province? Proc. 24th Ann. Geol. Conv. Geol. Soc. Philippines (GEOCON 2011), Geology working for a resilient society, p. 57-58. *(Abstract only)*
(online: http://rwg-tag.bravehost.com/Conferences/geocon/abstracts/D2%200845-0900%20Mitchell%202.pdf)
(Gold mineralization in argillites- quartzites, overlain by U Carboniferous-Lower Permian pebbly diamictites, interpreted as glacial deposits from Gondwana. Veins are orogenic or mesothermal, probably generated by metamorphic dehydration at depths of >15 km. Textures suggest gold formation in brittle-ductile transition zone at >4km, possibly related to Late Jurassic collision in suture along E margin of Slate belt, which continues S for >2800 km nearly to Borneo)

Mitchell, A.H.G. (2017)- Geological belts, plate boundaries and mineral deposits in Myanmar. Elsevier, p. 1-509.
(Comprehensive overview of geology, mineral potential and plate tectonics of Myanmar. Several of the structural belts of Myanmar continue into SW China and NW Thailand. With chapters on petroleum occurrences in C Burma Depression by M.F. Ridd and offshore petroleum geology by A. Racey)

Mitchell, A.H.G., C.A. Ausa, L. Deiparine, T. Hlaing, N. Htay & A. Khine (2004)- The Modi Taung-Nankwe gold district, Slate belt, central Myanmar: mesothermal veins in a Mesozoic orogen. J. Asian Earth Sci. 23, 3, p. 321-341.
(*Quartz-gold veins of Modi Taung-Nankwe gold district, C Myanmar, hosted by mudstones of late Paleozoic Slate belt. Mineralization in E Jurassic following collision of Myanmar (on passive W margin of Shan-Thai continental block) with oceanic arc on overriding plate to W. Collision generated thrusting, metamorphism of Plateau rocks thrust W beneath Slate belt to form Mogok Metamorphics. Reversal in orogenic polarity initiated late Jurassic E-ward subduction of oceanic crust beneath Myanmar and generation of magmatic arc. Young radiometric ages on Mogok Metamorphic belt imply renewed Tertiary uplift or intrusion of Tertiary granites)*

Mitchell, A., S.L. Chung, T. Oo, T.H. Lin & C.H. Hung (2012)- Zircon U-Pb ages in Myanmar: magmatic-metamorphic events and the closure of a neo-Tethys ocean? J. Asian Earth Sci. 56, p. 1-23.
(Main metamorphic event in Mogok Metamorphic belt (MMB) in Myanmar pre-dated India-Asia collision. MMB and Slate belt interpreted as part of W Myanmar (W Burma) block, separated in Jurassic from Shan Plateau to E by SW continuation of Bangong-Nujiang-Luxi 'Neo-Tethys I' ocean. Intrusive and metamorphic events in and near MMB related to W-ward subduction of this ocean and end-Jurassic collision of Plateau with overriding W Myanmar-Slate belt block; to orogenic polarity reversal and E Cretaceous W-ward translation of Plateau sequence over suture zone; and to E-ward subduction of ancestral Indian Ocean or 'Neo-Tethys II' beneath Myanmar with generation of Wuntho-Popa arc beginning before Late Cretaceous)

(online at: https://books.googleusercontent.com/books/...)

Nyunt, M. & S. Lwin (1997)- Tectonic setting and hydrocarbon occurrence in the Central Myanmar Tertiary belt. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc. (IPA), Jakarta 1997, p. 319-333.
(Onshore C Myanmar Tertiary Basin is 1300km long, 200km wide depression, which originated in Eocene as array of pull-apart rift segments along oceanic-cratonic transform zone between Indian and SE Asian lithospheric plates (influenced by oblique subduction of Indian oceanic crust beneath SE Asian craton and dextral slip along intra cratonic Sagaing transform fault). Proven reservoirs mainly Oligo-Miocene sandstones. Oils derived from Tertiary land plant material)

Nyunt, Thet Tin, H.J. Massonne & Tay Thye Sun (2017)- Jadeitite and other high-pressure metamorphic rocks from the Jade Mines Belt, Tawmaw area, Kachin State, northern Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 13, p. 295-315.
(World's largest jadeite (NaAlSi2O6) deposit, with highest-quality jade, in Pharkant-Tawmaw Jade Mines Belt in N part of C Myanmar basin. N-S trending belt. Jadeitite in serpentinite melange, probably formed in subduction zone environment. Associated with albitites, chlorite schists, garnet-mica schists, graphite schists, glaucophane and epidote schists and amphibolite. Timing of jadeite formation still controversial: original oceanic crust may have formed in M Jurassic (163 Ma zircon age), ~146 ma (Late Jurassic) zircons may reflect age of subduction and high-P metamorphism. Rapid exhumation required for jadeite preservation)

Oo, T., T. Hlaing & N. Htay (2002)- Permian of Myanmar. J. Asian Earth Sci. 20, 6, p. 683-689.
(Permian 'Plateau Limestone' with minor basal clastics widespread on Shan Plateau in E and S Myanmar. Thitshipin Lst three fusulinid biozones (1) Pseudoschwagerina (early E Permian, also with Pseudofusulina, Pseudofusulinella), (2) Parafusulina (late E Permian, with P. cf. kattaensis), (3) Neoschwagerina- Verbeekina (early Late Permian; with Yangchienia, Schubertella, Tetrataxis and Polydiexodina). Overlying Nwabangyi Lst of Paleofusulina- Codonofusiella zone (Late Permian, also with Hemigordius renzi, Shanita amosi, etc.) Unconformable over Devonian silicicarbonates in Shan State, and Carboniferous meta-siliciclastics in other areas and suggest Permian limestones were deposited after emplacement of Mergui Terrane onto S margin of Shan-Thai Block, when Shan-Thai Block was in S hemisphere)

Ovung, T.N., J. Ray, X. Teng, B. Ghosh, M. Paul, P. Ganguly, S. Sengupta & S. Das (2017)- Mineralogy of the Manipur Ophiolite Belt, North East India: implications for mid-oceanic ridge and supra-subduction zone origin. Current Science 112, 10, p. 2122-2129.
(online at: www.currentscience.ac.in/Volumes/112/10/2122.pdf)
(In Indo-Myanmar Ranges ophiolitic rocks in two parallel belts along E margin of Indian plate: (1) E belt through C Myanmar, Sumatra and Java; (2) W belt through Nagaland, Manipur, W Myanmar and Andaman islands. Wide compositional gap in Cr and Mg content of spinel in mantle peridotites of W Belt Manipur Ophiolite Belt implies upper mantle melting in different tectonic settings: (1) mid-oceanic ridge (MOR) origin for high-Al spinel peridotites and (2) supra-subduction zone origin for high-Cr spinel peridotites)

Pal, T., A. Bhattacharya, G. Nagendran, N. Yanthan, R. Singh & N. Raghumani (2014)- Petrogenesis of chromites from the Manipur ophiolite belt, NE India: evidence for a supra-subduction zone setting prior to Indo-Myanmar collision. Mineralogy and Petrology 108, 5, p. 713-726.
(Manipur ophiolite belt in W Ophiolite Belt of Indo-Myanmar Ranges consists of serpentinised peridotite, dykes, volcanic rocks and pelagic sediments. Compositions of magmatic chromites suggest ophiolite formed in supra-subduction zone setting)

Panda, D.., B. Kundu, V.K. Gahalaut & C. Rangin (2018)- Crustal deformation, spatial distribution of earthquakes and along strike segmentation of the Sagaing Fault, Myanmar. J. Asian Earth Sci. 166, p. 89-94.
(~1200 km long, N-S Sagaing fault is plate boundary fault between Burma and Sunda plate, accommodates ~50-55% of dextral motion of India-Sunda plate motion. Along strike segmentation)

Pascoe, E.H. (1965)- Manual of the geology of India and Burma, 3rd Edition, 3 vols. Government of India Press, Calcutta, p. 1-2363.

Paumard, V., E. Zuckmeyer, R. Boichard, S.J. Jorry, J. Bourget, J. Borgomano, T. Maurin & J.N. Ferry (2017)- Evolution of Late Oligocene - Early Miocene attached and isolated carbonate platforms in a volcanic ridge context (Maldives type), Yadana field, offshore Myanmar. Marine Petroleum Geol. 81, p. 361-387.
(Stratigraphic evolution of Late Oligocene- E Miocene (Aquitanian) carbonate platforms of Yadana High, offshore Myanmar (N of Andaman spreading zone). Seven seismic sequences in three stages: (1) Chattian development of aggrading attached and isolated platforms; (2) platform emersion at Oligo- Miocene transition; (3) Aquitanian drowning of small buildup and km-scale backstepping on large platforms (3DF and Yadana). Aquitanian onset of renewed volcanic activity, followed by development of ~300-850m thick Burdigalian fringing carbonate reefs in ~6 My. Platforms developed on volcanic ridge of hotspot origin in Indian Ocean, not part of volcanic arc)

Peng, T., Y. Wang, G. Zhao, W. Fan & B. Peng (2008)- Arc-like volcanic rocks from the southern Lancangjiang zone, SW China: geochronological and geochemical constraints on their petrogenesis and tectonic implications. Lithos 102, p. 358-373.
(Triassic volcanic rocks in C part of San-Jiang orogenic belt, SW China, mainly in E segment of Lancangjiang zone. Interpreted as products of subduction during closure of Paleo-Tethys. Mainly andesites with minor basaltic andesites. Andesite zircon age of 248.5±6.3 Ma (E Triassic), and similar to typical subduction-related arc volcanic rocks. Associated with M-Triassic (~230 Ma) syn-collision granites, andesites in S Lancangjiang zone viewed as E Triassic continental margin volcanic arc rocks, suggesting Paleo-Tethyan Ocean not closed until M Triassic continent- continent or continent- arc collision)

Peng, T., S.A. Wilde, Y. Wang, W. Fan & B. Peng (2013)- Mid-Triassic felsic igneous rocks from the southern Lancangjiang Zone, SW China: petrogenesis and implications for the evolution of Paleo-Tethys. Lithos 168-169, p. 15-32.
(SW Lancangjiang magmatic belt in SW China mainly composed of Lincang batholith and Mesozoic volcanic belt with abundant rhyolites. Zircon U-Pb results define emplacement ages for large Lincang batholith at ~230 Ma and ~220 Ma (just E of Changning-Mengliang suture zone). M-Triassic magmatism was generated in post-collisional tectonic setting, possibly tied to slab breakoff, resulting in post-collisional extension and asthenospheric upwelling that induced melting of middle-lower crust to produce felsic magma. This post-collisional magmatism indicates continent-continent/arc collision between Gondwana-derived Sibumasu and Indochina blocks was completed by early M Triassic)

(Review of onshore and offshore petroleum geology of Myanmar and adjoining basins, in 11 chapters by Racey & Ridd and Ridd & Racey)

Racey, A. & M.F. Ridd (2015)- Myanmar offshore petroleum overview. In: A. Racey & M.F. Ridd (eds.) Petroleum geology of Myanmar, Chapter 6, Geol. Soc., London, Mem. 45, p. 57-62.
(Myanmar offshore petroleum exploration since 1972, with main regions Rakhine (=Ganges-Brahmaputra delta), Moattama and Tanintharyi (=Ayeyerwaddy Delta). Mainly gas fields, with main discoveries Zawtika (2.05 Tcf), Shwe/ShwePhyu/Mya (4.09 Tcf biogenic gas in distal Bengal Fan), Yadana (2.89 Tcf in E Miocene carbonates in forearc basin setting) and Yetagun (1.5 Tcf,41 MMb condensate, thermogenic)

Racey, A. & M.F. Ridd (2015)- Petroleum geology of the Moattama region, Myanmar. In: A. Racey & M.F. Ridd (eds.) Petroleum geology of Myanmar, Chapter 6, Geol. Soc., London, Mem. 45, p. 63-81.
(Offshore Moattama Region dominated by Martaban Basin, between Yadana- M8 highs in W and Tanintharyi Shelf in E. Late Oligocene- E Miocene carbonate platform of Yadana- M8 highs (with Yadana and smaller gas fields) overlies volcanic arc basement, and is overlain by thin U Miocene- Recent clastics from ancestral Ayeyarwady River. In C part of Martaban Basin area thick Miocene clastics from ancestral Ayeyarwady and Thanlwin Rivers (with Zawtika biogenic gas field))

Racey, A. & M.F. Ridd (2015)- Petroleum geology of the Tanintharyi region, Myanmar. In: A. Racey & M.F. Ridd (eds.) Petroleum geology of Myanmar, Chapter 8, Geol. Soc., London, Mem. 45, p. 83-91.

Racey, A. & M.F. Ridd (2015)- Petroleum geology of the Rakhine region, Myanmar. In: A. Racey & M.F. Ridd (eds.) Petroleum geology of Myanmar, Chapter 9, Geol. Soc., London, Mem. 45, p. 93-108.
(Rakhine Basin off NW Myanmar (with Shwe gas field) also extends onshore under Rakhine coastal lowlands (with small oil fields). Rakhine Coastal Lowlands represents S-ward extension of hydrocarbon-bearing regions of Assam and E Bangladesh. Structurally complex onshore and offshore shelf area separated from poorly structured deepwater area by dextral trench-parallel shear fault system which represents boundary between India Plate in W and Burma Platelet in E)

Rangin, C. (2017)- Active and recent tectonics of the Burma Platelet in Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, p. 53-64.
(Burma Platelet covers W part of Myanmar, between Indian Plate/ Bengal Basin in W and Sunda Plate in E. Boundaries are active Sagaing dextral strike-slip fault in E, and debatable Bengal Basin subduction zone in W. Non-rigid sliver plate with several right-lateral shear zones accommodated N-ward India/Sunda dextral wrench movement, with hyper-oblique convergence since E Cenozoic)

Rangin, C., T. Maurin & F. Masson (2013)- Combined effects of Eurasia/Sunda oblique convergence and East Tibetan crustal flow on the active tectonics of Burma. J. Asian Earth Sci. 76, p. 185-194.

(Deformation of India/ Sunda plate result of partitioned oblique convergence. Sub-meridian dextral strike slip faulting accommodates India/Sunda motion in buffer zone (Burma platelet). This wide dextral strike slip shear zone is complicated by side effect of Tibet plateau collapse. Apparent E-W shortening component of hyper-oblique subduction is only effect of regional gravitational forces related to Tibet plateau collapse whereas N-S strike slip faulting accommodates India/Sunda motion)

Ridd, M.F. (2017)- Central Burma Depression and its petroleum occurrences. In: A.H.G. Mitchell, Geological belts, plate boundaries and mineral deposits in Myanmar, Elsevier, Chapter 12, p. 325-349.
(Synopsis of Ridd & Racey (2015) papers. All Myanmar onshore oil-gas fields are in 1200km long Central Burma Depression. Possibly oldest oil production/ mining in world. N-S trending basin with up to 15,000m of U Cretacous- Pleistocene sediments. Most productive fields Yenangyaung, Chauk and Yenangyat)

Ridd, M.F. (2017)- Karen-Tenasserim Unit. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 16, p. 365-384.
(Fault-bounded, N-S trending Karen-Tenasserim Unit of Bender (1983) W of Shan Plateau in southern Central Myanmar is direct continuation of 'Phuket -Slate Belt Terrane' of Ridd (2009) in Peninsular Thailand (and Tengchong Block to N?). With metamorphic rocks (incorrectly called Mogok Metamorphics), overlain by thick U Paleozoic Mergui Gp with intervals of ?Carboniferous- E Permian glacial diamictites and Permian 'Moulmein Limestone' (= Ratburi Lst of Peninsular Thailand; at Myeik/Mergui archipelago of S Myanmar with Lonsdaleia, Schwagerina, Productus sumatrensis, etc.). Aso with common granitoid intrusions. Often viewed as W part of Sibumasu Block, but interpreted as separate 'Phuket Terrane' or 'Irrawaddy block' (Mitchell 2012, 2015, Ridd 2016) (but no ophiolites found yet between them)

(Variety of Mesozoic basaltic and alkaline igneous rocks on E margin of Indian shield. Igneous rock suites from Meghalaya-Nagaland region with K-Ar ages of 149-107 Ma (Late Jurassic-E Cretaceous). Mantle upwelling in extensional tectonic regime related to fragmentation of Indian plate from Australia-Antarctica in E Cretaceous main trigger for magmatic activity. Includes latest Jurassic age of 148± 4 Ma for basalts of Nagaland Ophiolite Complex)

Satyabala, S.P. (2003)- Oblique plate convergence in the Indo-Burma (Myanmar) subduction region. Pure Applied Geophysics 160, 9, p. 1611-1650.
(Indo-Burma (Myanmar) subduction boundary highly oblique to direction Indian plate motion relative to Eurasian plate.Area includes Wadati-Benioff zone of earthquakes, magmatic arc, fold-thrust belts. Also oblique subduction features-like arc-parallel strike-slip fault (Sagaing Fault) and buttress (Mishmi block) that resists the motion of fore-arc sliver. Study of earthquakes consistent with model of M Miocene- Recent E-ward subduction, volcanic activity and transcurrent movement)

Searle, D.L. & B.T. Haq (1964)- The Mogok belt of Burma and its relationship to the Himalayan orogeny. In: G. Kohli et al. (eds.) Himalayan and Alpine orogeny, Proc. 22nd Int. Geological Congress, India 1964, 11, p. 132-161.

Searle, M.P. (2006)- Role of the Red River shear zone, Yunnan and Vietnam, in the continental extrusion of SE Asia. J. Geol. Soc., London, 163, p. 1025-1036.
(1000km long Ailao Shan-Red River fault zone from SE Tibet to Gulf of Tonkin and S China Sea. Left-lateral strike-slip shearing along Red River shear zone started after 21 Ma, not 35 Ma as previously thought, and fault was purely crustal structure. None of geological features used to propose 500-1000 km offsets are robust, and total offset remains unknown (but see also Tang et al. 2012; JTvG))

Searle, M.P., C.K. Morley, D.J. Waters, N.J. Gardiner, U Kyi Htun., T.T. Nu & L.J. Robb (2017)- Tectonic and metamorphic evolution of the Mogok Metamorphic and Jade Mines Belts and ophiolitic terranes of Burma (Myanmar). In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 12, p. 261-293.
(Mogok High-T Metamorphic terrane along W margin of Sibumasu/ Shan Plateau in Myanmar (Burma) thought to be S-ward continuation of Lhasa block of S Tibet. S of Burma MMB may extend into tin granite province of Mergui coast and S to Phuket. MMB has little in common with Western granite belt of peninsula Malaysia, dominated by Triassic tin-bearing biotite granites. Includes Jade Mines Belt (ophiolitic mantle rocks subjected

to high-P metamorphism). Peak metamorphism time ~M-L Eocene (~43-33 Ma), rapid exhumation in late E Miocene (~16-22 Ma))

Searle, M.P., S.R. Noble, J.M. Cottle, D.J. Waters, A.H.G. Mitchell, Tin Hlaing & M.S.A. Horstwood (2007)- Tectonic evolution of the Mogok metamorphic belt, Burma (Myanmar) constrained by U-Th-Pb dating of metamorphic and magmatic rocks. Tectonics 26, 3, p. 1-24.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2006TC002083/epdf)
(Mogok belt of high-grade metamorphic rocks of Birma extends >1500 km along W margin of Shan-Thai block. Previous geochronology suggested long-lasting Jurassic- E Cretaceous subduction-related event with emplacement of granodiorites and orthogneisses (171-120 Ma) and poorly constrained Tertiary metamorphic event. New U-Pb isotope data suggest two Tertiary metamorphic events affecting MMB: (1) Paleocene ~59 Ma and (2) Late Eocene- Oligocene (at least from 37 (47?)- 29 Ma))

Sein, C., J. van der Made & G.E. Rossner (2009)- New material of *Propotamochoerus* (Suidae, Mammalia) from the Irrawaddy Formation, Myanmar. Neues Jahrbuch Geol. Palaont., Abhandl. 251, 1, p. 17-31.
(New records of Late Miocene Propotamochoerus from Lower Irrawaddy Fm at Tebingan in Myanmar (P. "hysudricus", P. wui). Presence in Myanmar indicates faunal affinities between India, SE Asia and S China)

Sengupta, S., S.K. Acharyya, H.J. van den Hul & B. Chattopadhyay (1989)- Geochemistry of volcanic rocks from the Naga Hills Ophiolites, northeast India and their inferred tectonic setting. J. Geol. Soc., London, 146, p. 491-498.
(Highly disrupted and deformed slices of ophiolitic rocks occur in linear belt in Nagaland and Manipur, known as the Naga Hills Ophiolites. Principal rock types dunite, harzburgite, lherzolite, wehrlite, pyroxenite and mafic volcanics. Volcanics low-Ti and high-Ti groups, probably not cogenetic. Low-Ti group overlapping Mid-Ocean Ridge Basalt and island arc-like characteristics, and possibly suggest back-arc basin setting. High-Ti group similarities with within-plate basalts erupted at off-axis seamounts)

Sengupta, S., K.K. Ray, S.K. Acharyya & J.B. de Smeth (1990)- Nature of ophiolite occurrences along the eastern margin of the Indian Plate and their tectonic significance. Geology 18, p. 439-442.
(U Mesozoic- Lower Eocene ophiolitic rocks in two parallel belts along E margin of Indian plate: (1) E belt: C Burma, Sumatra and Java, with gravity highs from steeply dipping mafic rocks, and denotes line of subduction prior to M Eocene (root zone of Cretaceous-Paleocene oceanic crust?) (2) W belt: Nagaland, Manipur, W Burma, and Andaman, flanked toE by negative gravity anomaly zone, with rootless subhorizontal ophiolites overlying Eocene-Oligocene flysch of Indo-Burmese Range (W-propagating ophiolite nappes from E belt during late Oligocene terminal collision of Indian and Eurasian continental blocks) (but associated with M Eocene ophiolite-derived clastics?). Late Oligocene unconformity in entire region Ophiolite occurrences in Andaman and Mentawai islands belong to W belt; generally linked with active subduction W of island arc, but subduction began only in Late Miocene and could not have produced ophiolites emplaced much earlier)

Sevastjanova, I., L. Wilson, P. Markwick, C. Davies, A. Quallington & M. Harland (2016)- A source-to-sink study in Myanmar: implications for exploration. AAPG Geoscience Techn. Workshop Characterization of Asian hydrocarbon reservoirs, Bangkok, Search and Discovery Art. 30454, 6p. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2016/30454sevastjanova/ndx_sevastjanova.pdf)
(Detrital zircon U-Pb age data from Rakhine Basin shows Precambrian zircons more abundant in present-day river sands compared to Eocene-Miocene. This implies provenance change and increased sediment reworking between Miocene- Present, consistent with suggested rapid uplift of Indo-Burman ranges since Late Miocene)

Shellnutt, J.G. (2014)- The Emeishan large igneous province: a synthesis. Geoscience Frontiers 5, 3, p. 369-394.
(online at: www.sciencedirect.com/science/article/pii/S1674987113001072)
(Late Permian Emeishan large igneous province in SW China covers W margin of Yangtze Block (S China Block) and E Tibetan Plateau, with displaced units in N Vietnam (Song Da zone). Contains base metal deposits and is contemporaneous with late Capitanian (~260 Ma) mass extinction. Mainly flood basalts, but also ultramafic and silicic volcanic rocks. Three nearly concentric zones with thicker crust from inner to outer zone.

Age of the ELIP constrained to interval of 3 Myrs or less. Uncertainty whether magmas derived from subcontinental lithospheric mantle or asthenosphere/ mantle plume sources or both. ELIP likely derived from short-lived, plume-like upwelling of mantle-derived magmas)

Shellnutt, J.G. (2015)- Igneous Rock associations 16. The Late Permian Emeishan Large Igneous Province. Geoscience Canada 42, p. 169-180.
(online at: https://journals.lib.unb.ca/index.php/GC/article/download/21548/26356)
(Review of Late Permian Emeishan large igneous province (ELIP) covers W margin of Yangtze Block and Tibetan plateau of SW China, with displaced correlative units in N Vietnam (Song Da zone). Contemporaneous with Late Capitanian mass extinction (260 Ma) erupted in <3 Myrs. Mainly flood basalts, but also also picritic and silicic volcanic rocks. Considered to be mantle plume-derived, albeit with some crustal contamination)

Shellnutt, J.G., S.W. Denyszyn & R. Mundil (2012)- Precise age determination of mafic and felsic intrusive rocks from the Permian Emeishan large igneous province; SW China. Gondwana Research 22, 1, p. 118-126.
(New zircon CA-TIMS U-Pb from intrusive rocks of Panxi region (Inner Zone) of M-L Permian ELIP yielded ages between >257 Ma and ~260 Ma, consistent with estimates from magneto-biostratigraphic data)

Shellnutt, J.G. & B.M. Jahn (2011)- Origin of Late Permian Emeishan basaltic rocks from the Panxi region (SW China): implications for the Ti-classification and spatial-compositional distribution of the Emeishan flood basalts. J. Volcanology Geothermal Research 199, p. 85-95.

Shellnutt, J.G., T. Usuki, A.K. Kennedy & H.Y. Chiu (2015)- A lower crust origin of some flood basalts of the Emeishan large igneous province, SW China. J. Asian Earth Sci. 109, p. 74-85.
(Neoproterozoic (i.e. ~750-850 Ma) zircons in Late Permian Emeishan basalts indicates either assimilation of older material during emplacement or rocks could be derived from mafic Neoproterozoic precursor, like Neoproterozoic Kangdian basalts)

Shellnutt, J.G. & K.L. Wang (2014)- An ultramafic primary magma for a low Si, high Ti-Fe gabbro in the Panxi region of the Emeishan large igneous province, SW China. J. Asian Earth Sci. 79, A, p. 329-344.
(Kelang gabbro (256± 3 Ma) in contact with syenite of Late Permian (~260 Ma) Baima igneous complex of Emeishan Large Igneous Province. Gabbro may be uppermost portion of large mafic-ultramafic intrusion unrelated to Baima igneous complex)

Shen, S., Q. Feng, Q. Wei, Z. Zhang & H. Zhang (2006)- A study on the geochemical characteristics of Upper Permian continental marginal arc volcanic rocks in the northern segment of South Lancangjiang Belt. Chinese J. Geochemistry 25, 3, p. 216-222.
(Geochemical characteristics of U Permian continental marginal arc volcanics from Xiaodingxi and Zangli on the E side of Yunxian-Lincang granite. Dominated by basalt-andesite-dacite. Lancangjiang Belt, together with ocean-ridge and ocean-island volcanic rocks and ophiolites in Changning-Menglian Belt, indicate Lancangjiang oceanic crust (Paleotethys) subducted E-wards)

Shen, S., Q. Feng, Q. Wei & Z. Zhang (2007)- Newly developed evidence for the original Tethysan island-arc volcanic rocks in the southern segment of the South Lancangjiang Belt. Chinese J. Geochemistry 26, 1, p. 91-97.
(Pre-Ordovician metamorphic volcanic rocks in Huimin-Manlai region of Yunnan Province represent Tethysan island-arc volcanic rocks)

Shen, S.Z., G.R. Shi & Z.J. Fang (2002)- Permian brachiopods from the Baoshan and Simao Blocks in Western Yunnan, China. J. Asian Earth Sci. 20, 6, p. 665-682.
(Four Permian brachiopod assemblages from W Yunnan, SW China. Faunas from Baoshan Block dominated by species characteristic of Cathaysian Province with some links with Peri-Gondwanan faunas. Simao Block characterised exclusively by taxa of Cathaysian Province)

Shen, S.Z., G.R. Shi & K. Zhu (2000)- Early Permian brachiopods of Gondwana affinity from the Dingjiazhai Formation of the Baoshan block, western Yunnan, China. Rivista Italiana Paleont. Stratigr. 106, 3, p. 263-282.
(online at: https://riviste.unimi.it/index.php/RIPS/article/download/6146/6108)
(28 species and 3 assemblages of E Permian brachiopods in 100-340m thick Dingjiazhai Fm of Baoshan block. In ascending order: (A) Bandoproductus qingshwigouensis- Marginifera semigrariosa (lower member with glacial dropstones; Asselian), (B) Punctocyrtella australis- Punctospirifer afghanus (latest Asselian- E Sakmarian) and (C) Callytharrella dongsbanpoensis (Late Sakmarian-Artinskian; correlative with Late Sakmarian Spinomartinia prolifica assemblage of S Thailand). Uppermost Dingjiazhai Fm with fusulinids Eoparafusulina spp., Schwagerina spp and Triticites. Strong Gondwanan affinity)

Shi, G.H., W. Cui, S. Cao, N. Jiang, P. Jian, D. Liu, L. Miao & B. Chu (2008)- Ion microprobe zircon U-Pb age and geochemistry of the Myanmar jadeitite. J. Geol. Society, London, 165, p. 221-234.
(Myanmar jadeitite from W part of Sagaing fault belt with three groups of zircons: (1) ~163 Ma, indicating M Jurassic igneous (oceanic crust formation) or hydrothermal (serpentinization) event; (2) ~146.5 Ma, with jadeite inclusions, suggesting Late Jurassic age of formation of Myanmar jadeitites, and subduction of E Indian oceanic plate; (3) 122 Ma, representing later unknown thermal event)

Shi, G.H., D.A. Grimaldi, G.E. Harlow, J. Wang, J. Wang, M. Yang, W. Lei, Q. Li & X. Li (2012)- Age constraint on Burmese amber based on U-Pb dating of zircons. Cretaceous Research 37, p. 155-163.
(online at: www.cugb.edu.cn/uploadCms/file/20600/20170113080954938661.pdf)
(Commercially exploited Cretaceous amber (burmite) from clastic rocks rich in volcanics in Hukawng Valley, N Myanmar, with diverse biota. Earlier age estimates Albian- Cenomanian based on palynology and insects. Zircons from amber two age groups: (1) 102-108 Ma; (2) 98.8 Ma (E Cenomanian; viewed as maximum age for burmite). Ages also indicate volcanic activity at ~98.8 Ma in area)

Shi, G.H., G.E. Harlow, J. Wang, J. Wang, E. Ng, X. Wang, S. Cao & W. Cui (2012)- Mineralogy of jadeitite and related rocks from Myanmar: a review with new data. European J. Mineralogy 24, 2, p. 345-370.
(Jadeitite composed almost entirely of jadeite and related pyroxene. It is found in subduction channel serpentinite melange associated with High P/ low T metamorphosed rocks, but generally rarer than eclogite or blueschist. Late Jurassic jadeitite from Myanmar Jade Mine Tract at W side of Sagaing Fault highly diverse mineralogy, with >30 minerals: jadeite, omphacite, kosmochlor, etc. Primary jadeitite veins occur in serpentinite with albitite and/or amphibolite boundaries. At least two stages of jadeitization identified. Late-stage zeolites, pectolite, hyalophane, etc. formed at lower P and T. Jadeite-forming fluids rich in Na, Al, Ba, Sr and Ca. Most rocks in serpentinite melanges subject to infiltration and potential replacement by jadeitite or reaction with jadeitite)

Shi, G.H., N. Jiang, Y. Liu, X. Wang, Z.Y. Zhang & Y.J. Xu (2009)- Zircon Hf isotope signature of the depleted mantle in the Myanmar jadeitite: implications for Mesozoic intra-oceanic subduction between the Eastern Indian Plate and the Burmese Platelet. Lithos 112, p. 342-350
(Lu-Hf isotope signatures of zircons in jadeitite from N Myanmar. Indo-Burma Range interpreted as Eastern subduction zone where oceanic crust of E Indian plate was overridden by Burmese platelet. Jadeite formed in serpentinite, marking subduction zone. Three zircon groups: ~163, 146 and 122 Ma. Zircon in jadeitite can be used to constrain age of serpentinization/rodingitization, and age of formation of ultramafic rock within ophiolites. Results suggest presence of Mesozoic intra-oceanic subduction in Indo-Burman Range)

Shi, G.H., W. Lei, H. He, Y.N. Ng, Y. Liu, Y.X. Liu, Y. Yuan, Z. Kang & G. Xie (2014)- Superimposed tectono-metamorphic episodes of Jurassic and Eocene age in the jadeite uplift, Myanmar, as revealed by 40Ar/39Ar dating. Gondwana Research 26, 2, p. 464-474.
(Jade Mine Track HP ophiolites/ serpentinite melange of Myanmar between Indo-Burma Range and Tagaung-Myitkyina Belt with two contrasting Ar-Ar ages: (1) Late Jurassic (152.4 Ma of glaucophane from blueschist) and (2) M Eocene (~45 Ma) of phengitic muscovites from quartz schists. Late Jurassic Jadeite Uplift possibly related to Woyla intra-oceanic arc subduction zone)

Shi, G.U., P. Tropper, W. Cui, J. Tan & C. Wang (2005)- Methane (CH4)-bearing fluid inclusions in the Myanmar jadeitite. Geochemical J. 39, 6, p. 503-516.
(Fluid inclusions in high-pressure jadeitites from famous jadeite tract of N Myanmar mostly H2O (87-94%) and methane (CH4). Stable isotope ratios of CH4 indicative of abiogenic thermal maturation, probably from subducted organic carbon in paleosubduction zone. CH4 may be stable to at least upper 20 km of subduction zone where jadeitite veins formed under low T / high-P conditions)

Shi, Y. (2010)- Early Permian fusulinids from West Yunnan and their chronological puzzle. In: C.P. Lee et al. (eds.) 6th Symp. Int. Geol. Correl. Progr. Project 516 (IGCP516), Geological anatomy of East and South Asia, Kuala Lumpur 2010, p. 42-43. *(Abstract only)*
(E Permian (Artinskian) fusulinids described recently from W Yunnan Sibumasu/ Cimmerian terranes: Eoparafusulina-Pseudofusulina faunas from Baoshan;, Eoparafusulina-Monodiexodina fauna from Tengchong)

Shi, Y., J.L. Anderson, Z. Wu, Z. Yang, L. Li & J. Ding (2016)- Age and origin of Early Paleozoic and Mesozoic granitoids in Western Yunnan Province, China: geochemistry, SHRIMP zircon ages, and Hf-in-zircon isotopic compositions. J. Geology 124, 5, p. 617-630.
(E Paleozoic magmatism in Baoshan block (granitoids with zircon Pb/U ages of ~481, 493 Ma and indications of crustal melting/reworking. Tengchong block Late Triassic S-type granites with zircons of 216-226 Ma, probably in post-collisional tectonic setting. Late Early Cretaceous (118 Ma) S-type granite; emplacement may be related to closure of Neotethys ocean)

Shi, Y., H. Huang & X. Jin (2017)- Depauperate fusulinid faunas of the Tengchong Block in western Yunnan, China, and their paleogeographic and paleoenvironmental indications. J. Paleontology 91, 1, p. 12-24.
(online at: www.cambridge.org/core/journals/journal-of-paleontology/article/depauperate-fusul...)
(M Permian fusulinids from Tengchong Block, W Yunnan, China (= part of Sibumasu) dominated by Chusenella, Nankinella and Schwagerina. Low diversity through E-M Permian and paucity of M Permian neoschwagerinids and verbeekinids in block confirm Gondwana-affinity and possibly relatively low temperature of seawater. Depauperate assemblages of limited number of species with abundant individuals)

Shi, Y., H. Huang, X. Jin & X. Yang (2011)- Early Permian fusulinids from the Baoshan Block, Western Yunnan, China and their paleobiogeographic significance. J. Paleontology 85, 3, p. 489-501.
(Sakmarian-Artinskian fusulinids from N and S Baoshan and W Yunnan, dominated by Pseudofusulina and Eoparafusulina spp. and similar to those from C Pamir, S Afghanistan, E-C Iran, C Oman, E Hindu Kush and N Karakorum)

Shi, Y., X. Jin, H. Huang & X. Yang (2008)- Permian fusulinids from the Tengchong Block, Western Yunnan, China. J. Paleontology 82, p. 118-127.
(Permian fusulinid faunas from N Tengchong Block, SW China. Lower Dadongchang Fm dominated by Eoparafusulina, possibly Sakmarian age. Dadongchang Fm mainly Chusenella and Monodiexodina, indicating Wordian-Capitanian age. Similar to fusulinid assemblages from Baoshan and Sibumasu Blocks (both low diversity without Cathaysian-Tethyan Pseudoschwagerinidae, Verbeekinidae, Neoschwagerinidae))

Shimada, K., N. Egi, T. Tsubamoto, M. Maung, T. Htike, M. Thein, Y. Nishioka et al. (2016)- The extinct river shark *Glyphis pagoda* from the Miocene of Myanmar and a review of the fossil record of the genus *Glyphis* (Carcharhiniformes: Carcharhinidae). Zootaxa 4161, 2, p.
(Re-description of extinct river shark, Glyphis pagoda (Noetling), based on 20 teeth from three Miocene localities in Myanmar (nearshore marineObogon Fm and freshwater Irrawaddy sediments). Glyphis pagoda likely reached 185cm in length)

Shoup, R.C., A.J. Filipov & M. Hiner (2017)- Geological interpretation of the reservoir and pay distribution of the G3.2 and G5.2 series of the Shwe Field, Myanmar. AAPG/EAGE/MGS 3rd Oil & Gas Conf., Yangon 2017, Search and Discovery Art. 20401, 33p.

(On Tertiary clockwise rotation of crustal blocks of E Himalayas around NE edge of India)

Soe A.N., Myitta, S.T. Tun, A.K. Aung, T. Thein, B. Marandat, S. Ducrocq & J.J. Jaeger (2002)- Sedimentary facies of the late Middle Eocene Pondaung Formation (central Myanmar) and the palaeoenvironments of its anthropoid primates. Comptes Rendus Palevol 1, 3, p. 153-160.
(Primate-bearing Pondaung Fm in NW part of C Myanmar mainly composed of cyclic sequences of sandstones and variegated clays, deposited in fluvio-deltaic environment. Anthropoid primate remains in swale-fill sediments, sometimes in carbonate nodules of pedogenetic origin and in small crevasse channel deposits of U Pondaung Fm)

Soe Min, I.M. Watkinson, Soe Thura Tun, Win Naing & Tin Lwin Swe (2017)- The Kyaukkyan Fault, Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics. Geol. Soc., London, Memoir 48, Chapter 21, p. 453-471.
(Kyaukkyan Fault active N-S dextral strike-slip structure across W Shan Plateau, parallel to and ~100-150 km E of central Sagaing Fault. Probable Late Oligocene- M Miocene onset of dextral shear)

Soibam, I., M.C. Khuman & S.S. Subhamenon (2015)- Ophiolitic rocks of the Indo-Myanmar Ranges, NE India: relicts of an inverted and tectonically imbricated hyper-extended continental margin basin? In: G.M. Gibson et al. (eds.) Sedimentary basins and crustal processes at continental margins: from modern hyper-extended margins to deformed ancient analogues, Geol. Soc., London, Spec. Publ. 413, p. 301-331.
(Indo-Myanmar Ranges structural and tectonic features best explained by dextral shear and oblique subduction of Indian Plate below Myanmar Plate. U Cretaceous- Lower Eocene ophiolitic rocks Alpine-type harzburgite and lherzolite enriched in trace and rare earth elements, also diabase dykes, pillow basalts. Formation and unroofing probably by mantle exhumation in hyperextended continental margin setting. Paleomagnetic data suggest no latitudinal change since formation)

Stamp, L.D. (1922)- An outline of the Tertiary geology of Burma. Geol. Magazine 59, 11, p. 481-501.
(Main physical geographic belts of Myanmar: (1) Shan Plateau, in E: N-S trending belt of highly folded Paleozoic and E Mesozoic rocks; continuous with plateau of Yunnan; main folding post-E Jurassic and pre-late Tertiary; (2) Central Tertiary Belt; (3) Arakan Yoma foldbelt in W. With detailed discussion of Tertiary stratigraphy and paleogeography)

Stamp, L.D. (1927)- Conditions governing the occurrence of oil in Burma. J. Inst. Petroleum Technol. 13, 60, p. 21-70.

Stamp, L.D. (1927)- The geology of the oil fields of Burma. American Assoc. Petrol. Geol. (AAPG) Bull. 11, 6, p. 557-579.
(Oil fields of Burma in long N-S line in Tertiary synclinal trough in central part of country, bounded in E by Shan Plateau and in W by Arakan Yoma/ Naga Hills, originally marine gulf, filled in by clastics of Chindwin and Irrawaddy Rivers. Oil-bearing reservoirs mainly deltaic. Main fields from N to S: Indaw, Yenangyat-Singu,

Yenangyaung, Minbu, Padaukpin and Yenanma. Largest producer Yenangyaung (3,000,000,000 gallons since 1900). Singu has largest reserves. Discovery of important new fields unlikely)

Stamp, L.D. (1934)- Natural gas fields of Burma. American Assoc. Petrol. Geol. (AAPG) Bull. 18, 3, p. 315-326.

Stojanovic, D., J.C. Aitchison, S. Kachovich, K. Lokho & T.R. Ireland (2016)- New age constraints for the Manipur ophiolitic melange: insights into Tethyan ophiolites of the Indo-Myanmar Range. American Geoph. Union (AGU), Fall General Assembly 2016, Abstract id. T11A-2595, 1p. *(Abstract only)*
(Manipur Ophiolite Complex disrupted belt of ophiolitic melange along border ranges between Myanmar and NE Indian states Manipur and Nagaland. Ranges formed through collision of Indian plate and displaced elements of Sibumasu terrane that have been sinistrally displaced >450 km along Asian margin by Sagaing fault (Neotethys suture). Well-preserved Lower Cretaceous radiolarian assemblages in green ribbon chert blocks (= minimum age of underlying ophiolitic ocean floor))

Sun, Y., X. Lai, P.B. Wignall, M. Widdowson, J.R. Ali, H. Jiang, W. Wang, C. Yan, D.P.G. Bond & S. Vedrine (2010)- Dating the onset and nature of the Middle Permian Emeishan large igneous province eruptions in SW China using conodont biostratigraphy and its bearing on mantle plume uplift models. Lithos 119, p. 20-33.
(M Permian Emeishan large igneous province of SW China. Conodont ages show eruptions began in M Capitanian Jinogondolella altudaensis Zone (~263 Ma) and increased in J. xuanhanensis Zone (~262 Ma). Postulated km-scale plume-related domal uplift prior to Emeishan eruptions not supported by data; rather more complex interaction between plume and lithosphere with minor localized uplift and subsidence is inferred)

Suzuki, H., M. Maung, Zaw Win, T. Tsubamoto, M. Maung, N. Egi, M. Takai & N. Shigehara (2006) Stratigraphic positions of the Eocene vertebrate localities in the Paukkaung area (Pondaung Formation, Central Myanmar). Asian Paleoprimatology 4, p. 67-74.
(online at: https://repository.kulib.kyoto-u.ac.jp/dspace/bitstream/2433/199770/1/aspp_04_067.pdf)
(Detailed survey of ~275m thick Upper Member of Eocene Pondaung Fm W of Paukkaung, to clarify stratigraphic relationship among the localities of fossil vertebrates. Most localities (Pkl, Pk2, Pk3, Pk4, Pk5 and Pk8) in single claystone (Ayoedawpon Taung Claystone), which overlies widely traceable Ayoedawpon Taung Sst. Localities Pk9 and and Pk12 below and above this claystone)

Suzuki, H., M. Maung, N.S. Aung & N. Shigehara (2006)- Lithostratigraphy of the Pondaung Formation (Eocene) between Tabyin and Kyauktakha to the west of Pauk, Central Myanmar. Asian Paleoprimatology 4, p. 75-97.
(online at: https://repository.kulib.kyoto-u.ac.jp/dspace/bitstream/2433/199769/1/aspp_04_075.pdf)
(Pondaung Fm along Tabyin-Kyauktakha route composed of sandstone, siltstone and claystone with minor coal, acidic tuff and pebbly sandstone. Thickness~1170m. Upper Member mainly sandstone that, unlike in areas of Pale and Myaing, did not preserve fossil vertebrates)

Swe, Y.M., C.C. Aye & K. Zaw (2017)- Gold deposits of Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 25, p. 557-572.
(>300 gold occurrences in Myanmar, in 6 main associations: porphyry and epithermal deposits in Late Cretaceous- Paleogene Central Magmatic Arc; orogenic gold; skarn, sediment-hosted, Slate Belt-hosted and quartz veins in ophiolite-greenschist units)

Tainsh, H.R. (1950)- Tertiary geology and principal oil fields of Burma. American Assoc. Petrol. Geol. (AAPG) Bull. 34, p. 823-855.
(Review of Tertiary geology of Myanmar. Gravity minimum of Arakan Yoma runs through Andaman Islands to join gravity low of Vening Meinesz, SW of Sumatra along Mentawai Islands. Gravity maximum associated with Burma volcanic line can be traced to volcanoes of Narcondam and Barren Island in Andaman area may correspond to high of volcanic belt of Sumatra. Major oil fields near Irrawaddy River in C part of Upper Burma. Principal oil fields described are anticlinal structures of Chauk- Lanywa and Yenangyaung)

Takai, M., H. Saegusa, Thaung-Htike & Z.M.M. Thein (2006)- Neogene mammalian fauna in Myanmar. Asian Paleoprimatology 4, p. 143-172.
(online at: https://repository.kulib.kyoto-u.ac.jp/dspace/bitstream/2433/199765/1/aspp_04_143.pdf)
(Review of Neogene mammalian fossils from E-M Miocene Pegu beds (12 mammal genera) and Late Miocene-Pliocene Irrawaddy beds (14 mammal families) along Irrawaddy River, Myanmar. Although fossils scarce, Myanmar faunas greater similarity to S Asian(India) fauna than to E Asian (China) fauna until Pliocene)

Takai, M., C. Sein, T. Tsubamoto, N. Egi, M. Maung & N. Shigehara (2005)- A new eosimiid from the latest middle Eocene in Pondaung, Central Myanmar. Anthropologal Science 113, p. 17-25.
(online at: https://www.jstage.jst.go.jp/article/ase/113/1/113_1_17/_pdf)
(New eosimiid primate, Eosimias paukkaungensis from latest M Eocene of Pondaung. Mandibular fragments larger than homologues of Eosimias species from China, but smaller than Bahinia pondaungensis)

Takai, M. & N. Shigehara (2004)- The Pondaung primates, enigmatic ñpossible anthropoidsò from the Latest Middle Eocene, Central Myanmar. In: C.F. Ross & R.F. Kay (eds.) Anthropoid origins: new visions, Kluwer/ Plenum, New York, p 283-321.
(Recent discoveries of 'possible anthropoids' from M Eocene from China, Myanmar and Thailand suggest 'protoanthropoids' may have originated in E Asia, not Africa)

Takai, M., N. Shigehara, T. Tsubamoto, N. Egi, A.K. Aung, T. Thein, A.N. Soe & S.T. Tun (2000)- The latest Middle Eocene primate fauna in the Pondaung area, Central Myanmar. Asian Paleoprimatology, Volume 1, Primate Research Institute, Kyoto University, Inuyama, Japan, p. 7-28.
(Four M Eocene primate taxa known from Pondaung Fm of Burma, incl. Pondaungia cotteri (discovered in 1914), Amphipithecus mogaungensis (1923), Bahinia pondaungensis (1998), and unnamed new taxon (1998))

Tanaka, K., C. Mu, K. Sato, K. Takemoto, D. Miura, Y. Liu, H. Zaman et al. (2008)- Tectonic deformation around the eastern Himalayan syntaxis: constraints from the Cretaceous palaeomagnetic data of the Shan-Thai Block. Geophysical J. Int. 175, p. 713-728.
(E-M Cretaceous red sandstones sampled at four localities in Lanpin-Simao fold belt of Shan-Thai Block. Shan-Thai Block ~20° CW rotation in early stage of India-Asia collision, followed by S-ward displacement along Red River Fault before 32 Ma, then subjected to N-S compressive stresses from 32-27 Ma, shaping structure of Chongshan- Lancang- Chiang Mai Belt. Some local CW rotation in Pliocene-Quaternary in central Shan-Thai)

Tarrass, I., P. Dattilo, P. Bourguignon, S. Van De Beuque & J.P. Thiriet (2017)- Turbidite systems of the East Andaman Basin (Myanmar): impacts on exploration. In: SE Asia Petroleum Expl. Soc. (SEAPEX) Exploration Conf. 2017, Singapore, 2p. *(Abstract)*
(Andaman Sea series of pull-apart basins formed in right lateral strike slip regime in back-arc setting. Volcanic basement overlain by Eocene and younger carbonate and clastic sequences. Oligocene- E Miocene shelf clastics sourced from E, with carbonate platforms and reefs mainly on W volcanic highs. Huge siliciclastic succession related to Irrawaddy Delta from U Miocene-present. Large slope channels, extending in abyssal plain)

Teillet, T., F. Fournier, F. Gisquet, L.F. Montaggioni, J. Borgomano, Q. Villeneuve & Fei Hong (2019)- Diagenetic history and porosity evolution of an Early Miocene carbonate buildup (Upper Burman Limestone), Yadana gas field, offshore Myanmar. Marine Petroleum Geol. 109, p. 589-606.
(Diagenetic history of Upper Burman Limestone reservoir in Miocene Yadana carbonate platform major offshore gas reservoir in Andaman Sea, offshore Myanmar. High porosity (av. 28%) mainly due to development of microporosity, moldic and vuggy porosity. Long-term depositional hiatus (M-L Miocene) at top of reservoir related to platform drowning and non-deposition in deep marine setting. Microporosity development and sparry calcite cementation mainly occurred in marine to marine shallow burial environments. Major decrease in porosity (10%) below gas-water contact suggests porosity evolution after hydrocarbon emplacement).

Teillet, T., F. Fournier, L.F. Montaggioni, M. BouDagher-Fadel, J. Borgomano, J.C. Braga, Q. Villeneuve & Fei Hong (2019)- Development patterns of an isolated oligo-mesophotic carbonate buildup, early Miocene, Yadana field, offshore Myanmar. Marine Petroleum Geol. 111, p. 440-460.

(Development history of 160m of upper part of Oligocene- E Miocene Yadana buildup in N Andaman Sea. Three types of carbonate factories: (1) scleractinian, (2) echinodermal and (3) large benthic foraminiferal- coralline algal. Carbonate accumulation on t Yadana platform mainly controlled by light penetration, nutrient content and hydrodynamic conditions)

Thein, T. (2004)- Review of the large-bodied Pondaung primates of Myanmar. In: C.F. Ross & R.F. Kay (eds.) Anthropoid origins: new visions, Kluwer/ Plenum, New York, p. 219-247.
(M Eocene Pondaung Fm in NW C Myanmar has been known for mammal fossils since 1916. Fossils include artiodactyls (Anthracotheriidae) and perissodactyls (Amynodontidae), carnivores, and primates. Primates from represented by Pondaungia cotteri Pilgrim, 1927, Amphipithecus mogaungensis Colbert, 1937, Bahinia pondaungensis Jaeger et al., 1999, and Myanmarpithecus yarshensis)

Tsubamoto, T., N. Egi, M. Takai, C. Sein & M. Maung (2005)- Middle Eocene ungulate mammals from Myanmar: a review with description of new specimens. Acta Palaeontologica Polonica 50, 1, p. 117-138.
(online at: www.app.pan.pl/archive/published/app50/app50-117.pdf)
(Two new ungulate taxa from M Eocene Pondaung Fm. Pondaung ungulate fauna now 29 species, mainly artiodactyls and perissodactyls. Paleoenvironment of fauna was humid forested/woodland vegetation with large rivers, located not far from E Tethyan Sea. Relatively high endemism at generic level)

Tsubamoto, T., T. Htike, Z.M. Maung Thein, N. Egi, Y. Nishioka & M. Takai (2012)- New data on the Neogene anthracotheres (Mammalia, Artiodactyla) from central Myanmar. J. Vertebrate Paleontology 32, 4, p. 956-964.
(Anthracotheres from Neogene in C Myanmar with 4 species of anthracotheres: Microbunodon silistrensis from M Miocene; Microbunodon milaensis and Merycopotamus dissimilis from latest Miocene- Pliocene)

Tsubamoto, T., Z.M. Maung Thein, N. Egi, T. Nishimura, T. Htike & M. Takai (2011)- A new anthracotheriid Artiodactyl from the Eocene Pondaung Formation of Myanmar. Vertebrata Palasiatica 49, p. 85-113.

(online at: http://www.ivpp.cas.cn/cbw/gjzdwxb/xbwzxz/201102/P020110216367564823071.pdf)
Mandible and molars of new anthracotherid from M Eocene Upper Pondaung Fm (~38 Ma), C Myanmar, Myaingtherium kenyapotamoides. Some similarities of M3 molar with 'Anthracothema' verhoeveni Von Koenigswald from Timor)

Tsubamoto, T., M. Takai, N. Egi, N. Shigehara, S.T. Tun et al. (2002)- The Anthracotheriidae (Mammalia; Artiodactyla) from the Eocene Pondaung Formation (Myanmar) and comments on some other anthracotheres from the Eocene of Asia. Paleont. Research 6, 4, p. 363-384.
(online at: https://ci.nii.ac.jp/els/contents110002695299.pdf?id=ART0002971777)
(On anthracoceres (hippopotamid like mammals) from latest M Eocene Pondaung Fm of C Myanmar. Three Anthracothema, Anthracokeryx and Anthracohyus synonymized into Anthracotherium. Four species, based on M1 size. Pondaung Anthracotherium species oldest of genus. Anthracothema (Anthracitherium) also known from Timor)

Tsubamoto, T., M. Takai, N. Shigehara, N. Egi, S.T. Tun, A.K. Aung, M. Maung, T. Danhara & H. Suzuki (2002)- Fission-track zircon age of the Eocene Pondaung Formation, Myanmar. J. Human Evolution 42, p. 361-369.
(Pondaung Fm in C Myanmar with >20 mammal genera. ~2000m thick freshwater deposits, overlying and partially interfingering with Tabyin Fm (with M Eocene Nummulites acutus). Overlain by marine Yaw Fm)with Late Eocene Nummulites yawensis, etc.). One tuff from upper Pondaung Fm with fission track age from 75 zircons of 37.2 ± 1.3 Ma (M-L Eocene boundary))

Tsubamoto, T., S.T. Tun, N. Egi, M. Takai, N. Shigehara, Aung N. Soe, K.A. Aung & T. Thein (2003)- Reevaluation of some ungulate mammals from the Eocene Pondaung Formation, Myanmar. Paleontological Research 7, 3, p. 219-243.

Tun, Soe Thura & I.M. Watkinson (2017)- The Sagaing Fault, Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 19, p. 413-441.
(N-S trending and relatively straight Sagaing Fault across Myanmar 1500 km long active strike-slip fault that accommodates more than half of right-lateral motion between Sundaland and India, within diffuse plate boundary along E margin of India, which occupies much of Myanmar. Ridge-subduction transform linking major thrust systems in N (E Himalaya) to Andaman Sea spreading centre S. N-ward younging strike-slip segments. Little evidence for pre-M Miocene movement, but more diffuse dextral slip possibly accommodated 300-700km of offset since Eo-Oligocene)

Udchachon, M., P. Charusiri, H. Thassanapak & C. Burrett (2018)- A new section of Lower Palaeozoic rocks in Kayin State (Southeast Myanmar). Proc. Geologists Assoc. 129, 2, p. 215-226.
(Lower Paleozoic rocks mapped in Kayin State (Sibuma Block). Three new formations with thickness >900 m, Lower siliciclastics overlain by predominantly carbonate with M Ordovician conodonts. Older formations probable correlate to S Shan State of Myanmar and Lower Ordovician siliciclastics of W Thailand. Folds in Lower Paleozoic rocks overturned to NE; deformation in one major phase between Tournaisian- E Permian)

Uddin, A., W.E. Hames & K.M. Zahid (2010)- Laser 40Ar/39Ar age constraints on Miocene sequences from the Bengal basin: implications for Middle Miocene denudation of the eastern Himalayas. J. Geophysical Res., Solid Earth 115, 7, B07416, p. 1-9.
(Orogenic sedimentation had begun in Bengal basin by E Miocene. Laser 40Ar/39Ar age determinations of detrital muscovite grains from E-M Miocene Bhuban Fm show ages from ~12 Ma- 516 Ma, suggesting derivation from a combination of sources. Modes of ~16, 18, 26 and 40 Ma most consistent with unroofing of Higher Himalayas since E Miocene. Detrital ages of ~16 and 22 Ma most prominent in highest levels, consistent with M Miocene unroofing of crystalline rocks of E Himalayas)

Uddin, A., P. Kumar & J.N. Sarma (2007)- Early orogenic history of the eastern Himalayas: compositional studies of Paleogene sandstones from Assam, northeast India. Int. Geology Review 49, p. 798-810.

(Disang Fm deep marine flysch-type sequence of cherts, carbonaceous mudstones and fine-grained sandstones of Late Eocene age in front of obducted Naga ophiolites= foreland basin fill?)

Uddin, A. & N. Lundberg (1998)- Unroofing history of the eastern Himalaya and the Indo-Burman ranges; heavy-mineral study of Cenozoic sediments from the Bengal Basin, Bangladesh. J. Sedimentary Res. 68, 3, p. 465-472.
(U Eocene- Neogene fill of Bengal basin provides unroofing history of E Himalaya and Indo-Burman ranges. Quartzose sandstones of Eocene-Oligocene Fms only 0.2% heavy minerals, most likely sourced from Indian craton immediately to W. E Miocene sandstones of Surma Gp contain more heavy-minerals, indicating mostly metamorphic source rocks. U Miocene U Surma Gp also abundant blue-green amphibole, orthopyroxene, and sparse chromite, suggesting deeper exhumation, of high P metamorphic and ophiolitic rocks)

Uddin, A. & N. Lundberg (1998)- Cenozoic history of the Himalayan-Bengal system: sand composition in the Bengal Basin, Bangladesh. Geol. Soc. America (GSA) Bull. 110, 4, p. 497-511.

Ueno, K., Y. Mizuno, X. Wang & S. Mei (2003)- Artinskian conodonts from the Dingjiazhai Formation of the Baoshan Block, West Yunnan, Southwest China. J. Paleontology. 76, 4, p. 741-750.
(E Permian conodonts from U Dingjiazhai Fm diamictite-bearing unit, in Gondwana-derived Baoshan Block. Conodont fauna in limestones in upper part of formation consists of Sweetognathus spp. Mesogondolella, etc., dated as M Artinskian. Dingjiazhai Fm overlain by basaltic volcanics related to rift volcanism during separation of Baoshan Block from Gondwanaland. Faunas including brachiopods and fusulinids from limestones interpreted as middle latitudinal, non-tropical, and Gondwana-influenced assemblage developed at N margin of Gondwanaland just after deglaciation (Ueno 2000))

Ueno, K., Myint Thein & A.J. Barber (2016)- Permian fusuline fauna from the Minwun Range, Central Myanmar. In: Development of the Asian Tethyan Realm: genesis, process and outcomes, 5th Int. Symposium Int. Geoscience Program (IGCP) Project 589, Yangon, p. 6. *(Abstract only)*
(online at: http://igcp589.cags.ac.cn/5th%20Symposium/Abstract%20Volume.pdf)
(Fault-bounded blocks of Permian limestones in Sagaing Fault Zone (associated with ophiolites of C Ophiolite Belt?) at Minwun Range with Permian fusulinids containing abundant Chalaroschwagerina, together with Pseudofusulina kraftii, Levenella, Pamirina, Schubertella, Toriyamaia, Minojapanella, and Pseudoreichelina. Age late Yakhtashian (late E Permian) age and Tethyan/ Cathaysian paleobiogeographic affinity)

Ueno, K. & S. Tsutsumi (2009)- Lopingian (Late Permian) foraminiferal faunal succession of a Paleo-Tethyan mid-oceanic carbonate buildup: Shifodong Formation in the Changning-Menglian Belt, West Yunnan, SW China. Island Arc 18, 1, p. 69-93.
(Late Permian foraminiferal succession in Changning-Menglian Belt (closed remnants of Paleo-Tethys Ocean). Shifodong Fm is uppermost unit in thick Carboniferous-Permian carbonate section on oceanic seamount basalts. Sixteen fusuline taxa, 3 zones: Codonofusiella kwangsiana, Palaeofusulina minima and Palaeofusulina sinensis Zones. Foram fauna in Paleo-Tethyan shallow-marine environment high faunal diversity, comparable to circum-Tethyan shelves like S China, and more diversified than coeval mid-oceanic Panthalassan faunas like Kamura Lst in Jurassic accretionary complex of SW Japan)

Ueno, K., Y. Wang & X. Wang (2003)- Fusulinoidean faunal succession of a Paleo-Tethyan oceanic seamount in the Changning-Menglian Belt, West Yunnan, Southwest China: an overview. Island Arc 12, 2, p. 145-161.
(Fusulinids from Paleo-Tethyan seamount-type carbonates of Changning-Menglian Belt, SW China, which is main Paleo-Tethys suture in E Asia. Basalts and overlying carbonates ~1100m thick with 17 late E Carboniferous- M Permian fusulinid zones. Tropical Tethyan-type succession, although diversity lower than those of Paleo-Tethyan shelves, such as S China, Indochina, and C Asia)

U Ko Ko (2016)- Structural observations along the Salin-Pyay Pleistocene strike-slip deformation belt. 2nd AAPG/EAGE/MGS Conference Unlocking the complex geology of Myanmar, Yangon 2015, Search and Discovery Art. 10845, 17p. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2016/10845ko/ndx_ko.pdf)

(Major Pleistocene strike-slip deformation over 200- 300 km wide belt of Myanmar sedimentary basins between Sagaing fault and escarpment between shallow and deep waters of Rakhine Yoma foldbelt. Tied toN-ward translational subduction of India below SE Asia plates)

Ukstins Peate, I. & S.E. Bryan (2008)- Re-evaluating plume-induced uplift in the Emeishan large igneous province. Nature Geoscience 1, p. 625-629.
(Mantle plumes should generate broad domal uplift (>1000 km wide, 500-1000m high) preceding volcanism in large igneous provinces. Most of Emeishan large igneous province in SW China emplaced at sea level, with no evidence for dynamic pre-volcanic uplift. Any positive relief that developed more likely result of formation of volcanic edifice and rapid accumulation of volcanic pile)

Ukstins Peate, I. & S.E. Bryan (2009)- Pre-eruptive uplift in the Emeishan? Nature Geoscience 2, p. 531-532.
(Part of discussion-reply with He et al. 2009, who argue for subaerial volcanism, as demonstrated by plant fossils (Cladophlebis permica))

Utitsan, S., T. Benjawan, S. Thanatit, W. Wetmongkongorn, U.S. Than, K.H. Myint & L.B. Wah (2014)- Geological evolution of Bago-Yoma Basin, Onshore Myanmar. AAPG Asia Pacific Region AAPG/MGS Conf., Yangon 2014, Search and Discovery Art.10659, 10p. *(Extended Abstract)*
(online at: www.searchanddiscovery.com/documents/2014/10659utitsan/ndx_utitsan.pdf)
(Bago-Yoma Basin 1 of 8 Tertiary basins in onshore Myanmar, with up to 14km of Late Cretaceous-Cenozoic deposits. Basins in N-S trend between Indo-Myanmar ranges to W and Shan Plateau to E. Basins experienced NW-SE extension in Miocene, followed by NE-SW transpression in Pliocene during change of maximum horizontal stress direction. Bago-Yoma Basin SE of main petroleum producing fields of C Myanmar Basin)

(online at: http://pubs.usgs.gov/fs/2012/3107/)

Wang, C., J. Deng, E.J.M. Carranza & M. Santosh (2013)- Tin metallogenesis associated with granitoids in the southwestern Sanjiang Tethyan Domain: nature, deposit types, and tectonic setting. Gondwana Research 26, 2, p. 576-593.
(Tin mineralization in SW Sanjiang Tethys Sn metallogenic domain in SW China extends from SE Asia tin belt in S. C part of domain is Changning-Menglian Sn belt and related to ~239-178 Ma (M Triassic- E Jurassic) S-type granitoids generated by Tengchong/Baoshan- Simao Blocks collision (= Paleotethys closing). W part of domain is Tengchong/ Baoshan Sn metallogenic belt, related to Cretaceous S-type granitoids (136-113 Ma, resulting from W Burma- Tengchong/Baoshan Blocks collision and 89-52 Ma, corresponding to India- Asia continental collision. Permian (298-262 Ma) I-type granitoids include Lincang granodiorite)

Wang, J.G., F.Y. Wu, X.C. Tan & C.Z. Liu (2014)- Magmatic evolution of the Western Myanmar Arc documented by U-Pb and Hf isotopes in detrital zircon. Tectonophysics 612-613, p. 97-105
(Magmatic arc that formed along Asian margin of Neo-Tethys well studied in Trans-Himalaya in Tibet, but SE extension of arc poorly documented in Myanmar. Detrital zircons from Chindwin Basin indicate mid-Cretaceous arc magmatism in W Myanmar (main magmatic stage ~110-80 Ma, with subordinate stage at ~70-40 Ma))

Wang, M. & D. Cheong (2016)- Reconstruction of burial history and analysis of the hydrocarbon potential using sedimentary modeling the middle Bengal Fan, Myanmar. Geosciences J. 20, 6, p. 813-825.
(Bengal Fan 3 stages of evolution: I (4.5-1.81 Ma; low sedimentation and subsidence), II (1.81-0.79 Ma; highest sedimentation and rapid subsidence), and III (0.79-0 Ma; high sedimentation, slowest subsidence). Biogenic gas typical hydrocarbon in area; generation and migration probably immediately after deposition of Unit 2. Thermogenic hydrocarbon potential low due to relatively low T and short burial)

Wang, X.D., T. Sugiyama & K. Ueno (1998)- Carboniferous and Permian stratigraphy of the Baoshan Block, West Yunnan, Southwest China. Permophiles, Newsletter Permian Stratigraphy 32, p. 38-40.
(Carboniferous and Permian stratigraphy of Baoshan Block (comparable to Sibumasu Block; Gondwana-derived terranes in present-day SE Asia). Basal Permian includes diamictites of possible glaciomarine origin, fusulinid forams Pseudofusulina and Eoparafusulina, small solitary corals incl. Cyathaxonia and basaltic lavas. M Permian Shazipo Fm limestone with forams Eopolydiexodina, Neoschwagerina sp., Verbeekina, Shanita amosi, Hemigordius and massive corals)

Wang, Y. (2013)- Earthquake geology of Myanmar. Ph.D. Thesis, California Institute of Technology, Pasadena, p. 1-300.
(Earthquake distributions in Myanmar suggest three distinct active structural systems that accommodate oblique convergence between Indian plate and SE Asia and extrusion of Asian territory around E syntaxis of Himalayan Range. Focus on right-lateral Sagaing fault and oblique subducting N Sunda megathrust)

Wang, Y., K. Sieh, S.T. Tun, K.Y. Lai & Than Myint (2014)- Active tectonics and earthquake potential of the Myanmar region. J. Geophysical Research 119, 4, p. 3767-3822.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2013JB010762/epdf)
(In Myanmar and immediate surroundings three tectonic systems accommodate oblique collision of Indian plate with SE Asia and extrusion of Asia. Subduction and collision associated with Sunda megathrust under and in Indoburman Range and Naga Hills accommodate most of shortening across transpressional plate boundary. Sagaing fault system dominant locus of dextral motion associated with N-ward translation of India. Left-lateral faults of N Shan Plateau, N Laos, Thailand and S China facilitate extrusion of rocks around E syntaxis of Himalaya. All systems produced major earthquakes in recorded history)

Wang, Y., A. Zhang, W. Fan, T. Peng, F. Zhang, Y. Zhang, & X. Bi (2010)- Petrogenesis of late Triassic post-collisional basaltic rocks of the Lancangjiang tectonic zone, southwest China, and tectonic implications for the evolution of the eastern Paleotethys: geochronological and geochemical constraints. Lithos 120, 3, p. 529-546.
(Xiaodingxi and Manghuihe volcanic sequences of Lancangjiang igneous zone in SW China with zircon ages of ~214 and 210 Ma (~Late Norian), i.e. ~15-20 Myrs younger than syn-collisional granite magmatism (230-241

Ma; ~Carnian). Tectonic model involving E-ward subduction in E Permian and collision in Triassic proposed for E Paleotethys Ocean. During Late Triassic, upwelling of asthenospheric mantle, shortly after slab detachment, may have led to melting of metasomatized mantle wedge, resulting in post-collisional Group 1 and Group 2 magmas)

Wang, Y. & Y. Zhang (2010)- Llandovery sporomorphs and graptolites from the Manbo Formation, the Mojiang County, Yunnan, China. Proc. Royal Society (London), B, 277, p. 267-275.
(online at: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC2842664/)
(E Silurian (Llandoverian) sporomorphs and graptolites from Manbo Fm, Mojiang area, W Yunnan (part of Indo-China plate in Palaeozoic). Sporomorphs suggest South China and Indo-China paleo-plates may have been in close proximity in Llandoverian; both closely related to Gondwanaland)

Wang, Z. & X. Tan (1994)- Palaeozoic structural evolution of Yunnan. J. Southeast Asian Earth Sci. 9, p. 345-348.
(Yunling-Wuliangshan zone along SW margin of Yangtze Platform was passive margin in E Paleozoic-Devonian and active margin in Carboniferous-Permian. May be main suture of Paleotethys, after E-M Triassic collision. In SW of area Tengcong-Baoshan block (=Sibumasu; JTvG) with Late Carboniferous ice-rafted deposits and Stepanoviella- Lytvolasma fauna Also possible 'Gondwanan E Permian' Glossopteris flora. Paleomag suggests Baoshan was at latitude 38°S in Devonian and 30° S in Carboniferous. E of Baoshan but W of Paleotethys suture are Gengma Block (with Devonian with Monograptus, M Carboniferous-Permian carbonates with Monodiexodina in Permian, no ice-rafted sediments) and Lincang blocks at E side of Changning-Menglian Fracture. Permian 'Cathaysian' Gigantopteris flora at E side of Lancangjiang suture)

Wen, Z., N. Fang & R. Xin (2016)- Meso-Tethys and Neo-Tethys tectonic evolution in Myanmar and adjacent areas. In: Development of the Asian Tethyan Realm: genesis, process and outcomes, 5th Int. Symposium Int. Geoscience Program (IGCP) Project 589, Yangon, p. 55. *(Abstract only)*
(online at: http://igcp589.cags.ac.cn/5th%20Symposium/Abstract%20Volume.pdf)
(Two Tethyan suture zones inMyanmar: (1) Mesotethys Taguang-Myitkyina suture (equivalent of Bangong-Nujiang suture in Tibetan Plateau): ophiolites formation in M Jurassic, M Triassic-E Jurassic subduction under Sibumasu block, and M Jurassic-M Cretaceous West Burma block collision with Sibumasu; (2) Neotethys Yarlung-Tsangpo suture (continuation of Yarlung-Tsangpo suture in Tibetan Plateau): Indo-Burma Range ophiolites formation in E Cretaceous, Late Jurassic-E Cretaceous subduction under West Burma block and Late Cretaceous-Tertiary closing of ocean)

Westerweel, J., P. Roperch, A. Licht, G. Dupont-Nivet, Z. Win, F. Poblete, G. Ruffet, H.H. Swe, M.K. Thi & D.W. Aung (2019)- Burma Terrane part of the Trans-Tethyan arc during collision with India according to palaeomagnetic data. Nature Geoscience 12, 10, p. 863-868.
(Palaeomagnetic data from Burma Terrane (also called West Burma Block) at E edge of India collision zone, which was part of Trans-Tethyan island arc at near-equatorial S latitude at ~95 Ma, suggesting island endemism for Burmese Cretaceous amber biota. Terrane underwent significant CW rotation between ~80 and 50 Ma, then was translated N on Indian Plate by at least 2000 km along dextral strike-slip fault system in E. Reconstructions suggest initial collision of India with near-equatorial Trans-Tethyan subduction system at ~60 Ma, followed by later collision with Asian margin (Cretaceous arc (~97-87 Ma and younger?) has been correlated with intra-oceanic mid-Cretaceous Woyla Arc in Sumatra as part of Incertus Arc and may continue W to Kohistan Arc in Pakistan)

Whittaker, J., L. Zaninetti & D. Altiner (1979)- Further remarks on the micropalaeontology of the Late Permian of eastern Burma. Notes Laboratoire Paleontologie Universite de Geneve 5, p. 1-7.
(Companion paper to Zaninetti et al. 1978)

Win, M.M., M. Enami & T. Kato (2016)- Metamorphic conditions and CHIME monazite ages of Late Eocene to Late Oligocene high-temperature Mogok metamorphic rocks in central Myanmar. J. Asian Earth Sci. 117, p. 304-316.

(High T/ P regional Mogok metamorphic belt in C Myanmar, between W margin of Sibumasu block and E edge of W Burma block. Four age components: ~49 Ma (Late Eocene peak metamorphic upper-amphibolite-granulite stage), 38 Ma, ~28 Ma and ~24 Ma (Late Oligocene postdated hydration stage))

Win, S. & M.M. Myint (1998)- Mineral potential of Myanmar. Resource Geology 48, 3, p. 209-218.

Win, T.T., R.M. Davies, W.L. Griffin, P. Wathanakul & D.H. French (2001)- Distribution and characteristics of diamonds from Myanmar. J. Asian Earth Sci. 19, p. 563-577.
(Diamonds in headless placers at several locations in Myanmar. Common abrasion due to alluvial transport. Brown radiation spots suggest long history in surface environments. Syngenetic minerals mainly of peridotitic paragenesis and include olivine, chromite and native iron. Derivation from upper mantle more likely than from crustal metamorphic sources. Primary source of diamonds alkaline igneous rock (lamproitic rather than kimberlitic) but reached present locations via sedimentary redistribution)

Wolfart, R., U.M. Win, S. Boiteau, M. Wai, P.U. Cung & U.T. Lwin (1984)- Stratigraphy of the Western Shan Massif, Burma. Geol. Jahrbuch, B57, p. 3-92.

Wolfart, R., U.M. Win, S. Boiteau, M. Wai, P.U. Cung & U.T. Lwin (1984)- The tectonics of the Western Shan Massif, Burma. Geol. Jahrbuch, A75, p. 285-294.

(Radiolarians in exotic siliceous blocks in U Triassic sedimentary melange in Shangrila, SW China show Garze-Litang tectonic belt was deep-water basin in E Carboniferous-M Permian)

Xing, X., Y. Wang & Y. Zhang (2016)- Detrital zircon U-Pb geochronology and Lu-Hf isotopic compositions of the Wuliangshan metasediment rocks in SW Yunnan (China) and its provenance implications. J. Earth Science (China) 27, 3, p. 412-424.
(online at: http://en.earth-science.net/PDF/20160613095735.pdf)
(Wuliangshan Gp low-grade metasediments E of Lancang giant igneous zone, SW Yunnan, syn-orogenic product of collision between Baoshan with Simao-Indochina blocks. Detrital zircons major age-peak at ∼259 Ma, four subordinate-peaks at ∼1859, 941, 788 and 447 Ma. Youngest zircon age of 230±5 Ma suggests deposition after M Triassic. Provenance mainly from Simao/ Yangtze blocks to E rather than Baoshan Block to W)

Xu, Y.G. & B. He (2007)- Thick, high-velocity crust in the Emeishan large igneous province, SW China: evidence for crustal growth by magmatic underplating or intraplating. Geol. Soc. America (GSA), Special Paper 430, p. 841-858.

Yan, D.P., M.F. Zhou, C.Y. Wang & B. Xia (2006)- Structural and geochronological constraints on the tectonic evolution of the Dulong-Song Chay tectonic dome in Yunnan province, SW China. J. Asian Earth Sci. 28, p. 332-353.
(Dulong-Song Chay dome on border of China (SE Yunnan) and N Vietnam consists of metamorphic core complex, probably ~800 Ma protolith age, and cover sequence, separated by extensional detachment fault, both overlain unconformably by Late Triassic strata. Late Silurian- E Devonian (~436-402 Ma) granitic intrusion in core complex. Metamorphic grades upper greenschist-low amphibolite facies in core to low greenschist facies in cover sequence. Major extension at M Triassic (237 Ma). Dulong granites intruded Dulong-Song Chay dome in Early Cretaceous (144-140 Ma) and M Cretaceous (116±10 Ma))

Yan, J.X. & D. Liang (2005)- Early and Middle Permian paleoclimates of the Baoshan Block, western Yunnan, China: insight from carbonates. J. Asian Earth Sci. 24, 6, p. 753-764.
(Baoshan Block of W Yunnan, SW China formed E part of Cimmerian Continent in Permian. E Permian formed under influence of Permo-Carboniferous glaciation. After E Permian rifting faunal elements of Gondwana affinity decreased, while those of Cathaysian affinity increased. Late Permian faunas exclusively Cathaysian. E Permian Dingjiazhai Fm carbonates characterized by warm-temperate bryozoan-echinoderm facies of

heterozoan association, with no non-skeletal grains. Overlying Yongde and Shazipo Fm carbonates subtropical-tropical chloroforam facies of photozoan association, with common non-skeletal grains)

Yan, J.X., D.Y. Liang & M. Wu (2004)- Permian carbonates of Baoshan block, western Yunnan and their paleoclimatic implications. Science in China, Ser. D, Earth Sci. 47, p. 385-392.
(online at: http://earth.scichina.com:8080/sciDe/fileup/PDF/04yd0385.pdf)
(E Permian carbonates of Djingjiazhai Fm, Baoshan block, temperate facies, dominated by bryozoans, crinoids and brachiopods and without fusulinids. Artinskian basalts (marking rifting-separation from Gondwanaland) overlain by M Permian (Roadian-Wordian) Yongde Fm bryozoan-mollusc limestone with minor fusulinids and algae (incl. Permocalculus). M-L Permian (Wordian- Capitanian- E Wuchiapingian) Shazipo Fm carbonates oolitic, warm-water, incl. common fusulinids and algae)

Yang, S.Y. & J.W. Kim (2014)- Pliocene basin-floor fan sedimentation in the Bay of Bengal (offshore northwest Myanmar). Marine Petroleum Geol. 49, p. 45-58.
(Late Pliocene basin-floor fan deposits in NE Bay of Bengal, Myanmar, with dry, biogenic gas in three fields on W flank of the NW-SE anticline. Reservoir sands stacked in back-stepping fashion and sourced from NW as part of Bengal fan. Shwe field fan-shaped (12 km long, 4 km wide) and ~30 km off base of slope)

Yang, W. (1999)- Stratigraphic and phytogeographic palynology of late Paleozoic sediments in western Yunnan, China. Science Repts. Niigata University, Ser E (Geology), 14, p. 15-99.
(online at: http://work.geobiology.cn/)
(Extensive review of W Yunnan geology and Permo-Carboniferous flora. E Permian Gondwanan glacial sediments, overlain by cold-water fauna like Eurydesma and cool Glossopteris flora. In late E Permian appearance of tropical- subtropical Tethyan elements, incl. Monodiexodina, Costiferina, etc.)

Yang, X., X. Jin, Z.S. Ji, Y.Z. Wang, J.X. Yao & H.L. Yang (2004)- New materials of the *Shanita-Hemigordius* assemblage (Permian foraminifers) from the Baoshan Block, Western Yunnan. Acta Geologica Sinica (English Ed.) 78, 1, p. 15-21.
(Description of abundant late M Permian hemigordiid foraminifera Shanita and Hemigordius from 'Cracked Lst' NE of Woniu Temple of Baoshan, W Yunnan. Assemblage similar to Shanita fauna from Shazipo Fm, Zhengkang, W Yunnan, and to Permian of Burma, Thailand, Iran and Turkey. all believed to originate on tectonic blocks derived from N margin of Gondwana)

Yao, W., L. Ding, F. Cai, H. Wang, Q. Xu & Than Zaw (2017)- Origin and tectonic evolution of upper Triassic turbidites in the Indo-Burman ranges, West Myanmar. Tectonophysics 721, p. 90-105.
(Petrography, detrital zircon ages and Hf isotopic data from Late Triassic Pane Chaung Fm exposed in Indo-Burman Ranges (W Burma Block). With Carnian-Norian Halobia molluscs; maximum depositional ages ~233-206 Ma. Detrital zircon age populations and Hf values interpreted to be derived from W Papua region. Triassic zircons (mainly ~210-250 Ma) probably from contemporaneous volcanic source. Older populations (~600-450 Ma, 1250-900 Ma and Archean from orogenic belts and cratons in Australia. Zircon ages different from similar-aged strata in Indochina and Sibumasu, but comparable to NW Australia and Greater India. Probably deposited in Late Triassic submarine fan along N margin of Australia)

(Myanmar with >70 copper occurrences, including large high-sulphidation Cu ± Au deposits W of Monywa. Production started in 1985 with development of Sabetaung deposit at Monywa in C Myanmar. Copper produced as by-product from Bawdwin Mine, a volcanic-hosted massive sulphide deposit. Most copper associated with epigenetic vein-type and epithermal gold ± silver deposits)

Zaw Win (1991)- Triassic ammonites from the Plateau Limestone, East of Lungyaw and Baukkewzu, Myit-tha and Ywa-ngan Township, Myanmar. Georeports 1, 1, p. 75-87.

Zaw Win (2004)- Permian-Triassic Plateau Limestone in Lungyaw-Sakangyi Area, Shan State: its depositional and biotic history. J. Myanmar Academy Arts and Science 2, 5, p. 217-239.

Zaw Win (2008)- Triassic organic reefs in Lungyaw-Sakangyi Area, Ywa-ngan Township, Shan State. J. Myanmar Geosciences Soc. 1, 1, p. 21-36.
(M-U Triassic organic reefs in upper Plateau Lst in Myanmar massive ridges forming NNW-SSE trending range. Composed off in situ frame-building hexacorals (incl. Montlivaltia), calcisponges (Paradeningeria) and encrusting calcareous algae. Foraminifera include Alpinophragmium perforatum, Trocholina, Agathammina, Duotaxis, etc. Limestone turbidites flanks limestone masses as fore-reef slope and toe-of slope facies. Reefs probably developed as fringe of steep shelf margin that may have undergone growth-faulting)

Zaw Win (2009)- Fossil brachiopods from the Zwekabin Range. Hpa-an University Research J. 2009, 1, p. 145-149.
(Spinomartinia prolifica brachiopod assemblage found for first time from U Taungnyo Gp exposed along NW flank of Zwekabin Range, S Myanmar. Associated with Retimarginifera cf. alata, Torynifer, etc. Correlated with Spinomartinia prolifica fauna of E Permian Ko Yao Noi Fm of S Thailand and Kinta Valley of W Malay Peninsula , where age determined as Late Sakmarian (E Permian). Spinomartinia fauna viewed as 'transitional' biotic province with both Gondwanan and Tethyan affinities and endemic taxa of Shan-Thai Terrane (S. prolifica also in upper part of Mergui Gp of Slate Belt of S Myanmar, below Moulmein Lst; Mitchell 2017, p. 101-102)

Zaw Win, H.H. Aung & K.K. Shwe (2011)- *Shanita thawtinti*, a new milioloid foraminifer from the Middle Permian of Myanmar. Micropaleontology 57, 2, p. 125-137.
(online at: www.micropress.org/micropen2/articles/1/7/30349_articles_article_file_1727.pdf)
(Shanita thawtinti n. sp. proposed for pillared miliolid in Plateau Limestone Gp, W Shan Plateau, Myanmar. Characterized by very large size. Age interpreted as M Permian (Murgabian=Wordian) based on fusulinids Neoschwagerina craticulifera below and Neoschwagerina margaritae above. Shanita amosi and Hemigordiopsis renzi at slightly lower horizons)

Zaw Win & K.K. Shwe (2005)- Study of fusulinaceans from the Plateau Limestone at Kyaukap: taxonomic and biostratigraphic consideration. J. Myanmar Academy Arts and Science 3, p. 73-90.

Zaw Win, K.K. Shwe & O.S. Yin (2017)- Sedimentary facies and biotic associations in the Permian-Triassic limestones on the Shan Plateau, Myanmar. In: A.J. Barber et al. (eds.) Myanmar: geology, resources and tectonics, Geol. Soc., London, Memoir 48, Chapter 15, p. 343-363.
(Thick late E Permian- M-L Triassic Plateau Limestone on Shan Plateau of E Myanmar (= W part of Sibumasu terrane). Unconformably over Ordovician-Silurian formations. Basal dolomitic limestone unit rich in corals (Wentzelella cf timorica, Ipciphyllum, Polythecalis), fusulinids (Pseudofusulina, Yangchienia, rare Neoschwagerina), small forams (Shanita amosi, Hemigordiopsis renzi, Agathammina, Pachyphloia), algae (Mizzia), etc. Triassic algal and cherty basinal limestones. Plateau Lst correlated with: (1) Ratburi Lst of Peninsular Thailand, (2) Chuping Fm/ Kodiang Lst of NW PeninsularMalaysia and (3) U Shazipo Fm of Baoshan Block, SW Yunnan)

Zhang, H., J. Liu & W. Wu (2012)- Geochronology and tectonic evolution of the Lincang Batholith in southwestern Yunnan, China. J. Geol. Research 2012, Article ID 287962, p. 1-11.
(online at: www.hindawi.com/journals/jgr/2012/287962/)
(U-Pb zircon dating of Late Triassic (~220, 230 Ma) granites of Lincang Batholith, subduction-related magmatism along W edge of Lanping-Simao-Indochina terrane, prior to latest Triassic closure of Paleo-Tethys)
(E Devonian graptolites from SW Yunnan, close to NE Myanmar border. Rel. cosmopolitan species. Three zones of based on Monograptus spp.. Part of Sibumasu Block with related graptolite occurrences in E Myanmar, N Thailand, W Malay Peninsula (Jaeger 1969, 1983))

Zhang, J., W. Xiao, B.F. Windley, F. Cai, K. Sein & S. Naing (2017)- Early Cretaceous wedge extrusion in the Indo-Burma Range accretionary complex: implications for the Mesozoic subduction of Neotethys in SE Asia. Int. J. Earth Sciences 106, 4, p. 1391-1408.
(Indo-Burma Range of Myanmar (E extension of Yarlung-Tsangpo Neotethyan belt of Tibet in China), contains melanges with serpentinite, greenschist facies basalt, chert, sericite schist, silty slate and unmetamorphosed Triassic sandstone, mudstone and siltstone interbedded with chert in E, and farther N high-P blueschist and eclogite blocks in Naga Hills melange. IBR metamorphic rocks exhumed by wedge extrusion in subduction zone accretionary complex. Amphibolites zircon ages of 119 ± 3 Ma and 115 Ma, close to ages of nearby calc-alkaline granite and diorite, which belong to active continental margin arc along W side of Shan-Thai block. IBR accretionary complex generated during E Cretaceous (115-128 Ma) subduction of Neotethys Ocean).

Zhang, P., L. Mei, X. Hu, R. Li, L. Wu, Z. Zhou & H. Qiu (2017)- Structures, uplift, and magmatism of the Western Myanmar Arc: constraints to mid-Cretaceous-Paleogene tectonic evolution of the western Myanmar continental margin. Gondwana Research 52, p. 18-38.
(Arc-basin system along W Myanmar continental margin, with at least three igneous events in W Myanmar Arc: mid-Cretaceous (110-90 Ma), latest Cretaceous- E Paleocene (69-64 Ma) and Eocene (53-38 Ma), and associated uplift in Late Cretaceous, Eocene and Late Oligocene. Magmas significant juvenile mantle source component involving subducted sediments and juvenile crustal materials. Magmatism can be correlated with Gangdese arc in Lhasa terrane of S Tibetan Plateau. Model of E-ward subduction of Neo-Tethyan/Indian plate oceanic crust under Sibumasu starting in mid-Cretaceous, with long-lived back-arc extension in W Myanmar)

Zhang, R.Y., C.H. Lo, S.L. Chung, M. Grove, S. Omoti, Y. Iizuka, J. G. Liou & T.V. Tri (2013)- Origin and tectonic implication of ophiolite and eclogite in the Song Ma Suture Zone between the South China and Indochina Blocks. J. Metamorphic Geol. 31, 1, p. 49-62.
(Song Ma belt in N Vietnam with ophiolite, metabasite, metasediments and eclogite, and thought to be suture zone between Indochina and South China blocks. Eclogite high-P metamorphism in subduction zone with low T gradient (~8 °C/km). Song Ma ophiolite experienced ocean-floor metamorphism. Metabasalt and gabbro with MORB-type geochemical affinities. Eclogite U-Pb zircons mean age 230.5 ± 8.2 Ma, interpreted as closure age of Paleotethys and subsequent collision of two blocks in M Triassic (main Indosinian Orogeny))

Zhang, R.Y., C.H. Lo, X.H. Li, S.L. Chung, Tran Tuan Anh & Tran V. Tri (2014)- U-Pb dating and tectonic implication of ophiolite and metabasite from the Song Ma suture zone, northern Vietnam. American J. Science 314, 2, p. 649-678.
(Song Ma ophiolites mainly peridotite, basalt and gabbro with greenschist- lower amphibolite-facies metamorphism. U-Pb zircon ages 340± 29 Ma (E Carboniferous), interpreted as protolith age. Metamorphic rims age of ~280 Ma (E Permian). Metabasalt protolith age ~315 Ma. Eclogite and garnet hornblende metamorphic ages ~ 230 Ma. Three-stage evolution: (1) Paleotethys oceanic crust formation at 340-315 Ma and ocean-floor metamorphism at 283-280 Ma, (2) <280-230 Ma: Paleotethys lithosphere subduction and HP metamorphism at ~230 Ma; closure of Paleotethys in M Triassic; and (3) <230 Ma: breakoff of Paleotethys oceanic lithosphere and exhumation of subducted slabs. Subduction polarity still problematic)

Zhang, Y.D., J.X. Fan, B.D. Erdtmann & X. Liu (2009)- Darriwilian graptolites of the Shihtien Formation (Ordovician) in west Yunnan, China. Alcheringa 33, 4, p. 303-329.
(online at: www.tandfonline.com/doi/pdf/10.1080/03115510903043762?needAccess=true)
(W Yunnan in SW China part of Sibumasu Terrane. Ordovician rocks affected by several phases of tectonics. M-L Darriwilian graptolite fauna from Shihtien Fm at Baoshan and Shidian with 15 species, incl. Didymograptus artus, D. murchisoni, D. spinulosus, Pterograptus sp., Hustedograptus spp, Archiclimacograptus spp., etc. Two biozones:Didymograptus artus and D. murchisoni. Graptolite fauna similar to Baltica and S China)

Zhang, Y.D., J.X. Fan & X. Liu (2009)- Graptolite biostratigraphy of the Shihtien Formation (Darriwilian) in West Yunnan, China. Bull. Geosciences 84, 1, p. 35-40.
(online at: www.geology.cz/bulletin/fulltext/bullgeosci841_1103.pdf)
(Rich M Ordovician graptolite fauna from Shihtien Fm at Baoshan and Shidian in W Yunnan, SW China (W Yunnan generally considered part of Sibumasu/ Shan-Tai terrane). Incl. Didymograptus artus, D. murchisoni, D. spinulosus, Pterograptus, Hustedograptus, etc., indicating Darriwilian age.)

Zhang, Y., W.H. He, G.R. Shi & K.X. Zhang (2013)- A new Changhsingian (Late Permian) Rugosochonetidae (Brachiopoda) fauna from the Zhongzhai section, southwestern Guizhou Province, South China. Alcheringa 37, p. 223-247.

Zhang, Y., W.H. He, G.R. Shi, K.X. Zhang & H.T. Wu (2015)- A new Changhsingian (Late Permian) brachiopod fauna from the Zhongzhai section (South China) Part 3: Productida. Alcheringa 39, 3, p. 295-314.
(Latest Permian Brachiopod fauna from section at Zhongzhai, Guizhou Province (S China). 15 species of Productida. Etc.)

Zhang, Y.D. & A.C. Lenz (1998)- Early Devonian graptolites from southwest Yunnan, China. J. Paleontology 72, 2, p. 353-360.

Zhang, Y., Y. Wang, R. Zhan, J. Fan, Z. Zhou & X. Fang (2014)- Ordovician and Silurian stratigraphy and palaeontology of Yunnan, Southwest China- A guide to the field excursion across the South China, Indochina and Sibumasu. IGCP Project 591 Post-conference fieldtrip, Kunming 2014, Science Press, Beijing, p. 1-128.

(Yunnan province of SW China comprises three terrains: South China (E Yunnan), Indochina (Simao; C and S Yunnan) and Sibumasu (Baoshan- Tengchong; W Yunnan- E Myanmar, etc.). All were part of NE Peri-Gondwana Region in Early Paleozoic, possibly off the NW Australia sector)

Zhao, J., B. Huang, Y. Yan & D. Zhang (2015)- Late Triassic paleomagnetic result from the Baoshan Terrane, West Yunnan of China: implication for orientation of the East Paleotethys suture zone and timing of the Sibumasu-Indochina collision. J. Asian Earth Sci. 111, p. 350-364.
(Paleomagnetic study of Late Triassic basalts from S part of Baoshan Terrane (= N-most Sibumasu Block) in W Yunnan indicates 15°N paleolatitude in Late Triassic time. Wider paleomagnetic comparison supports view that E Paleotethys Ocean separated Sibumasu and Indochina blocks and closed no later than Late Triassic. N-S directed Changning-Menglian suture zone likely E-W at time of Sibumasu-Indochina collision)

Zhao, J.M. & G.D. Zhou (1987)- Discovery of *Lytvolasma* fauna from western section of Eastern Kunlun Mountains. Acta Palaeontologica Sinica 26, 4, p. 486-491.
(Lytvolasma late E Permian coral fauna from E Kunlun Mts, W Qinghai. Also with Pleramplexus, Wannerophyllum, Lophophyllidium wichmanni, Timorphyllum, etc. Coral fauna characterized by simple forms with no dissepiments, signifying cold-water fauna. Comparable to Basleo beds of Timor)

Zheng, D., S.C. Chang, V. Perrichot, S. Dutta, A. Rudra, Lin Mu, R.S. Kelly, Sha Li et al. (2018)- A Late Cretaceous amber biota from central Myanmar. Nature Communications 9, 3170, p. 1-6.
(online at: www.ncbi.nlm.nih.gov/pmc/articles/PMC6085374/pdf/41467_2018_Article_5650.pdf)
(Insect faunas in U Campanian (~72.1 Ma) amber from Tilin, C Myanmar. Chemical composition suggests conifer tree source, indicating gymnosperms still abundant in latest Campanian equatorial forests. Twelve families of insects found, incl. ants, wasps, midges, lice, etc.)

Zherikhin, V.V. & A.J. Ross (2000)- A review of the history, geology and age of Burmese amber (burmite). Bull. Natural History Museum, London (Geology) 56, 1, p. 3-10.
(online at: https://ia800304.us.archive.org/24/items/bulletinofnatura561natu/bulletinofnatura561natu.pdf)
(Burmese amber has been known since 1st century AD. Recorded from five regions in Myanmar, but only mined commercially in Hukawng Valley in N Myanmar. Amber in clastic deposits with Nummulites of M Eocene age, but amber as reworked pebbles and probably of Cretaceous age (also associated with reworked Cenomanian limestone clasts with Orbitolina birmanica). With 10 additional papers on insects from Burmese amber)

Zhou, Z. & Z. Yang (2005)- Permian ammonoids from Xinjiang, Northwest China. J. Paleontology 79, 2, p. 378-388.
(late E Permian ammonoid faunas from Xinjiang in W China (edge of Tarim Basin, E of Pamir). With Parapronorites, Propinacoceras, Medlicottia, Agathiceras, Prostacheoceras, Metaperrinites, Perrinites, etc., similar to faunas from adjacent Pamirs and Thailand. Associated with fusulinid limestones)

Zhou, Z.R., Y.J. Wang, J.Z. Sheng & K.Y. Zhu (2000)- *Neofusulinella lantenoisi* Deprat, 1913, type species of the Permian fusulinid genus *Neofusulinella* from Baoshan County, West Yunnan, China. Acta Palaeontologica Sinica 39, 4, p. 457-465.
(E-M Permian Neofusulinella present in Baoshan area (Yunnan; Maokouan age = ?) and Rat Buri Limestone near Takli, Thailand, along W margin of S China- SE Asia block)

Zhu, B., Z. Guo, R. Liu, D. Liu & W. Du (2014)- No pre-eruptive uplift in the Emeishan large igneous province; new evidences from its 'inner zone', Dali area, southwest China. J. Volcanology Geothermal Res. 269, p. 57-67.
(M-L Permian Emeishan LIP considered example of crustal domal uplift caused by mantle plume upwelling before onset of volcanism, but emplacement began in deeper water setting. Lower Succession volcanism had grown into shallower water; Upper Succession subaerial lavas and tuffs. Inconsistent with domal uplift model)

Zhu, B.Q., C.X. Mao, G.W. Lugmair & J.D. Macdougall (1983)- Isotopic and geochemical evidence for the origin of Plio-Pleistocene volcanic rocks near the Indo-Eurasian collisional margin at Tengchong, China. Earth Planetary Sci. Letters 65, 2, p. 263-275.

(In Yunnan Province, SW China, regional extension associated with India- Asia collision formed series of N-S trending basins. Near Tengchong close to Myanmar border, basin is characterized by K-rich basalt-dacite volcanism which began in Pliocene (~ 7 Ma) and continued to historic times. Five chemical groups recognized)

Carter, A. & P.D. Clift (2008)- Was the Indosinian orogeny a Triassic mountain building or a thermotectonic reactivation event? Comptes Rendus Geoscience 340, 2, p. 83-93.
(No definitive evidence for Triassic age of collision between Indochina and S China blocks. Indosinian event in S China/ Vietnam is reactivation event caused by closure of Paleotethys with accretion of Sibumasu block to Indochina in E-M Triassic (~250-220 Ma))

Carter, A., D. Roques & C. Bristow (2000)- Denudation history of onshore central Vietnam: constraints on the Cenozoic evolution of the western margin of the South China Sea. Tectonophysics 322, p. 265-277.
(Apatite fission track analysis suggests denudation across C Vietnam during syn- and post-rift phases of South China Sea occurred at similar rates (~40m/ Myr), suggesting extension was not dominant factor controlling Cenozoic denudation. Regional Late Miocene cooling linked to enhanced erosion and deposition of prograding sediments in adjacent offshore basins and associated with initiation of regional basaltic magmatism and development of topography)

Carter, A., D. Roques, C. Bristow & P. Kinny (2001)- Understanding Mesozoic accretion in Southeast Asia: significance of Triassic thermotectonism (Indosinian orogeny) in Vietnam. Geology 29, 3, p. 211-214.
(Zircon U-Pb study of metamorphic basement of Vietnam show large part was affected by short-lived episode of ductile deformation and high T metamorphism between 258 ± 6 Ma and 243 ± 5 Ma (Late Permian- earliest Triassic), caused by accretion of Sibumasu to Indochina- S China ('Indosinian Orogeny'). Coincident with final N-S China collision (Qinling orogenesis))

Cawood, P.A., Y. Wang, Y. Xu & G. Zhao (2013)- Locating South China in Rodinia and Gondwana: a fragment of greater India lithosphere? Geology 2013, 41, p. 903-906.
(online at: http://geology.gsapubs.org/content/41/8/903.full.pdf+html)
(From formation of Rodinia at end of Mesoproterozoic to Pangea breakup at end Paleozoic, S China craton (Cathaysia+Yangtze blocks) was adjacent to W Australia and N India. Neoproterozoic arc-backarc assemblages ages from ~1000 to 820 Ma, with NW decrease in ages, suggesting SE-directed subduction at periphery of Rodinia. E Paleozoic detrital zircon age spectra require E Gondwana source, similar to Tethyan Himalaya and W Australia, suggesting common source and accumulation along N margin of Gondwana. S China block rifted from Gondwana in Late Devonian- E Carboniferous, before drifting across Tethys Ocean, and accreting to Asia (N China) along Qinling-Dabie suture in Permian-Triassic)

Charoentitirat, T., K. Ueno & N. Ratthapon (2011)- Late Paleozoic carbonates and foraminiferal faunas in northern Lao PDR: their geotectonic implications. In: Proc. Int. Conf. Geology, geotechnology and mineral resources of Indochina (GEOINDO 2011), Khon Kaen, p. 6-8. *(Extended Abstract)*
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2011/34445.pdf)
(N Laos limestones NW of Luang Prabang and S of Sayabouli with Late Permian foraminifera Dagmarita, Septoglobivalvulina? and Reichelina?. Similar to W margin of Indochina Block in Thailand, suggesting link between NE Thailand and NW Laos. Nan-Uttaradit Suture between Sukhothai zone and Indochina Block runs NNE-ward into NW Laos and continues to Lancangjiang suture in W Yunnan (similar to Ueno et al. 2010))

Charvet, J., H. Lapierre & Y. Yu (1994)- Geodynamic significance of the Mesozoic volcanism of southeastern China. J. Southeast Asian Earth Sci. 9, 4, p. 387-396.
(Two main magmatic episodes during Yenshanian cycle, separated by tectonic event: (1) Late Jurassic-M Cretaceous, and (2) Late Cretaceous bimodal suite of continental basalts and acidic rocks, separated by angular unconformity. Geodynamic evolution: (1) subduction of Izanagi plate beneath E Asian continental margin until M Cretaceous; (2) collision with W Philippines Block around E-L Cretaceous boundary; (3) post-collisional extension and onset of rifting during Late Cretaceous)

Chen, Z., Wei Lin, M. Faure, C. Lepvrier, Nguyen Van Vuong & Vu Van Tich (2013)- Geochronology and isotope analysis of the Late Paleozoic to Mesozoic granitoids from northeastern Vietnam and implications for the evolution of the South China block. J. Asian Earth Sci. 86, p. 131-150.
(In NE Vietnam widespread Late Paleozoic and Permo-Triassic granitic plutons. Zircon ages suggest at least four thermal events, at ~525, 254-251, ~245-220 and ~91 Ma. Granitic rocks formed by re-melting of Paleoproterozoic continental crust. NE Vietnam granites belongs to S China block. Late Cretaceous magmatism in back-arc extensional tectonic setting)

Cheng, Y., J. Mao & P. Liu (2016)- Geodynamic setting of Late Cretaceous Sn-W mineralization in southeastern Yunnan and northeastern Vietnam. Solid Earth Sciences 1, 3, p. 79-88
(online at: www.sciencedirect.com/science/article/pii/S2451912X16300046)
(Late Cretaceous (~80-100 Ma) Sn-W mineralization in SE Yunnan (S China) and NE Vietnam many similarities, representing one regional magmatic-mineralization event. Late Cretaceous magmatic-mineralization- metamorphic activities widely distributed along E Asian continental margin, and product of subduction of Paleo-Pacific Plate under Eurasia (also Triassic magmatism with Sn-W mineralization))

Chi, C.T. & J.W. Geissman (2013)- A review of the paleomagnetic data from Cretaceous to lower Tertiary rocks from Vietnam, Indochina and South China, and their implications for Cenozoic tectonism in Vietnam and adjacent areas. J. Geodynamics 69, p. 54-64.
(Review of paleomagnetic data from Cretaceous of Vietnam, Indochina and S China in common reference frame with respect to Eurasia's coeval paleopoles. S China Block has been relatively stable with respect to Eurasia since mid-Cretaceous. Cretaceous - E Tertiary paleomagnetic data from Indochina-Shan Thai Block reveal complex patterns of intra-plate deformation in response to the India-Eurasia collision. Red River transcurrent fault system complicated slip history in area with modest (~800 km) S-ward translation)

Chung Nguyen (2014)- A review of Tertiary palynomorph assemblage in Cuu Long Basin: case study of palynomorphs in Miocene-Oligocene sediments. Int. J. Sciences Basic Applied Research (IJSBAR) 24, 3, p. 103-111.
(online at: http://gssrr.org/index.php?journal=JournalOfBasicAndApplied&page=issue&op=archive)
(E Oligocene- Late Miocene palynomorph assemblages and Vietnam Petroleum Institute (VPI) palynological zonation, with age-restricted taxa Florschuetzia trilobata, F. meridionalis, Stenochlaenidites papuanus (= S. laurifolia), Jussiena, Verutricolporites pachydermus, Gothanipollis basensis, Cicatricosisporites dorogensis, Lycopodiumsporites neogenicus, Meyeripolis nahankotensis, etc)

Clift, P.D., A. Carter, I.H. Campbell, M.S. Pringle, Nguyen Van Lap, C.M. Allen, K.V. Hodges & M.T. Tan (2006)- Thermochronology of mineral grains in the Red and Mekong Rivers, Vietnam: provenance and exhumation implications for Southeast Asia. Geochem. Geophys. Geosystems 7, 10, p. 1-28.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2006GC001336/epdf)
(Zircon dating of sand samples from mouths of Red and Mekong Rivers shows main sources from crust within Yangtze Craton, formed during Triassic Indosinian Orogeny. Indosinian grains in Mekong younger (210-240 Ma) than in Red River (230-290 Ma))

Counillon, H. (1896)- Documents pour servir a ' l'etude geologique de Luang Prabang (Cochinchine). Comptes Redus Academie Sciences Paris 123, p. 1330-1333.
(Incl. first record of Permian dicynodonts vertebrates in Luang Prabang area of N Laos (known throughout Pangea and linking N Laos to main Eurasian continent by Permian time; see also Battail (2009))

Cung, T.C., S. Dorobek, S.C. Richter, M.F.J. Flower, E. Kikawa, Y.T. Nguyen & R. McCabe (1998)- Paleomagnetism of late Neogene basalts in Vietnam and Thailand; implications for the post-Miocene tectonic history of Indochina. AGU Geodynamics Series, Mantle dynamics and plate interactions in East Asia, 1998, 27, p. 289-299.
(Paleomagnetic poles for Late Miocene-Quaternary basalts in Vietnam indistinguishable from other Neogene paleomagnetic poles for Indochina, Borneo, S China, and Eurasia, suggesting little or no relative motion between these regions since at least Late Miocene (and possibly earlier). CW declinations from coeval basalts in W and C Thailand probably related to local strike-slip faults that developed during late Neogene uplift and extension of Indochina)

Corsin, P. & C. Desreumaux (1972)- Decouverte dûune flore neocomienne dans les ñGres superieursò de Bokor (Cambodge meridional). Annales Soc. Geol. du Nord 92, p. 199-212.
('Discovery of a Neocomian flora in the 'Upper sands' of Bokor (East Cambodia)'. Philippe et al. (2004) noted that wood from 'Gres superieurs' of Indochina very similar to that from Phu Kradung Fm of NE Thailand (= Late Jurassic oldest formation of Khorat Gp))

Cromie, P.W. (2010)- Geological setting, geochemistry and genesis of the Sepon gold and copper deposits, Laos. Ph.D. Thesis, University of Tasmania, p. 1-395.
(online at: http://eprints.utas.edu.au/10703/)
(Sepon Mineral District gold-copper deposits along Truong Son Fold Belt on NE margins of Indochina Terrane in SE Laos. Geology dominated by Ordovician- Devonian fluvial and marine sediments. Mineralization tied to intrusion of rhyodacite porphyry along faults in E Permian (U-Pb zircons ages ~280-300 Ma) and mainly hosted in Devonian calcareous shale)

Cullen, P.J., P.L. Birch, S.C. Wright, C.J. Keamey & A.T. Pink (1997)- Exploration in the Savannakhet Basin, Peoples Democratic Republic of Laos. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Conf. Petroleum Systems of SE Asia and Australasia, Indon. Petroleum Assoc. (IPA), Jakarta, p. 425-447.
(Collision of Indochina Block with S China Plate in E Carboniferous led to initiation of Khorat Basin as foreland basin to Annamitic fold-belt of NE Vietnam. Subsequent Permo-Triassic collision of Shan-Thai plate from W trapped Indochina Block between converging thrust-fold belts. Marine clastic foredeep and carbonate foreland ramp sedimentation gave way to continental foreland basin deposition across Mesozoic Khorat intermontane basin. Later collision of Lhasa/Myanmar Block and Indian Plate from W rejuvenated earlier compressional structures and propagated fold belts into foreland, resulting in isolation of sub-basins including Savannakhet Basin. Three hydrocarbon plays: Paleozoic carbonate play (analogous to Khorat Plateau play of Thailand), Triassic clastic play, and E Jurassic Khorat Group clastics play)

Cung, T.C. (1996)- Paleomagnetism of Mesozoic and Cenozoic rocks from Vietnam: implications for the Tertiary tectonic history of Indochina and a test of the extrusion model. Ph.D. Thesis Texas A&M University, College Station, p. 1-227.

Cung, T.C. (2007)- Paleomagnetism of Cretaceous continental redbed formations from Indochina and South China, their Cenozoic tectonic implications: a review. VNU J. Science, Earth Sci. 23, p. 220-230.
(online at: www.js.vnu.edu.vn/e_4_07/B3.pdf)
(Cretaceous paleomagnetic data from S China block confirms S China block has been relatively stable with respect to Eurasia since Cretaceous time. Cretaceous paleomagnetic data from Indochina- Shan Thai block reveal complex intraplate deformations due to India- Eurasia collision. CCW rotations recorded from Borneo and Malay Peninsula indicate complex tectonic evolution of SE Asian region)

Cung, T.C. & S.L. Dorobek (2004)- Cretaceous palaeomagnetism of Indochina and surrounding regions: Cenozoic tectonic implications. In: J. Malpas et al. (eds.) Aspects of the geological evolution of China, Geol. Soc., London, Spec. Publ. 226, p. 273-287.
(Paleomagnetic studies of Cretaceous volcanics and sediments from S Vietnam suggests ~5-10° S-ward displacement and virtually no rotation since Cretaceous. Review of paleomag data suggests Sundaland three domains with different rotation/ translation histories: Shan-Thai, Indochina, offshore Sundaland)

Cung, T.C. & J.W. Geissman (2013)- A review of the paleomagnetic data from Cretaceous to lower Tertiary rocks from Vietnam, Indochina and South China, and their implications for Cenozoic tectonism in Vietnam and adjacent areas. J. Geodynamics 69, p. 54-64.
(Cretaceous paleomagnetic data from S China Block show present geographic position of S China Block relatively stable relative to Eurasia since mid-Cretaceous. Cretaceous- E Tertiary data from Indochina- Shan Thai Block reveal complex patterns of intra-plate deformation in response to India-Eurasia collision. Most paleomagnetic results from E and S of Red River fault system at latitude of Yunnan consistent with modest (~800 km) S-ward component of latitudinal translation)

Cung, T.C., J.W. Geissman, V.Q. Hoang, T.P.D. Nguyen & T.H. Nguyen (2014)- New paleomagnetic results of upper Permian- lower Triassic volcanic sequences from the Hoa Binh area, northwest Vietnam. Vietnam J. Earth Sciences 36, p. 413-423.
(online at: www.vjs.ac.vn/index.php/jse/article/download/6429/5701)
(Paleomag work on late Permian- E Triassic volcanics (basalt ages 257-270 Ma; distal equivalents of Emeishian?) of Viet Nam Fm at Hoa Binh dam suggest paleolatitude of ~15°S, and that volcanic terrane was close to or part of S China Block since late Permian)

Cuny, G., J. Mo, R. Amiot, E. Buffetaut, S. Suteethorn,V. Suteethorn & H. Tong (2017)- New data on Cretaceous freshwater hybodont sharks from Guangxi Province, South China. Research and Knowledge 3, 1, p. 11-15.
(online at: https://rk.msu.ac.th/wp-content/uploads/2017/09/04-Gilles.pdf)

(Fluvial Lower Cretaceous Xinlong Fm in Guangxi with diverse assemblage of vertebrates, incl. fresh-water hybodont shark teeth Acrorhizodus khoratensis)

De Franceschi, D. & C. Vozenin-Serra C. (1997)- La flore du Trias superieur vietnamien. Implications paleogeographiques. Comptes Rendus Academie Sciences, Paris, Ser. 2, 324, 4, p. 333-340.
('The flora of the Upper Triassic of Vietnam; paleogeographic implications'. Vietnamese U Triassic flora belongs to coastal floristic assemblage of SW Pacific. (see also Vozenin-Serra & De Franceschi, 1999))

Deng, J., C. Wang, J.W. Zi, R. Xia & Q. Li (2018)- Constraining subduction-collision processes of the Paleo-Tethys along the Changning-Menglian suture: new zircon U-Pb ages and Sr-Nd-Pb-Hf-O isotopes of the Lincang Batholith. Gondwana Research 62, p. 75-92.
(Changning-Menglian suture remnant of main Paleo-Tethys in SW China, with abundant magmatic rocks formed during orogenic processes related to closure of Paleo-Tethys. Lincang granitoid batholith crystallization ages of 261, 252 (Late Permian) to 203 Ma (Late Triassic), suggesting multi-stage emplacement. Three episodes related to subduction (before ~252 Ma), syn-collision (250-237 Ma) and post-collision (235-203 Ma))

(Fish fauna from U Jurassic Long Binh Fm (andesitic volcanics and continental redbeds), 17km E of Ho Chi Minh city, Vietnam. Mainly small actinopterygian fish, three different taxa)

Chung, S.L., B.M. Jahn, Wu Genyao, C.H. Lo & B. Cong (1998)- The Emeishan flood basalt in SW China: a mantle plume initiation model and its connection with continental breakup and mass extinction at the Permian-Triassic boundary. In: M.F.J. Flower (ed.) Mantle dynamics and plate interactions in East Asia, AGU Geodynamics Ser. 27, p. 47-58.
(online at: www.agu.org/books/gd/v027/GD027p0047/GD027p0047.pdf)
(Mantle plume model proposed to account for generation of the Emeishan LIP in SW China and N Vietnam. Magmatism may have played role in rifting of Qiangtang Terrane of Tibet from S China Block (Yangtze Craton) in Permian when these blocks were near equator)

Fan, P.F. (1995)- Tectonic patterns and Cenozoic basalts in the western margin of the South China Sea. In: G.H. Teh (ed.) Proc. AAPG-GSM Int. Conf. Southeast Asian basins; oil and gas for the 21st century, Kuala Lumpur 1994, Bull. Geol. Soc. Malaysia 37, p. 91-99.
(online at: www.gsm.org.my/products/702001-100960-PDF.pdf)
(Allochthonous fragments (Indosinia, Sibumasu, E Malaya, and SW Kalimantan) rifted from Gondwanaland and drifted N. At ~50 Ma collision of Indian continent led to fragmentation of Asia, followed by Andaman Sea opening, clockwise rotation of Indochina plate and S China Sea rifting and opening. Indian-Eurasian collision pushed Indochina Peninsula in ESE direction. Most M Tertiary movements along left-lateral Red River, Tonle Sap-Mekong faults, with extension along these faults responsible for widespread Plio-Pleistocene alkaline basalts from Vietnam/Kampuchea N-ward into E Thailand. Basalts composition tholeiitic to alkalic)

Faure, M., C. Lepvrier, Vuong Van Nguyen, Tich Van Vu, W. Lin & Z. Chen (2014)- The South China block-Indochina collision: where, when, and how? J. Asian Earth Sci. 79, p. 260-274.
(Two NW-SE striking orogens in NW and NE Vietnam, each stack of NE-directed nappes, due to SW-directed subduction with arc magmatism, ocean closure, and continental collision. Song Ma zone and Song Chay ophiolitic melange represent two ophiolitic sutures (closing N branch of Paleotethys). Late Triassic unconformity, 225-205 Ma (Norian) postorogenic plutonism, and 250-230 Ma syntectonic metamorphism support E-M Triassic age for tectonic events)

Faure, M., W. Lin, Y. Chu & C. Lepvrier (2016)- Triassic tectonics of the southern margin of the South China Block. Comptes Rendus Geoscience 348, 1, p. 5-14.
(M Triassic orogens widespread around and inside S China Block, resulting from oceanic, then continental subduction of S China Block below Indochina. Triassic suture hypothesized offshore of SCB, E of Hainan Island. Within SCB Xuefengshan M Triassic intracontinental orogen)

Faure, M., W. Lin, P. Monie & S. Meffre (2008)- Palaeozoic collision between the North and South China blocks, Triassic intracontinental tectonics, and the problem of the ultrahigh-pressure metamorphism. Comptes Rendus Geoscience 340, p. 139-150.

(Widespread ultrahigh-pressure rocks in Qinling-Dabie suture between N and S China blocks. Structures and zircon dating of migmatites in core of C Qinling suggests Silurian continent collision, before 400 Ma. Late Permian- M Triassic N-ward continental subduction of SCB responsible for development of UHP metamorphism. Age of UHP metamorphism unsettled. Radiometric ages from Neoproterozoic- Cretaceous, with cluster of ages around 240-210 Ma, leading previous authors to accept Triassic age for NCB-SCB collision)

Faure, M., Van Vuong Nguyen, Luong Thi Thu Hoai & C. Lepvrier (2018)- Early Paleozoic or Early-Middle Triassic collision between the South China and Indochina Blocks: The controversy resolved? Structural insights from the Kon Tum massif (Central Vietnam). J. Asian Earth Sci. 166, p. 162-180.
(Kon Tum massif in C Vietnam is E-M Triassic Metamorphic Core Complex. Top-to-NW ductile shearing accommodated exhumation. MCC superimposed on E Paleozoic collision belt between N and S Vietnam. Interaction between Emeishan mantle plume and continental subduction proposed)

('Geochronology of South Vietnam')

Le Dzuy Bach & Ngo Gia Thang (1995)- Phanerozoic ophiolites in Indochina. In: Proc. Int. Symp. Geology of Southeast Asia and adjacent areas, Hanoi 1995, J. Geology, Hanoi, B, 1995, 5-6, p. 212-221.

Lee, K.Y. (1984)- Geology of the Dian-Qian-Gui foldbelt, Southwest China. U.S. Geol. Survey (USGS), Open-File Report 84-357, p. 1-52.
(online at: http://pubs.usgs.gov/of/1984/0357/report.pdf)

Lee, T.Y, C.H. Lo, S.L. Chun, C.Y. Chen, P.L. Wang, W.P Lin et al. (1998)- 40Ar/39Ar dating result of Neogene basalts in Vietnam and its tectonic implication. In: M.F.J. Flower et al. (eds.) Mantle dynamics and plate interactions in East Asia, AGU Geodynamics Ser. 27, p. 317-330.
(Large scale Late Neogene magmatic activity around S China Sea, from Taiwan Straits, S China to Hainan Island and Indochina Peninsula. Ar/Ar ages of basalts from Vietnam show oldest rocks early M Miocene (~16 Ma; mainly quartz tholeiite). Since Late Miocene (-8 Ma) it changed to olivine tholeiite, and from Pliocene-Quaternary common alkali basalt and basanite. First appearance of igneous activity in Vietnam coincides with cessation of sea-floor spreading in S China Sea. See also Flower et al. 1993, Hoang & Flower 1998)

Leloup, P.H., N. Arnaud, R. Lacassin, J.R. Kienast, T.M. Harrison, T.T. Phan Trong, A. Replumaz & P. Tapponnier (2001)- New constraints on the structure, thermochronology and timing of the Ailao Shan- Red River shear zone. J. Geophysical Research 106, p. 6683-6732.
(Cooling diachronism along Ailao Shan fault suggests left-lateral rates of 4-5 cm/yr from 27 Ma- ~17 Ma. Similarities of deformation kinematics along ASRR and in S China Sea confirms causal link between continental strike-slip faulting and marginal basin opening)

Leloup, P.H., R. Lacassin, P. Tapponnier, U. Scharer, D. Zhong, X. Liu, L. Zhang Liangshang, S. Ji & Phan Trong Trinh (1995)- The Ailao Shan- Red River shear zone (Yunnan, China), Tertiary transform boundary of Indochina. Tectonophysics 251, p. 3-84.
(Red River Fault zone is major geological discontinuity that separates S China from Indochina. Today it corresponds to great right-lateral fault along several metamorphic complexes. U/Pb ages of deformation-associated melts ~22.4- 26.3 Ma, implying shear in Lower Miocene. ASRR belt site of major left-lateral motion, as Indochina was extruded toward SE as result of India-Asia collision)

Leloup, P., P. Tapponnier, R. Lacassin & M. Searle (2007)- Discussion on the role of the Red River shear zone, Yunnan and Vietnam, in the continental extrusion of SE Asia. J. Geol. Soc. 164, p. 1253-1260.
(Critique and response of Searle (2006) paper)

Lepvrier, C., M. Faure, V.N. Van, T.V. Vu, W. Lin, T.T. Trong & P.T. Hoa (2012)- North-directed Triassic nappes in Northeastern Vietnam (East Bac Bo). J. Asian Earth Sci. 41, 1, p. 56-68.
(NE Vietnam structure system of slightly metamorphosed nappes formed in Triassic, prior to unconformable deposition of U Triassic terrigenous sediments)

Lepvrier, C., H. Maluski, Vu Van Tich et al. (2004)- The Early Triassic Indosinian orogeny in Vietnam (Truong Son Belt and Kontum Massif); implications for the geodynamic evolution of Indochina. Tectonophysics 393, p. 87-118.
(E Triassic (~250-240 Ma) Indosinian Orogeny interpreted as result of synchronous oblique collision of Indochina block with both Sibumasu and S China)

Lepvrier, C., Nguyen V. Vuong, H. Maluski, P.T. Thi, T.V. Vu (2008)- Indosinian tectonics in Vietnam. Comptes Rendus Geoscience 340, 2-3, p. 94-111.
(In Vietnam E Triassic Indosinian collision affected Truong Son belt and Kontum Massif, which were parts of Gondwana-derived Indochina continental block, around 250-240 Ma. Collisional process resulted from NW-striking convergence of Indochina with respect to adjacent blocks. Indosinian evolution applied on continental crust that had been probably affected by Devonian event, as in S China)

Le Van De (1997)- Outline of plate-tectonic evolution of continental crust of Vietnam. In: P. Dheeradilok (ed.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and South Pacific (GEOTHAI'97), Department of Mineral Resources, Bangkok, 2, p. 465-475.

Li, M., M. Yan, X. Fang, Z. Zhang, & X. Liu (2018)- Origins of the Mid-Cretaceous evaporite deposits of the Sakhon Nakhon Basin in Laos: Evidence from the stable isotopes of halite. J. Geochemical Exploration 184, A, p. 209-222.
(online at: https://www.sciencedirect.com/science/article/pii/S0375674217303035)
(Evaporite deposits in Sakhon Nakhon Basin, SE Laos, is northern continuation of M-L Cretaceous salt basin of Khorat Plateau (Thailand; Indochina Plate). Isotopes and trace metals in 600m halite-dominated core suggest continental and hydrothermal origins, with trace marine remnants (probably formed originally by evaporation of seawater, being dissolved in meteoric water and hydrothermal fluid, and subsequently precipitated))

Li, Y., C.Q. Ma, G.F. Xing & H.W. Zhou (2015)- The Early Cretaceous evolution of SE China: insights from the Changle-Nan'ao metamorphic belt. Lithos 230, p. 94-104.
(SE China widespread Jurassic- Cretaceous magmatism, but episode of 'magmatic quiescence' at ~130-110 Ma. E Cretaceous (~140-130 Ma) magmatism in coastal SE China attributed to Paleo-Pacific plate subduction beneath SE China. Collision between W Philippines and SE China blocks at ~130-120 Ma resulted in magmatic quiescence and formation of Changle-Nan'ao metamorphic belt. Post-collisional extension triggered reinitiation of magmatism associated with amphibolite-facies metamorphism at ~110 Ma)

Li, X. (2000)- Cretaceous magmatism and lithospheric extension in Southeast China. J. Asian Earth Sci. 18, p. 293-305.
(E-M Cretaceous 'Yanshanian' magmatism in SE China in four episodes: (1 136-146 Ma, (2) 122-129 Ma, (3) 101-109 Ma (possibly subduction-related calc-alkaline) and (4) 87-97 Ma (A-type granites and bimodal volcanics, marking initiation of extensional environment). Associated with formation of extensional basin systems. Belt of Yanshanian magmatism usually explained as magmatic arc, but width of >1000 km far greater than normally observed in subduction zones (300-400 km))

Li, X.H., Z.X. Li, W.H. Li & Y.J. Wang (2006)- Initiation of the Indosinian orogeny in South China: evidence for a Permian magmatic arc on Hainan Island. J. Geol. 114, p. 341-353.

(Syntectonic granites on Hainan Island, off SE China, with calc-alkaline I-type affinities and zircon ages of 267-262 Ma, reflecting initiation of late E Permian continental margin arc along E margin of China)

Li, X.H., Z.X. Li & W.X. Li (2014)- Detrital zircon U-Pb age and Hf isotope constrains on the generation and reworking of Precambrian continental crust in the Cathaysia Block, South China: a synthesis. Gondwana Research 25, p. 1202-1215.
(S China Block (Yangtze and Cathaysia blocks) one of largest Precambrian blocks in E Asia. Precambrian detrital zircon ages from (meta)sedimentary samples and river sands three major peaks (~2485, 1853 and 970 Ma) and four subordinate peaks (~1426, 1074, 780 and 588 Ma). Five of seven detrital zircon age peaks coincident with crystallisation ages of igneous rocks exposed in Cathaysia (~1.89-1.83 Ga, 1.43 Ga, 1.0-0.98 Ga and 0.82-0.72 Ga. Cathaysia Block is orogenic belt between E Antarctica, Laurentia and Australia during the assembly of Columbia/Nuna supercontinent at ~1.9-1.8 Ga to become part of supercontinent Rodinia. Cathaysia Block amalgamated with Yangtze Block during Sibao Orogeny at ~1.0-0.89 Ga)

Li, X., J. Zheng, S. Li, Bo Liu, L. Xiang, Y. Wang & X. Liu (2016)- Late Triassic orogenic collapse and Palaeo-Pacific slab roll-back beneath central South China: constraints from mafic granulite xenoliths and structural features. In: Evolution of West Pacific Ocean, South China Sea and Indian Ocean, Geological J. 51, Supplement S1, p. 123-136.
(Daoxian mafic granulite xenoliths in basalts from S Hunan Province and structural features of Xuefengshan belt suggest Late Triassic orogenic collapse under central S China Block, accompanied by lithospheric extension and asthenospheric upwelling. Could have contributed to mantle disturbance to enhance rollback of Paleo-Pacific slab)

Li, Z., J.S. Qiu & X.M. Yang (2014)- A review of the geochronology and geochemistry of Late Yanshanian (Cretaceous) plutons along the Fujian coastal area of southeastern China: implications for magma evolution related to slab break-off and rollback in the Cretaceous. Earth-Science Reviews 128, p. 232-248.
(Cretaceous Late Yanshanian magmatic belt along SE coast of China define linear NNE–SSW-trending belt of magmatism. Emplacement mainly ~125-90 Ma, with major peak from 115-90 Ma. First appearance of sparse I-type granitoids with post-collisional extensional granite affinities and emplacement of A-type granites mark start of extension during E Cretaceous at ~125-119 Ma. Subsequent bimodal magmatism at 115-90Ma suggests major igneous event as response to back-arc extension. Break-off and rollback of subducting Paleo-Pacific Plate during Cretaceous responsible for Late Yanshanian tectono-magmatic evolution in area)

Liem, N.V. (1966)- Some Triassic foraminifera from Hoang Mai Limestone, Nghe An Province. Acta Scient. Vietnamica, Sect. Biol. Geol. Geogr., 1, p. 37-44.

Liu, C., Y. Pan & R. Zhu (2012)- New paleomagnetic investigations of the Emeishan basalts in NE Yunnan, southwestern China: constraints on eruption history. J. Asian Earth Sci. 52, p. 88-97.
(Magnetostratigraphic studies of Emeishan basalts and known radiometric ages (peaking at ~260 Ma), suggests eruption period of Emeishan large igneous province <3 Myr)

Liu, H., Y. Wang, P.A. Cawood, W. Fan, Y. Cai & X. Xing (2015)- Record of Tethyan Ocean closure and Indosinian collision along the Ailaoshan suture zone (SW China). Gondwana Research 27, 3, p. 1292-1306.
(online at: http://or.nsfc.gov.cn/bitstream/00001903-5/252870/1/1000014253494.pdf)
(NW-SE trending Ailaoshan suture part of ~2900 km long Jinshajiang- Ailaoshan- Song Ma- Hainan suture, and separates Yangtze (S China Craton) block in N from Simao (Indochina) block in S. Granitic plutons in Ailaoshan zone yield zircon ages of 247-252 Ma. Indosinian magmatism confirmed along Ailaoshan zone. Latest Permian convergent margin magmatism represented by Xin'anzhai granitoid (~252 Ma) terminated through accretion of Simao-Indochina to S China Blocks, marking start of Triassic Indosinian Orogeny, resulting in generation of the ~247 Ma (earliest Triassc) Tongtiange S-type leucogranite)

Liu, H.C., Y.J. Wang, X.F. Guo, W.M Fan & J.J. Song (2016)- Late Triassic post-collisional slab break-off along the Ailaoshan suture: insights from OIB-like metagabbros and associated rocks. Int. J. Earth Sciences (Geol. Rundschau) 106, 4, p. 1359-1373.

(Late Triassic gabbroic intrusion in Mengdong village in S China- Indochina collision zone, Yunnan, SW China, metamorphosed to amphibolite. Late Triassic magmatic flare-up at ~222± 5 Ma in Ailaoshan suture zone post-collisional setting, with heat source from slab break-off and OIB-type asthenospheric mantle upwelling)

Liu, J., M.D. Tran, Y. Tang, Q.L. Nguyen, T.H. Tran, W. Wu, J. Chen, Z. Zhang & Z. Zhao (2012)- Permo-Triassic granitoids in the northern part of the Truong Son belt, NW Vietnam: geochronology, geochemistry and tectonic implications. Gondwana Research 22, p. 628-644.
(N segment of Truong Son belt of NW Vietnam (on N margin Indochina Block) three granitoid complexes. U-Pb dating of magmatic zircons three populations, suggesting M Permian- E Triassic arc magmatism at 280-270 Ma and 250-245 Ma, and magmatism of Dien Bien complex during post-collisional extension at ~229- 202 Ma)

Liu, L. X. Xu & Y. Xia (2016)- Asynchronizing paleo-Pacific slab rollback beneath SE China: insights from the episodic Late Mesozoic volcanism. Gondwana Research 37, p. 397-407.
(Late Jurassic - Cretaceous NW-directed Paleo-Pacific subduction under SE China caused widespread Andean-type active margin magmatism between ~160-88 Ma. Multiple stages: 160-148, 145-130, 130-127 and 110-88 Ma. General SE-ward younging trend in Cretaceous indicates increasing slab dip angle/ slab rollback of Paleo-Pacific subduction after 150 Ma)

Liu, S., R.Z. Hua, S. Gao, C.X. Feng., Z. Huang, S. Lai et al. (2009)- U-Pb zircon, geochemical and Sr-Nd-Hf isotopic constraints on the age and origin of Early Palaeozoic I-type granite from the Tengchong-Baoshan Block, Western Yunnan Province, SW China. J. Asian Earth Sci. 36, p. 168-182.
(Cambrian monzogranite from Tengchong-Baoshan Block, W Yunnan, zircon ages of ~499- 502 Ma. Numerous other granitoids of similar age (490-470 Ma) across Tengchong-Baoshan Block and on Indian Plate and Himalayan Orogenic Belt, both parts Gondwana supercontinent. Tengchong-Baoshan Block also formed part of Gondwana, and separated in Late Paleozoic)

(Da Lat basin in SE Vietnam initiated during marine transgression in E Jurassic (Hettangian, ~198 Ma) and ended by regression in M Jurassic (Bathonian, ~165 Ma). Aalenian- Bajocian with common molluscs (?Myophorella) and mid-outer shelf ichnofossils (Skolithis, Paleophycus, Thalassinoides))

Pubellier, M., C. Rangin, P.V. Phach, B.C. Que, D.T. Hung & C.L. Sang (2003)- The Cao Bang- Tien Yen fault: implications on the relationships between the Red River Fault and the South China coastal belt. Advances in Natural Sciences 4, 4, p. 347-361.

Qian, X., Q. Feng, Y. Wang, C. Chonglakmani & D. Monjai (2016)- Geochronological and geochemical constraints on the mafic rocks along the Luang Prabang zone: Carboniferous back-arc setting in northwest Laos. Lithos 245, p. 60-75.
(Paleotethyan sutures/collisional zones: Luang Prabang tectonic zone in NW Laos links with Jinshajiang-Ailaoshan suture zone to N and Nan suture zone to SW. Diabase and basalt in Luang Prabang tectonic zone with zircon ages of ~335, 305 Ma, suggesting Carboniferous age of mafic rocks (also 430-470 Ma peak). E-MORB-like characteristics with addition of subduction-related component. Ages of mafic rocks along Luang Prabang tectonic zone similar to mafic rocks from Jinshajiang-Ailaoshan, Song Ma and Nan suture zones, and suggest development of Carboniferous back-arc basin separating Sukhothai Terrane and Indochina Block. Luang Prabang tectonic zone remnant of synchronous back-arc basins to NE of Paleotethyan Main Ocean)

Qian, X., Q. Feng, Y. Wang, C. Chonglakmani & D. Monjai (2016)- Petrochemistry and tectonic setting of the Middle Triassic arc-like volcanic rocks in the Sayabouli area, NW Laos. J. Earth Science (China) 27, 3, p. 365-377.
(online at: http://en.earth-science.net/PDF/20160612013151.pdf)
(Volcanic rocks from Sayabouli area in NW Laos traditionally mapped as Permian- E Triassic sequences on geologic map, but basaltic-andesite with zircon U-Pb age of 238±2 Ma, suggests M Triassic age. Rocks similar to continental arc volcanic rocks from Phetchabun belt in NE Thailand, through W Loei sub-belt (E-dipping subduction linked closing of Nan backarc basin between Sukhothai terrane and W margin of Indochina Block))

Qian, X., Q. Feng, W. Yang, Y. Wang, C. Chonglakmani & D. Monjai (2015)- Arc-like volcanic rocks in NW Laos: geochronological and geochemical constraints and their tectonic implications. J. Asian Earth Sci. 98, p. 342-357.
(Loei Fold Belt at W margin of Indochina Block linked to subduction of Paleotethys Ocean. In NW Laos andesitic and rhyolitic samples from Muang Feuang region of Belt have E Carboniferous zircon ages (~330, 335, 350 Ma). Basaltic and basaltic-andesitic samples frome Pak Lay region zircon ages of ~315 Ma. Suggest Carboniferous active continental margin along W margin of Indochina Block)

Racheboeuf, P., P. Ta Hoa, H.H. Nguyen, M. Feist & P. Janvier P. (2006)- Brachiopods, crustaceans, vertebrates, and charophytes from the Devonian Ly Hoa, Nam Can and Dong Tho formations of Central Vietnam. Geodiversitas 28, 1, p. 5-36.
(online at: http://sciencepress.mnhn.fr/sites/default/files/articles/pdf/g2006n1a1.pdf)
(New vertebrate remains from Devonian of C Vietnam (Indochina Block) provide further information about various fish fossils (similar to Yangtse Platform, S China block, brachiopods (Corbicularia, etc.) and charophytes (Sycidium))

Rangin, C., P. Huchon, X. Le Pichon, H. Bellon, C. Lepvrier, D. Roques, Nguyen Dinh Hoe & Phan Van Quynh (1995)- Cenozoic deformation of central and south Vietnam. Tectonophysics 251, p. 179-196.
(Pre-Tertiary basement of C and S Vietnam pervasive strike-slip and normal faulting. Two superposed strike-slip systems: (1) Paleogene (large NW-SE left-lateral strike-slip faults, parallel to Red River Fault; E-W maximum shortening axis) and (2) E Neogene (dominant N 160°E to N-S right-lateral faults). Indochina affected bycollision of India with Eurasia, first through pervasive NW-SE left-lateral strike-slip faulting (extrusion of Indochina), then through N160°E to N-S right-lateral faulting, compatible with large right-lateral sub-meridian shear zone over E margin of Indochina as S China Sea basin was opening)

Roger, F., M. Jolivet, H. Maluski, J.P. Respaut, P. Munch, J.L. Paquette, Tich Vu Van & Vuong Nguyen Van (2014)- Emplacement and cooling of the Dien Bien Phu granitic complex: Implications for the tectonic evolution of the Dien Bien Phu Fault (Truong Son Belt, NW Vietnam). Gondwana Research 26, p. 785-801.
(Dien Bien Phu and Muong Lay granites in N Vietnam exposed E and W of DPB fault. U/Pb age of ~277 Ma and considered related to subduction of Song Ma Ocean under Indochina Block during Indosinian orogeny.

Roger, F., P.H. Leloup, M. Jolivet, R. Lacassin, P.T. Tranh, M. Brunel & D. Seward (2000)- Long and complex thermal history of the Song Chay metamorphic dome (northern Vietnam) by multi-system geochronology. Tectonophysics 321, p. 449-466.
(Song Chay Range with high-grade granitic and metamorphic dome near Cenozoic Ailao Shan-Red River fault zone. Previously considered to be Proterozoic S China basement. Granite with zircon age of 428±5 Ma. Rb/Sr on ands 39Ar/40Ar ages suggest Late Triassic episode of rapid cooling interpreted as due to doming. AFT age of 33.6±3.6 Ma confirms rapid Eocene-Oligocene cooling event, final exhumation of Song Chay dome)

Roger, F., H. Maluski, C. Lepvrier, V.V. Tich & J.L. Paquette (2012)-, LA-ICPMS zircons U/Pb dating of Permo-Triassic and Cretaceous magmatism in northern Vietnam- geodynamic implications: J. Asian Earth Sci. 48, p. 72-82.
(NE Vietnam major tectonic episode with nappes emplacement in Triassic. Allochtonous structures intruded by E-M Triassic post-tectonic granitic melts (Phia Bioc granite intrusive; 245-248 Ma), possibly synchronous with strike-slip faulting events (250-245 Ma) in Truong Son Belt Indosinian orogen. Probably linked with intra-plate

magmatism of Emeishan Large Igneous Province or with magmatism associated with Paleotethys closure. Cretaceous Phia Oac granite (87.3 ± 1.2 Ma) probably tied to 'late Yanshanian' Paleo-Pacific subduction)

Rossignol, C., S. Bourquin, E. Hallot, M. Poujol, M.P. Dabard, F. Roger, R. Martini & M. Villeneuve (2016)- Les bassins sedimentaires permo-triasiques Nord vietnamiens: archives de la collision Indochine- Chine du Sud (orogenese Indosinienne). Reunion des Sciences de la Terre 25, Caen, p. 280. *(Abstract only)*
('The Permo-Triassic sedimentary basins of North Vietnam: archives of the Indochina- South China collision (Indosinian orogeny'. Indosinian unconformity in N Vietnam postdates Middle Triassic. E Triassic arc S of Song Ma suture suggests S-dipping subduction of oceanic crust under Indochina Block)

Rossignol, C., S. Bourquin, E. Hallot, M. Poujol, M.P. Dabard, R. Martini, M. Villeneuve, J.J. Cornee, A. Brayard & F. Roger (2018)- The Indosinian orogeny: a perspective from sedimentary archives of north Vietnam. J. Asian Earth Sci. 158, p. 352-380.
(New Triassic stratigraphic framework for Song Da and Sam Nua basins, N Vietnam. Song Da Basin at S margin of S China Block in foreland setting during late E- M Triassic, not rift. Sam Nua basin on N margin of Indochina Block records activity of proximal magmatic arc from late Permian-Anisian, resulting from subduction of S-dipping oceanic slab that separated S China and Indochina blocks. Both basins M-L Triassic erosion, creating major unconformity from erosion of M Triassic Indosinian S China -Indochina collisional belt. Late Triassic terrestrial syn- to post-orogenic foreland basins with coarse detrital material)

Rossignol, C., S. Bourquin, M. Poujol, E. Hallot, M.P. Dabard & T. Nalpas (2016)- The volcaniclastic series from the Luang Prabang Basin, Laos: a witness of a Triassic magmatic arc? J. Asian Earth Sci. 120, p. 159-183.
(Luang Prabang Basin in NW Laos with long lasting Triassic subduction related arc volcanism (~ 35My; but rock age data mainly E Norian). Zircon ages of volcanic and volcanoclastic rocks ~233-215 Ma. Triassic active margin along W margin of Indochina Block, with E-dipping subduction from ~250(?)-215 Ma. Oceanic subduction episode followed by continental collision of Indochina Block with E Simao Block (area is E of Sukhothai terrane and Nan-Uttaradit suture= closing of Paleotethys or marginal basin/ branch?; see also Blanchard et al. 2013, Qian et al. 2016)

Sanematsu, K. & S. Ishihara (2011)- 40Ar/39Ar Ages of the Da Lien Granite related to the Nui Phao W mineralization in Northern Vietnam. Resource Geology 61, 3, p. 304-310.
(40Ar/39Ar dating of biotite and muscovite of Da Lien granite, Nui Phao, N part of Vietnam on South China Plate indicate Late Cretaceous cooling age (82.8- 81.5 Ma) age of granite with polymetallic mineralization)

Sanematsu, K., H. Murakami, S. Duangsurigna, S. Vilayhack, R.A. Duncan & Y. Watanabe (2011)- 40Ar/39Ar ages of granitoids from the Truong Son fold belt and Kontum massif in Laos. J. Mineralogical Petrological Sci. 106, p. 13-25.

(2013)- Formation of Cretaceous Cordilleran and post-orogenic granites and their microgranular enclaves from the Dalat zone, southern Vietnam: tectonic implications for the evolution of Southeast Asia. Lithos 182-183, p. 229-241.
(Cordilleran-type batholiths ofDalat zone of S Vietnam preserve evidence of Cretaceous convergent zone magmatism superimposed on Precambrian rocks of Indochina Block. Plutons of Dalat zone transitioned from active continental margin batholiths to highly extended crust with within-plate plutons. Deoca and Dinhquan plutons zircon U/Pb ages ~118-115 Ma, Ankroet pluton zircon age ~87Ma. Compositional change of Dalat

zone granitic rocks in M-L Cretaceous indicates tectonic regime evolved from continental arc environment to post-orogenic extension. Region of highly extended crust facilitated opening of S China Sea in Cenozoic)

Shen, J.W., T. Kawamura & W.R Yang (1998)- Upper Permian coral reef and colonial rugose corals in northwest Hunan, South China. Facies 39, p. 35-65.
(Late Permian (Palaeofusulina zone) coral reef limestone in Kanjia-ping, Hunan. Bafflestones formed by in-situ colonies of Waagenophyllum. Associated with fusulinids (Palaeofusulina, Nankinella, Staffella, Codonofusiella) and smaller foraminifera (Colaniella). Reef at Kanjia-ping is youngest Permian reef known)

Shi, M.F., F.C. Lin, W.Y. Fan, Q. Deng, F. Cong, M.D. Tran, H.P. Zhu & H. Wang (2015)- Zircon U-Pb ages and geochemistry of granitoids in the Truong Son terrane, Vietnam: Tectonic and metallogenic implications. Journal of Asian Earth Sciences 101, p. 101-120.
(Truong Son terrane in N Indochina block composed of six or more volcano-plutonic complexes. At least four stages of magmatic activitiy in Paleozoic- E Mesozoic: Ordovician-Silurian (420-470 Ma), Late Carboniferous-E Permian (280-300 Ma), Late Permian- M Triassic (245-270 Ma) and M-L Triassic (200-245 Ma).

Spagnuolo, S.A., J. Chambers & C. Luxton (2009)- Comparison of the geologic evolution and petroleum system of the Hai Phong sub-basin and the Phu Khanh Basin, offshore Vietnam. Proc. 2009 SE Asia Petroleum Expl. Soc. (SEAPEX) Conference, Singapore, p. 1-31. *(Abstract + Presentation)*
(Two underexplored basins off Vietnam, both with initial extension tectonics but have contrasting post syn-rift evolution. Phu Khan Basin no evidence for wrench fault system; mild M Miocene compressional event caused re-activation of pre-existing extensional faults. Compression event appears to have ceased by end M Miocene. Post M Miocene transformation of basin into passive margin with progradational-aggradational mega-sequences. Hai Phong sub-basin in N with major M Miocene and Late Pliocene inversion events)

Steyer, J.S. (2009)- The geological and palaeontological exploration of Laos; following in the footsteps of J.B.H. Counillon and A. Pavie. In: E. Buffetaut et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia, Geol. Soc., London, Spec. Publ. 315, p. 25-32.
(Brief history of geological exploration in Laos since late 1800's, mainly by Counillon)

Stokes, R.B. (2013)- Depratôs trilobites and the position of the Indochina Terrane in the Early Palaeozoic. Proc. Int. Symposium Geoscience resources and environments of Asian terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 201-207.
(Late Ordovician-Silurian trilobite faunas collected by Deprat in ~1915 from Laos and C Vietnam on Indochina Terrane, have European affinities (paleo-location adjacent to Bohemia ? (but topic of controversy in 1919: according to Mansuy trilobites came from Europe and had been 'planted' in Laos by Deprat)

Stokes, R.B., P. Lovatt Smith, A. Racey, C.H.C. Brunton, O. Dawson, A.R.H. Swan & M.F. Whitaker (2012)- Some Upper Palaeozoic fossil localities in the Vientiane Contract Area, Lao PDR, and their geological importance. J. Science Technol. Mahasarakham University (MSU) 31, p. 63-73.
(online at: http://journal.msu.ac.th/2012_/index.php/SCI/article/view/286/294)
(New Upper Paleozoic (Carboniferous- Permian) localities from C and W Laos. Includes latest Permian limestone with Palaeofusulina- Colaniella fauna N of Vientiane)

Stokes, R.B., P.F. Lovatt Smith & K. Soumphonphakdy (1996)- Timing of the Shan-Thai-Indochina collision: new evidence from the Pak Lay Foldbelt of the Lao PDR. In: R. Hall & D.J. Blundell (eds.) Tectonic evolution of SE Asia, Geol. Soc., London, Spec. Publ. 106, p. 225-232.
(Pak Lay Foldbelt in NW Laos is product of Indosinian orogeny (collision of Shan-Thai and Indochina along Nan-Uttaradit ophiolite suture). Current hypotheses place timing of collision in Permian or Triassic. However, in area S of Pak Lay M-U Jurassic argillites (with Classopollis spp., Calliatisporites dampieri, etc.) and volcanic rocks in steeply dipping imbricated wedge, which is unconformably overlain by Cretaceous Khorat Gp, suggesting Late Jurassic Shan-Thai-Indochina suturing)

Suasta, M., O. Arifin. & K. Suhanto (2014)- Gold mineralization along Ban Mai- Nakachan trend, west part of Sepon mineral district, Savannakhet Province, LAO PDR. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Indon. Soc. Econ. Geol. (MGEI) Ann. Conv., Palembang, p. 319-329.

Sun, L.Q., H.F. Ling, K.D. Zhao, P.R. Chen, W.F. Chen, T. Sun, W.Z. Shen & G.L. Huang (2017)- Petrogenesis of Early Cretaceous adakitic granodiorite: implication for a crust thickening event within the Cathaysia Block, South China. Science China (Earth Sciences) 60, 7, p. 1237-1255.
(E Cretaceous Lingxi pluton in interior of Cathaysia Block (zircon U-Pb age 100±1 Ma). Granodiorite with geochemical features of adakitic rocks, derived from partial melting of thickened Proterozoic lower continental crust at P ≥12 kbar (= crust thickness ≥40 km), leaving garnet-bearing amphibolite residue. Crust thickened by late E Cretaceous compressive event (angular unconformity between Upper Cretaceous rift deposits and folded early Lower Cretaceous or Jurassic). During subsequent lithospheric extension (driven by Paleo-Pacific subduction?) lower crust heated by upwelling asthenospheric materials, resulting in Lingxi and other coeval granitoids in Cathaysia Block)

Swiecicki, T. & K. Maynard (2009)- Geology and sequence stratigraphy of Block 06/94, Nam Con Son basin, offshore Vietnam. Proc. 2009 SE Asia Petroleum Expl. Soc. (SEAPEX) Conf., Singapore, p. 1-17. *(Abstract + Presentation)*
(Similarities and differences in tectonostratigraphic development of Cuu Long, Nam Con Son and W Natuna basins. W Natuna and Cuu Long Late Eocene/E Oligocene onset of rifting. All three basins with M Oligocene rifting, coincident with sea-floor spreading in S China Sea. Cuu Long Basin compressional reactivation of strike-slip faults in Late Oligocene ; inversion of early grabens in W Natuna Basin in E, M and Late Miocene. Nam Con Son Basin with second period of M -L Miocene rifting following end of sea-floor spreading)

Takemoto, K., N. Halim, Y. Otofuji, Tran Van Tri, Le Van De & S. Hada (2005)- New paleomagnetic constraints on the extrusion of Indochina: Late Cretaceous results from the Song Da terrane, northern Vietnam. Earth Planetary Sci. Letters 229, p. 273-285
(U Cretaceous redbeds of Song Da terrane between Indochina and S China blocks suggest Song Da terrane behaved as part of S China Block, when Shan-Thai Block and S part of Indochina Block experienced 10.5° ± 9.5° S-ward displacement accompanied with CW rotation later than Indo-Asian collision)

Tang, Y., J. Liu, M.D. Tran, Z. Song, W. Wu, Z. Zhang, Z. Zhao & W. Chen (2013)- Timing of left-lateral shearing along the Ailao Shan-Red River shear zone: constraints from zircon U-Pb ages from granitic rocks in the shear zone along the Ailao Shan Range, Western Yunnan, China. Int. J. Earth Sciences (Geol. Rundschau) 102, p. 605-626.
(Zircon U-Pb ages of granites along Ailo Shan- Red River FZ constrain on timing of left-lateral shearing: initiation later than 31 Ma from pre-shearing granitic plutons but earlier than 27 Ma from syn-shearing granitic dykes, and termination ~21 Ma from the post-shearing granitic dykes. Left-lateral shearing result of SE-ward extrusion of Indochina block during Indian-Eurasian plate collision)

Thang, Bui Duc (1989)- Lower Triassic conodonts from North Vietnam. Acta Palaeontologica, Warsaw, 34, 4, p. 391-416.

Thanh, T.D., P. Janvier & T.H. Phuong (1996)- Fish suggests continental connections between the Indochina and South China blocks in Middle Devonian time. Geology 24, 6, p. 571-574.
(Yunnanolepiform antiarch (placoderm fish) from the Givetian Dong Tho Fm of C Vietnam, well S of Song Ma suture, in marginal marine facies. Hitherto known exclusively from Lower Devonian of S China block, suggesting close links between Indochina and South China blocks in M Devonian time)

Thanh, N.X., Mai Trong Tu, T. Itaya & S. Kwon (2011)- Chromian-spinel compositions from the Bo Xinh ultramafics, northern Vietnam; implications on tectonic evolution of the Indochina Block. J. Asian Earth Sci. 42, 3, p. 258-267.
(Bo Xinh ultramafics, N of Song Ma fault zone isolated bodies long considered as remnants of Paleotethys Ocean lithosphere between Indochina and S China blocks. Cr-spinel compositions suggest parental magma was

lherzolite-harzburgite in composition, indicating forearc tectonic environment. Combined with information on magmatism, metamorphism and sedimentary environment, suggest presence of S-ward subduction zone since Cambrian and collision of Indochina and S China in Late-Silurian- E Devonian. Permian-Triassic magmatic-metamorphic events in Indochina block linked to N-ward subduction of Paleo-oceanic plate beneath Indochina block, followed by M-L Triassic Sibumasu collision)

Thassanapak, H., M. Udchachon & C. Burrett (2012)- Devonian radiolarians and tentaculitids from central Laos. J. Asian Earth Sci. 60, p. 104-113.
(Radiolaria (Trilonche spp, Stigmosphaerostylus spp., etc.) and tentaculitids (Homoctenus ultimus, Costulatostylionina vesca) in 4m of thick M-U Devonian section of silicified shales at Ban Phonxai, C Laos (N part of Indochina Terrane). Indicative of Frasnian age. Pelagic deep shelf fauna from Indochina Terrane similar to that from S China)

Thassanapak, H., M. Udchachon & C. Burrett (2017)- Silurian radiolarians from the Sepon Mine, Truong Son Terrane, central Laos and their palaeogeographic and tectonic significance. Geol. Magazine 155, 8, p. 1621-1640.
(Late Silurian radiolarian fauna of 18 species from cherts in Sepon Mine area, C Laos. With Futobari morishitai, F. solidus, Zadrappolus yoshikiensis and Z. tenuis. Evidence from Silurian-Devonian of S Truong Son Terrane indicates deepening to S (radiolarian cherts; terrestrial red sandstone facies to NE). In contact with E Silurian limestone and U Ordovician- E Silurian graptolitic shale, overlain by turbiditic volcaniclastics from nearby Long Dai Volcanic Arc. Arc probably maintained by N-ward subduction along Thakhek-Danang Shear Zone)

(Large Carboniferous-Permian Yangtze carbonate platform of S China (Yangtze) Block), with 26 Late Carboniferous- E Permian cyclothems identified. Probably rel. arid climate))

Ueno, K., Y. Kamata, K. Uno, T. Charoentitirat, P. Charusiri, K. Vilaykham & R. Martini (2018)- The Sukhothai Zone (Permian-Triassic island-arc domain of Southeast Asia) in Northern Laos: insights from Triassic carbonates and foraminifers. Gondwana Research 61, p. 88-99.
(Sukhothai Zone Permian-Triassic Paleo-Tethyan island-arc system along W margin of Indochina Block considered to extend from N Thailand to SW Yunnan (China), but no evidence from N Laos in between.

Foraminifers from shallow marine limestone in Long area of NW Laos of Triassic (Carnian) age (Aulotortus sinuosus, A. tumidus, Ophthalmidium, Endotriada, Endoteba, Palaeolituonella, etc.). In Thailand similar Carnian limestone only in Doi Long Fm in Sukhothai Zone)

Ueno, K., A. Miyahigashi, Y. Kamata, K. Hisada, H. Hara, K. Uno, T. Charoentitirat, P. Charusiri et al. (2014)- Permian and Triassic carbonates in the Oudom Xai- Luang Namtha area, northern Laos: stratigraphical and paleontological constraints for connecting Northern Laos with Northern Thailand. In: Development of the Asian Tethyan Realm, Proc. 3rd Int. Symposium Int. Geosciences Program (IGCP) Project 589, Tehran 2014, p. 2-4. *(Extended Abstract)*
(Permian limestones in N Laos dominated by sponge- Tubiphytes-microbial reefal boundstone with Colaniella cylindrica, Agathammina, Pachyphloia, Neoendothyra, Reichelina, Palaeofusulina?, etc., referable to Changhsingian (latest Permian). Also M Triassic (Anisian) carbonates with ooid grainstones and Late Triassic (Carnian) sponge-microbial boundstones. In Thailand similar carbonate succession only in Lampang-Phrae-Nan area of Sukhothai Zone, suggesting Sukhothai Zone extends to W part of N Laos)

Usuki, T., C.Y. Lan, K.L. Wang, T. A. Tran, M.W. Yeh, H.Y. Chiu & S.L. Chung (2010)- Early Archean crustal components in the Indochina block: evidence from U-Pb ages and Hf isotope of detrital zircons from the central Vietnam. In: 7th Int. Symp. Gondwana to Asia: evolution of Asian continent and its continental margins, Qingdao 2010, Int. Assoc. Gondwana Research, Japan, p. 45. *(Abstract only)*
(online at: www.igm.nsc.ru/labs/lab212/~safonova/pdf/7thiagrabstracts.pdf)
(U-Pb dating and Hf isotope analysis of detrital zircons from C Vietnam rivers, to characterize continental crust of Indochina block. Zircon dating results: Archean- Cambrian zircons four major clusters (2.5, 1.6, 1.0-0.9 and 0.65-0.5 Ga), younger zircons three clusters (450, 250, 30 Ma). Indochina block long crustal evolution history, involving significant amount of Archean continental crustal components)

Usuki, T., C.Y. Lan, T.F. Yui, Y. Iizuka, Van Tich Vu, Tuan Anh Tran, K. Okamoto, J.L. Wooden, J.G. Liou (2016)- Early Paleozoic medium-pressure metamorphism in central Vietnam: evidence from SHRIMP U-Pb zircon ages. Geosciences J. 13, 3, p. 245-256.
(Zircon analyses of two paragneiss samples of Kham Duc Complex, C Vietnam ~447, 452Ma, different from the available Ar-Ar mineral ages of 254-225 Ma. ~450 Ma zircon rim ages reflect possible crustal thickening event in Late Orrdovician (most likely collisional orogeny between Indochina and S China blocks), while Permo-Triassic Ar-Ar ages would result from Indosinian overprint. Late Neoproterozoic-Neoarchean ages from detrital zircon cores suggest protoliths may have derived from sediments at Gondwana margin)

(Indochina Block of Cambodia, Laos, S Vietnam and E Thailand 3 main periods of folding from Late Paleozoic-U Triassic/ E Jurassic; essentially rigid since Jurassic)

Xia S., Y. Shen, D. Zhao & X. Qiu (2015)- Lateral variation of crustal structure and composition in the Cathaysia Block of South China and its geodynamic implications. J. Asian Earth Sci. 109, p. 20-28.

Xia, W., J. Zhou, W. Yuan, S. Zhang & Y. Yang (1994)- Genetic stratigraphic framework and evolutional history of Late Triassic foreland basins in South China. Earth Science. J. China University of Geoscience 19, 1, p. 19-29. *(in Chinese)*
(Late Triassic foreland basin in W Guizhou and E Yunnan provinces))

Xin, Q., Q. Feng, Y. Wang, W. Yang, C. Chonglakmani & D. Monjai (2016)- Petrochemistry and tectonic setting of the Middle Triassic arc-like volcanic rocks in the Sayabouli Area, NW Laos. J. Earth Science (China) 27, 3, p. 365-377.
(Volcanic rocks from Sayabouli area in NW Laos mapped as Permian- E Triassic, but basaltic-andesite with zircon U-Pb age of 238±2 Ma, suggests M Triassic age. Geochemical affinity to continental arc volcanics, and similar to arc volcanics from Phetchabun belt in NE Thailand, suggesting Late Permian- M Triassic continental margin/ volcanic belt at margin of Indochina Block, from NW Laos to C Thailand through W Loei sub-belt)

Xu, Y., C.Y. Wang & T. Zhao (2016)- Using detrital zircons from river sands to constrain major tectono-thermal events of the Cathaysia Block, SE China. J. Asian Earth Sci. 124, p. 1-13.

(Detrital zircons from Minjiang and Zhujiang Rivers in SE China show five major U/Pb age populations: 90-250 Ma, 400-500 Ma, 0.7-1.2 Ga, 1.6-2.0 Ga and 2.3-2.6 Ga. About 80-90% of present crust in NE and SW Cathaysia Blocks formed by 1.6 Ga. The 140-120 Ma tectono-thermal events likely related to change of subduction direction of Paleo-Pacific plate from N-ward to NW ward at 140 Ma. The 112-90 Ma tectono-thermal events may be correlated with rollback of subducted Paleo-Pacific plate at ~110 Ma)

Yang, Z., V. Courtillot, J. Besse, X. Ma, L. Xing, S. Xu & J. Zhang (1992)- Jurassic paleomagnetic constraints on the collision of the North and South China Blocks. Geophysical Research Letters 19, 6, p. 577-580.
(S China Block underwent final accretion to N China Block in M Jurassic. Accretion of N China Block to Siberia not complete until Late Jurassic and possibly even until E Cretaceous)

Yang, Z., Z. Sun, T. Yang & J. Pei (2004)- A long connection (750-380 Ma) between South China and Australia: paleomagnetic constraints. Earth Planetary Sci. Letters 220, p. 423-434.
(Paleomagnetic study on M Cambrian in N Sichuan Basin (Yangtze Block). S China Block placed against NW Australia, correlating Grenville-age Jiangnan orogenic belt with Rudall belt of W Australia, and subsequently Late Proterozoic Jiangnan and Officer/Adelaide rift systems. Paleobiogeographic evidence indicates this configuration might maintain by M Devonian)

Yao, A., K. Kuwahara, Y. Ezaki, J. Liu & W. Hao (2004)- Permian radiolarians from the Qinfang Terrane, South China, and its geological significance. J. Geosciences Osaka City University 47, 3, p. 71-83.
(online at: http://dlisv03.media.osaka-cu.ac.jp/infolib/user_contents/kiyo/DB00011403.pdf)
(Early- Late Permian radiolarian chert of Qinfang Terrane with nine zones, probably signifying deep basin between Yangzi Block in NW and Cathaysia block in SE)

Yonemura, K., Y. Osanai, N. Nakano, M. Owada & S. Baba (2013)- Petrology, geochemistry, and origin of metamorphosed mafic rocks of the Trans Vietnam orogenic belt, Southeast Asia. J. Mineralogical Petrological Sci. 108, p. 55-86.
(online at: https://www.jstage.jst.go.jp/article/jmps/108/2/108_120813/_pdf)
(NW-SE trending Trans-Vietnam Orogenic Belt thought to have formed by continent-continent collision between S China and Indochina blocks in Permian- Triassic. Amphibolite-facies metamorphosed mafic rocks widespread in Song Ma suture zone, Kontum Massif, etc., derived from arc and oceanic crust between these plates)

Yu, Y., S.S. Gao, K.H. Liu, T. Yang, M. Xue & Khanh Phon Le (2017)- Mantle transition zone discontinuities beneath the Indochina Peninsula: implications for slab subduction and mantle upwelling. Geophysical Res. Letters 44, 14, p. 7159-7167.
(Velocity model shows evidence for presence of slab segments in Mantle Transition Zone beneath C and slab window beneath W Indo-China plate. Also broad mantle upwelling adjacent to E edge of slab segments, which may responsible for widespread Cenozoic volcanism and pervasive low upper mantle velocities in area)

Zeng, G., Z.Y. He, Z. Li, X.S. Xu & L.H. Chen (2016)- Geodynamics of paleo-Pacific plate subduction constrained by the source lithologies of Late Mesozoic basalts in southeastern China. Geophysical Research Letters 43, p. 10,189-10,197.
(SE China Late Mesozoic basalts four age groups: 178-172 Ma, ~150 Ma, 137-123 Ma and 109-64 Ma. Mainly pyroxenites. Subduction of Paleo-Pacific plate most likely candidate for mantle-derived magmatism after ~150 Ma. Slab rollback with increased dip angle possible model for lithological variations of Late Mesozoic mantle)

Zhang, X., H. Ma, Y. Ma, Q. Tang & X. Yuan (2013)- Origin of the late Cretaceous potash-bearing evaporites in the Vientiane Basin of Laos: ŭ11B evidence from borates. J. Asian Earth Sci. 62, p. 812-818.
(Late Cretaceous Maha Sarakham Fm evaporites on Khorat Plateau with one of largest potash deposits in world. Origin has long been controversial. Main borates boracite and hilgardite with isotopic values suggesting marine borates)

Zhao, J., J. Qiu, L. Liu & R. Wang (2016)- The Late Cretaceous I- and A-type granite association of southeast China; implications for the origin and evolution of post-collisional extensional magmatism. Lithos 240-243, p. 16-33.
(SE China coast granites two groups: (1) in N, I-type alkali-feldspar granites generated by mixing of mantle-derived material with crustal-derived magmas (98-96 Ma); and (2) in S, A-type plutons (89-86 Ma). All granites highly siliceous, K-rich. Both granite types emplaced during post-collisional extensional tectonism associated with rollback of steeply subducting Paleo-Pacific Plate (increase of dip angle of subducted Paleo-Pacific plate between Early- Late Cretaceous)

Zhao, L., X. Zhou, M. Zhai, M. Santosh, Y. Geng (2015)- Zircon U-Th-Pb-Hf isotopes of the basement rocks in northeastern Cathaysia block, South China: implications for Phanerozoic multiple metamorphic reworking of a Paleoproterozoic terrane. Gondwana Research 28, p. 246-261
(Zircon age peaks of 1.86-1.87 Ga and 230-250 Ma interpreted to represent time of metamorphic reworking. The extensive ~1870 Ma Paleoproterozoic thermal event may be response of Cathaysia block to assembly of Columbia supercontinent)

Zhao, X., Y. Jiang, G. Xing, M. Yu, J. Mao & S. Yu (2018)- Newly discovered Late Cretaceous adakites in South Fujian Province: implications for the late Mesozoic tectonic evolution of Southeast China. Island Arc 27, 2, e12236, p. 1-17.
(online at: https://onlinelibrary.wiley.com/doi/pdf/10.1111/iar.12236)
(Late Cretaceous Yongchun pluton adakitic intrusion in S Fujian, SE China. Zircon U-Pb ages of ~98-100 Ma, similar to those of nearby plutons. Magmas generated by partial melting of Mesoproterozoic continental crust mixed with mantle-derived magmas. Magmatism associated with thickening of lower crust during change in subduction angle and convergence rate of Paleo-Pacific Plate at 100 Ma)

Zhang, D., M. Yan, X. Fang, Y. Yang, T. Zhang, J. Zan, W. Zhang, C. Liu & Q. Yang (2018)- Magnetostratigraphic study of the potash-bearing strata from drilling core ZK2893 in the Sakhon Nakhon Basin, eastern Khorat Plateau. Palaeogeogr. Palaeoclim. Palaeoecology 489, p. 40-51.
(online at: https://www.sciencedirect.com/science/article/pii/S0031018217302080)
(Khorat Plateau one of world's largest potash evaporite deposits. Magnetostratigraphic study of 595m deep borehole in SE Sakhon Nakhon Basin in C Laos penetrated entire potash-bearing Nong Boua Fm and reached underlying sandstone beds. Combined with palynological, isotopic and other evidence, polarity zones correlated to geomagnetic polarity time scale, giving magnetostratigraphic ages of >63.5 Ma- ~92 Ma for evaporite section (= ~Turonian- Maastrichtian?))

Zhong, W.F., Q.L. Feng, C. Chonglakmani, D. Monjai & Z.B. Zhang (2012)- Permian-Triassic stratigraphic correlations between Laos and Yunnan and their tectonic significance. Earth Science (J. China University of Geosciences) 2012, S2, p. 73-80.
(New work in NW Laos shows Permian- Triassic (incl. U Permian clastics with coal) between Luangprabang and Chiang Rai belts are comparable to Simao basin between Ailaoshan and Lancangjiang belts. Nan River belt in N Thailand can therefore not be linked with Lancangjing belt by crossing NW Laos)

Zhou, J.X., K. Luo, Bo Li, Z.L. Huang & Z.F. Yan (2016)- Geological and isotopic constraints on the origin of the Anle carbonate-hosted Zn-Pb deposit in northwestern Yunnan Province, SW China. Ore Geology Reviews 74, p. 88-100.

Zhou, M.F., J. Malpas, M. Sun, X.Y. Song, P.T. Robinson, A.K. Kennedy, C.M. Lesher & R.R. Keays (2002)- A temporal link between the Emeishan large igneous province (SW China) and the end-Guadalupian mass extinction. Earth Planetary Sci. Letters 196, 3-4, p. p. 113-122.
(Emeishan flood basalt province in SW China zircon ages show age of Xinjie intrusion feeder to main phase of EFB volcanism is 259±3 Ma, coincident with proposed end-Guadalupian extinction event at 256-259 Ma)

Zhou, X., T. Sun, W. Shen, L. Shu & Y. Niu (2006)- Petrogenesis of Mesozoic granitoids and volcanic rocks in South China: a response to tectonic evolution. Episodes 29, 1, p. 26-33.

(online at: www.episodes.co.in/www/Backissues/291/26-33.pdf)
(Mesozoic granitoids and volcanic rocks in S China two main phases, responding to regional tectonic regime (1) mainly Late Triassic 'Indosinian' granites, tied to continent-continent collision within Tethyan orogenic domain; (2) Late Jurassic- Cretaceous 'Yanshanian' associated with NW-WNW-ward subduction of Paleo-Pacific ocean. Late Yanshanian K1 granitoid-volcanic rocks represent active continental margin magmatism; K2 tholeiitic basalts (85-105 Ma?) interlayered with red beds are interpreted as genetically associated with development of back-arc extensional basins in interior of S China Block)

Zi, J.W. (2012)- Late Paleozoic- Triassic tectono-magmatism in the Paleo-Tethys ocean, SW China: timing, nature and implications for continental amalgamation and orogenic processes. Ph.D. Thesis, University of Western Australia, Perth, p. 1-189.
(online at: research-repository.uwa.edu.au/files/3214568/Zi_Jianwei_2012.pdf)

Zi, J.W., P.A. Cawood, W.M. Fan, E. Tohver, Y.J. Wang, T.C. McCuaig & T.P. Peng (2013)- Late Permian-Triassic magmatic evolution in the Jinshajiang orogenic belt, SW China and implications for orogenic processes following closure of the Paleo-Tethys. American J. Science 313, 2, p. 81-112.
(Jinshajiang orogenic belt, SW China, records closure of Paleo-Tethys seaway and ensuing collision. Following consumption of ocean, M Triassic (247-237 Ma) collision zone magmatism. From 234-214 Ma emplacement of high-K, calc-alkaline granodiorites-monzogranites prior to isostatic uplift and extension, probably caused by breakoff of subducted slab. Melange and collision-related magmatic suites unconformably overlain by Late Triassic (229-217 Ma) conglomerate-rich sequence that represents overlap assemblage, across Qamdo-Simao terrane (Indochina) and Yangtze Block of S China)

Zi, J.W., P.A. Cawood, W. Fan, Y. Wang, E. Tohver, C. McCuaig & T. Peng (2012)- Triassic collision in the Paleo-Tethys Ocean constrained by volcanic activity in SW China. Lithos 144-145, p. 145-160.
(Collision-related Triassic volcanic rocks in Jinshajiang-Ailaoshan orogenic belt in SW China suggest initial collision and amalgamation of Qamdo-Simao (Indochina) terrane with Yangtze Block (S China) along Jinshajiang- Ailaoshan and Song Ma sutures probably in E Triassic, following consumption of Paleo-Tethys Ocean. 247-246 Ma Pantiange high-Si rhyolites represent early magmatic products. 245-237 Ma bimodal volcanism interpreted as extension within evolving collisional orogen, probably related to oblique convergence)

Zuo, X., L.S. Chan & J.F. Gao (2017)- Compression-extension transition of continental crust in a subduction zone: A parametric numerical modeling study with implications on Mesozoic-Cenozoic tectonic evolution of the Cathaysia Block. PlosS One 12, 2, e0171536, p. 1-35.
(online at: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5300286/pdf/pone.0171536.pdf)
(Numerical modeling of transition from Mesozoic compression to extension in Cathaysia Block, SE China (upper plate of Paleo-Pacific subduction zone). Initiation of Late Cretaceous- Paleogene extensional regime probably triggered by roll-back of slowly subducting slab)

IX.6. Malay Basin, Gulf of Thailand

Achalabhuti, C. (1976)- Petroleum geology of Thailand (Gulf of Thailand and Andaman Sea) -summary. In: Proc. Conf. Circum-Pacific Energy and Mineral Resources, Honolulu 1974, American Assoc. Petrol. Geol. (AAPG), Spec. Vol. M25, p. 251-255.

Achalabhuti, C. (1981)- Natural gas deposits of Gulf of Thailand. In: M.T. Halbouty (ed.) Energy Resources of the Pacific Region, American Assoc. Petrol. Geol. (AAPG), Spec. Vol. SG 12, p. 155-166.
(Two commercial gas-condensate fields with reserves up to 5 TCF found in Union Oil Block 12 and Texas Pacific's concession block 15 and block 16. Union field in S Pattani trough, Texas Pacific field in N part Malay basin. Several gas-condensate reservoirs identified in E-M Miocene deltaic sandstones)

Achalabhuti, C. (1981)- Offshore hydrocarbon production and potential of Thailand. In: M.J. Valencia (ed.) Proc. EAPI/CCOP Workshop, Honolulu 1980, Energy 6, 11, p. 1247-1254.
(Four commercial gas/condensate fields delineated in Gulf of Thailand with gas reserves of >7 TCF. Also small amounts of crude oil in some wells. Continental woody material primary source, minor components from marine algae. Deep water drilling in Andaman Sea revealed Tertiary source beds mainly immature. Pre-Tertiary sedimentary basins beneath offshore areas of Andaman Sea and Gulf of Thailand more favorable for hydrocarbon potential)

Ahmad, M.N. & P. Rowell (2012)- Application of spectral decomposition and seismic attributes to understand the structure and distribution of sand reservoirs within Tertiary Rift Basins of Gulf of Thailand. AAPG Ann. Conv. Exh., Long Beach 2012, Search and Discovery Art. 40992 (2012), 32p. *(Abstract/ Presentation)*

Porous zones in carbonate of B6/27 from subsurface hydrothermal leaching, not near-surface tropical weathering)

Clark, S.J.A. & R.C. Davis (2017)- Observations of hydrocarbon migration within the Jasmine Field and the impact on risk assignment for exploration prospectivity in Eastern Block B5/27, Gulf of Thailand. In: Proc. SE Asia Petroleum Expl. Soc. (SEAPEX) Exploration Conf. 2017, Singapore, Session 8, 4p. *(Extended Abstract)*
(Jasmine Field (Jasmine and Ban Yen) in NW Pattani Basin, Gulf of Thailand. Discovered in 1974, cumulative production 65 MMSTB Oil from >160 pools in 30 fault blocks and 27 M-L Miocene reservoirs. Oils appear to be expelled from similar organofacies at similar maturities, from kitchen S of Ban Yen area)

Creaney, S., A.H. Hussein, D. Curry, K.M. Bohacs & R. Hassan (1994)- Source facies and oil families of the Malay Basin, Malaysia. American Assoc. Petrol. Geol. (AAPG) Bull. 78, p. 1139. *(Abstract only)*
(Malay Basin several petroleum systems with Oligocene- M Miocene non-marine source rocks. Lower Oligocene- Lw Miocene lacustrine-dominated, Lw-M Miocene coastal/delta plain coal-related sources. Two lacustrine sources, with low pristane/phytane ratios, low oleanane, general absence of resin-derived terpanes. Multiple sources in coaly section (pristane/phytane ratios up to 8, very high oleanane, often abundant resinous compounds). All source rocks generally overmature in basin center and immature toward basin margin. Oils low in sulfur. Migration largely strata parallel with little cross-stratal mixing of families)

Cuny, G., C. Laojumpon, O. Cheychiw & K. Lauprasert (2010)- Fossil vertebrate remains from Kut Island (Gulf of Thailand, Early Cretaceous). Cretaceous Research 31, p. 415-423.
(Mesozoic vertebrate fauna from sandstones on Ko Kut, E Gulf of Thailand, includes fresh water hybodont sharks, actinopterygians, turtles, goniopholidid crocodiles and theropod dinosaurs. Incl. Heteroptychodus kokutensis n.sp. Fauna same age as Sao Khua Fm (Khorat Group) and not Jurassic, but Berriasian or younger. Tectonic affinities of Kut island unclear, may represent Sibumasu or Indochina Block)

Duval, B.C. & J. Gouadain (1994)- Exploration and development in the Bongkot Field Area (Gulf of Thailand): an integrated approach. In: Proc. 14th World Petroleum Congress, Stavanger 1994, p. 247-257.
(Bongkot gas- condensate field, largest in Gulf of Thailand. Complex geometry of reservoirs: faulted blocks and mid to late Tertiary fluvio-deltaic sands distributed across 2000m thick sedimentary section)

Fontaine, H., D. Rodziah & U. Singh (1990)- A Triassic 'reefal' limestone in the basement of the Malay Basin, South China Sea: regional implications. Bull. Geol. Soc. Malaysia 27, p. 1-25.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1990016.pdf)
(Sotong B1 well in SW part of Malay Basin (4.9° N, 104.8° E) drilled ~300m of Late Triassic limestone at TD. Two limestone types: (1) black wackestone-packstone (10000-10017') with some oolites, sponges, Tubiphytes; (2) grey wackestone-packstone (9736-9761') rich in fragments of sponges, bryozoa, corals (Pinacophyllum,

Thecosmilia?). Common Tubiphytes (= Shamovella), calcareous sponges (Colospongia). Foraminifera: Alpinophragmium perforatum, Opthalmidium, Tetrataxis, etc.. 'Tethyan', probably reefal, Norian-age)

Fontaine, H., D. Rodziah & U. Singh (1990)- Discovery of an Upper Triassic limestone basement in the Malay Basin, offshore Peninsular Malaysia: regional implications. J. Southeast Asian Earth Sci. 4, 3, p. 219-232.
(Same paper as above on limestone at base of Sotong B1 well with Triassic limestone penetrated from 9030-10,017'. With pseudoalgae, foraminifera (Alpinophragmium) and abundant calcisponges)

Fujiwara, M. (2010)- Significant erosion during development of the Middle Miocene unconformity and its effect on hydrocarbon generation in the Gulf of Thailand. AAPG Int. Conf. Exh., Rio de Janeiro 2009, Search and Discovery Art. 20084, p. 1-9.
(online at: www.searchanddiscovery.com/documents/2010/20084fujiwara/ndx_fujiwara.pdf)
(>20 oil-gas fields in Pattani Trough rift basin, with up to 7500m of Tertiary sediment. Source rocks Oligocene lacustrine shales and M Miocene coaly shales. M Miocene Unconformity with ~4500' of erosion at Erawan gas field, based on shale compaction trend and 'paleo-anticline' below MMU, possibly related to 'Himalayan' compressional event in Gulf of Thailand)

Fujiwara, M. (2011)- The Middle Miocene Unconformity (MMU) in the southern part of the Pattani Trough in the Gulf of Thailand. J. Japanese Assoc. Petroleum Technologists 76, 6, p. 545-555.
(online at: https://www.jstage.jst.go.jp/article/japt/76/6/76_545/_pdf)
(In Japanese, with English summary. Gulf of Thailand >4000 wells drilled since 1971. Over 30 oil-gas fields discovered. mainly in Cenozoic Pattani Trough rift basin, 200km long/ 50km wide, with 2 main unconformities: deep MTU (below drill depths) and shallower Mid-Miocene Unconformity (MMU). Compaction trends from sonic logs suggest ~1000m of erosion at MMU (possibly too high). MMU between Florschuetzia levipoli and F. meridionalis zones)

Fujiwara, M., M. Yamada & A. Sasaki (2009)- Possible inorganic origin of the high CO2 gas reservoirs in the Platong and the Erawan Gas Fields, Gulf of Thailand. AAPG Hedberg Conf., Variations in fluvial-deltaic and coastal reservoirs deposited in tropical environments, Jakarta, Search and Discovery Art. 90102, 2p. *(Extended Abstract)*

Fyhn, M.B.W., L.O. Boldreel & L.H. Nielsen (2010)- Escape tectonism in the Gulf of Thailand: Paleogene left-lateral pull-apart rifting in the Vietnamese part of the Malay Basin. Tectonophysics 483, p. 365-376.
(Vietnamese part of Malay basin large, deep pull-apart basin formed through M-Late Eocene- Oligocene left-lateral strike-slip along NNW-trending fault zones, likely associated with SE Asian extrusion tectonism. Deep rift widens to S and connects with main Malay Basin. Neogene thermal sag led to thick sediment succession. Moderate rifting resumed in E Miocene. Late Neogene basin inversion attributed to 70 km of right-lateral movement across major N-S-trending faults in central part of basin, but not in Vietnamese territory)

Fyhn, M.B.W., S.A.S. Pedersen, L.O. Boldreel, L.H. Nielsen, P.F. Green, P.T. Dien, L.T. Huyen & D. Frei (2010)- Palaeocene- early Eocene inversion of the Phuquoc-Kampot Som Basin: SE Asian deformation associated with the suturing of Luconia. J. Geol. Soc., London, 167, 2, p. 281-295.
(Phuquoc-Kampot Som Basin, Gulf of Thailand (Cambodia- Vietnam) is Late Jurassic-E Cretaceous foreland basin. Paleocene- E Eocene basin inversion-erosion event associated with Luconia suturing to SE Asia and shutdown of Paleo-Pacific subduction under SE Asia segregated larger Mesozoic basin. Inversion focused along Kampot and Khmer-Chanthaburi fold belts and indicate link between initial SE Asian left-lateral strike-slip faulting and Luconia suturing)

Fyhn, M.B.W., H.I. Petersen, A. Mathiesen, L.H. Nielsen, S.A.S. Pedersen, S. Lindstrom, J.A. Bojesen-Koefoed, I. Abatzis & L.O. Boldreel (2010)- Vietnamese sedimentary basins: geological evolution and petroleum potential. Geol. Survey Denmark and Greenland Bull. 20, p. 91-94.
(online at: www.geus.dk/publications/bull/nr20/nr20_p091-094.pdf)
(Review of two basins in Vietnamese part of Gulf of Thailand: (1) Phu Quoc Basin undrilled, 500 km long, N-S trending basin with up to 4km of mainly non-marine Late Jurassic- Lower Cretaceous sediments, bordered in E

by Jurassic-Cretaceous magmatic arc, inverted in Late Paleocene- E Eocene (AFTA data suggest Late Paleocene- E Eocene cooling); unconformably overlain by Eocene-Neogene; (2) Tho Chu basin= NE part of Malay Basin, initiated between M-L Eocene, with mainly NNW-trending rifts)

Ghosh, D., M.F.A. Halim, M. Brewer, B. Viratno & N. Darman (2010)- Geophysical issues and challenges in Malay and adjacent basins from an E & P perspective. The Leading Edge 29, 436, p. 1-11.
(Malay Basin N-S-trending pull-apart rift basin, formed during Late Eocene-E Oligocene, underwent thermal subsidence and sedimentation in E Miocene. M Miocene structural inversion resulting in E-W anticlines)

(Berthierine oolitic ironstones in Lower Miocene Terengganu shale of Tenggol Arch, basement high between S Malay Basin and Penyu basin. Ironstones in 30-50m-thick, laterally extensive dark green mudstone, deposited during regional marine transgression over SW margin of ancestral S China Sea. Oolitic ironstones possibly deposited as offshore shelf storm layers and derived from lateritic soils on land)

Madon, M. (1994)- Depositional and diagenetic histories of reservoir sandstones in the Jerneh Field, central Malay Basin. Bull. Geol. Soc. Malaysia 36, p. 31-53.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1994020.pdf)
(U Miocene reservoir sandstones in Jerneh field at 1250-2000m. Sandbodies facies: distributary mouthbar-shoreface in delta front, channel point bar deposits in delta plain. Laterally continuous sheet sandstones characterize shallow marine facies deposited during transgression over delta. Increasing compaction and quartz cementation with depth, resulting in reduced porosities (10% and 25%.). Quartz overgrowths started forming at ~1200m. K-feldspar dissolved by acidic formation waters; plagioclase d relatively stable)

Madon, M. (1995)- Tectonic evolution of the Malay and Penyu Basins, offshore Peninsular Malaysia. Ph.D. Thesis, University of Oxford, p. 1-325.
(online at: http://ora.ox.ac.uk/objects/uuid%3Af00a727d-8769-4ac8-88ab-35d8c662ea61)
(Malay and Penyu Basins formed in E Oligocene as result of regional dextral shear deformation caused by indentation of India into Eurasia. Basement inhomogeneities control basin development. Penyu Basin first developed as isolated grabens at fault intersections, in response to N-S extension. Low-angle listric normal faults, pull-apart grabens and flower structures suggest thin-skinned crustal extension and strike-slip tectonics.

E-W Basement faults in Malay Basin oblique to NW basin trend. Basin developed by transtension of NW-trending sinistral shear zone, in which fault-bounded blocks rotate, creating E-trending half-grabens. M-L Miocene transpressive inversion related to rotation of regional stress field by progressive indentation of India into Eurasia. Lithospheric stretching dominant process of basin formation. High heat flows (85-100 mW m^{-2}*) consistent with β stretching factors of 1.2- 4.3)*

Madon, M. (1997)- Analysis of tectonic subsidence and heat flow in the Malay Basin. In: Geol. Soc. Malaysia Annual Geol. Conf. '97, Terengganu, Bull. Geol. Soc. Malaysia 41, p. 95-108.
(online at: www.gsm.org.my/products/702001-100867-PDF.pdf)
(Malay Basin high present-day surface heat flow (~33-42 m W m2, interpreted as result of lithosphere thinning during basin formation. Basin relatively young (~35 Ma), and still undergoing thermal subsidence. Lithospheric stretching model with rifting over 10 Myrs starting at 35 Ma. Subsidence curves suggest stretching factors (B) of 1.2 on basin flanks to ~4.3 in centre. Basin flanks uplifted during initial rifting, causing subsidence to be delayed for ~10 Ma)

Madon, M. (1997)- The kinematics of extension and inversion in the Malay Basin. Bull. Geol. Soc. Malaysia 41, p. 127-138.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1997029.pdf)
(Malay Basin development began in Late Eocene- E Oligocene with sinistral transtensional shear of NW-trending shear zone that contains pre-existing E-trending basement faults. Shearing caused crustal blocks to rotate anticlockwise and form E trending half-grabens between them. Reversal of shear during E-M Miocene caused transpressive deformation and en echelon pattern of inverted half-grabens. Intensity of deformation increases SE-wards towards W Natuna Basin due to buttressing effect of Natuna basement ridge)

Madon, M. (2006)- Overpressure history of the Malay Basin, offshore Peninsular Malaysia. In: Petroleum Geol. Conf. & Exh. 2003, Kuala Lumpur, Bull. Geol. Soc. Malaysia 49, p. 135-144.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2004021.pdf)
(Malay Basin present-day depth to top overpressure in basin centre between 1900-2000m, in lower Group E. Top overpressure shallower at basin flanks, <1500m deep along faulted W basin margin. Top overpressure in basin centre influenced by Group F regional shale)

Madon, M. (2007)- Overpressure development in rift basins: an example from the Malay Basin, offshore Peninsular Malaysia. Petroleum Geoscience 13, 2, p. 169-180.
(Malay Basin Tertiary transtensional rift basin with at least two major overpressure compartments, sealed by regional shale units. Main, basin-centre overpressure compartment has domal shape, shallower in basin centre. In basin centre, top of overpressure ~1900-2000m depth and confined mainly to M Miocene unit E. Smaller overpressure compartment on NE flank of basin, sealed by the onlapping, transgressive shale of unit L (Lower Miocene) and at a depth of 2600-3000m. Disequilibrium compaction primary cause of overpressure, and consequence of high subsidence and sedimentation rates)

(Review of Malay Basin offshore E coast Peninsular Malaysia, straddling Thai border in NW and Vietnam border in NE. Over 50 oil and 30 gas fields discovered since 1969. NW-SE trending Oligo-Miocene rift-sag basin with up to 14km of sediment)

Madon, M. & A. Anuar (1999)- Penyu Basin. In: The petroleum geology and resources of Malaysia, Chapter 9, Petronas, Kuala Lumpur, p. 220-223.
(Review of Penyu Basin offshore of Kuantan, Peninsular Malaysia. Small extensional basinof interior Sundaland, S of main Malay Basin and W of W Natuna Basin. Oligocene non-marine syn-rift sediments overlain by Miocene sag phase. Several sub-basins. Main structures E-M Miocene transpressional folds ('Sunda folds'). Much of section in basin is immature for hydrocarbons. Top of oil window at ~2100m. With Rhu Field sub-commercial oil discovery)

Madon, M.B., A. Anuar & R. Wong (1997)- Structural evolution, maturation history and hydrocarbon potential of the Penyu Basin. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum Systems of SE Asia and Australasia, Jakarta 1997, Indon. Petroleum Assoc. (IPA), p. 403-424.
(Penyu Basin offshore Malaysia between Pahang and Johor Platforms on N Sunda Shelf under-explored. Basin structurally contiguous with W Natuna Basin. Comprises half-grabens bounded by two NW and ENE-trending faults, probably formed in E Oligocene by N-S extension. Early Oligocene alcustrine facies, marine incursions starting in Late Oligocene. Inversion of rift faults around E-M Miocene boundary)

Madon, M.B. & A.B. Watts (1998)- Gravity anomalies, subsidence history and the tectonic evolution of the Malay and Penyu basins (offshore Peninsular Malaysia). Basin Research 10, p. 375-392.
(Malay and Penyu basins up to 14 km sediment fill, with 20-30 mGal negative free air gravity anomalies. Modeling suggests basins formed by combination lithosphere stretching and thin-skinned crustal extension)

Madon, M., J.S. Yang, P. Abolins, R. Abu Hassan, A.M. Yakzan & S. B. Zainal (2006)- Petroleum systems of the Northern Malay Basin. In: Petroleum Geol. Conf. & Exh. 2003, Kuala Lumpur, Bull. Geol. Soc. Malaysia 49, p. 125-134.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm2004020.pdf)
(N Malay Basin petroleum province central/basinal gas-rich area, flanked on both sides and to S by mixed oil/gas zones. Non-associated gas fields in central zone mainly in D and E reservoirs, in Late Miocene inversion anticline. Vertical migration dominant process in basin centre. High CO2 gases typical of reservoirs in groups I and older and derived from inorganic sources. Low CO2 gas (<6%) more typical of D-E reservoirs and derived from organic thermal degradation)

Madsen, E.B., L. O. Boldreel & S.A.Schack Pedersen (2012)- Thin-skinned thrust-fault complex in the Phu Quoc Basin, SW Vietnam. Proc. Int. Petroleum Techn. Conf. (IPTC), Bangkok 2012, p. 1409-1416.
(Phu Quoc Basin is Late Jurassic- E Cretaceous foreland basin SW of Vietnam in undrilled E part of Gulf of Thailand. Deformation of basin took place during orogenic build-up of Kampot Fold Belt in E-M Cretaceous, which resulted in formation of thin-skinned thrust-fault complex, with complex piggyback basins. Main part of complex concealed under Neogene marine deposits)

Madsen, E.B. & S.A. Schack Pedersen (2012)- Thin-skinned thrust-fault complex in the Phu Quoc Basin, SW Vietnam. Int. Petrol. Techn. Conf. IPTC 2012, Bangkok, IPTC 14624, 8p.
(Phu Quoc Basin Late Jurassic- E Cretaceous foreland basin SW of Vietnam, E Gulf of Thailand. Structural model for basin from reflection seismic. Deformation of basin during orogenic build-up of Kampot Fold Belt in E-M Cretaceous, which resulted in thin-skinned thrust-fault complex. Main part of thrust belt concealed under Neogene marine deposits, but outcrops on Phu Quoc island and islands in Nam Du archipelago)

Maga, D., J. Jong, M. Madon & F.L. Kessler (2015)- Fluid inclusions in quartz: implications for hydrocarbon charge, migration and reservoir diagenetic history of the Penyu Basin and Tenggol Arch, offshore Peninsular Malaysia. Bull. Geol. Soc. Malaysia 61, p. 59-73.
(online at: www.gsm.org.my/products/702001-101675-PDF.pdf)
(In Penyu Basin and Tenggol Arch area, SW of Malay Basin fluid inclusions in quartz in Oligocene Groups L and M reservoirs and in Miocene Groups K and H reservoirs (none in I, J). Two populationsin 'oil quartzes': (1) oil inclusions in detrital quartz grains; (2) oil inclusions in quartz cement, indicating oil migration preceded quartz cementation)

Miall, A.D. (2002)- Architecture and sequence stratigraphy of Pleistocene fluvial systems in the Malay Basin, based on seismic time slices analysis. American Assoc. Petrol. Geol. (AAPG) Bull. 86, p. 1201-1216.
(3-D seismic data from nonproductive, shallow Pleistocene section in N Malay Basin show 5 types of fluvial systems, from braided systems with >4 km wide channel-belts to small-scale meandering systems with meander-belt widths of few 100m. Incised-valley system 40m deep forms is base of one of two sequence boundaries)

Minezaki, T. & K. Moriyama (2002)- The origin of hydrocarbon and carbon dioxide in the gas fields for the Pattani Trough, the Gulf of Thailand. J. Japanese Association Petroleum Technology 67, 1, p. 16-29.
(online at: https://www.jstage.jst.go.jp/article/japt1933/67/1/67_16/_pdf/-char/en)
(In Japanese with English abstract. Gases in Pattani Trough derived from thermal cracking of Type III kerogens and of pre-existing oils. Oils waxy and heavy, probably of lacustrine algal origin. Two source facies: Oligocene lacustrine-algal and Miocene fluvial-coaly. Oil generation from Oligocene source rocks started in E Miocene; gas generation mainly M-L Miocene in central trough. CO2 contents increase with depth from few to ~25% in Trough. Some wells CO2 as high as 91% (Platong gas field), probably of inorganic origin (magmatic decomposition of carbonate basement)

Mohamad, H., R. Wong & M.F.A. Halim (2001)- Seismic facies analysis of the synrift sediments in the North Malay Basin and their impact on the deep reservoir potential. In: Proc. CCOP 37th Ann. Sess. Bangkok 2000, 2, Techn. Repts., p. 30-32.

Morley, C.K. & R. Westaway (2006)- Subsidence in the super-deep Pattani and Malay basins of Southeast Asia: a coupled model incorporating lower-crustal flow in response to post-rift sediment loading. Basin Research 18, 1, p. 51-84.
(Two Early Cenozoic rifts in SE Asia (beneath Pattani and Malay basins) limited upper-crustal extension ($\beta \leq 1.5$), yet very thick post-rift fill with 6-12 km of Late Cenozoic terrestrial and shallow marine sediment. Explanation for high post-rift subsidence involves lower-crustal flow caused by sediment loading and erosion of sediment sources)

Morley, C.K., N. Wonganan, N. Sankumarn, T.B. Hoon, A. Alief & M. Simmons (2001)- Late Oligocene-Recent stress evolution in rift basins of northern and central Thailand: implications for escape tectonics. Tectonophysics 334, p. 115-150.
(Thailand Tertiary rift basins evolved under E-W extension, but extension direction changed periodically. Extension interrupted by inversion events. Basins evolution: (1) widespread Oligocene- Lower Miocene extension; (2) In C and N Thailand extension persisted into U Miocene-Pliocene; (3) In W Natuna, Penyu, Malay basins extension ceased in earliest Miocene, in N Gulf of Thailand in M Miocene. Inversion in Gulf of Thailand in Lower and M Miocene. Relationship between strike-slip and extensional and inversion events more complex than can be explained by simple escape tectonic models)

Muhamad, Abdul J. & A.S.A. Jamil (2010)- Organic facies variation in lacustrine source rocks in the southern Malay Basin. Bull. Geol. Soc. Malaysia 56, p. 27-33.
(On source rock quality of Oligocene lacustrine shales in Groups K, L, M in S Malay Basin Anding Barat Laut 1 well. Kerogens mixture of algal, bacterial and higher plant organic matter. Group L lacustrine shales best oil-prone source rock with TOC 0.45-1.95%, HI values 300-400, predominantly Type II kerogen. Groups L- M more algal input, shown by lower Pr/Ph ratio (3.1- 4.0), lower Tm/Ts ratio, high C30-diahopane, etc.. E Miocene Group K more fluvial, more terrigenous organics, higher Pr/Ph ratio (5.1- 6.2), higher oleanane, predominance of C29-steranes. Change in organic facies reflect transition from synrift to post-rift phase)

Ng Tong San (1987)- Trap styles of the Tenggol Arch and the southern part of the Malay Basin. Bull. Geol. Soc. Malaysia 21, p. 177-193.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1987010.pdf)
(Tenggol Arch at S end of Malay Basin rel. stable block between Malay and Penyu E Oligocene(?) rift systems. Drape over basement topography and anticlinal features identified. Anticlines elongated with great reliefs near E flank of S Malay basin, believed to be related to M Miocene shear movement. 23 wells drilled in area, with several oil-gas discoveries)

(online at: www.geus.dk/publications/bull/nr20/nr20_p099-102.pdf)
(Phu Quoc basin SW of Vietnam in NE Gulf of Thailand underlain by thin-skinned thrust-fault complex concealed by Neogene marine sediments. Fold belt continues into hills at border between Vietnam of Cambodia and Kampot foldbelt. Width of tectonic complex ~200 km wide; shortening ~50%. Deformation of sedimentary succession in E-M Cretaceous (documented by biostratigraphical studies on Phu Quoc island) and tied to subduction of Pacific Ocean plate. Piggy-back basins formed during displacement along thrust faults. Translations 3-8 km from E to W. See also Madsen et al. 2012))

Petersen, H.I., A. Mathiesen, M.B.W. Fyhn, N.T. Dau, J.A. Bojesen-Koefoed, H. Nielsen & H.P. Nytoft (2011)- Modeling of petroleum generation in the Vietnamese part of the Malay Basin using measured kinetics. American Assoc. Petrol. Geol. (AAPG) Bull. 95, 4, p. 509-536.
(2-D modeling of hydrocarbon generation for Malay-Cho Thu Basin in Gulf of Thailand-S China Sea. Source rocks comprise Oligocene synrift lacustrine mudstones and coals, postrift coals, and coaly mudstones. Main play risks include timing of generation from oil-prone lacustrine synrift deposits relative to structural trap formation and relatively small kitchen areas. Minor contribution from lacustrine deposits after principal trap formation consistent with prominent terrigenous geochemical signature of oils in basin)

Petersen, H.I., N. Sherwood, A. Mathiesen, M.B.W. Fyhn, N.T. Dau, N. Russell, J.A. Bojesen-Koefoed & L.A. Nielsen (2009)- Application of integrated vitrinite reflectance and FAMM analyses for thermal maturity assessment of the northeastern Malay Basin, offshore Vietnam: implications for petroleum prospectivity evaluation. Marine Petroleum Geol. 26, p. 319-332.
(In NE Vietnam part of Malay Basin oil- gas discovery well 46-CN-1x encountered a ∼55 m of lacustrine mudstones with good potential as oil source. Vitrinite reflectance (VR) measurements may be suppresed in alginite-bearing rocksby 0.14%.Modelled temperature histories indicate onset of hydrocarbon generation for the uppermost Oligocene source rocks between 2 Ma and present-day, which post-dates trap formation)

PETRONAS (1999)- The petroleum geology and resources of Malaysia. Petronas Press, Kuala Lumpur, 665p.
(Major review of Malaysian basins and hydrocarbons by collective of authors)

PETRONAS (2007)- Chronostratigraphic chart of the Cenozoic and Mesozoic basins of Malaysia. Petroliam Nasional Berhad, Kuala Lumpur, p. 1-71.
(Elegant review of Cenozoic chronostratigraphy, sequence stratigraphy, biostratigraphy and unconformities of Malaysian basins (incl. Malay Basin, Malacca Straits, Sarawak, Sabah. With extensive reference list)

Phoosongsee, J. & C.K. Morley (2019)- Evolution of a major extensional boundary fault system during multi-phase rifting in the Songkhla Basin, Gulf of Thailand. J. Asian Earth Sci. 172, p. 1-13.
(N-S trending Songkhla rift basin in SW Gulf of Thailand is half-graben structure that developed in phases between Late Eocene and early M Miocene. Two phases of rifting in are Eocene-Oligocene in E and Oligocene-Miocene in W Gulf of Thailand and onshore. Songkhla: Eocene early rift; (2) Oligocene- E Miocene late rift (3) M Miocene and younger post-rift)

Phoosongsee, J., C.K. Morley & A.J. Ferguson (2019)- Quantitative interpretation of seismic attributes for reservoir characterization of Early-Middle Miocene syn- and post-rift successions (Songkhla Basin, Gulf of Thailand). Marine Petroleum Geol. 109, p. 791-807.
(Hydrocarbon reservoirs in Gulf of Thailand mainly in E-M Miocene and predominantly fluvial channels. In Songkhla Basin two distinctive channel characteristics: (A) N-S oriented meandering channel complexes, developed during late syn-rift (upper E Miocene), (B) NE-SW oriented long, narrow fluvial channels with tidal and marine influence in post-rift phase I (M Miocene))

Pigott, J.D. & N. Sattayarak (1993)- Aspects of sedimentary basin evolution assessed through subsidence analysis. Example: northern Gulf of Thailand. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 407-420.
(Oligocene- Recent subsidence analysis suggests N Gulf of Thailand basins exhibit time-transient characteristics of cratonic rift and wrench style basins; basin evolution varied in time and space)

Pigott, J.D., R. Zhai, K.L. Pigott & T. Tonianse (2012)- Searching for the missing link: The regressive system tract- seismic stratigraphic evidence from the Southern Gulf of Thailand In: Int. Petroleum Technology Conference (IPTC), Bangkok 2012, IPTC 15113, 21p.
(Seismic stratigraphic and geomorphic analysis of 3D seismic from S Gulf of Thailand reveal preservation of complete eustatic cycle on Quaternary tropical coastal plain periodically affected by oscillating sea levels. Aggradational interfluvial coastal plain records mainly Highstand Systems Tract)

Pongwapee, S., C.K. Morley & Krit Won-in (2019)- Impact of pre-existing fabrics and multi-phase oblique extension on Cenozoic fault patterns, Wichianburi sub-basin of the Phetchabun rift, Thailand. J. Structural Geology 118, p. 340-361.
(Cenozoic fault patterns associated with rift development in Wichianburi sub-basin show controls at different scales, including influence by margin of Permian basin and NW-SE to NE-SW trending Triassic folds/ faults. Regional change from E-W to NW-SE extension in M Miocene)

Pradidtan, S. (1990)- Calculation of heat flow of the Tertiary basins in the Gulf of Thailand. In: B. Elishewitz (ed.) Proc. CCOP Heat Flow Workshop III, Bangkok 1988, CCOP Techn. Publ. 21, p. 99-106.
(Heatflow values from 9 wells in Gulf of Thailand rel. high)

Pradidtan, S. & R. Dook (1992)- Petroleum geology of the northern part of the Gulf of Thailand. In: C. Piencharoen (ed.) Proc. Nat. Conf. Geologic resources of Thailand: potential for future development, Bangkok, Dept Min. Resources, p. 235-246.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1992/6222.pdf)
(Numerous Tertiary intra-cratonic rift basins in N Gulf of Thailand: Sakhon, Paknam, Hua Hin, NW, W, Kra, East Kra, North Kra, Prachuap, Chumphon and N pat of Pattani basin. Tertiary sediments almost entirely non-marine, with limited biostratigraphic controls. three lower units synrift fluvial and lacustrine facies, upper unit Late Miocene- Recent post-rift. Locally organic-rich lacustrine source rocks)

Pradidtan, S. & S. Polachen (1990)- TH-40 sandstone play Hua Hin Basin, Thailand. In: CCOP/WRGA Play modelling exercise 1989-1990, CCOP Techn. Publ. 23, p. 97-112.
(Assessment of undiscovered hydrocarbons and play description of TH-40 Oligocene stacked fluvio-lacustrine sands in rotated fault blocks in Hua Hin Basin, N Gulf of Thailand)

Pradidtan, S. C. Singhasenee & R. Charusirisawad (1990)- Stratigraphy of Tertiary basins in the Gulf of Thailand. In: Proc. Development geology for Thailand into the year 2000, Chulangkorn University, Bangkok, p. 408-429.
