(Thailand's offshore Tertiary basins yielded nearly 5 BBOE (~80% gas). Exploration started in 1970s and peaked by mid 1990s. Some fields in N Pattani Basin with significant oil (Jasmine, 60 MMBO). Eocene-Oligocene NW-SE grabens, overprinted by narrow N-S faulted depocenters developed during Miocene 'back-arc' stretching of continental Sundaland crust. Basins fill: lower synrift lake/fluvial deposits, post -rift fluvial sequences and drowning brackish intertidal to marine succession. Hydrocarbons sourced from synrift lacustrine shales. Mature stage of exploration, but complex trapping mechanisms still have exploration potential)

Restrepo-Pace, P., S. King, R. Jones, C. Goulder, Y. Ah Chim & C. Russell (2010)- The Penyu Basin revisited: the abandoned ómateô of the Malay-Natuna Basin. In: Proc. Petrol. Geol. Conf. Exhib., Kuala Lumpur 2010, Geol. Soc.Malaysia, p. 141-144. *(Extended Abstract)*
(Penyu basin transtensional-transpressional basin that developed coeval to Malay Basin to N. No commercial discoveries yet made on Malaysian side of basin, but straddling Malay- Penyu basin is ~350-400 MMBO Belida field, an inverted structure on basement ridge that separates Malay from Penyu basin, and not underpinned by source rock. Distinctive oil signature may be linked to contribution from Penyu source. Rhu oil discovery indicates working petroleum system within Penyu)

(online at: www.searchanddiscovery.com/documents/2012/41103tingay/ndx_tingay.pdf)
(Gas generation accounts for ~46-67% of measured excess pore pressure in N Malay basin, with remaining 33-54% generated by coincident disequilibrium compaction)

Tingay, M., C. Morley, A. Laird, O. Limpornpipat, K. Krisadasima, S. Pabchanda &, H. Macintyre (2012)- Overpressures in the Northern Malay Basin: part 1- origin and distribution. Int. Petrol. Techn. Conf. IPTC, Bangkok 2012, 4, IPTC 15345, p. 3260-3271.
(see also companion paper Limpornpipat et al. (2012) for Part 2. Pore pressure data and sonic velocity-vertical effective stress plots from 31 wells reveal overpressures in N Malay Basin mainly generated by fluid expansion within 2A, 2B and 2C source rock formations. Gas generation accounts for ~70-50% of excess pore pressure in region, with remaining 30-50% generated by coincident disequilibrium compaction)

Tingay, M.R.P., C.K. Morley, A. Laird, O. Limpornpipat, K. Krisadasima, S. Pabchanda& H.R. Macintyre (2013)- Evidence for overpressure generation by kerogen-to-gas maturation in the northern Malay Basin. American Assoc. Petrol. Geol. (AAPG) Bull. 97, 4, p. 639-672.
(Pore-fluid pressure data and sonic velocity-vertical effective stress plots from 30 wells reveal overpressures in N Malay Basin primarily generated by fluid expansion and are located within Miocene 2A, 2B, and 2C source rock formations. Association of fluid expansion overpressures with gas, combined with sonic density response to overpressure and regional geology that precludes other overpressuring mechanisms, provides in-situ evidence for basinwide gas generation overpressuring. Gas generation accounts for ~1/2 to 2/3 of measured excess pore pressure in region, with remainder generated by coincident disequilibrium compaction)

Tjia, H.D. (1994)- Inversion tectonics in the Malay Basin: evidence and timing of events. Bull. Geol. Soc. Malaysia 36, p. 119-126.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1994027.pdf)
(Pre-Oligocene half grabens of Malay Basin are pull-apart depressions formed by dextral divergent wrenching. Oligocene- U Miocene sediment fill subjected to compressional deformation, probably in Late Miocene. Extensional regime attributed to 'extrusion' of continental SE Asia and Malay Basin basement due to hard collision between India with Asian Plate. Miocene regional compression probably result of change in motion of Pacific Plate from earlier NNW direction to W-ward direction, combined with N-ward progression of Indo-Australian Plate)

Tjia, H.D. (1998)- Origin and tectonic development of Malay-Penyu-West Natuna basins. Bull. Geol. Soc. Malaysia 42, p. 147-160.
(online at: www.gsm.org.my/products/702001-100849-PDF.pdf)
(Late Cretaceous hot spot arched up continental crust of N Sunda Shelf into Malay Dome. Crest broke into three rift arms, now represented by Malay, Penyu and W Natuna basins. Triple junction is still one of highest heat-flow areas of region. Hot spot activity ended by M Eocene, allowing basins to become aulacogens with up

to 12 km thick Oligocene and younger sediments. Widespread M Miocene fault inversions and unconformity may be tied to end of South China Sea spreading and end of subduction along N Borneo margin)

Tjia, H.D. (2000)- Tectonic and structural development of Cenozoic basins of Malaysia. Proc. Geol. Soc. Malaysia, Ann. Geol. Conf. 2000, Penang, p. 3-16.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2000_01.pdf)
(Cenozoic Malaysian basins in: (1) interior of semi-cratonic continental crust (Malay and Penyu basins); (2) marginal belts of semi-cratonic continental crust (small basins of Strait of Melaka and onshore Peninsular Malaysia); (3) straddling collisional plate boundaries (Sarawak and NW Sabah basins); (4) associated with microcontinent (Sandakan, Labuk Bay, Malawali and Tidung basins). Basins may develop as (a) aulacogens above mantle-plume dome (Malay and Penyu); (b) pull-aparts where wrench faulting is dominant (onshore basins of Peninsular Malaysia and Malacca Straits; inverted structures common). (c) At collisional plate boundaries; (d) NE Sabah and Tidung basins originated as rifts in breakup of E Sabah microcontinent)

Tjia, H.D. (2010)- Growing evidence of active deformation in the Malay basin region. Bull. Geol. Soc. Malaysia 56, p. 35-40.
(online at: https://gsmpubl.files.wordpress.com/2014/08/bgsm2010005.pdf)
Very young crustal movements in Malay basin region point to possibility of late reactivation of regional faults. Malay basin originated in Late Cretaceous as aulacogen on Malay Dome, modified by sinistral transtensional wrenching, post M Miocene transpression and general structural inversion. From Pliocene onward most of basin area considered tectonically quiet, but basement-rooted regional fault zones may intrude into Pliocene-Pleistocene strata and almost reach seabed)

Tjia, H.D., Z. Mohamed, A. S.M. Saad, A. Ridhwan, A. Rahim, J. Baharom et al. (2010)- In the quest of open fractures in the crystalline basement of the Malay and Penyu Basins. Petrol. Geosc. Conf. Exhib., Kuala Lumpur 2010, p. *(Extended Abstract)*

Tjia, H.D. & M.I. Ismail (1994)- Tectonic implications of well-bore breakouts in Malaysian basins. Bull. Geol. Soc. Malaysia 36, p. 175-186.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1994032.pdf)
(In Sarawak Basin well-bore breakout directions follow change of tectonic grain in Rajang Accretionary Prism and major tectonic boundaries (W Baram Line, etc.)) and rotations of certain tectonic domains. Other sets directions associated with SW segment of S China Sea spreading ridge. Breakout patterns in Sabah Basin differentiate SW and NE domains which experienced 25° CW rotation. Sandakan Basin experienced compression normal to its axis and also E-W regional compression that is active)

Trevena, A.S. & R.A. Clark (1986)- Diagenesis of sandstone reservoirs of Pattani Basin, Gulf of Thailand. American Assoc. Petrol. Geol. (AAPG) Bull. 70, 3, p. 299-308.
(Miocene sandstones from Pattani basin gas fields, central Gulf of Thailand, show rapid decline in porosity-permeability with depth, from rapid mechanical compaction and cementation by quartz overgrowths, kaolinite, and illite, related to high geothermal gradients. Best porosity- permeability in large pores between 915- 1980m. At greater depths most interparticle pores occluded, and porosity mainly secondary in origin)

Uttarathiyang, T. & J.D. Pigott (2008)- The unexplored post rift Oligocene deltas frontier: North Malay Basin, Thailand. In: Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok 2008, p. 370-373.

(Heat flows over Malay and offshore Sarawak basins variable, from normal to very high (47- 137 mW/m2). In Sabah and Sandakan basins values between 34.5- 64 mW/m2)

Wan Ismail Wan Yusoff (1993)- Geothermics of the Malay basin, offshore Malaysia. M.Sc. Thesis Durham University, p. 1-202.
(online at: http://etheses.dur.ac.uk/5537/1/5537_2976.PDF)
(Review of temperature/ heat flow data of Malay Basin from 59 exploration wells. Malay Basin average heat flow 86 mWm-2, average geothermal gradient 47°C/km, both high. Heat flow regional highs in NW, S and C portions of basin and lower heat flow in SE and NE peripheries. Anomalous heat flow related to subsurface fluid movement and overpressures)

Waples, D.S., R. Mahadir & Meor S. Mahmood (2000)- Geochemistry of gases in the Malay Basin. AAPG Int. Conf. & Exh. 2000, Bali, American Assoc. Petrol. Geol. (AAPG) Bull. 84, p. *(Abstract only)*
(Three end-member gas types in Malay Basin: biogenic, thermal and basement gas. Most gas samples mixtures. Gases with significant biogenic component limited to NE corner of basin, was probably generated locally and does not appear to offer an important exploration. Gases dominated by CO2 predominantly sourced from basement. North central part of basin gas mainly of "normal" thermal origin, with accumulations of moderate size. "Deep" thermal gas seems to dominate over "normal" thermal gas in large accumulations)

Waples, D.S., R. Mahadir & L. Warren (1995)- Implications of vitrinite-reflectance suppression for the tectonic and thermal history of the Malay Basin. Bull. Geol. Soc. Malaysia 37, p. 269-284.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1995a18.pdf)
(Vitrinite-reflectance (Ro) values in Malay Basin wells lower than expected for high present-day geothermal gradients. Calculated Ro values can only be fitted to measured Ro data by assuming late heat pulse in last few million years. Ro may also be suppressed by abundant liptinite and perhydrous vitrinite. In alternative model paleo heat flow increased during Oligocene rifting and decayed exponentially to modern levels, leading to much earlier hydrocarbon generation)

Waples, D.S. & M. Ramly (1995)- A simple statistical method for correcting and standardizing heat flows and subsurface temperatures derived from logs. Bull. Geol. Soc. Malaysia 37, p. 253-267.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1995a17.pdf)

Waples, D.S. & M. Ramly (1996)- Geochemistry of gases in the Malay Basin. Bull. Geol. Soc. Malaysia 39, 241-258.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1996020.pdf)
(Three end-member gas types in Malay Basin: biogenic, thermal and basement gas. Most gas samples in Malay Basin mixtures of these. Gases with significant biogenic component limited to NE corner of basin, in small accumulations. Gases dominated by CO2 predominantly sourced from basement.North central part of basin gas mainly of 'normal' thermal origin)

Waples, D.W., L. Warren & R. Mahadir (1994)- A thermal model for the evolution of the Malay Basin. American Assoc. Petrol. Geol. (AAPG) Bull.78, p. 1169. *(Abstract only)*
(Reconstruction of thermal structure of Malay Basin: (1) major heating event in last 100,000 yr; (2) low Ro values throughout basin indicates heat flow prior to heating event, only slightly higher stable cratons, (3) present-day heat flow lowest in E Malay Basin and highest in NW, where Pliocene-Pleistocene subsidence greatest. Basin evolution model: (1) slight Late Eocene extension of stable craton without high heat flow, thermal doming or rift development; (2) continued slight extension and downwarping until end of M Miocene,

when local compression uplifted basement in E portion of basin, leading to 15 km of erosion in some areas; (3) stronger extensional regime throughout basin during Pliocene, causing submergence and greatest subsidence in W, accompanied by increase in heat flow. Strong subsidence (and presumably the increase in basal heat flow) began at ~5.5 Ma, but thermal effects not noted in upper section until recently)

Watcharanantakul, R. & C.K. Morley (2000)- Syn-rift and post-rift modeling of the Pattani Basin, Thailand: evidence for a ramp-flat detachment. Marine Petroleum Geol. 17, p. 937-958.
(Syn-rift section in Pattani Basin has synformal geometry atypical of rifts. Not all subsidence can be modelled as extension-related. Basin probably developed due to both extensional faulting and as synformal basin developed over ramp-flat geometry along major low-angled extensional fault in upper crust. Discrepancy suggests active mantle processes or non-uniform extension (subduction rollback) beneath Gulf of Thailand)

Woollands, M.A. & D. Haw (1976)- Tertiary stratigraphy and sedimentation in the Gulf of Thailand. In: Offshore SE Asia Conf. 1976, Singapore, SE Asia Petrol. Expl. Soc. (SEAPEX), Paper 7, p. 1-22.
(Subdivide Tertiary of Gulf of Thailand into three major cycles of sedimentation)

Wong, R. & S.S. Karimi (2001)- Occurrences of two major transgressive cycles in the North Malay Basin and their impact on the deep reservoir potential. In: Proc. CCOP 37th Ann. Sess. Bangkok 2000, 2, Techn. Repts., p. 27-29.
(Two major transgressive cycles in N Malay Basin: (1) E-M Miocene Group I, H lower coastal plain sands deepening and fining upwards to M Miocene Group F marine shales; (2) U Miocene Group E and D fluvial coastal sands capped by Pliocene Group A/B marine shales. Sandy formation in Groups I, H, E, and D display high amplitude, continuous seismic signature, shale-prone Groups F and A/B weak amplitude, discontinuous seismic facies. Strong indication of deep reservoir potential below overpressured Group F shales)

Yakzan, M., H. Awalludin, M.N. Bahari & R.J. Morley (1996)- Integrated biostratigraphic zonation for the Malay Basin. Bull. Geol. Soc. Malaysia 39, p. 157-184.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1996015.pdf)
(Biostratigraphic scheme for Malay Basin based on foraminiferal, nannofossil and quantitative palynological data. Stratigraphic relationships in U Oligocene fluvial-lacustrine sediments best determined from miospores and freshwater algae. In E Miocene marine flooding surfaces characterized by benthic foraminifera not age diagnostic, but permit accurate correlations. E-M Miocene boundary marine transgressive unit dated by nannofossils and benthic foram and palynological events. Uppermost Miocene- Pleistocene marine facies dated using planktonic foraminifera and nannofossils)

(TGS Heimdal seismic survey)

Barckhausen, U., M. Engels, D. Franke, S. Ladage & M. Pubellier (2014)- Evolution of the South China Sea: revised ages for breakup and seafloor spreading. Marine Petroleum Geol. 58 B, p. 599-611.
(Continental breakup of S China Sea basin began in latest Cretaceous in NE and propagated S and W over possibly >40 My. Revised interpretation of seafloor spreading anomalies: onset of seafloor spreading in central SCS at 32 Ma. After ridge jump at 25 Ma spreading began in SW sub-basin, ending at 20.5 Ma in entire basin, followed by phase of magmatic seamount formation mainly along abandoned spreading ridge. Seafloor spreading ended probably because due to blocking of subduction zone along E and S margin by collision with N Palawan or part of Dangerous Grounds continental fragment (see also commentary by Chang et al. 2015))

Barckhausen, U., M. Engels, D. Franke, S. Ladage & M. Pubellier (2014)- Reply to Chang et al., 2014, Evolution of the South China Sea: revised ages for breakup and seafloor spreading. Marine Petroleum Geol. 59, p. 679-681.
(Chang et al. (2015) evidence for ~15 Ma end of seafloor spreading in S China Sea, based on age of E Taiwan Ophiolite, may be questioned because it is based on single K-Ar age of questionable accuracy and E Taiwan Ophiolite may not be obducted piece of S China Sea ocean floor)

Barckhausen, U. & H.A. Roeser (2004)- Seafloor spreading anomalies in the South China Sea revisited. In: P. Clift et al. (eds.) Continent-ocean interactions within East Asian marginal seas, American Geophys. Union (AGU), Geophys. Monograph 149, p. 121-125.
(Updated interpretation of seafloor spreading anomalies in S China Sea based on new magnetic data. Symmetric seafloor spreading of 5.6 cm/year full rate began at ~31 Ma at E-W trending ridge in central part of SCS. After ridge jump of ~50 km to S at 25 Ma spreading accelerated to 7.3 cm/ year. Second spreading center became active in SW part of SCS, which remained separated from original spreading axis. Formation of oceanic crust ended at 20.5 Ma at both axes (earlier than generally interpreted age of ~17-16 Ma; JTvG))

Ben-Avraham, Z. & S. Uyeda (1973)- The evolution of the China Basin and the Mesozoic paleogeography of Borneo. Earth Planetary Sci. Letters 18, p. 365-376.
(At least three stages in tectonic evolution of S China Sea basin: (1) N-S extension associated with formation of oceanic crust in middle Mesozoic; (2) and (3) stages of E-W compression associated with closing of China Basin in Tertiary, involving NW movement of Borneo toward Asia with underthrusting along Palawan Trough. Early Mesozoic paleogeographic reconstruction places Borneo adjacent to mainland China and Hainan. Opening of basin explained by simple rotation of small plate, which included Borneo and Natuna Islands)

(online at: https://www2.units.it/geodin/bib/JGR06.pdf)
(Satellite gravity shows linear feature of ~1000 km length, paralleling S China Sea extinct spreading center. Model crustal thickness between 8-12 km over oceanic, 10- 20 km over continental crust parts of S China Sea. Spreading center is continuous and bends from older E-W orientation to younger SW-NE orientation rather than being made up of two separate axis segments)

Briais, A. & G. Pautot (1990)- Reconstructions of the South China Sea from structural data and magnetic anomalies. In: X. Jin et al. (eds.) Proc. Symposium Recent contributions to the geological history of the South China Sea, Hangzhou 1990, p. 60-70.
(online at: https://epic.awi.de/38705/2/south-china-sea_1990.pdf)
(Oceanic spreading in S China Sea very asymmetric and at least one ridge jump. Spreading probably started at ~26 Ma and stopped synchronously along spreading ridge at ~15.5 Ma. Extension mostly related to extrusion of Indochina Block as consequence of India-Asia collision)

Briais, A., P. Tapponnier & G. Pautot (1989)- Constraints of Sea Beam data on crustal fabrics and seafloor spreading in the South China Sea. Earth Planetary Sci. Letters 95, p. 307-320.

Briais, A., P. Patriat & P. Tapponnier (1993)- Updated interpretation of magnetic anomalies and seafloor spreading stages in the South China Sea; implications for the Tertiary tectonics of Southeast Asia. J. Geophysical Research 98, p. 6299-6328.
(New set of magnetic profiles in NE and SW South China Sea. Spreading between 32-27 Ma created rel. smooth basement, now covered by thick sediments. Ridge jumped S and created rough basement, with thinner sediments than in N, from ~27-16 Ma, while spreading rate was slower. Spreading stopped at ~15.5 Ma. Reconstruction of Oligo-Miocene SE Asia blocks movements tied to extrusion of Indochina after India-Asia collision. Cessation of spreading after 16 Ma synchronous with final increments of left-lateral shear and normal uplift in Ailao Shan (18 Ma) and incipient Australian-Eurasian plates collisions)

Buhring, C., M. Sarnthein & H. Erlenkeuser (2004)- Toward a high-resolution stable isotope stratigraphy of the last 1.1 M.y.: Site 1144, South China Sea. In: W.L. Prell et al. (eds.) Proc. Ocean Drilling Program (ODP), Scientific Results 184, Chapter 2, p. 1-29.
(online at: www-odp.tamu.edu/publications/184_SR/VOLUME/CHAPTERS/205.PDF)
(High-resolution oxygen and carbon stable isotope statigraphy of 518m-long cored Quaternary section of ODP Site 1144 in northern S China Sea. One 5 cm thick layer with Australasian microtektites (386.18- 386.23 mcd) near Brunhes/Matuyama boundary and within transition of lower MIS 19- MIS 20 oxygen isotope stages. Proposed age model layer suggests age of microtektites layer 787 ka. Microtektite layer also in SONNE-95 core 17957 from southern SCS, within MIS 19–20 transition, 10 cm (~11.6 ky) below Brunhes/Matuyama reversal)

(Taiping Island in Spratly (Nansha) Islands in N part of S margin of SW Sub-basin of S China Sea. Basement highs dominated by fault blocks and volcanic basement structures)

Chang, J.H., T.Y. Lee & H.H. Hsu (2015)- Comment on Barckhausen et al., 2014- Evolution of the South China Sea: revised ages for breakup and seafloor spreading. Marine Petroleum Geol. 59, p. 676-678.
(Youngest available age for fragment of S China Sea (now part of E Taiwan ophiolite) is ~15 Ma, suggesting cessation of S China Sea seafloor spreading more consistent with previous studies than Barckhausen et al (2014) suggested age of 20.5 Ma (validity of K-Ar dating and interpretion of E Taiwan Ophiolite as piece of S China Sea oceanic crust questioned by Barckhausen et al. 2015; Reply))

Choi, T. & J. McArdle (2015)- Hydrocarbon prospectivity of the deep water Phu Kanh Basin. AAPG Asia Workshop, Tectonic evolution and sedimentation of South China Sea region, Kota Kinabalu, Sabah, Search and Discovery Art. 10751, 2p. *(Extended Abstract)*
(online at: www.searchanddiscovery.com/documents/2015/10751choi/ndx_choi.pdf)
(Frontier Phu Khanh Basin, offshore Vietnam, at transition zone between Indochina block and S China Sea margin. Post-2008 deep water wells proved working petroleum system. Two main depocentres with two syn-rift phases (Late Eocene- Oligocene and E-M Miocene). Several Late Oligocene inverted structures, related to opening of S China Sea. Basin history similar to NW Palawan Basin. Play types include basement play, Miocene reefal buildups, U Micene-Pliocene turbidite fans and Oligocene- E Miocene syn-rift clastics under major Mid-Miocene unconformity)

Chung, S.L., H. Cheng, B.M. Jahn, S.Y. OôReilly & B. Zhu (1997)- Major and trace element and Sr-Nd isotope constraints on the origin of Paleogene volcanism in South China prior to the South China Sea opening. Lithos 40, p. 203-220.
(Paleogene volcanics crop out in Sanshui, Heyuan and Lienping basins, in attenuated continental margin of S China. Bimodal lavas from Sanshui basin (64-43 Ma) bimodal, geochemically similar to Cretaceous A-type granites from nearby region. Paleogene volcanic activities resulted from lithospheric extension in S China that migrated S and eventually led to opening of S China Sea during ~ 30-16 Ma)

Clift, P.D. (2015)- Coupled onshore erosion and offshore sediment loading as causes of lower crust flow on the margins of South China Sea. Geoscience Letters 2, 13, p. 1-11.
(online at: https://link.springer.com/article/10.1186/s40562-015-0029-9)
(Several basins around S China Sea with accelerated phases of basement subsidence associated with phases of fast erosion onshore and deposition of thick sediments offshore, causing flow of ductile crust from offshore towards continental interior after end of active extension, partly reversing flow during continental breakup)

Clift, P.D. (2016)- Assessing effective provenance methods for fluvial sediment in the South China Sea. In: P.D. Clift et al. (eds.) River-dominated shelf sediments of East Asian seas, Geol. Soc., London, Spec. Publ. 429, p. 9-29.
(online at: http://www.geol.lsu.edu/pclift/pclift/Publications_files/2015_Clift_GSSP.pdf)
(Thermochronology methods best suited for provenance analysis in S China Sea, especially apatite fission track, which shows more diversity in sources than U-Pb zircon or Ar/Ar muscovite dating. Triassic Indosinian ages very common in many of source regions)

Clift, P.D., S. Brune & J. Quinteros (2015)- Climate changes control offshore crustal structure at South China Sea continental margin. Earth Planetary Sci. Letters 420, p. 66-72.
(online at: http://earthbyte.org/Resources/Pdf/Clift_etal_2015_Climate_changes_control_offshore_crustal_structure_SouthChinaSea.pdf)
(Rifted continental lithosphere subsides as consequence of combined crustal thinning and mantle lithosphere cooling, but some continental margin basins experience anomalous subsidence after active extension. Deep basins on N margin of S China Sea (Baiyun Sag, etc.) show basement subsidence accelerating after ~21 Ma, postdating extension by several million years. Sediment loading by increased sediment flux after faster onshore erosion following E Miocene monsoon intensification is viable trigger for ductile flow after active extension)

Clift, P., G.H. Lee, N.A. Duc, U. Barckhausen, H.V. Long & S. Zhen (2008)- Seismic reflection evidence for a Dangerous Grounds miniplate: no extrusion origin for the South China Sea. Tectonics 27, TC3008, p. 1-16.
(S boundary of Dangerous Grounds is subduction zone that jammed in M Miocene. Dangerous Grounds bounded by strike-slip zone, also active until ~16 Ma. W Baram Line originates as strike-slip fault in Dangerous Grounds and continuous with Red River Fault Zone. Because Dangerous Grounds independent of Sundaland until ~16 Ma, extrusion impossible as mechanism to rift S China Sea. SE motion by Dangerous Grounds and Sundaland suggests subduction (slab rollback?) main trigger for plate motions. Reconstruction places ~280km upper limit on motion on Red River Fault and ~1400km width to Paleo-S China Sea)

Clift, P. & J. Lin (2001)- Preferential mantle lithospheric extension under the South China margin. Marine Petroleum Geol. 18, p. 929-945.
(online at: www.whoi.edu/science/GG/people/jlin/papers/Clift&Lin_M&P.Geol.2001.pdf)
(Continental rifting in northern S China Sea culminated in seafloor spreading at ~30 Ma (Late Oligocene). Basin and margins classic break-up in juvenile arc crust environment. Extension of crust exceeded that in mantle lithosphere under S China Shelf, but depth-dependent extension rather than lithospheric-scale detachment. Timing of major extension is mid-late Eocene- Late Oligocene (~45-25 Ma))

Clift, P., J. Lin & U. Barckhausen (2002)- Evidence of low flexural rigidity and low viscosity lower continental crust during continental break-up in the South China Sea. Marine Petroleum Geol. 19, 8, p. 951-970.

(S China Sea formed by seafloor spreading in Late Oligocene at ~30 Ma following series of extensional events within Mesozoic continental arc crust. Study of faults on seismic reflection profiles from margins. Forward models based on upper crustal faulting underpredicted subsidence, especially towards continent-ocean transition (COT). Interpreted to indicate preferential extension of continental lower crust along COT on both margins. Forward models based on upper crustal faulting support idea of very weak continental crust)

Clift, P.D., J. Lin & ODP Leg 184 Scientific Party (2001)- Patterns of extension and magmatism along the continent-ocean boundary, South China margin. In: R.C.L. Wilson, R.B. Whitmarsh et al. (eds.) Non-volcanic rifting of continental margins: a comparison of evidence from land and sea, Geol. Soc. London, Spec. Publ. 187, p. 489-510.
(Early Oligocene sea-floor spreading in S China Sea preceded by Maastrichtian and Mid-Eocene continental extension that generated rift basins on margin and outer structural high. Seismic evidence of rift-related volcanic rocks~25 km landward of continent-ocean boundary. S China margin may be intermediate type of continental extension between Iberia-type non-volcanic and Greenland-type volcanic margin)

(Oil-saturated granites, with mineral parageneses typical of hydrothermal metasomatism and leaching haloes, near faults in crystalline basement of S Vietnam continental shelf. Presence of native silver, barite, copper, etc., indicates deep origin for mineralizing fluids)

Dong, D.D., S.G. Wu, J.B. Li & T. Ludmann (2014)- Tectonic contrast between the conjugate margins of the South China Sea and the implication for the differential extensional model. Science China Earth Sciences 57, 6, p. 1415-1426.
(Conjugate margins of S China Sea strongly asymmetric)

Dorobek, S.L. (2000)- Cenozoic carbonate buildups of the South China Sea and the early post-rift history of passive continental margins. Geol. Soc. America (GSA), Ann. Mtg. 2000, Abstracts with Programs 32, 7, p. 226. *(Abstract only)*
(S China Sea underlain by Paleogene rifted continental and young (32-15 Ma) oceanic crust. Extensional basement highs became nucleation sites for carbonate sedimentation during latest syn-rift to early post-rift phases. Longest lived, largest and thickest buildups in most offshore rift basins. Large isolated platforms commonly coalescence from smaller buildups. Growth of buildups strongly influenced by long-term subsidence. Many of farthest offshore buildups still growing today. Termination of more inboard Cenozoic buildups due to hypernutrification or increasing turbidity from major river systems. Only in offshore Palawan and E parts of Dangerous Grounds tectonic subsidence rates rapid enough to drown carbonate buildups)

Du Bois, E.P. (1981)- Review of principal hydrocarbon-bearing basins of the South China Sea area. Energy 6, 11, p. 1113-1140.
(S China Sea area basins include: Thai, Malay, West Natuna and Penyu, Saigon and Mekong (Vung Tau), E Natuna, Greater Sarawak including C Luconia and Balingian provinces, Baram Delta/Brunei-Sabah and NW Palawan Shelf. Hydrocarbons commonly associated with M and Upper Miocene age rocks. Oligocene and Pliocene occurrences locally significant.)

(Mainly brief review of Paleozoic-Mesozoic geology of mainland SE Asia, Sumatra, Borneo and The Philippines. To NW and SE of S China Sea shows and potential have been noted in pre-Tertiary sections)

Fontaine, H. & M. Mainguy (1985)- Pre-Tertiary oil and gas potential in the South China Sea. In: Proc. 2nd EAPI/CCOP Workshop, Energy 10, 3-4, p. 403-412.
(Mainly addendum to paper above on distribution of pre-Tertiary sediments in SE Asia and petroleum potential. Permian limestone section probably best target for petroleum exploration. Pre-Tertiary rocks probably gas prone)

Franke, D. (2013)- Rifting, lithosphere breakup and volcanism: comparison of magma-poor and volcanic rifted margins. Marine Petroleum Geol. 43, p. 63-87.

(Volcanic rifted margins evolve by extension accompanied by extensive extrusive magmatism during breakup, (up to 15km volcanic flows, seaward dipping reflectors). Magma-poor rifted margins with wide domains of extended crust (rotated faults blocks with detachment surfaces near base of continental crust), but limited magmatism. South China Sea intermediate between above end-members, with basin-and-range type rifting followed by formation of oceanic crust)

Franke, D., U. Barckhausen, N. Baristeas, M. Engels, S. Ladage, R. Lutz, J. Montano, N. Pellejera, E.G. Ramos & M. Schnabel (2011)- The continent-ocean transition at the southeastern margin of the South China Sea. Marine Petroleum Geol. 28, 6, p. 1187-1204.
(S China Sea created by magma-poor rifting in Paleogene. Study of continent-ocean transition (COT) at S margin off NW Palawan between continental blocks of Reed Bank and Palawan- Calamian islands. Two major NE trending rifted basins. Continent-ocean transition interpreted at seaward limit of continental crust, but magnetic spreading anomalies terminate ~80-100 km farther N. Area in-between extensive volcanism (dykes, extrusive basaltic lava flows, occurring after breakup). COT varies from distinct outer ridge with steep seafloor relief to rotated fault blocks and half-grabens above eroded pre-rift basement and no seafloor relief. Gravity modelling shows extremely thinned crust across shelf)

Franke, D., D. Savva, M. Pubellier, S. Steuer, B. Mouly, J.L. Auxietre, F. Meresse & N. Chamot-Rooke (2014)- The final rifting evolution in the South China Sea. Marine Petroleum Geol. 58, B, p. 704-720.
(S China Sea ~30-40 Myrs of rifting. Initial latest Cretaceous- E Paleocene rift architecture preserved at distal margins. Rift basins bounded to crustal blocks by listric normal faults on either side and with Moho uplifts under major rift basins. Most basin-bounding faults sole out in middle crust. Only in region within ~50 km from Continent-Ocean Transition normal faults reach mantle, dipping seaward or landward, which may indicate presence of exhumed mantle bordering continental margins. Post-rift (Oligocene-E Miocene) platform carbonates indicate delay in subsidence during rifting. Symmetric process predominate in initial rift stage. Considerable along-margin variations suggested, with alternating 'upper and lower plate' margins. Breakup in major E subbasin of SCS in E Oligocene, breakup of SW subbasin in Late Oligocene)

Funnell, R., R. Allis & T. Huyen (1997)- Thermal regimes in two Vietnamese basins, Cuu Long and Nam Con Son, and implications for hydrocarbon generation. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc. (IPA), Jakarta 1997, p. 499-509.
(Steady-state surface heat flow ~70 ± 5 mW/m2 for hydrocarbon-producing Cuu Long Basin and 80 ± 8 mW/m2 for Nam Con Son Basin about 100 km to SE)

Fyhn, M.B.W., L.O. Boldreel & L.H. Nielsen (2009)- Tectonic and climatic control on growth and demise of the Phanh Rang carbonate platform offshore south Vietnam. Basin Research 21, 2, p. 225-251.
(Phanh Rang carbonate platform offshore S Vietnam >15,000 km2, one of largest in S China Sea. Platform growth initiated in late M Miocene and terminated in Pliocene. Late Miocene regional uplift and subaerial exposure, causing karstification. Deteriorated growth conditions and fast subsidence resulted in platform split-up, backstepping and local drowning. Isolated platforms nucleated on structural highs as transgression continued. Longest surviving platform now crops out at seafloor at ~500m depth)

Fyhn, M.B.W., L.O. Boldreel & L.H. Nielsen (2009)- Geological development of the central and south Vietnamese margin: implications for the establishment of the South China Sea, Indochinese escape tectonics and Cenozoic volcanism. Tectonophysics 478, p. 184-214.
(Vietnamese margin of S China Sea underlain by Paleogene rift basins established through SE-ward extrusion of Indochina. Late Oligocene, basin inversions offshore contemporaneously with initial right-lateral inversion along Mae Ping Shear Zone and onset of major uplift of metamorphic core complexes, probably in response to N-ward movement of India. Renewed rifting offshore after jump of SCS spreading axis and Neogene SW-ward propagation of continental break-up, consequence of slab-pull associated with subduction of proto-SCS under Borneo. Rifting and continued until end M Miocene. Termination of seafloor spreading marked by latest M Miocene unconformity in Nam Con Son and Phu Khanh basins. Neogene volcanism)

Fyhn, M.B.W., L.O. Boldreel, L.H. Nielsen, T.C. Giang, L.H. Nga, N.T.M. Hong, N.D. Nguyen & I. Abatzis (2013)- Carbonate platform growth and demise offshore Central Vietnam: effects of Early Miocene transgression and subsequent onshore uplift. J. Asian Earth Sci. 76, p. 152-168.
(online at: repository.vnu.edu.vn/bitstream/VNU_123/27728/1/BS2013.53.pdf)
(Miocene carbonate platforms off C Vietnam mainly on two regional platforms separated by E Vietnam Boundary Fault Zone: (1) Tuy Hoa Platform to W (platform growth E-M Miocene, terminated by M Miocene time regional uplift/ subaerial exposure) (2) Triton Platform in E (also initiated in E Miocene, partial drowning in M Miocene; repeated partial drowning events through M-L Miocene resulted in W-wards retreat of platform growth and eventual platform drowning and termination of carbonate deposition). Modern carbonate growth continues on isolated platforms of Paracel Islands)

Fyhn, M.B.W., L.H. Nielsen, L.O. Boldreel, L.D. Thang, J. Bojesen-Koefoed, H.I. Petersen, T.H. Nguyen et al. (2009)- Geological evolution, regional perspectives and hydrocarbon potential of the northwest Phu Khanh Basin, offshore Central Vietnam. Marine Petroleum Geol. 26, p. 1-24.
(Seismic stratigraphic and structural analyses of NW Phu Khanh Basin, off C Vietnam. Initial rifting in latest Cretaceous? or Paleogene controlled by left-lateral transtension. Rifting stopped due to M Oligocene transpression but resumed by left-lateral transtension in Late Oligocene. Thick lacustrine and alluvial sediments deposited in Paleogene rift periods. Late Oligocene rifting ended due to inversion, triggered by right-lateral wrenching near Oligo-Miocene boundary. Direct Hydrocarbon Indicators and oil-gas seeps)

Fyhn, M.B.W., L.H. Nielsen, H.I. Petersen, A. Mathiesen, L.O. Boldreel, J.A. Bojesen-Koefoed, H.P. Nytoft et al. (2010)- Geological evolution and aspects of the petroleum potential of the underexplored parts of the Vietnamese margin. Petrovietnam Journal 10, p. 2-19.
(online at: www.vpi.pvn.vn/Upload/TapChi/TCDK20110522080147.pdf)
(Vietnamese margin includes underexplored basins with significant hydrocarbon potential. Review of origin and petroleum potential of Song Hong, Phu Khanh, Malay-Tho Chu and Phu Quoc basins. Jurassic-Cretaceous magmatic arc (Paleo-Pacific subduction) underlies part of Vietnamese margin. Phu Quoc basin formed in response to magmatic arc and was inverted during Paleocene- E Eocene, plate collision. Eocene-Oligocene left-lateral strike-slip faulting along margin resulted in rifting and source-rock deposition. Widespread Miocene carbonate deposition along E Vietnamese margin. Magmatism affected the margin from Early Neogene; associated Late Neogene onshore uplift and denudation promoted offshore sedimentation)

Fyhn, M.B.W., H.I. Petersen, L.H. Nielsen, T.C. Giang, L.H. Nga, N.T.M. Hong, N.D. Nguyen & I. Abatzis (2012)- The Cenozoic Song Hong and Beibuwan Basins, Vietnam. Geol. Survey Denmark and Greenland Bull. 26, p. 81-84.
(online at: www.geus.dk/publications/bull/nr26/nr26_p81-84.pdf)
(Song Hong Basin offshore Vietnam in NW part of S China Sea with up to 15-20 km of Cenozoic sediment. Not clear yet whether this part of Vietnam margin is transform margin or oblique rift margin. Inverted Eo-Oligocene syn-rift succession outcrops on Bach Long Vi island 500m core demonstrates thick lacustrine section with oil-prone source-rock with 2-7% total organic carbon)

Glass, B.P. & C. Koeberl (2006)- Australasian microtektites and associated impact ejecta in the South China Sea and the Middle Pleistocene supereruption of Toba. Meteoritics Planetary Science 41, 2, p. 305-326.
(Australasian microtektites and associated unmelted ejecta in ODP holes in central S China Sea. Hole 1144A highest microtektites abundance of any known Australasian microtektite site, associated with partly melted particles with fractured mineral inclusions, probably close to source crater, possibly near 22° N/ 104° E. Parent material for Australasian tektites may be fine-grained (Jurassic?) sedimentary deposit. Size of source crater 43 ± 9 km, based on thickness of ejecta layers and distance from proposed source. Rhyolitic volcanic ash layer just above microtektite layer may be from supereruption of Toba caldera complex ~800 ka ago)

Granath, J.W., W.G. Dickson, J.M. Christ & M.E. Odegard (2004)- Exploration-scale features from high resolution gravity and topographic datasets and their derivatives. In: R.A. Noble et al. (eds.) Proc. Deepwater and Frontier Exploration in Asia & Australia Symposium, Jakarta, Indon. Petroleum Assoc. (IPA), DFE04-PO-052, 11p.

Hayes, D.E. & S.S. Nissen (2005)- The South China Sea margins: implications for rifting contrasts. Earth Planetary Sci. Letters 237, p. 601-616.
(Dramatic differences in crustal thicknesses along margin of S China. Continental crustal extension much less along E and C segments than W segment of margin. Differences accommodated by early formation of oceanic crust adjacent to E margin, with continued extension of continental crust to W. Two models predict oceanic crust of SCS basin toward W not forming until 6-12 My after initial formation to E (~32 Ma). Total crustal extension ~1100 km, remarkably consistent for all segments)

He, E., M. Zhao, X. Qiu, J.C. Sibuet, J. Wang & J. Zhang (2016)- Crustal structure across the post-spreading magmatic ridge of the East Sub-basin in the South China Sea: tectonic significance. J. Asian Earth Sci. 121, p. 139-152.
(Last phase of opening of S China Sea ~N145° direction of spreading. Seafloor spreading features of East Subbasin cut by post-spreading volcanic ridge, ~E-W in W part (Zhenbei-Huangyan seamounts chain))

He, L., K. Wang, L. Xiong & J. Wang (2001)- Heat flow and thermal history of the South China Sea. Physics Earth Planetary Interiors 126, p. 211-220.
(Heatflow values from S China Sea widely scattered, with mean of 77 mW/m2. Heat flow increases gradually from N margin to central basin, with two high heat flow centers. S margin average heat flow 80 mW/m2, similar to N margin. W margin (Manila trench) average 49 mW/m2. Thermal history inferred from multistage pure-shear extension model shows that since Late Miocene basement heat flow increased as result of greater extension. Present-day high heat flow primarily result of Pliocene extension)

He, L., J. Wang, X. Xu, J. Liang, H. Wang & G. Zhang (2009)- Disparity between measured and BSR heat flow in the Xisha Trough of the South China Sea and its implications for the methane hydrate. J. Asian Earth Sci. 34, p. 771-780.
(Calculated heat flow from depth of bottom-simulating seismic reflectors (BSRs) on seismic profile in Xisha Trough of S China Sea (32-80 mW/m2) lower than measured heat flow (83-112 mW/m2). Disparity between measured and BSR heat flows may be due to theoretical error. Based on theoretical model, assuming BSR at top of free gas zone, the methane flux along the Xisha seismic profile is estimated, and the thickness of the methane hydrate occurrence zone is predicted.

Hinz, K. & H.U. Schluter (1985)- Geology of the Dangerous Grounds, South China Sea, and the continental margin of southwest Palawan: results of Sonne cruises SO-23 and SO-27. Energy 10, p. 297-315.
(Seismic, magnetic and gravity data recorded along 51 profiles in SE part of S China Sea (Dangerous Grounds, Palawan Trough), combined with geological sampling. Five unconformities: (1) Miocene-Pliocene; (2) M Miocene, coinciding with end of seafloor spreading in S China Sea; (3) Lower Miocene, which often marks top of carbonate platform; (4) M-U Oligocene, representing transition from rift to drift phase in S China Sea; (5) Cretaceous-Paleocene, interpreted as onset of rifting. Dangerous Grounds and parts of Palawan Trough underlain by stretched continental crust. Oldest rocks in Dangerous Grounds of U Triassic-Jurassic age. U Oligocene- Lower Miocene carbonate platform extends from Dangerous Grounds E beneath Palawan Trough and C-S Palawan shelf. C-S Palawan part of microcontinent with Dangerous Grounds/Reed Bank, N Palawan and Calamian block. E edge of carbonate platform overlain by wedge of chaotically deformed allochthonous sediments, overthrust from S onto carbonate platform, implying Palawan Trough does not represent the location of ancient subduction zone but is elastic downwarp of crust below overthrust allochthonous wedge)

Hoang Ngoc Dang & C. Sladen (1997)- Petroleum geology of offshore Da Nang, Central Vietnam. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc., Jakarta 1997, p. 449-460.
(Offshore Da Nang area of Vietnamese S China Sea with gas fields in large Miocene carbonate platform/ buildups on Tri Ton Horst. Source rock most likely E Miocene marine source in Quang Ngai Graben to W and possibly Tri Ton Rift in E. Non-marine lacustrine and carbonaceous claystones source rocks (29m thick) encountered in well 118-CVX-1X beneath carbonates, but these are immature)

Holland, D.C., J.S. Dickens & A.D. Horbury (1992)- A case of drowning; death of a carbonate platform in the South China Sea. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015 *(Poster Abstract)*
(Da Nang carbonate platform in S China Sea off Vietnam with characteristics of terminal drowning event at variety of data scales. Seismic data show backstepping at large scale. Evolution of M Miocene drowning preserved in detail in changes in environmental stress of faunal assemblage, rates of sedimentation and facies, and cementation history. Biostratigraphic data indicate slightly different ages of platform termination at different locations. Exposure surfaces within carbonate, but transition from shallow water carbonate to deeper water carbonates and final covering by deep water clastic sediments without surface exposure)

Hsu, S.K., Y.C. Yeh, W.B. Doo & C.H. Tsai (2004)- New bathymetry and magnetic lineations identifications in the northernmost South China Sea and their tectonic implications. Marine Geophysical Res. 25, p. 29-44.
(Seafloor spreading of S China Sea (SCS) commonly believed to take place between ~32-15 Ma. New magnetic data in northernmost SCS suggests existence of E-W trending magnetic patterns and demonstrate oldest SCS oceanic crust could be Late Eocene (37 Ma, anomaly C17), with half-spreading rate of 44 mm/yr)

Hu, Y., L. Chen, D. Feng, Q. Liang, Z. Xia & D. Chen (2017)- Geochemical record of methane seepage in authigenic carbonates and surrounding host sediments: a case study from the South China Sea. J. Asian Earth Sci. 138, p. 51-61.

Huang, C.D., T.Y. Lee, C.H. Lo, S.L. Chung, J.C. Wu, C.L. Tien, M.W. Yeh et al. (2017)- Structural inversion in the northern South China Sea continental margin and its tectonic implications. J. Terrestrial Atmospheric Oceanic Sci. 28, 6, 891-922.

Huchon, P., T.N.H. Nguyen & N. Chamot-Rooke (1998)- Finite extension across the South Vietnam basins from 2D gravimetric modeling: relation to South China Sea kinematics. Marine Petroleum Geol. 15, p. 619-634.
(Crustal thickness map over S Vietnam basins from inversion used to estimate stretching: 190 km in E to 30 km in W. Comparison with S China Sea kinematics implies decoupling relative to Indochina block and supports formation of S China Sea in Late Oligocene- E Miocene by S-ward subduction of Proto-South China Sea)

Huchon, P., T.N.H. Nguyen & N. Chamot-Rooke (2001)- Propagation of continent break-up in the south-western South China Sea. In: R.C.L. Wilson et al. (eds.) Non-volcanic rifting of continental margins: a comparison of evidence from land and sea, Geol. Soc., London, Spec. Publ. 187, p. 31-50.
(Bathymetric, seismic and gravity data on SW tip of S China Sea oceanic basin, where propagation of continental break-up occurred before ~15 Ma. Oceanic domain V-shaped, typical of oceanic propagating rifts. Main stretching direction slightly oblique to rift axis. At continent-ocean boundary, continental crust stretched by factor 4, rapidly decreasing to ~2 over few 10s of km (corresponds to >1 Ma of break-up propagation)

Hui, G.G., S. Li, X. Li, L.L. Guo, Y.H. Suo, I.D. Somerville, S. Zhao, M. Hu, H. Lan & J. Zhang (2016)- Temporal and spatial distribution of Cenozoic igneous rocks in the South China Sea and its adjacent regions: implications for tectono-magmatic evolution. In: Evolution of West Pacific Ocean, South China Sea and Indian Ocean, Geological J. 51, Suppl. S1, p. 429-447.
(S China Sea marginal basins with >70 Cenozoic magmatic activities identified. Geodynamic evolution: (1) early bimodal volcanism (>32 Ma) mainly in Paleogene basins at N margin, under dextral transtensional regime from India- Eurasia collision; (2) syn-spreading igneous rocks, with magmatic emplacement resulting from NNE-trending dextral strike-slip pull-apart tectonics; (3) Quaternary E-W-trending post-spreading basalts, under extrusion regime from collision between Luzon–Taiwan Arc and Eurasian Plate. In Indochina and Malay Peninsula, widespread Cenozoic extensional post-spreading plutons possibly derived from mantle plume or controlled by Ailaoshan Red River left-lateral strike-slip fault zone)

Hutchison, C.S. (2004)- Marginal basin evolution: the southern South China Sea. Marine Petroleum Geol. 21, 9, p. 1129-1148.
(Southern S China Sea W of W Baram Line is Sundaland extinct passive margin, with rifting from Eocene (~46 Ma)- E Miocene (19-21 Ma). E of line is convergent margin that became collision zone in M Miocene. Oil-prolific Baram Delta, resulting from uplift and erosion of W Cordillera, built out to NW Borneo Trough. Passive margin continental rise (Dangerous Grounds) underthrust beneath Sabah to cause uplift of W Cordillera. W Baram Line now extinct major right-lateral transform fault)

Hutchison, C.S. (2014)- South China Sea carbonate build-up seismic characteristics. Bull. Geol. Soc. Malaysia 60 (C.S. Hutchison Memorial Issue), p. 19-26.
(online at: https://gsmpubl.files.wordpress.com/2015/04/bgsm2014002.pdf)
(More than 600 active reefs in Spratly Islands and 200 build-ups in C Luconia, buried in U Miocene, all begun at 'Middle Miocene Unconformity' (= late E Miocene). C Luconia build-ups buried by U Miocene influx from nearby Sarawak (Setap Shale). Build-ups at Dangerous Grounds and NW Borneo Trough drowned by rapidly deepening water. Spratly Islands reefs kept pace with deepening sea)

Hutchison, C.S. & V.R. Vijayan (2010)- What are the Spratly Islands? J. Asian Earth Sci. 39, p. 371-385.
(Spratly Islands, Dangerous Ground Province, are active carbonate build-ups that probably initiated in Miocene on NE-SW trending sea-floor cuestas that parallel magnetic anomalies of S part of S China Sea. Cuestas composed of Triassic and Cretaceous strata indicating Dangerous Ground is part of pre-rift Sundaland continent that included S China, Vietnam, Peninsular Malaysia, W Sarawak and possibly part of Sabah)

Janson, X., G.P. Eberli, A.J. Lomando & F. Bonaffe (2010)- Seismic characterization of large-scale platform-margin collapse along the Zhujiang carbonate platform (Miocene) of the South China Sea, based on Miocene outcrop analogs from Mut Basin, Turkey. In: W.A. Morgan, A.D. George et al. (eds.) Cenozoic carbonate systems of Australasia, Soc. Sedimentary Geology (SEPM), Spec. Publ. 95, p. 79-98.

(On carbonate platform margin collapse or slumps, seen on seismic sections across Lower Miocene Zhujiang Platform margin, subsurface Pearl River Mouth Basin. Truncation of margin suggests several slump scars, associated downslope with rotated and folded strata that are still connected to detachment surfaces)

Jian, Z., X. Cheng, Q. Zhao, J. Wang & P. Wang (2001)- Oxygen isotope stratigraphy and events in the northern South China Sea during the last 6 million years. Science in China 44, 10, p. 952-960.
(Stable isotopic analysis of foraminifera from ODP Site 1148 in N South China Sea (SCS). Before ~3.1 Ma SCS more influenced by warm intermediate Pacific water. Decrease in deepwater temperature between 3.1- 2.5 Ma demonstrates formation of N Hemisphere ice-sheet. Sea surface temperature reductions during E-M Pliocene may be related to Antarctic region ice-sheet growth)

Li, J.B., W. Ding, J. Gao, Z. Wu & Z.J. Ziyin (2011)- Cenozoic evolution model of the sea-floor spreading in South China Sea; new constraints from high resolution geophysical data. Acta Geophys. Sinica 54, 6, p. 894-906.
(Revision of Cenozoic evolution model of S China Sea from new high resolution gravity- magnetic data. Two major sea-floor spreading episodes, separated by tectonic-sedimentary event near 25 Ma: (1) E and NW sub-basins from ~33.5- 25 Ma, forming oceanic crust with E-W or NEE-oriented magnetic anomalies; (2) Since 25 Ma sea-floor spreading continued with NW-SE-oriented spreading until 16.5 Ma, forming central E and SW sub-basins. NNW-trending transform fault separated E and SW sub-basins, with 95 km sinistral offset of spreading ridge. Before collision of Luzon arc with Eurasia Plate, S China Sea was a gulf-shape marginal sea opening to Pacific Ocean, resulting from W-ward propagation of spreading center into Sunda Continent)

Li, L., P.D. Clift & H.T. Nguyen (2013)- The sedimentary, magmatic and tectonic evolution of the southwestern South China Sea revealed by seismic stratigraphic analysis. Marine Geophysical Res. 34, 3-4, p. 341-365.
(online at: http://www.geol.lsu.edu/pclift/pclift/Publications_files/2013_Li_etal_MGR.pdf)
(SW South China Sea area of continental crust frozen immediately before onset of seafloor spreading. Major continental block separated from shelf margin by basin of hyperextended crust. Oligocene-E Miocene rifting followed by mild compression and inversion prior to 16 Ma, linked to Dangerous Grounds block- Borneo collision. Seafloor spreading continued until ~16 Ma. Scattered Late Miocene and Pliocene volcanic seamounts (~5-10 km across) in or on edge of deeper basins, not linked to tectonic activity. Further inversion of off-shelf in Pliocene, with no brittle faulting, possibly part of wider pattern of magmatism in S China Sea. Prograding clinoforms from shelf edge in S in Pliocene, after 5.3 Ma. Bulk of sediment from Mekong River, with additional supply from Borneo and Malay Peninsula via Molengraaff River and predecessors)

Li, L., P.D. Clift & H.T. Nguyen (2014)- Non-uniform hyper-extension in advance of seafloor spreading on the Vietnam continental margin and the SW South China Sea. Basin Research 26, p. 106-134.
(SW S China Sea preserves propagating oceanic spreading centre and associated continent-ocean transition at continental margin offshore SE Vietnam. Major normal faulting ceases after inversion event at ~16 Ma, main extension phase from ~28 Ma to 22-23 Ma. Depth-dependent extension required to explain depth of basins. Weak crust with high heatflow. Flow in ductile mid-lower crust responsible for much of subsidence before seafloor spreading, which extended ~300 km from tip of mid ocean ridge. Flow dominant towards spreading centre prior to 16 Ma. Extension in Continent-Ocean transition postdates seafloor spreading. Less extended crustal fragments form banks offshore Sunda shelf, surrounded by hyperextended crust of COT)

Li, Q., Z. Jian & X. Su (2005)- Late Oligocene rapid transformations in the South China Sea. Marine Micropaleontology 54, 1-2, p. 5-25.
(ODP Site 1148 unconformities at Lower/Upper Oligocene and Oligocene-Miocene boundaries plus two others in Upper Oligocene, together erasing sediment record of ~3 Ma in period of active seafloor spreading. Initial breakup of SCS probably at 34-33 Ma. Expanded Lower Oligocene section resulted from rifting between 33-29 Ma. Mid-Oligocene unconformity at 28.5 Ma probably related to initial collision between Indonesia and Australia. Narrowed Indonesian seaway may have accounted for Late Oligocene warming and chalk deposition in northern SCS. Unconformities near Oligocene- Miocene boundary probably correspond to changes in rotation of blocks and seafloor; also first New Guinea terrane docking at N Australian craton)

Li, Q., P. Wang, Q. Zhao, L. Shao, G. Zhong, J. Tian, X. Cheng et al. (2006)- A 33 Ma lithostratigraphic record of tectonic and paleoceanographic evolution of the South China Sea. Marine Geology 230, p. 217-235.

(ODP Site 1148 sequence show six major steps of S China Sea geohistory over past 33 Ma. Rapid deposition characterized Early Oligocene (33- 28.5 Ma) rifting. Slow sedimentation signifies S-ward stable seafloor spreading (28.5- 23 Ma) to end of spreading (23-15 Ma). Five major dissolution events. Return of high sedimentation in late Pliocene- Pleistocene caused by intensified down-slope transport)

Li, Q., P. Wang, Q. Zhao, J. Tian, X. Cheng, Z. Jian, G. Zhong & M. Chen (2008)- Paleoceanography of the mid-Pleistocene South China Sea. Quaternary Science Reviews 27, p. 1217-1233.

(online at: http://earth.scichina.com:8080/sciDe/fileup/PDF/01yd0871.pdf)
(Three 2cm-thick layers of volcanic tephra from ODP 1143 Site in S China Sea dated as. 0.07, 0.8 and ~1.0 Ma by microbiostratigraphy, presumably from Toba eruption. Dominated by volcanic glass shards with median grain size of 70-75 μm)

Lin, A. T., A.B. Watts & S.P. Hesselbo (2003)- Cenozoic stratigraphy and subsidence history of the South China Sea margin in the Taiwan region. Basin Research 15, 4, p. 453-478.
(N margin of SCS in Taiwan region evolved from Paleogene rift to latest Miocene-Recent foreland basin, reflecting opening SCS and subsequent partial closure by Taiwan orogeny. Rifting (~58-37Ma) formed 4200 km wide extended zone. By ~37 Ma focus of rifting shifted to present-day continent-ocean boundary of S Taiwan,

which led to seafloor spreading of SCS at ~30 Ma. Rift-drift transition (~37-30 Ma) coeval with uplift of previously rifted margin, leading to erosion and breakup unconformity. Oligocene uplift followed by rapid, early post-breakup subsidence (~30-18 Ma). Subsidence of inner margin thermally controlled subsidence, subsidence in outer shelf accompanied by faulting during ~30-21 Ma. During ~21-12.5 Ma entire experienced broad margin thermal subsidence. At ~12.5 Ma rifting resumed and ceased at ~6.5Ma due to overthrusting of Luzon volcanic arc. Taiwan orogeny created foreland basin by loading rifted margin)

(online at: https://www.sciencedirect.com/science/article/pii/S1871174X1730029X)
(Well XK-1 in Xisha (= Paracel) Islands, NW part of S China Sea, penetrated Miocene reef carbonate section with 66 species of larger foraminifera. Three assemblages: (1) 1256-1180m Spiroclypeus higginsi- Borelis pygmaeus (Te5, E Miocene); (2) 1031-577m Nephrolepidina- Miogypsina Assemblage (Tf, M Miocene), and 468-380m Cycloclypeus- Heterostegina Assemblage (Tg, Late Miocene). Facies backreef lagoon-shelf in E Miocene, normal-frontal reef in early M Miocene, backreef lagoon-shelf in later M Miocene, normal- frontal reef in early Late Miocene, and proximal forereef shelf in later Late Miocene)

Mai, H.A., Y.L. Chan, M.W. Yeh & T.Y. Lee (2017)- Tectonic implications of Mesozoic magmatism to initiation of Cenozoic basin development within the passive South China Sea margin. Int. J. Earth Sciences 107, 3, p. 1153-1174.
(S China Sea classic example of non-volcanic passive margin, situated within three tectonic plates. Reconstruction indicated SE margin of Asia had gone through two crustal thinning events (NW–SE extension in Late Cretaceous and Paleogene). Sites for rifting development controlled by localized thermal weakening of magmatism. Interaction of two continental stretching events by Pacific followed by Neotethys subduction with local magmatic thermal weakening is cause for non-volcanic nature of SCS)

Matthews, S.J., A.J. Fraser, S. Lowe, S.P. Todd & F.J. Peel (1997)- Structure, stratigraphy, and petroleum geology of the SE Nam Con Son Basin, offshore Vietnam. In A.J. Fraser et al. (eds.) Petroleum Geology of Southeast Asia, Geol. Soc., London, Spec. Publ. 126, p. 89-106.
(SE Nam Con Son Basin, offshore Vietnam, experienced rift pulses in Paleogene- earliest Late Miocene in response to interaction of S China Sea rift propagation and regional transtensional shear. Mild contractional deformation in M Miocene, synchronous with inversion structures in W Natuna. Oldest dated Tertiary rocks are Late Oligocene fluvio-deltaic sediments. E-M Miocene non-marine to outer shelf clastics, thickest in N-S to NE-SW-trending half grabens. Regional truncational unconformity of late M Miocene age. Late Miocene deepening of depositional environments, with growth of carbonate build-ups on structural highs, progradation of Paleo-Mekong delta system and associated deep-marine submarine channel development)

(After end of seafloor spreading, residual magmatic activity still exists in deep basin of S China Sea)

Meyer, L., D. Walley, J. Sutton & M. Schapper (2017)- Ca Voi Xanh Field, Block 118, Offshore Da Nang, Vietnam: exploration highlights and development challenges. In: SE Asia Petroleum Expl. Soc. (SEAPEX) Exploration Conf. 2017, Singapore, Session 10, 1p. *(Abstract only)*

(Ca Voi Xanh field is largest gas discovery offshore Vietnam. Discovered in 2011 by 118-CVX-2X well in M Miocene Da Nang Carbonate, followed by two appraisal wells. Field lies along NW-SE trending Triton Horst structure. Gas with 30% CO2, decreasing from N to S. Still technical (reservoir) and commercial challenges)

Morley, C.K. (2016)- Major unconformities/termination of extension events and associated surfaces in the South China Seas: review and implications for tectonic development. J. Asian Earth Sci. 120, p. 62-86.
(S China Seas continental rifting began in E basins in Paleocene, propagating W-wards to Vietnam margin in Late Eocene. Continental breakup around 32-28 Ma caused regional reduction in extensional activity. Basins in slope and deepwater N of spreading centre reduced fault activity until 21-20 Ma. Propagation of oceanic crust W-ward between ~25-23 Ma. Termination of seafloor spreading between ~20.5-16 Ma. Dangerous Grounds area extension continued until ~16 Ma. End of seafloor spreading at ~20.5 Ma reflects loss of driving force as thinned continental crust entered NW Borneo subduction zone. Transitional period of ~5-7 my between onset of subduction of continental crust and final jamming of subduction zone (Deep Regional Unconformity). Last pulse of extension in W SCS ended at ~10.5 Ma. Escape tectonics not primary driving force for extension in S China Sea, although secondary role possible. Proto S China Sea development remains uncertain)

Morley, R.J., T. Swiecicki & D.T.T. Pham (2011)- A sequence stratigraphic framework for the Sunda region, based on integration of biostratigraphic lithological and seismic data from Nam Con Son Basin, Vietnam. Proc. 35th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA11-G-002, 22p.
(Stratigraphic successions in Pattani, Malay, Penyu, W Natuna and Nam Com Son Basins many common features: Late Eocene- E Oligocene synrift followed by Late Oligocene and younger post-rift deposition. E-M Miocene variable degrees of inversion and also extension in Nam Con Son Basin, followed by Late Miocene and Plio-Pleistocene regional subsidence. Sequences closely parallel sequence biostratigraphic frameworks of W Natuna and Malay basins)

Morley, R.J., T. Swiecicki & P. Restrepo Pace (2015)- Correlation across the South China Sea using VIM transgressive-regressive cycles. AAPG Workshop 'Tectonic evolution and sedimentation of South China Sea region', Kota Kinabalu, Search and Discovery Art. 51109, 7p. *(Extended Abstract)*
(online at: www.searchanddiscovery.com/documents/2015/51109morley/ndx_morley.pdf)
(Determination of age and environments of deposition in S China Sea region problematic due to sporadic occurrence of marine index microfossils in Late Eocene- Miocene extensional basins from Gulf of Thailand to Nam Con Son and Sarawak-Sabah. Proposed correlations across Vietnam- Indonesia- Malaysia basins using transgressive-regressive cycles deduced from palynomorph and benthonic foraminiferal abundances. Many cycles ~400 ka cyclicity, suggesting glacio-eustacy as driving mechanism. Six main unconformities: (1) M Oligocene (onset of S China Sea spreading);(2) basal Miocene (end of Proto-South China Sea subduction); (3) E Miocene at ~18 Ma (onset of second rifting phase in Nam Con Son Basin and offshore Sarawak); (4) M Miocene at ~11-12 Ma (end of Nam Con Son and offshore Sarawak rifting); (5) one or more Late Miocene with time gaps at ~9, 7.2 and 5.5 Ma; (6) E Pliocene at ~3.5 Ma and also near base Quaternary)

Murray, M.R. & S.L. Dorobek (2004)- Sediment supply, tectonic subsidence, and basin-filling patterns across the Southwestern South China Sea during Pliocene to Recent time. In: P. Clift et al. (eds.) Continent-ocean interactions within East Asian marginal seas, American Geophys. Union (AGU), Geophys. Monograph Ser. 149, p. 235-253.
(Sediment flux to SW parts of S China Sea in Late Cenozoic reflects contributions from E Tibet, W Borneo, and smaller drainages of C Indochina, Vietnam, Malay Peninsula and W Indonesia. Updip basins (Malay, Cuu Long, W Natuna) became filled after Miocene inversion. Paleo-Mekong River and depositional system with probable headwaters on Malay Peninsula began supplying large volumes of sediment to N S China Sea in Late Miocene and Pliocene, respectively)

Phong Van Phung, Anh Vu The & Tung Nguyen Thanh (2017)- The development of palaeokarst systems in the Middle Miocene carbonate reservoir, South Song Hong Basin. Int. J. Applied Engineering Research 12, 22, p. 12844-12851.
(online at: https://www.ripublication.com/ijaer17/ijaerv12n22_148.pdf)

(Numerous paleokarst features seen on offshore 3D seismic in M Miocene carbonate platform on Tri Ton high, S Song Hong Basin, Vietnam. Paleokarst networks beneath unconformity shows erosional topography, sinkholes, rivers/canyons and hills, revealing mature surface drainage system)

Pichot, T., M. Delescluse, N. Chamot-Rooke, M. Pubellier, Y. Qiu, F. Meresse, G. Sun et al. (2014)- Deep crustal structure of the conjugate margins of the SW South China Sea from wide-angle refraction seismic data. Marine Petroleum Geol. 58, p. 627-643.
(New 1000-km long wide-angle refraction seismic profile along conjugate margins of SW South China Sea used to derive 2D velocity model of crust and upper mantle. Most of continental crust deforms in brittle manner. Continent-Ocean Transitions narrow and slightly asymmetric ~60 km on N side and <30 km on S side. No direct indication for mantle exhumation. Moho interface remains rather flat over extended domain, suggesting decollement within ductile lower crust)

Pubellier, M., M. Aurelio & B. Sautter (2018)- The life of a marginal basin depicted in a structural map of the South China Sea. Episodes 41, 3, p. 139-142.
(online at: http://www.episodes.org/view/2068)
(CGMW 2017 1:3 M scale structure map shows location of rifting faults from normal to hyper-extended crust, oceanic crust and late involvement in convergent margin, reactivation of Mesozoic tectonostratigraphic setting (broad folds, granitic plutons) during rifting, and architecture of NW Borneo accretionary wedge)

Pubellier, M., M. Delescluse, D. Savva, D. Franke, F. Meresse, J.L. Auxietre, M. Aurelio, N. Chamot-Rooke, U. Nanni & L.S. Chan (2015)- Collapse and rifting in the South China Sea. AAPG Workshop 'Tectonic evolution and sedimentation of South China Sea region', Kota Kinabalu, Search and Discovery Art. 30406, 28p.
(Abstract + Presentation)
(online at: www.searchanddiscovery.com/documents/2015/30406pubellier/ndx_pubellier.pdf)
(S China Sea unusually long period of rifting. On upper plate of subduction zone in Mesozoic, then collapsed continental basin on edge of Yenshanian orogeny. Continental crust rifting from Paleocene- M Oligocene in E, continuing until M Miocene in SW. Sundaland rifting documented since E Eocene only. Jurassic and Cretaceous granites conditioned locations of extension. Morphology of sea floor reflects location of granites on which large reefal platforms developed. Some sub-basins extremely stretched crust (Phu Khanh, W Natuna, NW Palawan, Tainan) and upper mantle may be in contact with sediments. Early extension in Late Cretaceous - Paleocene (basement and Mesozoic granitoids exhumation), followed by E Eocene- M Miocene rifting (crust thinned to 12km over large areas by 'boudinage'). Extension continued after start of spreading and continued after regional MMU (15-12Ma). Structural configuration represents offshore 'Basin and Range'-style province)

Pubellier, M., N. Pinet & C. Rangin (1990)- Docking of the Philippine mobile belt aginst the Eurasian margin: closure of the South China Sea. In: X. Jin et al. (eds.) Proc. Symposium Marine geology and gephysics of the South China Sea, Hangzhou 1990, p. 71-82.
(online at: https://epic.awi.de/38705/2/south-china-sea_1990.pdf)
(Docking of Philippine Arc in late M Miocene in Luzon, Late Miocene (10 My) in Visayas (C Philippines) and Pliocene in Mindanao, and not yet completed in Molucca Sea. Docking rapidly followed by renewal of subduction along E edge of S China Sea, Sulu Sea and Celebes Sea, showing S-ward progression from 11 Ma in Manila Trench to 7 Ma in Negros Trench and Late Pliocene-Pleistocene in Celebes Sea. Subduction reversal from W subduction front (Manila, Negros and Sulu trenches) to Philippine Trench associated with beginning of activity along Philippine Fault s.s. and begins in late Pliocene. Decoupling between Philippine plate and Eurasian plate now along Philippine Trench and Philippine fault system)

Pubellier, M., D. Savva, M. Aurelio, F. Sapin et al. (2016)- Structural map of the South China Sea. Commision for the Geological Map of the World (CGMW), France.
(Detailed 1:3M scale structural elements map of South China Sea region)

Rangin (1997)- Constraints on strike-slip motion from seismic and gravity data along the Vietnam margin offshore Da Nang; implications for hydrocarbon prospectivity and opening of the East Vietnam Sea. In: A.J. Fraser et al. (eds.) Petroleum geology of Southeast Asia, Geol. Soc. London, Spec. Publ. 126, p. 341-353.

Roques, D., C. Rangin & P. Huchon (1997)- Geometry and sense of motion along the Vietnam continental margin: onshore/offshore DaNang area. Bull. Soc. Geologique France 168, p. 413-422.

Roberts, D.G. (1988)- Basin evolution and hydrocarbon exploration in the South China Sea. In: H.C. Wagner et al. (eds.) Petroleum Resources of China and related subjects, Circum-Pacific Council for Energy & Mineral Resources, Earth Science Ser., Houston, 10, p. 157-177.
(S China Sea is back-arc basin formed by rifting, spreading, and subduction in response to collision between Asian, Indian and W Pacific plates. Hydrocarbon exploration offshore China, Sarawak and in S China Sea discussed in context of basin evolution as shown from sequence analysis)

Ru, K. & J.D. Pigott (1986)- Episodic rifting and subsidence in the South China Sea. American Assoc. Petrol. Geol. (AAPG) Bull. 70, p. 1136-1155.

(S China Sea experienced at least 3 stages of rifting and two intervening stages of sea-floor spreading since E Cretaceous. Rifting and associated thermal activities initiated in Late Cretaceous (NE-SW trend; with widespread volcanic activity in SE China, Natuna arch and in SW Borneo regional Late Cretaceous uplift), Late Eocene and late Early Miocene (E-W trends). Heatflow data suggest oceanic crust in SW subbasin older (55 Ma) than in NW (35-36 Ma) or E (32 Ma))

Sattler, U., A. Immenhauser, W. Schlager & V. Zampetti (2009)- Drowning history of a Miocene carbonate platform (Zhujiang Formation, South China Sea). Sedimentary Geology 219, p. 318-331.
(Zhujiang carbonate platform (BP Liuhua 11-1 field, 220 km SE of Hongkong) succession of facies types, suggesting deepening-upward trend 1) grain facies with miogypsinid/lepidocyclinid fauna in oligotrophic back-reef setting; 2) in situ corals in patch-reef facies in oligotrophic lagoon (< 10m); 3) rhodoid facies, dominated by Heterostegina sp. and spiroclypeids, possibly capped by subaerial exposure surface; 4) pelagic marine shales burying platform after drowning. No evidence for meteoric diagenesis at drowning unconformity on top of carbonate platform)

Sattler, U., V. Zampetti, W. Schlager & A. Immenhauser (2004)- Late leaching under deep burial conditions: a case study from the Miocene Zhujiang carbonate reservoir, South China Sea. Marine Petroleum Geol. 21, 8, p. 977-992.
(Zhujiang E Miocene carbonates reservoir in Liuhua 11-1 field three porous zones of ~20m intercalated with tight zones, parallel to bedding. Majority of pores late leaching in deep burial settings. Tight zones lack porosity because of meteoric cementation prior to late leaching. Corrosive fluids migrated along bedding-parallel tight zone barriers and leached intervals in-between, emphasizing depositional pattern)

Savva, D., F. Meresse, M. Pubellier, N. Chamot-Rooke, L. Lavier, K. Wong Po, D. Franke, S. Steuer & F. Sapin (2013)- Seismic evidence of hyper-stretched crust and mantle exhumation offshore Vietnam. Tectonophysics 608, p. 72-83.
(Eocene-Recent Phu Khanh Basin opened during rifting of S China Sea, when continental crust ruptured along E-Vietnam Boundary Fault. Extreme crustal thinning and mantle uplift that sometimes places sediments in contact with Moho discontinuity mark central part of basin. Low-angle detachment fault separates several crustal blocks from Moho. Above mantle, upper and lower crusts form large crustal boudins. Three stages of extension: (1) rift sequence between tilted pre-rift basement and Oligocene (32 Ma); (2) Oligocene- Mid Miocene (15.5 Ma); (3) M Miocene- U Miocene (before 10.5 Ma). Two extension directions, N-S and NW-SE. Cessation of rifting not before 12-10.5 Ma)

Savva, D., M. Pubellier, D. Franke, N. Chamot-Rooke, F. Meresse, S. Steuer & J.L. Auxietre (2014)- Different expressions of rifting on the South China Sea margins. Marine Petroleum Geol. 58, B, p. 579-598.
(Different styles of rifting on continental margins of S China Sea. Inherited structures like granitic plutons or large folds condition geometry and location of normal faults and detachments. Evolution of rifting through time dependent of margins structure and thickness, and rifting migrated toward SW. Very shallow water depth or continental depositional environment characterize rifting until entire basin subsided in Late Miocene)

Schimanski, A. (2002)- Holocene sedimentation on the Vietnamese Shelf: from source to sink. Doct. Dissertation Christian-Albrechts Universitat, Kiel, 171p.
(online at: https://d-nb.info/972182144/34)
(Holocene deposits on Vietnamese shelf of S China Sea since last deglacial sea level rise. Sediments from 2 major rivers (Red River, Mekong; mainly deposited in deltas) and numerous small mountainous rivers)

Schimanski, A. & K. Stattegger (2005)- Deglacial and Holocene evolution of the Vietnam Shelf; stratigraphy, sediments and sea-level change. Marine Geol. 214, 4, p. 365-387.
(Shallow high-resolution seismic and sediment cores on Vietnam Shelf analyzed to unravel post-glacial evolution. Southern Shelf sedimentation with abundant incised valley fills, cut into late Pleistocene land surface by Paleo-Mekong River during sea level lowstands and filled with transgressive deposits. Central Shelf narrow and conformable strata. Northern Shelf with paleo-Red River channels incised valleys)

Schluter, H.U., K. Hinz & M. Block (1996)- Tectono-stratigraphic terranes and detachment faulting of the South China Sea and Sulu Sea. Marine Geology 130, p. 39-78.
(5 main terranes in S China Sea, 4 in Sulu Sea. Dangerous Grounds, Reed Bank, Palawan- NW Borneo Trough and Palawan continental terranes developed on proto-China margin by simple shearing in Late Cretaceous- E Paleocene. Rift was abandoned and new W-ward propagating rift system developed N of Dangerous Grounds-Reed Bank from M Eocene- E Miocene together with seafloor spreading in S China Sea. Leading edge of S-drifting continental terranes collided with Late Cretaceous- E Eocene subduction complex of N-most terrane of proto-Sulu Sea. Continuous convergence, back-arc spreading of SE Sulu Sea terrane and anti-clockwise rotation of Borneo responsible for compression structures of Sulu Sea terranes, including formation of splinters of oceanic crust. NNW-SSE right-lateral systems cut across most terranes, presumably ceasing at 12-16 Ma)

Shao, L., L. Cao, X. Pang, T. Jiang , P. Qiao & M. Zhao (2015)- Detrital zircon provenance of the Paleogene syn-rift sediments in the northern South China Sea. Geochem. Geophys. Geosystems 17, 2, p. 255-269.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1002/2015GC006113)
(Zircon U-Pb geochronology of syn-rift sequences in northern S China Sea suggests significant intrabasinal provenances in addition to terrigenous supply from China margin in N. Dongsha Uplift considered to account for dominance of E Cretaceous zircons in Eocene samples. Episodic nature of rifting and erosion processes in early S China Sea cause of complex patterns in Paleogene provenance history)

Shao, L., L. Cao, P. Qiao, X. Zhang, Q. Li & D.J.J.van Hinsbergen (2017)- Cretaceous-Eocene provenance connections between the Palawan continental terrane and the northern South China Sea margin. Earth Planetary Sci. Letters 477, p. 97-107.
(Zircon U-Pb geochronology and heavy mineral analysis of Cretaceous and Eocene from northern S China Sea and Palawan continental terrane show similarities of Upper Cretaceous and Eocene, exclude possibility of latest Cretaceous drift of Palawan continental terrane in response to Proto-S China Sea opening. Zircon age signatures suggesting conjugate relationship between Palawan terrane and eastern Pearl River Mouth Basin and remained attached to S China margin until Oligocene oceanization of S China Sea)

Shao, L., A. Meng, Q. Li, P. Qiao, Y. Cui, L. Cao & S. Chen (2017)- Detrital zircon ages and elemental characteristics of the Eocene sequence in IODP Hole U1435A: implications for rifting and environmental changes before the opening of the South China Sea. Marine Geology 394, p. 39-51.
(Littoral M-L Eocene sandstone sequence in IODP Hole U1435A mainly composed of subangular quartz (70-80%) and K feldspar (10-15%), indicating proximal provenance of felsic rocks. Detrital zircon ages mainly Mesozoic (E Cretaceous peak at ~110 Ma, derived from China active continental margin arc). Some grains with ages between ~ 65- 38 Ma, indicating M-L Eocene deposition before opening of S China Sea)

Shi, X.B., X. Qiu, K. Xia & D. Zhou (2003)- Characteristics of surface heat flow in the South China Sea. J. Asian Earth Sci. 22, 3, p. 265-277.
(592 surface heatflow measurements in S China Sea. Oceanic basins, W part of S and W fault system high heat flow values. Heat flow in Nansha (Spratley) Islands ~60 mW/m2 or higher, decreasing from NW to SE. Heat flow on E margin and E part of S margin lower, especially in Luzon Trough (av.<40 mW/m2). Values in SW subbasin lower than predicted from age of ocean floor)

Shi, X.B., Qiu X.L., Xia K.Y. & Zhou D. (2003)- Heat flow characteristics and its tectonic significance of South China Sea. J. Tropical Oceanology 22, 2, p. 63-73.
(Same as Shi et al. 2003, above?)

Shiau, L.J., P.S. Yu, K.Y. Wei, M. Yamamoto, T.Q. Lee, T.E. Fang & M.T. Chen (2008)- Sea surface temperature, productivity and terrestrial flux variations of the southeastern South China Sea over the past 800 000 years (MIAGES MD972142). Terrestrial Atmospheric Oceanic Sci. 19, 4, p. 363-376.

Shoup, R.C. (1995)- Tertiary paleogeography of the East and South China Seas. In: C.A. Caughey et al. (eds.) Proc. Int. Symp. Sequence stratigraphy in Southeast Asia, Jakarta 1995, Indon. Petroleum Assoc., p. 451-456.

Shyu, J.P., M.P. Chen, Y.T. Shieh & C.K. Huang (2001)- A Pleistocene paleoceanographic record from the north slope of the Spratly Islands, southern South China Sea. Marine Micropaleontology 42, p. 61-93.
(1.4 Ma paleoceanography history of offshore north-central Spratly islands, southern S China Sea)

Sibuet, J.C., Y.C. Yeh & C.S. Lee (2016)- Geodynamics of the South China Sea. Tectonophysics 692, B, p. 98-119.
(online at: http://archimer.ifremer.fr/doc/00316/42686/42059.pdf)
(Onset of seafloor spreading in S China Sea now established at 33 Ma. Chron 12 (32 Ma) is oldest chron identified. Crust of NE part of SCS N of chron C12 not oceanic but thinned continental crust intruded by volcanic elongated features emplaced at 17-22 Ma. End of SCS spreading either 15.5, 20.5 Ma or ?? Post-spreading magmatic activity (~13-3.5 Ma) masks spreading fabric. Bathymetric seafloor trends in C part of SCS, suggest extinct ridge axis trends N055°, with N145° transform faults. From Chron 10 until end of SCS opening, plate boundary between S South China Sea and EU plates jumped W-ward several times from Ulugan fault near Palawan to W limit of SW basin, explaining V-shape of SCS. Opening of SCS linked with N-ward subduction of proto-SCS whose suture is located S of Palawan and extends W in N Borneo)

Simon, B., H.L. ten Haven & C. Cramez (1997)- The petroleum systems of the South Con Son Basin, offshore South Vietnam. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc. (IPA), Jakarta 1997, p. 467-479.
(S Con Son Basin off SE Vietnam is Oligocene rift with tectonic readjustment in M Miocene. Importance of lacustrine source rock considered to be minor compared to terrigenous source rock)

Song, T. & C.F. Li (2015)- Rifting to drifting transition of the Southwest subbasin of the South China Sea. Marine Geophysical Res. 36, 2, p. 167-185.
(SW subbasin of S China Sea with very wide extended continental margins. Two major unconformities in conjugate margins: (1) breakup unconformity (BRU) at ~23 Ma (initial opening of NE S China Sea at ~33 Ma) (2) M Miocene unconformity erosional truncation. Local thick syn-rift and early spreading deposition beneath BRU only at seaward concave part of Continent- Ocean Boundary. End of S China Sea seafloor spreading is 15 Ma in E and SW subbasins)

Song, X.X., C.F. Li, Y. Yao & H. Shi (2017)- Magmatism in the evolution of the South China Sea: geophysical characterization. Marine Geology 394, p. 4-15.
(Most igneous emplacements in S China Sea margins after end of seafloor spreading, rare during rifting and spreading phases, supporting magma-poor margins before breakup of continental lithosphere. Post-spreading magmatic activities widespread in continental slope areas and central SCS, likely triggered by extension in relation to cooling and subsidence of oceanic and attenuated continental lithosphere. Possible total thermal contractional displacement up to 24 km)

Steinke, S., H.Y. Chiu, P.S. Yu, C.C. Shen, H. Erlenkeuser, L. Lowemark & M.T. Chen (2006)- On the influence of sea level and monsoon climate on the southern South China Sea freshwater budget over the last 22,000 years. Quaternary Science Reviews 25, p. 1475-1488.
(Changes in freshwater budget in S S China Sea over last 22,000 years from sediment core using Mg/Ca and O oxygen isotopes of planktonic foram Globigerinoides ruber. During Last Glacial Maximum higher freshwater contribution because closer to mouths of Baram, Rajang and N Sunda/ Molengraaff Rivers at that time)

Steinke, S., P.S. Yu, M. Kucera & M.T. Chen (2008)- No-analog planktonic foraminiferal faunas in the glacial southern South China Sea: implications for the magnitude of glacial cooling in the western Pacific warm pool. Marine Micropaleontology 66, p. 71-90.
(Planktonic foraminiferal abundances relatively unchanged in tropical S South China Sea during Last Glacial Maximum, except for relative high abundance of Pulleniatina obliquiloculata and Neogloboquadrina pachyderma (dextral) during glacials)

Steuer, S., D. Franke, F. Meresse, D. Savva, M. Pubellier & J.L. Auxietre (2014)- Oligocene-Miocene carbonates and their role for constraining the rifting and collision history of the Dangerous Grounds, South China Sea. Marine Petroleum Geol. 58B, p. 644-657
(Attenuated continental crust of Dangerous Grounds in SE part of S South China Sea affected by unconformities In NE Dangerous Grounds top of widespread Oligocene - E Miocene (18-20 Ma) carbonate platform. In SW Dangerous Grounds unconformity sealing tectonic activity known as 'M Miocene Unconformity', is of Early Miocene age. Luconia and S Dangerous Grounds sub-aerial during E Miocene, while Reed Bank, N Dangerous Grounds and parts of C Dangerous Grounds mostly submerged, except for some islands on W edge of Borneo-Palawan Trough (foreland basin, where flexural forebulge provided shallow marine conditions that promoted reef growth). Carbonate deposition migrated from Borneo-Palawan trough toward Dangerous Ground)

Su, D., X. Chen & Z. Liu (1995)- The gravity field and tectonics of the Nansha Islands (Dangerous Grounds). In: G.H. Teh (ed.) Proc. AAPG-GSM Int. Conf. Southeast Asian basins; oil and gas for the 21st century, Kuala Lumpur 1994, Bull. Geol. Soc. Malaysia 37, p. 117-123.
Gravity surveys of Nansha Islands in S part of S China Sea show three zones: (1) Zengmu (Sarawak) Basin, where gravity mostly controlled by sediment thickness; (2) Reed Bank Gravity High (highest gravity values in S China Sea), where gravity influenced mostly by deep crustal structure, and (3) Nansha (Palawan) Trough gravity low. Modelled crustal thickness ~25 km for Reed Bank, 20-25 km in reef areas, ~20 km in trough areas, and 17-20 km thick beneath Zengmu Basin)

(online at: www.scichina.com:8080/kxtbe/fileup/PDF/03ky2155.pdf)
(Study of pollen distributions in deep sea sediments of S China Sea and E China Sea (mainly Quaternary). Spectral analyses show Milankovich cyclicities in vegetation of surrounding land areas. Changes of herbs and pine pollen percentages in phase with d18O record. Not much detail)

Sun, X., Y. Luo, F. Huang, J. Tian & P. Wang (2003)- Deep-sea pollen from the South China Sea: Pleistocene indicators of East Asian monsoon. Marine Geology 201, p. 97-118.
(High-resolution pollen record from northern S China Sea ODP Site 1144, covers last 1.03 My. High, varying proportions of Pinus and herb pollen, forming base of 29 pollen zones that are closely correlated to Oxygen Isotope Stages (MIS) 1-29. Pinus dominant pollen zones correspond to interglacial periods, herb peaks relate to

heavier N18O stages assigned to glacials. Exposed N continental shelf covered by grassland during glacials. Relatively high fern percentage with smaller amplitude in variations before 600 ka may suggest more stable humid conditions before intensification of winter monsoon. Microtektites at 386.4m, part of Australasian strewnfield, close to Brunhes/Matuyama boundary (780 ka). Milankovich cyclicity)

Sun, Z., Z. Zhong, M. Keep, D. Zhou, D. Cai, X. Li, S. Wua & J. Jiang (2009)- 3D analogue modeling of the South China Sea: a discussion on breakup pattern. J. Asian Earth Sci. 34, p. 544-556.
(Modeling of S China Sea spreading history, from ~31-16 Ma. Breakup unconformities at ~30 Ma in N, and 23 Ma in S, similar to Briais et al. dating)

Sun, Z., D. Zhou, Z. Zhong, B. Xia, X. Qiu & J. Jiang (2006)- Research on the dynamics of the South China Sea opening: evidence from analogue modeling. J. Science in China, D 49, 10, p. 1053-1069.
(S China Sea continental rifting and early spreading from 32- 26 Ma. From 24 Ma on, spreading in NW-SE direction and ceased spreading at ~15.5 Ma. Early opening accompanied by ~15° CW rotation, while SE sub-sea basin opened with SE extension. Existence of rigid massifs changed orientations of some faults and rift belt, and led to deformation concentrated around massifs. Rifting and drifting of SCS might be caused by slab pull from proto S China Sea subducting toward Borneo and/or mantle flow caused by India-Asia collision)

Sun, Z., D. Zhou, S. Wu, Z. Zhong, M. Keep, J. Jiang & H. Fan (2009)- Patterns and dynamics of rifting on passive continental margin from shelf to slope of the northern South China Sea: evidence from 3D analogue modeling. J. Earth Science 20, 1, p. 136-146.

Tan, M.T. (1995)- Seismic stratigraphic studies of the continental shelf of Southern Vietnam. J. Petroleum Geol. 18, 3, p. 345-354.

Tang, Q. & C. Zheng (2013)- Crust and upper mantle structure and its tectonic implications in the South China Sea and adjacent regions. J. Asian Earth Sci. 62, p. 510-525.
(3D S-velocity model for crust and upper mantle of S China Sea area shows sea basinal regions, island arc and continental regions. Crustal thickness (~15- >50 km and lithospheric thicknesses ~60- >140km, thinnest in S China Sea, thickest in E Tibet and Yangtze Blocks. Results show: (1) Mesozoic subduction zone along S China margin; (2) influence of Indochina extrusion along Red River Fault limited; (3) slab remnant of proto-S China Sea beneath Borneo. With plate reconstructions at 150, 40, 30, 20, and 15 Ma)

Tang, X., L. Chen, S. Hua, S. Yang, G. Zhang, H. Shen, S. Rao & W. Li (2014)- Tectono-thermal evolution of the Reed Bank Basin, Southern South China Sea. J. Asian Earth Sci. 96, p. 344-352.
(Reed Bank Basin in S margin of S China Sea two stages of Paleogene rifting (~65.5-40.4 Ma and ~40.4-28.4 Ma) recognized from tectonic subsidence rates. Corresponding phases of heating with average basal paleo-heat flow values at end of rifting events ~60 and ~66.3 mW/m2. Thermal attenuation since ~28.4 Ma, with basal heat flow down to ~57.8-63.5 mW/m2 at present)

Taylor, B. & D.E. Hayes (1980)- The tectonic evolution of the South China Basin. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian Seas and Islands- 1, American Geophys. Union (AGU), Geophys. Monograph 23, p. 89-104.
(Magnetics patterns in S China Sea suggests active seafloor spreading from M Oligocene- E Miocene (32-17 Ma). Magnetic lineations trend E-W; position of relict spreading center coincides closely with E-trending linear chain of seamounts near 15°N. N Palawan was most likely attached to Reed-Bank Block and China Margin before M Oligocene. Limited data suggest change in spreading fabric in SW corner of basin)

Taylor, B. & D.E. Hayes (1983)- Origin and history of the South China Sea Basin. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian seas and islands, 2, American Geophys. Union (AGU), Geophys. Monograph 27, p. 23-56.
(New magnetic anomaly data date seafloor spreading in S China Sea as M Oligocene- E Miocene (32-17 Ma). Thick sediments (1-2.5 km) and rel. smooth oceanic basement characterize older parts of basin; thinner sediments (300m-1 km) and blocky basement fabric characterize younger central part of basin. Opening of

basin moved microcontinental blocks (incl. N Palawan and Reed Bank) from Paleogene position adjacent to China mainland. Basin initially opened in N-S direction. Seafloor spreading in basin ended slightly before late M Miocene cessation of subduction at Palawan subduction zone to S)

(online at: www.hyxb.org.cn/aosen/ch/...)
(Geochemical study of Kon Tum plateau, Sanshui basin and Daimao seamount volcanic rocks. Basaltic lavas indicate not deep-rooted plume origin, but shallower mantle domain)

Ye, Q., L. Mei, H. Shi, G. Camanni, Y. Shu, J. Wu, L. Yu, P. Deng & G. Li (2018)- The Late Cretaceous tectonic evolution of the South China Sea area: an overview, and new perspectives from 3D seismic reflection data. Earth-Science Reviews 187, p. 186-204.
(Three Late Cretaceous fault systems in N South China Sea margin, superimposed on Late Jurassic to Early Cretaceous (162-102 Ma) arc-related granitoids. WNW-striking thrust system formed as a result of sinistral transpressional event at ~100 Ma, likely related to oblique convergence between Paleo-Pacific Ocean and Eurasia Plates. Second phase at ~100- 72 Ma extensional, with ENE-striking extensional faults and basins, interpreted as back-arc extension/slab roll back of Paleo-Pacific Plate, eventually leading to opening of Proto-S China Sea. Third phase compressional event in Late Cretaceous (~72- 66 Ma), responsible for ENE-striking thrust system. Post-Yanshanian compressional event interpreted to have developed in response to ridge push)

Yu, H.S. (1994)- Structure, stratigraphy and basin subsidence of Tertiary basins along the Chinese southeastern continental margin. Tectonophysics 235, p. 56-76.

(Offshore Tertiary basins along broad shelf from Taiwan to Hainan Island with similar characteristics. Paleogene basins mainly NE-SW trending half-grabens and fault blocks)

Yu, X.Z., C. Xue, H. Shi, W. Zhu, Y. Liu & H. Yin (2017)- Expansion of the South China Sea basin: constraints from magnetic anomaly stripes, sea floor topography, satellite gravity and submarine geothermics. Geoscience Frontiers 8, 1, p. 151-162.
(online at: https://www.sciencedirect.com/science/article/pii/S1674987116000050)
(Model for Oligo-Miocene spreading in S China Sea basin. NW-SE expansion of SW subbasin later than N-S expansion of central basin; both expansions end at same time. Expansion of SW sub-basin similar to Japan Sea, likely caused by left-lateral strike slip on central fault zone in S China Sea)

Zampetti, V., U. Sattler & H. Braaksma (2005)- Well log and seismic character of Liuhua 11-1 Field, South China Sea; relationship between diagenesis and seismic reflections. Sedimentary Geology 175, p. 217-236.
(Seismic reflections in Miocene carbonate buildup of Liuhua 11-1 Field (220 km SE of Hongkong) image alternating tight and porous zones. Most porosity related to leaching in deep burial realm that postdates pressure solution, implying seismic reflections do not necessarily image depositional surfaces, although diagenetically induced porosity often follows primary depositional bedding)

(online at: http://en.earth-science.net/WebPage/Article.aspx?id=123)

Zhao, Q. (2005)- Late Cainozoic ostracod faunas and paleoenvironmental changes at ODP Site 1148, South China Sea. In: Marine micropaleontology of the South China Sea, Marine Micropaleontology 54, p. 27-47.
(Earliest Oligocene-Recent deep water ostracod faunas in northern S China Sea suggest spreading of SCS Basin predates Oligocene. Three ostracod assemblages recognized, reflecting paleodepth changes from upper bathyal (<1500m) in Early Oligocene, lower bathyal (1500- 2500m) in Late Oligocene- early M Miocene (26-14 Ma) to depth similar to the present (>2500m) since the late M Miocene- Present)

Zhao, Q., Z. Jian, B. Li, X. Cheng & P. Wang (1999)- Microtektites in the Middle Pleistocene deep-sea sediments of the South China Sea. Science in China, D, 42, p. 531-535.

(Common microtektites at 7.8- 8.1 m depth of core S095-17957-2, S China Sea. Microtektite layer near Brunhes/Matuyama magnetic reversal boundary ~0.78 Ma)

Zheng, H., X. Sun, P. Wang, W. Chen & J. Yue (2019)- Mesozoic tectonic evolution of the Proto-South China Sea: a perspective from radiolarian paleobiogeography. J. Asian Earth Sci. 179, p. 37-55.
(Proto-South China Sea represents subducted lithosphere that formerly occupied region of present-day S China Sea. In Triassic in transition zone between Pacific and Tethys oceans. In E-M Jurassic well connected to Pacific Ocean and part of Paleo-Pacific slab. During Late Jurassic- E Cretaceous PSCS in semi-closed environment and part W-facing Andean-type subduction zone. In late Late Cretaceous in extensional setting)

Zhong, G., J. Geng, H.K. Wong, Z. Ma & N. Wu (2004)- A semi-quantitative method for the reconstruction of eustatic sea level history from seismic profiles and its application to the southern South China Sea. Earth Planetary Sci. Letters 223, p. 443-459.
(Eustatic sea level curve since Pliocene (5.3 Ma) derived from high-res seismic data from N Sunda Shelf/ South China Sea (SCS). 36 fourth order sea level cycles recognized with periods ranging from 0.08- 0.29 My)

Zhong, L.F., G.Q. Cai, A.A.P. Koppers, Y.G. Xu & B. Xia (2018)- 40Ar/39Ar dating of oceanic plagiogranite: constraints on the initiation of seafloor spreading in the South China Sea. Lithos 302-303, p. 421-426.
(Oceanic plagiogranite dredged from Penglai Seamount on 17°N fossil spreading center of East Sub-basin of SCS near Manila Trench. 40Ar/39Ar ages of 32.3 ± 0.5 Ma and 28.9 ± 1.9 Ma. Trace elements and isotopic composition similar to mid-oceanic ridge basalts. New geochronology demonstrates initial opening of S China Sea before 32 Ma (E Oligocene))

Zhou, D., H. Chen, S. Wu & H.S. Yu (2002)- Opening of the South China Sea by dextral splitting of the East Asian continental margin. Acta Geologica Sinica 76, 2, p. 180-190.
(Sea of Japan and S China Sea both West Pacific marginal seas with many common features, implying common origin. E Asian margin was split under the stress field of dextral transtension. Etc.)

Zhou, D., K. Ru & H.Z. Chen (1995)- Kinematics of Cenozoic extension on the South China Sea continental margin and its implications for the tectonic evolution of the region. Tectonophysics 251, p. 161-177.
(N South China Sea large Cenozoic sedimentary basins developed, characterized by episodic rifting, clockwise rotation of rifts, E-ward aging breakup unconformity and intensifying crustal extension to E. Maximum rifting N of maximum thermal subsidence, which was in turn N of seafloor opening. Nansha microcontinent in S of S China Sea dominated by compressional deformation. Asymmetric development of extensional structures around S China Sea Basin explained by Wernicke simple-shear model. Tectonic development of S China Sea consequence of interactions of three major plates: retreat of W Pacific subduction zone in Late Cretaceous, hard collision and impinging of India to Tibet since Late Eocene and fast N-ward subduction of Indian Ocean-Australian plate since late E Miocene)

Zhou, D., Z. Sun, H.Z. Chen, H.H. Xu, W.Y. Wang et al. (2008)- Mesozoic paleogeography and tectonic evolution of South China Sea and adjacent areas in the context of Tethyan and Paleo-Pacific interconnections. The Island Arc 17, 2, p. 186-207.
(Lithofacies maps of six Mesozoic time slices of S China Sea and SE Eurasian continent margin. In E Triassic, Paleotethys Ocean extended E to study area through Song Da passage. Then significant E-W differential evolution began. Late Triassic uplift of W area after collision between Indosinian and S China blocks. Transgression of Paleo-Pacific waters in E and SE formed `E Guangdong-NW Borneo Sea'. E Jurassic marine transgression more pronounced, resulting in connection with Mesotethys Ocean to W. In M Jurassic, short-lived transgression in E Mesotethys with formation of `Yunnan-Burma Sea'. Late Jurassic-E Cretaceous climax of subduction of Mesotethys and Paleo-Pacific towards Eurasian continent, leading to formation of `Circum SE Asia Subduction-Accretion Zone' in M or Late Cretaceous. Evidence for newly recognized segment of this Mesozoic subduction-accretion zone under Cenozoic sediments in NE S China Sea)

Zhou, D., W. Wang, J. Wang, X. Pang, D. Cai & Z. Sun (2006)- Mesozoic subduction-accretion zone in northeastern South China Sea inferred from geophysical interpretations. J. Science in China Series, D, Earth Sciences 49, 5, p. 471-482.
(Segment of Mesozoic subduction-accretion zone inferred from gravity- magnetics across NE S China Sea at ~NE45° orientation. This fills gap of Great Late Mesozoic Circum SE Asia subduction-accretion Zone, which extended from Sumatra, Java, SE Kalimantan to N Palawan, and from Taiwan, Ryukyu to SW Japan)

Zhou, D. & B. Yao (2009)- Tectonics and sedimentary basins of the South China Sea: challenges and progresses. J. Earth Science (China Univ. Geosciences) 20, 1, p. 1-12.
(online at: www.earth-science.net/ejournal/paper/2009-1-01.pdf)
(Introduction to special volume Tectonics and sedimentary basins of the South China Sea, with 19 papers. SCS has passive margin in N, convergent margin in S and E, and transform margin in W. Deepsea basin subdivided into sub-basins NW, E (central), and SW. Correlation of magnetic anomalies 11-5c in E subbasin indicates seafloor spreading from 30- 16 Ma. Wells on N SCS shelf commonly penetrate Late Cretaceous granites (70-105 Ma)

Zhu, M., S. Graham & T. MacHargue (2009)- The Red River Fault zone in the Yinggehai Basin, South China Sea. Tectonophysics 476, p. 397-417.
(Mapping of offshore part of Red River Fault in Yinggehai Basin. Two boundary faults and two basin-center faults mapped. Three deformation phases for offshore Red River Fault e: (1) sinistral movement from ~30-16 Ma, (2) slip reversal between 16-5.5 Ma, and (2) slow dextral movement after 5.5 Ma. Horizontal displacement of dextral movement ~10's of km. Before M Miocene, sinistral movement of Red River Fault likely linked to spreading of S China Sea ('continental extrusion). After M Miocene, distributed shortening explains low rate of dextral accommodation of Red River Fault in response to continuing India-Asia collision)

Zhu, W & Chao Lei (2013)- Refining the model of South China Seaǿs tectonic evolution: evidence from Yinggehai-Song Hong and Qiongdongnan Basins. Marine Geophysical Res. 34, 3-4, p. 325-339.

Aurelio, M.A. (2000)- Shear partitioning in the Philippines: constraints from Philippine Fault and global positioning system data. Island Arc 9, 4, p. 584-597.
(Philippine Fault is major left-lateral structure in an island arc setting, accommodating component of oblique convergence between Philippine Sea Plate and Philippine archipelago. Formation of fault marks onset of new geodynamic regime in Philippine region around 4 Ma, when Philippine Sea Plate changed relative movement with respect to Eurasia from N-ward to a NW-ward motion)

Aurelio M.A., E. Barrier, C. Rangin & C. Muller (1991)- The Philippine Fault in the late Cenozoic evolution of the Bondoc- Masbate- N. Leyte area, Central Philippines. J. Southeast Asian Earth Sci. 6, p. 221-238.

(In Bondoc-Masbate-N Leyte region Philippine Fault is active left-lateral slip fault, dissects a region of three compressive(M Oligocene, end-Miocene collision between N Palawan Block and W edge Philippine Mobile Belt and final phase associated with Philippine Fault) and two tensional tectonic events (Late Oligocene- M Miocene and Plio-Pleistocene). Present configuration of Philippine Fault not older than M Pliocene)

Aurelio, M.A., M.T. Forbes, K.J.L. Taguibao, R.B. Savella, J.A. Bacud & D. Franke (2014)- Middle to Late Cenozoic tectonic events in south and central Palawan (Philippines) and their implications to the evolution of the south-eastern margin of South China Sea: evidence from onshore structural and offshore seismic data. Marine Petroleum Geol. 58, B, p. 658-673.
(Cenozoic tectonic history of SE margin of S China Sea. S and C Palawan dominated by Mesozoic ophiolites, emplaced over syn-rift Eocene turbidites (Panas Fm). Thrusting sealed by E Miocene (~20 Ma) sediments, constraining younger age of ophiolite emplacement at end Oligocene (~23 Ma). Nido Carbonate underthrusting at end E Miocene (~16 Ma). Tectonic wedge built in M Miocene (~16-12 Ma), forming thrust-fold belt, truncated by M Miocene Unconformity. Continuous convergent regime affected SE margin of S China Sea between end Eocene- end M Miocene. Intensity of thrusting decreases to NE, from NW Borneo Trough area into offshore SW Palawan)

Aurelio, M.A., R.E. Pena & K.J.L. Taguibao (2013)- Sculpting the Philippine archipelago since the Cretaceous through rifting, oceanic spreading, subduction, obduction, collision and strike-slip faulting: Contribution to IGMA5000. J. Asian Earth Sci. 72, p. 102-107.
(Review paper. Philippine archipelago two tectono-stratigraphic blocks, Palawan-Mindoro Continental Block (PCB) and Philippine Mobile Belt (PMB). PCB originally part of Asian mainland that rifted away in Mesozoic and drifted during opening of S China Sea (SCS) in Oligocene. PMB developed mainly from island arcs and ophiolite terranes that started to form in Cretaceous. At present, PMB collides with PCB in Visayas)

Aurelio, M.A., C. Rangin, E. Barrier & C. Muller (1990)- Tectonique du segment central de la faille Philippine (Region de Bondoc-Masbate): un decrochement tres recent. Comptes Rendus Academie Sciences, Paris, 310 (II), p. 403-410.
('Tectonics of the central segment of the Philippine Fault (Bondoc-Masbate Region): a young strike-slip fault'. Central segment of Philippine Fault from Bondoc to Masbate is complex strike-slip fault with extensional and compressive features and events recorded in sediments since Oligocene)

(Marine seismic data offshore S Luzon)

Aurelio, M.A., K.J.L. Taguibao, E.B. Cutiongco, J.M. Foronda, Z.M. Calucin & M.T. Forbes (2013)- Structural evolution of Bondoc-Burias area (South Luzon, Philippines) from seismic data. J. Asian Earth Sci. 65, p. 75-85.
(2-D offshore seismic profiles between Bondoc Peninsula and Burias Island, S Luzon, Philippines, show two distinct seismic sequences: lower sequence correlative to Late Oligocene- E Miocene limestone observed onshore in Bondoc Peninsula and Burias Island. Upper sequence, correlative to turbiditic and shallower marine clastic deposits widely exposed in Bondoc Peninsula, affected by thrust faulting and tight folding)

Aurelio, M.A., K.J.L. Taguibao, A.A. Morado, S. Steuer, M. Pubellier, M.T. Forbes & D. Franke (2015)- Twisted Nido Limestone: mark of a mid Tertiary bimodal deformation at the thinned SE edge of Sundaland. 6 AAPG Asia Pacific Workshop Tectonic evolution and sedimentation of South China Sea Region, Kota Kinabalu, Search and Discovery Art. 90236, 4p. *(Extended Abstract)*
(Area of Late Oligocene- E Miocene Nido Lst 1000 km long from W of Calamian Islands in N Palawan to NW Borneo Trough in S. Onland carbonate outcrops in Sabang, C Palawan. S of Sabang, carbonate thrust under tectonic wedges formed between Eocene and M Miocene. Accretionary wedges are overlain by Late Cretaceous ophiolites that began obducting in Eocene. Bimodal deformation of SE Sundaland as S China Sea opened. In S limestone at tail-end of subducting proto S China Sea, pulled down in direction of subduction (SE) and

continued to underthrust as ophiolite obduction took place. N segment warping upwards in response to collision of rifted N Palawan continental block with W edge of Philippine arc)

Austria, B.S. & R.A. Reyes (1992)- Possibilities of W. Batangas Basin in Philippines South China Sea. Oil and Gas J. 90, 23, p. 74-80.

Bachman, S.B., S.D. Lewis & W.J. Schweller (1983)- Evolution of a forearc basin, Central Luzon Valley, Philippines. American Assoc. Petrol. Geol. (AAPG) Bull. 67, 7, p. 1143-1162.
(Luzon C Valley with 14 km-thick forearc basin sequence, floored by oceanic crust on seaward (W) side and older accreted terranes on arc (E) side. Initial sedimentation on oceanic crust during E Tertiary N-ward translation and emplacement of crust as ophiolite. Basal sediments pelagic limestones and thin ash layers, overlain by turbidites from uplift and progressive dissection of ophiolite. Arc-derived sediments >8 km thick, shed into E side of basin in late Paleogene- Quaternary convergence along W margin of Luzon. By M Miocene, C Valley became continuous, elongate basin fringed by extensive shelf deposits. Nonmarine deposition began in central portions of basin in Pliocene. Late Miocene- Recent movement along Philippine fault zone caused uplift- folding of adjacent parts of basin. Hydrocarbon potential of C Valley not determined adequately)

Bacud, J., A. Moore & C.S. Lee, C. (1997)- Tectonic structure and petroleum potential of Tayabas Bay southeast Luzon, Philippines. J. Southeast Asian Earth Sci. 15, 2, p. 195-215.
(On AGSO/ PDE marine geological survey in Tayabas Bay. No wells drilled offshore; seismic data tied to onshore Bondoc Peninsula wells and stratigraphy. Geochemistry data confirm presence of mature source rocks in M Miocene Vigo Fm and/or Late Oligocene- E Miocene Panaon Lst, and hydrocarbon migration. Major N-NW-trending strike-slip fault. Oligo-Miocene reefal carbonate reservoirs believed to be present)

Balmater, H., D. Eslava, K. Queano, C. Dimalanta, N. Ramos, B. Payot & G. Yumul (2015)- Samar ophiolitic complex, central Philippines: fragment of a Mesozoic basin at the junction of eastern Neo-Tethys and Panthalassa. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 4. *(Abstract only)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(Samar Ophiolitic Complex, exposed in eastern C Philippines, and part of Jurassic- Cretaceous ophiolitic belt that serves as basement to most E Philippines islands. Paleomagnetic studies on upper crust of ophiolite suggests paleolatitude of -14º± 6º. This, and results from E Indonesia evidence that ophiolites preserved along W and S margins of Philippine Sea Plate are remnants of Mesozoic oceanic basin E of eastern Neo-Tethys and W of Panthalassa. Cretaceous and Cenozoic intra-oceanic arcs associated with this basin part of the Amami-Daito region, E Philippines, E Indonesia and N New Guinea, and were separated by Eocene opening of PSP)

Balmater, H.G., P.C. Manalo, D.V. Faustino-Eslava, K.L. Queano, C.B. Dimalanta, J.M.R. Guotana, N.T. Ramos, B.D. Payot & G.P. Yumul (2015)- Paleomagnetism of the Samar Ophiolite: implications for the Cretaceous sub-equatorial position of the Philippine island arc. Tectonophysics 664, p. 214-224.
(Samar Ophiolite complete suite at Samar island in E part of C Philippines. K-Ar ages of ~100 and 98 Ma (~Cenomanian). Paleomagnetic data suggest ophiolite formed at paleolatitude of 14°S ± 6°, i.e. several degrees S of three other Mesozoic ophiolites of Philippine Mobile Belt. PMB ophiolites in E and C Philippines share common age, geochemistry and paleolatitude with Halmahera Ophiolite, suggesting origin at Mesozoic supra-subduction zone that extended from few degrees N of Equator to ~15°S)

Bandy, O.L. (1963)- Cenozoic planktonic foraminiferal zonation and basinal development in Philippines. American Assoc. Petrol. Geol. (AAPG) Bull. 47, 9, p. 1733-1745.
(also in J. Geol. Soc. Philippines 16, 2 (1962))
(Planktonic foraminifera zonation Late Oligocene-Pliocene of Central Valley, Luzon, and S Iloilo, Panay, is similar to that recognized in other tropical areas of world. Late Oligocene-Early Miocene commenced with shelf-type conditions and orbitoidal facies, changing upward into increasingly deeper-water bathyal facies. In Late Miocene Central·Valley paralic facies, in Iloilo deep basinal conditions until M Pliocene)

Barretto, J.A.L., C.B. Dimalanta & G.P. Yumul (2000)- Gravity variations along the Southeast Bohol Ophiolite Complex (SEBOC), Central Philippines: implications on ophiolite emplacement. Island Arc 9, 4, p. 575-583.
(Basement complex of Bohol Island consists of SE Bohol Ophiolite Complex, Cansiwang Melange and Alicia Schist. SEBOC is complete, but dismembered ophiolite with outcrops generally trending NE-SW and dipping NW. SEBOC thrusted onto Cansiwang Melange, which is thrusted onto Alicia Schist. Orientation of Bouguer highs suggests thrusting direction of ophiolite units was to SW, not to SE)

Barrier, E., M. Aurelio, C. Muller, M. Pubellier et al. (1990)- La faille philippine; un exemple de grand decrochement actif a l'arriere d'une zone de subduction. Comptes Rendus Academie Sci., Paris, 311 (II), p. 181-188.
('The Philippine Fault: an example of large active displacement behind a subduction zone')

Barrier, E., P. Huchon & M. Aurelio (1991)- The Philippine fault: a key for Philippines kinematics. Geology 19, p. 32-35.
(Motion between Philippine Sea plate and Eurasia is distributed on two boundaries: Philippine Trench and Philippine fault. Geologic data from Visayas provide age of 2 to 4 Ma for fault, in good agreement with

beginning of subduction in Philippine Trench. Origin of Philippine fault is flip of subduction from W to E after locking of convergence to W by collision of Philippine mobile belt with Eurasian margin)

Bassoulet, J.P. (1983)- Jurassic microfossils from The Philippines. CCOP Techn. Bull. 16, p. 31-38.
(Late Jurassic foraminifera and algae from samples collected by Fontaine from Ili Island and Cayatong. Ili Lst with typical Tethyan Late Jurassic forams Pseudocyclammina lituus and Nautiloculina oolithica and dasyclad algae Salpingoporella pygmaea (also known from Bau Limestone of W Sarawak and from Sumatra))

Bautista, B.C., M.L. Bautista, K. Oike, F.T. Wu & R.S. Punongbayan (2001)- A new insight on the geometry of subducting slabs in northern Luzon, Philippines. Tectonophysics 339, p. 279-310.
(Earthquake focal mechanisms used to model geometry of Eurasian plate subducted slab beneath N Manila Trench. Model suggests collision and partial subduction of buoyant plateau at around 20°N to explain sharp bend in trench line and shallow dip of subducted slab. Tear in slab evidenced by gap in strain energy release and change in dip. Gap in seismicity may be subducted extinct, but still hot mid-oceanic ridge. High heatflow along extinct MOR. Subducted part of MOR may serve as weakest zone where tear could be localized)

(35 species of larger foraminifera, incl. Eocene Pellatispira madaraszi, Discocylina and-Alveolina, Oligocene Nummulites fichteli and Lepidocyclina formosa, Miocene (Te- Lower Tf) Spiroclypeus margaritatus, Miogypsina polymorpha, etc.)

Crespin, I. (1956)- Notes on a *Lepidocyclina*- bearing rock from Cebu, Philippines. In: Papers on Tertiary micropalaeontology, Bureau Mineral Res. Geol. Geophysics, Canberra, Report 25, p. 43-46.
(online at: www.ga.gov.au/products-services/legacy-publications/reports.html)
(Thin, large (up to 60mm), E Miocene (upper Te) Lepidocyclina (Eulepidina) badjirraensis Crespin from Magalambac, Mantalongan, Cebu, similar to specimens from type locality at Cape Range, Exmouth Gulf, NW Australia. Associated with Cycloclypeus eidae Miogypsina cf. kotoi, Lepidocyclina (N) borneensis)

Crispin, O.A. & H. Fuchimoto (1980)- K-Ar dating of some Philippine rocks. In: T. Kobayashi, R. Toriyama et al. (eds.) Symposium on the geology and paleontology of SE Asia, Tsukuba 1978, Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 21, p. 93-100.

(Results of K-Ar age dating of 66 samples from Philippines, ranging from Cretaceous- Miocene. Results often do not fit with associated stratigraphic/ paleontological data)

Dancer, N. (2003)- Reservoir characterisation of the Malampaya Field, a carbonate reefal build-up in the Philippines. Proc. 2003 SE Asia Petrol. Expl. Soc. (SEAPEX) Exploration Conf., Singapore, p. 1-36. *(Abstract+ Presentation)*
(Malampaya Field Oligo-Miocene carbonate reservoir with high porosity and large variation in permeability at depth of ~3000m TVDSS. Gas column 650m, oil rim 56m (API 29.4°). In-place reserves ~4.1 TCF gas and 300 MMBO. Porosity affected by diagenesis: (1) early cementation of flanks decreased porosity, meteoric leaching of lagoon increased porosity; (2) late stage burial decreased porosity with cementation along faults, porosity increased by late leaching by mixing of burial fluids and pore waters)

David, P.P. (1980)- Foraminiferal biostratigraphy of well Lagao No. 1, Sultan Sa Barongis, North Cotabato, Philippines. In: T. Kobayashi, R. Toriyama et al. (eds.) Symposium on the geology and paleontology of SE Asia, Tsukuba 1978, Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 21, p. 111-118.
(Entire 3657' drilled in Lagao 1 well, Cotabato Basin, SW Mindanao, of (Late) Pliocene-Pleistocene age. With Globoralia truncatulinoides and Gr. tosaensis in Nicaan Fm shales from 2210' to TD)

David, P.P. & H. Fontaine (1987)- Eocene limestone offshore Northeast Palawan Island, Philippines. Proc. 22nd Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Guangzhou 1985, 2, p. 341-345.
(Small islands off NE Palawan mainly composed of radiolarite and limestone with some ultrabasic rocks. Pabellion and Apulit small islands with steeply dipping E-M Eocene grey-black limestone with common Distichoplax biserialis algae, Nummulites, Discocyclina and Asterocyclina. Pellatispira, reported by Grey (1954), was not found again)

David, P.P. & H. Fontaine (1989)- Eocene limestone offshore Northeast Palawan Island, Philippines. Proc. 24th Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bangkok 1987, 2, p. 130-134.
(Same paper as above)

David, S.D. (1994)- Geologie du Sud-Est de Luzon- contributions a l'etude geodynamique ante-Neogene de la Ceinture Mobile Est Philippine. Doct. Thesis Universite de Nice-Sophia Antipolis, Nice, p. 1-352.
('Geology of SE Luzon- contributions to the pre-Neogene geodynamics of the East Philippine Mobile Belt')

David, S.D., J.F. Stephan, J. Delteil, H. Bellon & F.G. Sajona (1996)- Geology, geochemistry, geochronology and structures of the ophiolites in Southeastern Luzon, Philippines. J. Geol. Soc. Philippines 51, p. 115-129.
(Ophiolites identified inW Caramoan Peninsula (Lagonoy Ophiolite) and in Cagraray, Batan and Rapu-Rapu islands. Exposures characterized by imbricated ultramafic rocks, gabbros, basalt flows with pillow structures and volcaniclastics. These are unconformably overlain by Late Cretaceous volcanic arc sequence. K-Ar dating of gabbro near Lagonoy yielded age of ~113 Ma (Aptian-Albian). On Rapu-Rapu diorite cutting ultramafic rocks dated as 77 Ma. Ophiolite sequences generally trend NE-SW, dipping to SW. Metamorphism and strike-slip faulting on ophiolites and overlying Late Cretaceous volcanic arc sequence sealed by M Eocene nummulitic limestone. Ophiolites in SE Luzon are pre-Late Cretaceous in age, probably formed in intra - arc oceanic setting and emplaced during pre-M Eocene)

David, S., J.F. Stephan, J. Delteil, C. Muller & J. Butterlin (1994)- The Tabgon Flysch and Ragas Point Olistostrome in the Caramoan Peninsula: nature, age, structures and their tectonic implications. J. Geol. Soc. Philippines 49, 1, p. 41-63.
(Flysch and matrix of overlying olistostrome sequence in E part of Caramoan Peninsula yielded latest M Eocene- earliest Late Eocene (zones NP17- NP18) nannofossils. Olistostrome with blocks of late Bartonian-E Lutetian limestones and nummulitic conglomerates as youngest olistoliths. Rocks represent important tectonic episode during M-L Eocene, probably corresponding to change in motion of Pacific Plate in M Eocene, which resulted in left lateral strike-slip faulting in E Philippine Mobile Belt)

David, S., J.F. Stephan, J. Delteil, C. Muller, J. Butterlin, H. Bellon & E. Billedo (1997)- Geology and tectonic history of Southeastern Luzon, Philippines. J. Asian Earth Sci. 15, 4-5, p. 435-452.
(SE Luzon in E Philippine Mobile Belt. Three units limited by two NW-SE trending strike-slip faults. N-C unit is M- early Late Cretaceous volcanic arc unconformably overlain by M-L Eocene volcanic arc, followed by E Oligocene intrusives. Median Unit underlain by Late Cretaceous volcanic arc. W unit is pre-Late Cretaceous ophiolitic suite unconformably overlain by Late Cretaceous volcanic arc sequence and M Eocene limestones. Units overlain by Late Oligocene- Pliocene carbonate and clastic sequence)

De Boer, J., L.A. Odom, P.C. Ragland, F.G. Snider & N.R. Tilford (1980)- The Bataan orogene: eastward subduction, tectonic rotations and volcanism in the Western Pacific (Philippines). Tectonophysics 67, p. 251-282.
(Philippine mobile belt crustal fragment between two subduction systems of opposite polarity. Eastern (Philippine-Quezon) system probably originated in Eocene during NW-SW spreading of W Philippine basin. Western (Manila-Bataan) system originated in Oligocene by spreading of S China Sea basin. Arcs migrated E from Miocene-Present, changing composition from tholeiitic via calc-alkaline to shoshonitic. C Luzon rotating counterclockwise due to differential spreading in S China Sea basin)

Defant, M.J., J. De Boer & D. Oles (1988)- The western Central Luzon arc, two arcs divided by rifting ? Tectonophysics 145, p. 305-317.
(W Central Luzon arc complex zone of volcanism. Volcanoes of N (Bataan) segment of arc along two semi-parallel lineaments. N segment cut off from S extension of arc by NE-SW 'cross arc' zone of volcanism, the Macolod Corridor. Volcanoes of S (Mindoro) segment of arc along two parallel lineaments)

Defant, M.J., R.C. Maury, J.L. Joron, M.D. Feigenson, J. Leterrier et al. (1989)- The geochemistry and tectonic setting of the northern section of the Luzon arc (Philippines and Taiwan). Tectonophysics 183, p. 187-205.
(Luzon Arc with Miocene (10 Ma)- Recent volcanism associated with E-ward subduction along Manila Trench for 1200 km, from Taiwan south to Mindoro. Volcanism clearly subduction-related with calc-alkaline affinities. Earliest phase of volcanism tholeiitic, mid-oceanic-ridge basalt-like)

Defant, M.J., R.C. Maury, E.M. Ripley, M.D. Feigenson & D. Jacques (1991)- An example of island-arc petrogenesis: geochemistry and petrology of the Southern Luzon Arc, Philippines. J. Petrology 32, 3. p. 455-500.
(Luzon arc volcanism associated with E-ward subduction of S China Sea floor along Manila Trench. Volcanic rocks typical arc phenocryst mineralogies: olivine, clinopyroxene, plagioclase and titanomagnetite in mafic rocks and clinopyroxene, plagioclase, orthopyroxene, titanomagnetite, amphibole in more felsic samples. Rocks range from basalts to rhyolites and show typical calc-alkaline features. Continental crustal material seems to play significant role, particularly in Macolod Corridor and Mindoro segment)

De Guzman, R.A. (1975)- Geotectonic development of Southern Mindoro geosyncline. The Philippine Geologist (J. Geol. Soc. Philippines) 29, 4, p. 1-19.

De Leon, M.M. & P.J. Militante-Macias (1992)- Calcareous nannofossil biostratigraphy of the western part of Tarlac Province Central Luzon Basin. J. Geol. Soc. Philippines 47, 1-2, p.
(Calcareous nannofossils from outcrops of deep marine Aksitero, Moriones, Malinta and Tarlac Fms in W part of Tarlac Province, C Luzon. Represent 11 zones of 'standard' U Oligocene- U Miocene nannofossil zonation)

De Los Santos, V.C. & F.D. Spencer (1968)- Geology and resources of central Polillo Island, Quezon. Philippines Bureau of Mines, Spec. Project Series Publ. 15, Coal, p. 1-57.
(Hashimoto 1982: Includes record of Late Eocene Nummulites- Discocyclina- Pellatispira larger foram fauna in Babacolan Lst overlies meta-volcanic facies in area of Polillo coalfield. Also Late Oligocene Eulepidina-Spiroclypeus without Miogypsina from coal-bearing Burdeos Fm and E-M Miocene Austrotrillina- Miogypsina thecidaeformis from overlying Langoyen Lst))

Deng, J.H., X.Y. Yang, H. Qi, Z.F. Zhang, A.S. Mastoi & W. Sun (2017)- Early Cretaceous high-Mg adakites associated with Cu-Au mineralization in the Cebu Island, Central Philippines: implication for partial melting of the Paleo-Pacific Plate. Ore Geology Reviews 88, p. 251-269.
(E Cretaceous arc volcanics and diorites associated with large porphyry deposit in Cebu Island, C Philippines. Zircon U-Pb age of diorites ~110 Ma, close to formation age of Lutopan diorites in Atlas porphyry Cu-Au deposit. Successive generation of arc volcanics and adakites in Cebu Island responses to subduction and rollback of Paleo-Pacific Plate to proto-Philippine Sea Plate in E Cretaceous)

Deng, J.H., X.Y. Yang, Z.F. Zhang & M.Santosh (2015)- Early Cretaceous arc volcanic suite in Cebu Island, Central Philippines and its implications on paleo-Pacific plate subduction: constraints from geochemistry, zircon U-Pb geochronology and Lu-Hf isotopes. Lithos 230, p. 166-179.
(online at: http://icpms.ustc.edu.cn/laicpms/publications/2015-DengJH-lithos.pdf)
(E Cretaceous arc volcanic suite in Cebu Island of C Philippines with basalt, andesite, etc. (previously viewed as parts of ophiolite complexes). With zircon grains of ~126 and ~119 2 Ma (Aptian). Detrital zircons from river sand peak at ~118 Ma. Similar to E Cretaceous arc basalts in Amami Plateau in N and E Halmahera in S. Zircon Hf isotopes imply E Early Cretaceous subduction of Paleo-Pacific plate. Part of single subduction zone along S, W, N margin of W Philippine Basin before opening of Philippine Sea Plate)

Dickerson, R.E. (1922)- Review of Philippine paleontology. Philippine J. Science, Manila, 20, p. 195-229.
(online at: https://ia700802.us.archive.org/8/items/mobot31753002580576/mobot31753002580576.pdf)
(Paper describing economic uses of paleontology, and review of Mesozoic and Cenozoic fossils in Philippines. Mesozoic limited to ?Jurassic cherts on Panay with radiolaria Cenosphaera affinis and Dictyomitra tenuis. Cenozoic limited to Oligocene- Recent sediments, with fossils (mainly molluscs) at numerous localities)

Dickerson, R.E. (1924)- Tertiary paleogeography of The Philippines. Philippine J. Science, Manila, 25, 1, p. 11-50.
(Philippines sediments limited to chert of questionable Jurassic age, overlain by Miocene- Recent sediments and volcanics (incorrect: Cretaceous- Paleogene sediments also present; JTvG). With broad paleogeographic maps)

Diegor, W.G., P.C. Momongan & E.J. Mamaril-Diegor (1996)- Ophiolitic basement of Cebu. J. Geol. Soc. Philippines 51, 1-2, p.
(Cebu probably developed over oceanic crust. Cansi Volcanics (basic pillow lavas), Tunlob Schist, serpentinite diapirs (cold intrusion during wrench tectonics), Pandan Fm (incl. pillow basalt flow overlain by thin bedded cherts) all suggest ophiolitic affinity. Cansi Fm volcanism apparently began to pour over oceanic crust that may have previously been emplaced perhaps during E Cretaceous)

Dimalanta, C.B., D.V. Faustino-Eslava,, J.A.S. Gabo-Ratio, E.J. Marquez, J.T. Padrones et al. (2020)- Characterization of the proto-Philippine Sea Plate: evidence from the emplaced oceanic lithospheric fragments along eastern Philippines. Geoscience Frontiers 11, 1, p. 3-21.
(online at: www.sciencedirect.com/science/article/pii/S1674987119300349)
(Proto-Philippine Sea Plate proposed by several authors to account for origin of the Mesozoic supra-subduction ophiolites along Philippine archipelago and Halmahera. Nearly all crust-mantle sequences along E Philippines share Early to Late Cretaceous ages, and geochemical signatures reflect mid-oceanic ridge and supra-subduction signatures. Probably near-equatorial Mesozoic supra-subduction zone origin and likely fragments of Mesozoic Proto-Philippine Sea Plate)

Dimalanta, C.B., D.V. Faustino-Eslava, J.T. Padrones, K.L. Queano, R.A.B. Concepcion & S. Suzuki (2018)- Cathaysian slivers in the Philippine island arc: geochronologic and geochemical evidence from sedimentary formations of the west Central Philippines. Australian J. Earth Sciences 65, 1, p. 93-108.
(Clastic units from W Central Philippines (Mindoro, Panay and Palawan) likely from sources of Cathaysian origin. U-Pb dating peaks at 185-140 Ma, 140-120 Ma and 112-90 Ma, chronicling Yanshanian magmatic

events. Same formations also older intercept at 1.9-1.85 Ga, likely corresponding to orogenic episode in late Paleoproterozoic Cathaysian block. Also rel. strong continental chemical signature)

Dimalanta, C.B., E.G.L. Ramos, G.P. Yumul & H. Bellon (2009)- New features from the Romblon Island Group: key to understanding the arc-continent collision in Central Philippines. Tectonophysics 479, p. 120-129.
(Complete ophiolite sequence and melange in Romblon Island Group, C Philippines. Tablas, Romblon and Sibuyan Islands built on amalgamated crust and mantle rocks. Jurassic- Cretaceous age of formation and late E Miocene age of emplacement suggested for Sibuyan Ophiolite Complex. Emplacement of facilitated through displacements along E-verging thrust faults developed consequent to E Miocene arc-continent collision in C Philippines. K-Ar isotopic ages of 12 Ma for some metamorphic rocks in area)

Dimalanta, C.B., R.C. Salapare, D.V. Faustino-Eslava, N.T. Ramos, K.L. Queano, G.P. Yumul & T.F. Yang (2015)- Post-emplacement history of the Zambales Ophiolite complex: insights from petrography, geochronology and geochemistry of Neogene clastic rocks. J. Asian Earth Sci. 105, p. 215-227.
(Zambales Ophiolite Complex in Luzon made up of two blocks: (1) M Jurassic- E Cretaceous Acoje Block-San Antonio Massif of island arc tholeiite composition and (2) Eocene Coto Block-Cabangan Massif of transitional mid-ocean ridge basalt-island arc tholeiite affinity. Ophiolitic bodies overlain by Miocene- Pliocene sediments with varying quantities of ophiolitic and arc volcanic detritus)

Easton, W.H. & M.M. Melendres (1963)- First Paleozoic fossil from Philippine archipelago. American Assoc. Petrol. Geol. (AAPG) Bull. 47, 11, p. 1871-1873.
(Paleozoic cyathopsid coral (Gshelia? or Caninia) in cobble from Late Tertiary conglomerate at Punso, SE Mindoro. Coral probably of M-U Carboniferous age and first Paleozoic fossil derived from basement rocks)

Encarnacion, J.P. (1994)- Geochronological, geochemical and geological constraints on models of ophiolite generation and ARC growth: Evidence from the northern Philippines. Ph.D. Thesis University of Michigan, p. 1-132.
(On Eocene Zambales and Angat ophiolites of S Sierra Madre, Luzon. Zircon U-Pb ages from tonalite and plagiogranite of Zambales ophiolite ~44-45 Ma (M Eocene), Angat Ophiolite ~48 Ma, suggesting parts of a single plate, probably originated in backarc setting. Overlain by Eocene volcanic arc. Also Palawan Ophiolite which was obducted onto microcontinental fragment rifted from SE China)

Encarnacion, J. (2004)- Multiple ophiolite generation preserved in the northern Philippines and the growth of an island arc complex. Tectonophysics 392, p. 103-130.
(Oceanic arcs grow through addition of subduction-generated magmas, but in N Philippines also major contribution from repeated oceanic crust generation with subsequent preservation of basic-ultrabasic units in arc complex. At least five episodes of oceanic crust generation represented in N Philippines by ophiolitic sequences and recent intra-arc seafloor spreading. Ages pre-(?)Jurassic- Quaternary. Most ophiolites generated as back-arc, fore-arc, or intra-arc crust within Philippine arc complex)

Encarnacion, J. (2004)- Northern Philippine ophiolites: modern analogues to Precambrian ophiolites? In: T.M. Kusky (ed.) Precambrian ophiolites and related rocks, Elsevier Developments in Precambrian Geology 13, p. 615-626.
(N Philippines has ~150 My history of multiple, overlapping periods of oceanic crust generation, arc volcanism and deformation. At least five ophiolite complexes. Sedimentary basins probably floored by oceanic crust are dominated by immature sediments and volcanoclastics, locally up to 10 km thick. Entire arc-ophiolite complex being accreted to Eurasia since Miocene)

Encarnacion, J., E.J. Essene, S.B. Mukasa & C.H. Hall (1995)- High-pressure and -temperature subophiolitic kyanite-garnet amphibolites generated during initiation of Mid-Tertiary subduction, Palawan, Philippines. J. Petrology 36, 6, p. 1481-1503.
(Metamorphic rocks near base of pre-M Eocene ophiolite in C Palawan record conditions of ophiolite emplacement onto rifted SE margin of China (Palawan Block). Radiometric ages all around 34 Ma (~Eo-Oligocene boundary). P-T conditions and regional geology suggest metamorphism at depth >30 km in subduction zone. Rapid cooling and exhumation after peak metamorphic conditions in earliest Oligocene)

Encarnacion, J.P. & S.B. Mukasa (1997)- Age and geochemistry of an ánorogenicô crustal melt and implications for I-type granite petrogenesis. Lithos 42, p. 1-13.
(Capoas I-type biotite granite of Late M Miocene age (zircons 15± 3 Ma, monazites~13.4 Ma) at W side of N Palawan Continental Terrane. Intruded into Permian-Jurassic sedimentary rocks of N Palawan Continental Terrane (fragment of Mesozoic Andean margin of SE China that was separated from mainland during Late Oligocene- E Miocene opening of S China Sea). Composed mainly of older continental crust; probably calc-alkaline source rocks of Mesozoic Andean-type margin of S China that underwent partial melting in late M Miocene time in 'anorogenic' setting)

Encarnacion, J., S.B. Mukasa & C.A. Evans (1999)- Subduction components and the generation of arc-like melts in the Zambales ophiolite, Philippines: Pb, Sr and Nd isotopic constraints. Chemical Geology 156, p. 343-357.
(On M Eocene arc-like island arc tholeiites and minor boninitic rocks in Zambales Ophiolite Complex of C Luzon, which are less than ~1 Ma younger (44.2 Ma) than MORB-like sections (45.1 Ma))

Encarnacion, J.P., S.B. Mukasa & E.J. Obille (1993)- Zircon U-Pb geochronology of the Zambales and Angat ophiolites, Luzon, Philippines: evidence for an Eocene arc-back arc pair. J. Geophysical Research 98, p. 19991-20004.
(*Two basement terranes exposed on Luzon: Zambales ophiolite in W and Angat ophiolite in E, separated by 10 km thick and 100 km wide sedimentary basin. Zircon ages from plagiogranites in Zambales ophiolite ~45 Ma (M Eocene), in agreement with Late Eocene age of overlying Aksitero Fm. Zircons from Angat Ophiolite 48 Ma, younger than Late Cretaceous age based on radiolarian fauna from melange sequence SSE of main ophiolite. Small age difference between Zambales and Angat ophiolites suggests common origin. Zambales-Angat ophiolite represents preserved Eocene back-arc basin, formed behind Eocene arc, within Cretaceous oceanic basement, therefore not allochthonous terranes)*

Endo, R. (1968)- Fossil algae from Mindoro Oriental Province, Mindoro Island, the Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 4, p. 211-219.
(Algae from conglomeratic beds near Mansalay Fm (probably Jurassic) at Agbahag Point, Mindoro Oriental. Incl. Archaeolithporella hidensis, Vermiporella nipponica (= Vermiporella sumatrana Pia 1937?; JTvG), Macroporella, etc. Most species known from Permian of Japan, suggesting Permian pebbles reworked into Jurassic sediments)

Esguerra, F.B. (1961)- Geochemistry and mineralogy of the Surigao nickeliferous laterites, Mindanao, Philippines. Philippine Geologist 15, p. 1-26.

Evans, C.A., G. Casteneda & H. Franco (1991)- Geochemical complexities preserved in the volcanic rocks of the Zambales Ophiolite, Philippines. J. Geophysical Research, Solid Earth 96, B10, p. 16251-16262.
(Geochemical characteristics of volcanic rocks from Zambales Ophiolite, Luzon, indicate oceanic crust now preserved in ophiolite generated in oceanic subduction zone environment. Volcanic rocks magnesian basalt (including MOR Basalt, island arc tholeiite, and boninite-like lavas) to andesite and dacite and have trace elements suggesting derivation from heterogeneous mantle source). Paleomagnetic studies suggest Zambales Ophiolite formed as oceanic crust in vicinity of present-day Celebes Sea)

Fan, J., S.G. Wu & G. Spence (2015)- Tomographic evidence for a slab tear induced by fossil ridge subduction at Manila Trench, South China Sea. Int. Geology Review 57, 5-8, p. 998-1013.
(Tomography of high-velocity subducted slab of S China Sea beneath Manila Trench. Angle of slab varies along trench: at ~16° N slab dips at 24° ~ 32° for 20-250 km depth. A ~17.5° slabs near vertical from 70-700 km depth, at 20° N from horizontal abruptly to near vertical to 500 km depth. Steepening may indicate slab tear, coincident with axis of fossil ridge in SCS slab at ~17° N. Low-velocity zones above 300 km may represent the formation of slab window. Slab tear could explain volcanic gap and geochemical difference between Miocene and Quaternary volcanoes in Luzon Arc, and distribution of adakites and related porphyry Cu-Au deposits in Luzon area. Initial time of ridge subductio possibly started at ~8 Ma)

Fan, J., D. Zhao & D. Dong (2016)- Subduction of a buoyant plateau at the Manila Trench: tomographic evidence and geodynamic implications. Geochem. Geophys. Geosystems 17, 2, p. 571-586.
(P-wave tomography shows changes in dip angle of subducted Eurasian Plate from N to S along N Manila Trench/ Luzon Arc, consistent with partial subduction of buoyant plateau. Slab tears along edges of plateau in subducted plate and subducted lithosphere may be absent below 250 km at ~19°N and ~21°N. Subducted plate at ~21°N steeper than at ~19°N. May explain ~5 km separation of W and E volcanic chains in Luzon Arc at ~18°N, converging N-ward. Low-velocity zone at 20-200 km beneath Manila Accretionary Prism at ~22°N, suggesting subduction may stop there. Taiwan Orogeny may originate from subduction of buoyant plateau)

Fan, J., D. Zhao, D. Dong & G. Zhang (2017)- P-wave tomography of subduction zones around the central Philippines and its geodynamic implications. J. Asian Earth Sci. 146, p. 76-89.
(Tomographic data show subducted S China Sea slab under S segment of Manila Trench steepens and tears, resulting in migration of active volcanism in Macolod Corridor, due to between Palawan block- Philippine Mobile Belt collision. Subduction of Philippine Sea Plate along Philippine Trench started at 10-12°N or S of 12°N from at least ~10 Ma. High-velocity anomaly near mantle transition zone interpreted as subducted Proto S China Sea slab, sinking deeper SE-ward, suggesting Palawan block collision younging from S to N (see also Wu & Suppe 2017))

Faure, M. & K. Ishida (1990)- The mid-Upper Jurassic olistostrome of the West Philippines: a distinctive key-marker for the North Palawan block. J. Southeast Asian Earth Sci. 4, 1, p. 61-67.
(N Palawan island mainly chaotic mix of turbidites, slumps, pebbly mudstone, sandstone and olistostrome, with exotic blocks of Permian- Triassic chert and limestone, M-U Jurassic limestone, acidic lava and volcanoclastic rocks. Callovian- Lower Kimmeridgian radiolarians in mudstone matrix. Olistostrome with exotic blocks overlain by Late Cretaceous-Eocene turbidites. Similar olistostrome at Calamian, Mindoro, Panay and Carabao islands (other authors view this as Jurassic accretionary complex?; JTvG))

Faure, M., Y. Marchadier & C. Rangin (1989)- Pre-Eocene synmetamorphic structure in the Mindoro-Romblon-Palawan area, West Philippines, and implications for the history of Southeast Asia. Tectonics 8, 5, p. 963-979.
(Pre-Eocene 'basement' in Mindoro-Lubang area: (1) pre-Eocene olistostrome; (2) ophiolitic nappe; (3) schistose sequence (pelites, sandstones, etc.); and (4) gneissic unit. Ophiolite and schistose sequence two thrust sheets of oceanic origin thrust upon gneissic unit considered part of continental basement called W Philippines Block. Mindoro metamorphics not younger than Eocene and probably not older than late Paleozoic)

Faustino-Eslava, D.V., A.d.C. Perez, K.L. Queano, R.C. Salapare, J.T. Padrones, C.B. Dimalanta, G.P. Yumul, N.T. Ramos, B.D. Payot & P.M. Operio (2013)- Low-latitude paleoceans in the Philippines. In: 2nd Int. Symposium Int. Geoscience Programme (IGCP) Project 589, Borocay, Philippines, p. 102-103. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/2nd%20Symposium/Abstract%20volume.pdf)
(Fragments of ancient oceanic crusts along entire Philippine Archipelago. Paleomagnetic data from ophiolites and associated formations in Luzon and C Philippines suggest older rocks formed closer to equatorial paleolatitudes: Cretaceous Mangyan meta-ophiolite (Mindoro; ~2.4°S- 1.3°N) and Cretaceous-Eocene Chico River pillow basalts (Luzon; ~6°N). Pillow basalts of Oligocene Amnay Ophiolite in Mindoro ~10°N. Oligo-Miocene-Pliocene rocks of Luzon close to original deposition (e.g. Moriones and Sta. Cruz Fms; ~15°N)

Faustino, D.V., G.P. Yumul, J.V. De Jesus, C.B. Dimalanta, J.C. Aitchison, M.F. Zhou, R.A. Tamayo & M.M. De Leon (2003)- Geology of southeast Bohol, Central Philippines: accretion and sedimentation in a marginal basin. Australian J. Earth Sci. 50, p. 571-583.
(SE Bohol composed of Cretaceous basement complex with Alicia Schist, overthrust by Cansiwang melange, structurally overlain by SE Bohol Ophiolite Complex. Overlain unconformably by ~2000m thick Lower Miocene- Pleistocene carbonate and clastic sediments and igneous units. Accretionary prism beneath ophiolite complex and presence of boninites suggest SE Bohol Ophiolite Complex emplaced in forearc setting. It formed in E Cretaceous in suprasubduction zone environment related to SE-facing arc)

Faustino, D.V., G.P. Yumul, C.B. Dimalanta, J.V. De Jesus, M.F. Zhou, J.C. Aitchison & R.A. Tamayo (2006)- Volcanic-hypabyssal rock geochemistry of a subduction-related marginal basin ophiolite: Southeast Bohol Ophiolite-Cansiwang melange complex, Central Philippines. Geosciences J. 10, 3, p. 291-303.
(E Cretaceous SE Bohol Ophiolite- Cansiwang Melange Complex and Alicia Schist form basement of SE Bohol Island. Four discrete groups in volcanic and ophiolite-melange complex: boninitic rocks, enriched and normal mid-ocean ridge basalts and high-magnesian andesites. Geochemical diversity best explained by supra-subduction zone environment of formation. Formation of Cansiwang Melange concurrent with ophiolite emplacement by subduction-accretion along forearc margin, which was later jammed into inactivity with entry of Alicia Schist that most likely was oceanic bathymetric high)

Fernandez, M.V., A.P. Sevilla & S. David (1994)- Notes on the Cretaceous carbonates in Catanduanes Island and Caramoan Peninsula, Philippines. J. Geol. Soc. Philippines 49, 4, p. 241-261.
(Cretaceous rocks of Catanduanes Island and Caramoan Peninsula contain (1) Aptian- Cenomanian shallow water carbonates with Orbitolina texana and Orbitolina cf. conoidea; (2) Late Campanian- E Maastrichtian pelagic wackestones with Globotruncana, etc.; and (3) Late Maastrichtian Lepidorbitoides (Asterorbis) sp. in shallow marine packstones with rudists (possibly reworked in M-U Eocene olistostrome?; JTvG))

Fernando, A.G.S., C.Y. Magtoto, J.D.S. Guballa & A.M. Peleo-Alampay (2016)- Calcareous nannofossils from Cretaceous units in Catanduanes Island. Bull. Natl. Museum Natural Sci., Ser. C, 42, p. 35-47.
(online at: http://www.kahaku.go.jp/research/publication/geology/download/42/BNMNS_C42_35-47.pdf)
(Cretaceous outcrops in Catanduanes Island, E Philippines with two distinct nannofossil assemblages:UC10-UC12 zones (Coniacian-Santonian) and Campanian-Maastrichtian. Previously unmapped black mudstone in N Catanduanes UC5c subzone (Cenomanian-Turonian boundary; possibly oceanic anoxic event 2 (OAE2))

(Reprint of Fontaine et al. 1983)

Fontaine, H., N.D. Tien & D. Vachard (1986)- Discovery of Permian limestone south of Tara Island in the Calamian Islands, Philippines. In: H. Fontaine (ed.) The Permian of Southeast Asia, CCOP Tech. Bull. 18, p. 161-167.
(Permian limestones in NE part of Calamian islands. Malemeglemeg and Botulan Islands Late Murgabian-Midian age wackestone with forams-algae, incl. Tubiphytes and fusulinids. Getche island oolitic grainstone may be Permian or Triassic)

Forbes, M.T., C.B. Mapaye & J.A. Bacud (2011)- Structural characterization of offshore Southwest Palawan, Philippines using the most recent 2D/3D seismic data. Proc. 2011 SE Asia Petroleum Expl. Soc. (SEAPEX) Conference, Singapore, 16, 25p. *(Abstract + Presentation)*
(Improved seismic imaging allows identification of 4 major structures, Eocene half-graben with thick synrift deposits, varying deformational styles in fold-thrust belt, duplication of Oligo-Miocene Nido Lst reservoir, etc.)

Foronda, J. (1994)- Sequence stratigraphy of an Oligocene-Miocene mixed siliciclastic carbonate system, Visayan Basin, Central Cebu (Philippines). Doct. Thesis, Friedrich-Wilhelms-Universitat Bonn, Bonner Geowissensch. Schriften 11, p. 1-152. *(Unpublished)*

Foronda, J. (1996)- Depositional systems and coal cyclothems in the Upper Malubog Formation (Lower Miocene), Cebu, Central Philippines. In: C.A.Caughey et al. (eds.) Proc. Int. Symp. Sequence stratigraphy in Southeast Asia, Jakarta 1995, Indon. Petroleum Assoc. (IPA), p. 465-476.
(U Malubog Fm in C Cebu spans Lower Miocene NN2- NN3 nannoplankton zones. Thickness at least 620m. Composed of interbedded mudstones, siltstones, sandstones, minor carbonates and conglomerates. Represents single depositional sequence with shelf margin, transgressive, and highstand systems tracts. Coals cap two topmost deltaic cycles. During transgressive phase a retrograding barrier island system developed on top of deltaic deposits. Top of sequence is angular unconformity which represents NN4 hiatus in Visayan Basin)

Foronda, J.M., J.A. Bacud & C.F. Bastero (2007)- New potential plays in the syn-rift sequences in Offshore Palawan. Proc. 2007 SE Asia Petroleum Expl. Soc. (SEAPEX) Conf., Singapore, p. 1-28. *(Abstract + Presentation)*
(Paleogene 'syn-rift' sequences off NW Palawan mainly marine deposits. M Oligocene unconformity in S China Sea Basin separates Syn-Rift from widespread Nido Lst platform carbonates. Exploration targets Nido Lst buildups and fractured platform carbonates and overlying Pagasa Fm turbidites. Outboard highs where most wells have been drilled, syn-rift low net/gross, giving perceived lack of reservoir sands. Potential lowstand plays basin floor fans, leveed channels and incised valley fills. Basin floor fan may reach several km along dip. Leveed channel complex irregular and discontinuous reflections with occasional channels almost 1 km wide. Incised valley fills typically >2.5 km wide. Exploration risks for syn-rift plays include lack of local condensed section above basin floor fans to serve as seal and drilling sand-poor fill in leveed channels and incised valleys)

Foronda, J.M. & W. Schoell (1987)- Microfacies types of Binangonan Formation, Antipolo-Teresa, Rizal Province. The Philippine Geologist (J. Geol. Soc. Philippines), 41, p. 40-78.
(U Oligocene- Lw Miocene Binangonan Fm carbonates grade up from proximal turbidites into reef buildup and reef-associated carbonates. Basin margin facies mainly planktonic forams. Foreslope facies mainly floatstones and packstones. Main organic buildups comprised of boundstones, and minor packstones/ grainstones)

Forster, H., D. Oles, U. Knittel, M.J Defant & R.C Torres (1990)- The Macolod Corridor: a rift crossing the Philippine island arc. Tectonophysics 183, p. 265-271.
(Macolod Corridor in SW Luzon is 40 km wide zone of active Quarternary volcanism which crosses island in NE-SW direction. Probably pull-apart zone formed by NW-SE oriented shearing)

Forster, M.A., R. Armstrong, B. Kohn, G.S. Lister,M.A. Cottam & S. Suggate (2015)- Highly retentive core domains in K-feldspar and their implications for 40Ar/39Ar thermochronology illustrated by determining the cooling curve for the Capoas Granite, Palawan, The Philippines. Australian J. Earth Sci. 62, p. 883-902.
(online at: http://searg.rhul.ac.uk/pubs/forster_etal_2015%20Capoas%20K-feldspar%20Palawan.pdf)
(K-feldspar from Late Miocene Capoas Granite on NW Palawan with retentive diffusion domains that are closed to argon diffusion at near-solidus temperatures during cooling. High closure T from Capoas Granite K-feldspar consistent with coincidence of 40Ar/39Ar ages with U-Pb zircon ages at ~13.5 ± 0.2 Ma. Cooling rate then accelerated, but slowed by ~12 Ma, then once again accelerated at ~11 Ma)

Fournier, F. (2004)- Evolution de l'edifice carbonate du champ de gaz de Malampaya, Tertiaire, offshore Palawan, Philippines. Implications pour la caracterisation du reservoir. Thesis University of Provence, p. 1-208. *(Unpublished)*
('Evolution of the carbonate buildup of the Malampaya gas field, Tertiary, offshore Palawan, Philippines; implicatons for reservoir characterization'. Malampaya gas field in 850-1200m of water, within Late Eocene- E Miocene shallow-water carbonates. Carbonate system initially developed on crest of tilted block during rifting of S China Sea. High-frequency subaerially exposed cycles in inner-shelf (time scale 10-100ka))

Fournier, F. & J. Borgomano (2007)- Geological significance of seismic reflections and imaging of the reservoir architecture in the Malampaya gas field (Philippines). American Assoc. Petrol. Geol. (AAPG) Bull. 91, 2, p. 235-258.
(North Palawan 1989 Malampaya oil-gas discovery in U Eocene- Lower Miocene carbonate buildup. Porosity distribution mainly controlled by meteoric diagenesis)

Fournier, F., J. Borgomano & L.F. Montaggioni (2005)- Development patterns and controlling factors of Tertiary carbonate buildups: insights from high-resolution 3D seismic and well data in the Malampaya gas field (Offshore Palawan, Philippines). Sedimentary Geology 175, p. 189-215.
(Malampaya buildup off NW Palawan internal carbonate platform architecture. Carbonate system initiated in Late Eocene (Pellatispira) as attached shelf influenced by clastic input. Late Eocene- E Oligocene syn-depositional extensional tectonics (E tilting and block faulting) favoured development of small buildups on highs. After E-ward reef progradation, aggrading shelf developed in Late Oligocene- E Miocene. Demise of buildup in late E Miocene from increase in subsidence and/or nutrient input. Eustacy, oceanographic conditions and type of carbonate producers played subordinate role in buildup development and demise)

Fournier, F., L. Montaggioni & J. Borgomano (2004)- Paleoenvironments and high-frequency cyclicity from Cenozoic south-east Asian shallow-water carbonates: a case study from the Oligo-Miocene buildups on Malampaya (offshore Palawan, Philippines). Marine Petroleum Geol. 21, p. 1-21.
(Malampaya- Camago oil-gas field in Nido carbonate buildup of Late Oligocene- E Miocene age. Microfacies assemblages described. High-frequency cyclicity recognized of 3-10m thick shallowing-upward cycles, often capped by paleosol, probably reflecting Milankovic scale sea level fluctuations)

Francisco, F.U. (1953)- The Pre-Tertiary rocks of Buruanga Peninsula, Panay Island, Philippines. Proc. 8th Pacific Science Congress 2, p. 482-498.
(Buruanga Peninsula of Panay, is uplifted crustal block composed of Mesozoic? Buruanga metamorphic complex, intruded by quartz diorites (probably also pre-Tertiary) in SE, and capped by Tertiary volcanic and sedimentary rocks (now viewed as part of Palawan- Mindoro terrane; JTvG))

Francisco, F.U. (1966)- A review and assessment of oil exploration in the Philippines, 1. Petroleum Division, Philippine Bureau of Mines, p. 1-193.

Francisco, F.U. (1975)- A review of oil exploration and stratigraphy of sedimentary basins of the Philippines, 2. Petroleum Division, Philippine Bureau of Mines, p. 1-95.

Fraser, A.R. & E.B. Guazon (1994)- Geology and petroleum potential of Northeast Palawan Shelf. Australian Geol. Survey Org. (AGSO), Canberra, Record 1994/41, Part 3, p. 1-47.

Fuller, M., R. Haston & J. Almasco (1989)- Paleomagnetism of the Zambales ophiolite, Luzon, northern Philippines. Tectonophysics 168, p. 171-203.
(Paleomagnetic data suggest CCW rotation and N-ward translation of Zambales ophiolite since Eocene)

Fuller, M., R. Haston & E. Schmidtke (1989)- Paleomagnetism in SE Asia: sinistral shear between Philippine Sea Plate and Asia. In: C. Kissel and C. Laj (eds.) Paleomagnetic rotations and continental deformation, Kluwer Academic Publishers, p. 411-430.
(Paleomagnetic data from Philippine Sea Plate indicate CW rotation since Oligocene. Sinistral shear zone between Philippine Sea Plate and Asia (incl. Philippines))

Fuller, M., R. McCabe, I.S. Williams, J. Almasco, R.Y. Encina, A.S. Zanoria & J.A. Wolfe (1983)- Paleomagnetism of Luzon. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian Seas and Islands- II, American Geophys. Union (AGU), Geophys. Monograph 27, p. 79-94.
(Paleomag of 50 Cenozoic sites in N Philippines. No distinguishable rotations in past 5 My. E-M Miocene results reveal CW rotation of ~20°, but no detectable N-S translation. Eocene sites from Zambales ophiolite and

overlying sediments indicate formation at equatorial latitudes. Tectonic model for past 17 My invokes NW motion of Philippine Sea Plate and pinning of N Philippines at S margin by collision with Calamian continental fragment. Continued advance of leading edge of Philippine Sea Plate causes CCW rotation of Luzon and Manila trench, until N end of trench pinned by collision with Taiwan)

Gabo, J.A.S., C.B. Dimalanta, M.G.S. Asio, K.L. Queano, G.P. Yumul & A. Imai (2009)- Geology and geochemistry of the clastic sequences from Northwestern Panay (Philippines): implications for provenance and geotectonic setting. Tectonophysics 479, p. 111-119.
(Whole-rock geochem of clastic sequences in NW Panay show different compositions for Buruanga Peninsula (continental margin provenance; part of Palawan Microcontinental Block) and Antique Range (oceanic island arc provenance; Philippine Mobile Belt))

Galgana, G., M. Hamburger, R. McCaffrey, E. Corpuz & Q. Chen (2007)- Analysis of crustal deformation of Luzon Island, Philippines using geodetic observations and earthquake focal mechanisms. Tectonophysics 432, p. 63-87.
(GPS velocities from Luzon and focal mechanism used to constrain tectonic deformation in plate boundary zone between Philippine Sea Plate and Eurasia (Sundaland block). Luzon is tectonically active plate boundary zone, comprising six mobile elastic tectonic blocks between two active subduction zones. Philippine Fault and associated intra-arc faults accommodate much of trench-parallel component of relative plate motion)

Gallagher, J.J. (1986)- Philippine Islands: a tectonic railroad siding. In: M.T. Halbouty (ed.) Future petroleum provinces of the world, American Assoc. Petrol. Geol. (AAPG), Mem. 40, p. 515-527.
(Philippine islands mix of continental and oceanic crust fragments. Carbonate and clastic sediments of main terranes currently deforming by strike-slip, subduction and extension. Complex tectonic history potentially limits size of hydrocarbon accumulations. With plate tectonic reconstructions M Jurassic- Recent: Mesozoic subduction complex, Late Cretaceous- E Eocene rift and strike slip, E Oligocene- M Miocene drift, M Miocene collision between Cuyo tectonic element and subduction complex to S, Late Miocene and younger accretion)

Gallagher, J.J. (1987)- Philippine microplate tectonics and hydrocarbon exploration. In: M.K. Horn (ed.) Trans. 4th Circum-Pacific Energy and Mineral Resources Conference, Singapore 1986, p. 103-119.
(Similar to Gallager (1986) paper. Early carbonate and clastic stratigraphic traps developed during Mesozoic and Early Cenozoic rifting. Hydrocarbons generated in deep rift basins and migrated to early traps during rifting and drifting. Later Cenozoic compressional activity may have destroyed some traps. With plate tectonic reconstructions Late Triassic- Recent)

Gan, R.M. & F. Rillera (1984)- Lower Miocene carbonates in West Palawan. In: Joint ASCOPE/CCOP Workshop on the hydrocarbon occurrence in carbonate rocks, Surabaya 1982, ASCOPE Techn. Paper 2, Jakarta, p. 433-444.
(On E Miocene Nido Limestone in Palawan area)

Garrison, R.E., E. Espiritu, L.J. Horan & L.E. Mack (1979)- Petrology, sedimentology, and diagenesis of hemipelagic limestone and tuffaceous turbidities in the Aksitero Formation, Central Luzon, Philippines. U.S. Geol. Survey (USGS) Prof. Paper 1112, p. p. 1-16.
(online at: http://pubs.usgs.gov/pp/1112/report.pdf)
(Aksitero Fm of C Luzon is U Eocene- Lower Oligocene sequence of hemipelagic limestone with thin tuffaceous turbidites, overlying Zambales ophiolitic basement complex. Limestone mainly planktonic foraminifera and calcareous nannofossils, with up to 30% volcaniclastic debris. Hydrocarbons migrated into tuffaceous layers early during diagenesis but subsequently flushed out and only bitumen coatings remain. Deposition of Aksitero Fm probably at >1000m water depth in subsiding basin adjacent to active island arc system)

Geary, E.E., T.M. Harrison & M. Heizler (1988)- Diverse ages and origins of basement complexes, Luzon, Philippines. Geology 16. 4, p. 341-344.
(40Ar/39Ar ages from two basement complexes in SE Luzon document first occurrences of pre-Late Cretaceous age rocks in E Philippines: Late Jurassic (Caramoan complex) to E Cretaceous and E Miocene (Camarines

Norte- Calaguas Islands complex). Philippine Archipelago amalgamation of allochthonous Mesozoic and Cenozoic island-arc, ocean-basin and continental fragments assembled during Tertiary)

Geary, E.E. & R.W. Kay (1989)- Identification of an Early Cretaceous ophiolite in the Camarines Norte-Calaguas Islands basement complex, eastern Luzon, Philippines. Tectonophysics 168, p. 109-126.
(Pre-Late Cretaceous ophiolite assemblage underlies much of metamorphic basement of E part of Camarines Norte-Calaguas Islands, SE Luzon. Ophiolite lithologies harzburgites, gabbros, pillow lavas, etc., structurally disrupted by W-ward directed thrusting. Minimum age of 100 Ma inferred from Ar/Ar analyses of amphibolites associated with gabbros)

Geary, E.E., R.W. Kay, J.C. Reynolds & S.M. Kay (1989)- Geochemistry of mafic rocks from the Coto Block, Zambales ophiolite, Philippines: trace element evidence for two stages of crustal growth. Tectonophysics 168, p. 43-63.
(Coto Block portion of Zambales ophiolite two-stage crustal history: (1) dominantly N-MORB type ocean crust formation at large or back-arc basin spreading center; (2) soon thereafter chemically modified by incipient island arc magmatism, most probably in proto-forearc setting)

In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 22, p. 75-82.
(Discovery of generally rare E Oligocene/ zone Td reticulate Nummulites fichteli in N Luzon, in thin limestones in volcanoclastic Sagada Fm. Associated with Lepidocyclina(Eulepidina) and Cycloclypeus cf. oppenoorthi)

Hashimoto, W. & K. Matsumaru (1982)- Larger foraminifera from the Philippines. Part XIV. On some larger Foraminifera-bearing rocks from Palawan. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 24, p. 39-44.
(Three outcrop samples from Palawan with M-L Miocene larger foraminifera (Lepidocycline (Multilepidina) luxurians). No stratigraphic context)

Hashimoto, W. & K. Matsumaru (1984)- Mesozoic and Cenozoic larger Foraminifera of the Philippines and references to those found from Borneo by the APRSA's palaeontological reconnaissance. In: T. Kobayashi, R.

Toriyama & W. Hashimoto (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 147-166.
(Review of Cretaceous (Orbitolina) and Tertiary larger foraminifera occurrences in The Philippines)

Hashimoto, W., K. Matsumaru & P.M. Alcantara (1982)- Larger foraminifera from the Philippines. Part XIII. Larger foraminifera from the Trankalan Limestone and the Escalante (Toboso) Formation, West of Lanao River Valley, northeastern Occidental Negros. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 24, p. 31-38.
(Trankalan Lst with Late Oligocene Te2-3- Te4 larger foraminifera (Lepidocyclina, Spiroclypeus, Miogypsinoides companatus, etc., Escalante Fm with Early Miocene Te4-Te5 forams (inc. Miogypsina))

Hashimoto, W., K. Matsumaru & H. Fuchimoto (1980)- Consideration on the stratigraphy of the Caraballo Range, Northern Luzon: larger foraminiferal ranges on the Cenozoic of the Philippines. In: T. Kobayashi, R. Toriyama et al. (eds.) Symposium on the geology and paleontology of SE Asia, Tsukuba 1978, Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 21, p. 119-134.
(Caraballo Range of NE Luzon with larger foram-bearing limestones of different ages: low-metamorphic Lubingan Fm 'basement' with Eocene Nummulites Lst (= ~M Eocene metamorphism?). Mamparang Fm volcanics with Oligocene Eulepidina. Unconformably overlain by latest Oligocene- E Miocene (Te) Santa Fe Lst with Miogysinoides, Spiroclypeus, Eulepidian, etc., late E Miocene (Tf1) Natbang Fm)

Hashimoto, W., K. Matsumaru & K. Kurihara (1977)- Larger foraminifera from the Philippines. Part V. Larger Foraminifera from Cenozoic limestones in the Mansalay vicinity, Oriental Mindoro, with appendix "An orbitoid-bearing limestone from Barahid, Bongabong". In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 18, p. 59-76.

Hashimoto, W., K. Matsumaru & K. Kurihara (1978)- Larger foraminifera from the Philippines. Part VI. Larger foraminifera found from the Pinugay Hill Limestone, Tanay, Rizal, Central Luzon. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 19, p. 65-72.
(Cosico et al 1989: occ. Late Cretaceous Lepidorbitoides, Omphalocyclus and Paleocene Ranikothalia, Distichoplax, Assilina on Luzon)

Hashimoto, W., K. Matsumaru & K. Kurihara (1978)- Larger foraminifera from the Philippines. Part VII. Larger Foraminifera found from the Lutak Hill Limestone, Pandan Valley, Central Cebu, Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 19, p. 73-80.

Hashimoto, W., K. Matsumara, K. Kurihara, P.P. David & G.R. Balce (1977)- Larger foraminiferal assemblages useful for the correlation of the Cenozoic marine sediments in the mobile belt of the Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 18, p. 103-124.
(Range charts, etc.) showing occurrences of 137 species of larger forams between Paleocene- Miocene, and correlation with planktonic foram zonation)

Hashimoto, W., K. Matsumaru & M. Sugaya (1982)- Larger Foraminifera from the Philippines. Part XI. On the Coal Harbor Limestone, Cagraray Island, Batan Island Group, Albay Province. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 22, p. 55-62.
(Five U Oligocene- M Miocene species of larger forams)

Hashimoto, W. & T. Sato (1968)- Contribution to the geology of Mindoro and neighboring islands, The Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 5, p. 192-210.
(Mindoro and neighboring islands key area for early geologic history of Philippines, with crystalline schists, and folded Triassic, Jurassic and Eocene sediments. M-U Jurassic Mansalay Fm with conglomerates with

clasts of metamorphics and Permian fusulinid limestones. Thick Eocene clastics (>1000m) on N Mindoro, with Nummulites and Biplanispira?.)

Hashimoto, W. & T. Sato (1973)- Geological structure of North Palawan and its bearing on the geological history of the Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University Tokyo Press, 13, p. 145-161.
(N Palawan (mainly Malampaya Sound) low-metamorphic M Permian (with black fusulinid limestones, incl. Neoschwagerina, Verbeekina, Parafusulina)- M Triassic sediments, intensely folded, with NNW-SSE fold axes. In S Mindoro similar rocks unformably overlain by M and U Jurassic)

Hashimoto, W., T. Sato & S. Kanno (1984)- Geological summary of the APRSA activities in the Philippines. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University Press, Tokyo, 25, p. 61-108.
(Review of Japanese paleontological work in Philippines)

Hashimoto, S. G. Takizawa, G.R. Balce, E.A. Espiritu & C.A. Baura (1980)- Discovery of Triassic conodonts from Majalon and Uson Islands of the Calamian Island Group, Palawan Province, the Philippines, and its geological significance. Proc. Japan Academy 56, Ser. B, p. 69-73.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/56/2/56_2_69/_pdf)
(Discovery of Epigondolella abneptis, a Lower Norian index conodont of Japan, in limestone at SE coast of Malajon Island, Calamian Islands, N of Palawan. These radiolarites appear to be unconformably overlain by latest Triassic- E Jurassic limestones and clastics described by Fontaine 1979)

The tectonic and geologic evolution of Southeast Asian seas and islands- II. American Geophys. Union (AGU), Geophys. Monograph 27, p. 95-123.
(Geological and geochemical features of Acoje Block of Zambales ophiolite show volcanic arc signatures)

Hawkins, J.W., J.C. Moore, R. Villamor, C. Evans & E. Wright (1985)- Geology of the composite terranes of East and Central Mindanao. In: D.G. Howell (ed.) Tectonostratigraphic terranes of the Circum Pacific region 1, Circum-Pacific Council Energy and Mineral Resources, Earth Science Ser., p. 437-463.
(Phillippine Archipelago formed by amalgamation of many geologic terranes. E Mindanao two composite terranes, sutured together by mid-Tertiary (Late Oligocene?). W Mindanao terrane is extension of Sangihe Arc)

Hayami, I. (1968)- Some Jurassic bivalves from Mindoro. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 5, p. 173-185.
(Descriptions of 8 species of U Callovian- Oxfordian bivalves from dark grey mudstones of Mansalay Fm on Mansalay Island (part of Palawan Block, incl. Inoceramus cf. galoi, Aulacomyella, Plagiostoma, Astarte, Rutitrigonia, Myophorella, etc.)

Hayasaka, I. (1943)- On the Jurassic formation of the Philippines; with a note on *Trigonia*. Taiwan Tigaku Kidi, 14, p. 1-12.
(in Japanese, with English summary. Arkell 1956: Jurassic ammonites in shales of SE Mindoro Island, incl. Arietites, Oppelia, Macrocephalites, Peltoceras, Perisphinctes. Also bivalve Trigonia mindoroensis (see also Andal et al. 1968, Jurassic Mansalay Fm, ammonites interpreted as U Oxfordian in age)

Hayes, D.E. & S.D. Lewis (1984)- A geophysical study of the Manila trench, Luzon, Philippines. 1- Crustal structure, gravity and regional tectonic evolution. J. Geophysical Research, Solid Earth, 89, B11, p. 9171-9195.
(Manila Trench subduction zone is active convergent plate margin between S China Sea and N Philippines. With associated volcanic arc, E-dipping Benioff zone beneath Luzon, and well-developed fore arc basin system. Luzon Trough fore arc basins up to 4.5 km of Cenozoic sediments. Accretionary prism seaward of fore arc basin system. Uplifted Zambales ophiolite forms landward side of fore arc basin. Average convergence at Manila Trench 10-20 mm/yr and may be slowing in N due to collision of Taiwan with Eurasia (see also Lewis and Hayes 1989))

Hayes, D.E. & S.D. Lewis (1985)- Structure and tectonics of the Manila trench system, Western Luzon, Philippines. Energy 10, p. 263-279.
(Manila Trench active subduction zone W of Luzon is plate margin between S China Sea and N Philippines, with E-dipping Benioff zone beneath Luzon, accretionary prism of turbidite sediments, forearc basin with up to 4.5 km of Cenozoic sediments and volcanic arc. Subduction may have been active since Late Oligocene- E Miocene, synchronous with cessation of Paleogene subduction along E Luzon and similar to age of uplift and tilting of Zambales ophiolite. Trench strata folded and faulted at base of trench slope; major decollement usually near boundary between pelagic sediments and overlying turbidite sediments. Uplifted Zambales ophiolite forms landward side of forearc basin. Uplift of forearc basins only near intersection of relict spreading center of S China Sea plate)

Hayes, D.E. & W.J. Ludwig (1967)- The Manila Trench and West Luzon Trough- II. Gravity and magnetics measurements. Deep Sea Research 14, 5, p. 545-560.
(Manila Trench and W Luzon Troughs W of the Philippine Island Arc at Luzonwith free-air gravity anomalies of -80 mgal and -145 mgalrespectively. Magnetic anomalies cannot be correlated over appreciable distances and are much smaller E of the trench than W of it (see also companion paper of Ludwig et al. 1967)

Hedenquist, J.W., A. Arribas & M. Aoki (2017)- Zonation of sulfate and sulfide minerals and isotopic composition in the Far Southeast Porphyry and Lepanto epithermal Cu-Au deposits, Philippines. Resource Geology 67, 2, p. 174-196.
(online at: http://onlinelibrary.wiley.com/doi/10.1111/rge.12127/epdf)
(On Far Southeast (FSE) porphyry system and adjacent Lepanto Lepanto Cu-Au high-sulfidation deposit of Mankayan mineral district of N Luzon. Age of mineralization ~1.3-1.4 Ma)

Hedenquist, J.W., A. Arribas & T.J. Reynolds (1998)- Evolution of an intrusion-centred hydrothermal system: far Southeast- Lepanto porphyry and epithermal Cu-Au deposits, Philippines. Economic Geology 93, p. 373-404.

Hillmer, G. (ed.) (1991)- Central Philippines: mapping, mining, modern reefs. Mitteilungen Geol.-Palaont. Inst. Universitat Hamburg 71, p. 1-506.

Hinz, K., E.H.K. Kempter & H.U. Schluter (1985)- The southern Palawan-Balabac area: an accreted or non-accreted terrane? Proc. 3rd Conf. Asian Council on Petroleum (ASCOPE), Kuala Lumpur, 2, p. 48-72.

(Palawan Trough not underlain by SW-subducting oceanic plate from which sediments were scraped off in pre-M Miocene time, as Hamilton (1979) a.o. suggested, but by N Palawan continental terrane, which underlies Palawan Trough, the W shelf of Palawan and NW Borneo. Strongly deformed and ophiolite-bearing equivalents of Cretaceous Chert-Spilite and Paleogene Crocker Fms of S and C Palawan were overthrusted in pre-M Miocene time onto N Palawan continental terrane)

Hinz, K. & H.U. Schluter (1985)- Geology of the Dangerous grounds, South China Sea, and the continental margin off southwest Palawan: results of SONNE cruises SO-23 and SO-27. Energy 10, 3-4, p. 297-315.
(Seismic, magnetic and gravity data along 51 profiles in SE S China Sea (Dangerous Grounds, Palawan Trough). Five regional unconformities: Miocene-Pliocene, M Miocene (end of S China Sea seafloor spreading), Lower Miocene (often top of carbonate platforms), M-U Oligocene (rift-drift transition S China Sea) and Cretaceous-Paleocene (onset of rifting). Dangerous Grounds and parts of Palawan Trough underlain by stretched continental crust. Oldest rocks sampled in Dangerous Grounds U Triassic- Jurassic. U Oligocene- Lw Miocene carbonate platform from Dangerous Grounds E under Palawan Trough and Palawan shelf. C and S Palawan part of microcontinent with Dangerous Grounds/Reed Bank, N Palawan and Calamian block. E edge of carbonate platform overthrust from S by chaotically deformed sediments, suggesting Palawan Trough not ancient subduction trench, but loading of overthrust wedge)

Hock, M. & G. Friedrich (1985)- Structural features of ophiolitic chromitites in the Zambales Range, Luzon, Philippines. Mineralium Deposita 20, p. 290-301.
(Chromitite-bearing peridotites of Zambales mafic-ultramafic complex form lowermost level of Zambales ophiolite, which exposes complete ophiolitic sequence. Chromitites close to peridotite/gabbro transition zone)

Hock, M., G. Friedrich, W.L. Pluger & A. Wichowski (1986)- Refractory- and metallurgical-type chromite ores, Zambales ophiolite, Luzon, Philippines. Mineralium Deposita 21, 3, p. 190-199.
(Zambales ophiolite the major source of chromite ore in Philippines. Chromitites are concordant cumulates associated with distinct chromitite-bearing sequences within mantle peridotites. Refractory and metallurgical chromite deposits spatially separated and related to different lithologic associations)

Hollings, P., D.R. Cooke, P.J. Waters & B. Cousens (2011)- Igneous geochemistry of mineralized rocks of the Baguio District, Philippines: implications for tectonic evolution and the genesis of porphyry-style mineralization. Economic Geology 106, 8, p. 1317-1333.
(online at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.827.8817&rep=rep1&type=pdf)
(Baguio district large copper-gold province in epithermal, porphyry, and skarn deposits that formed in last 3.5 My. Pliocene and Pleistocene igneous rocks associated with mineralization are intermediate- felsic low-medium K intrusions (contaminated by young arc crust), and mafic-intermediate, medium K-shoshonitic hornblende-phyric dikes (primitive mantle-derived melts). Philippine arc currently sandwiched between two active subduction zones)

Hollings, P., G. Sweet, M. Baker, D.R. Cooke & R. Friedman (2013)- Tectonomagmatic controls on porphyry mineralization: geochemical evidence from the Black Mountain porphyry system, Philippines. In: M. Colpron et al. (eds.) Tectonics, metallogeny, and discovery: the North American Cordillera and similar accretionary settings, Society of Economic Geologists, Spec. Publ. 17, p. 301-335.
(Black Mountain SE Cu-Au porphyry system of Baguio district, N Luzon, two orebodies, associated with 6 intrusive phases between ~4.7- 2.8Ma. Porphyry mineralization interpreted to have formed as result of underplating of felsic magma chamber by mafic magma, from mantle recharge related to subduction of aseismic Scarborough Ridge)

Hollings, P., R. Wolfe, D.R. Cooke & P.J. Waters (2011)- Geochemistry of Tertiary igneous rocks of Northern Luzon, Philippines: evidence for a back-arc setting for alkalic porphyry copper-gold deposits and a case for slab roll-back?. Economic Geology and Bull. Soc. Econ. Geol. 106, 8, p. 1257-1277.

('Geochemistry and geochronology of the magmatic rocks of Lutopan and Talmban, Cebu, Philippines'. First zircon U/Pb determination in Philippines shows age of 109 ± 2 Ma forBiga porphyries, Lutopan, which agrees with new Rb/Sr ages of 103.5- 106.5Ma (Albian))

Keston, S. (1981)- Geological relationship between Reed Bank and offshore western Palawan, Philippines. Proc. 4th Regional Conf. Geology, Minerals and Energy Resources of SE Asia (GEOSEA), Manila 1981, p. 829-834.

Kiessling, W. & E. Flugel (2000)- Late Paleozoic and Late Triassic limestones from North Palawan Block (Philippines): microfacies and paleogeographical implications. Facies 43, p. 39-78.
(Permian- Carboniferous limestones in El Nido area. Paglugaban Fm with M Carboniferous fusulinids (Pseudofusulinella). Permian Minilog Fm Guadalupian fusulinids (Verbeekina verbeeki, Colania douvillei, Parafusulina, Neoschwagerina) and dasycladacean wacke-packstones with Permocalculus, Shamovella (=Tubiphytes) and Mizzia velebitana and colonial coral Waagenophyllum. Busuanga Island Late Triassic (Rhaetian) limestones in reef and platform facies with Triasina hantkeni, etc., similar to E Sulawesi, Banda Basin, Malay Peninsula, Malay Basin, etc. (also Sambosan seamount reefs, SW Japan; Peybernes 2016). Carbonates formed on seamounts surrounded by deep water radiolarian cherts (now in Jurassic- E Cretaceous accretionary complex?). With Golonka Permian-Triassic plate recontructructions. Permian-Triassic carbonates contradict close paleogeographic connection between N Palawan Block collided with S China Block in Late Cretaceous (then separated again with S China Sea opening))

Kintanar (1976)- Petroleum geology of the Philippines. Proc. 2nd Geol. Conv. and 1st Symp. Geology and Mineral Resources of the Philippines, GPS, Manila, 1, p. 401-432.

Knittel, U. (2011)- 83 Ma rhyolite from Mindoro- evidence for Late Yanshanian magmatism in the Palawan continental terrane (Philippines). Island Arc 20, p. 138-146.

(Low-grade meta-rhyolite with age of 83 Ma documents Late Cretaceous magmatism in N Mindoro Island, at NE edge of Palawan Continental Terrane which rifted from SE China in Oligocene. Rhyolite volcanism widespread in SE China in Cretaceous. Provides further evidence that NE Mindoro is indeed part of Palawan Continental Terrane, not part of Philippine Mobile Belt to E)

Knittel, U. & U. Daniels (1987)- Sr-isotopic composition of marbles from the Puerto Galera area (Mindoro, Philippines); additional evidence for a Paleozoic age of a metamorphic complex in the Philippine island arc. Geology 15, p. 136-138.
(Sr-isotopic composition of marbles from metamorphic complex of Puerto Galera area, NE Mindoro, compatible with either Tertiary or Paleozoic age. Late Paleozoic age most likely, implying metamorphic complex not part of basement of Philippine arc, but is accreted terrane)

Knittel, U. & M.J. Defant (1988)- Sr isotopic and trace element variations in Oligocene to Recent igneous rocks from the Philippine island arc: evidence for recent enrichment in the sub-Philippine mantle. Earth Planetary Sci. Letters 87, p. 87-99.
(Oligocene- Miocene plutonic rocks from Philippine island arc and Pliocene-Recent Bicol volcanic chain of S Luzon have Sr isotopic ratios of 0.7035-0.7039 (controlled by fluids from subducting Philippine Sea plate basalt). Volcanics erupted in past 5 Ma in C Luzon, Marinduque and Mindoro have higher radiogenic Sr (0.7042-0.7054; controlled by fluids from subducted S China Sea crust))

Knittel, U., M.J. Defant & I. Raczek (1988)- Recent enrichment in the source region of arc magmas from Luzon island, Philippines: Sr and Nd isotopic evidence. Geology 16, p. 73-76.
(Luzon wedged between E- and W-directed subducting slabs. W-ward subduction resulted in pre-Miocene igneous rocks from N Luzon typical of intra-oceanic arcs. Pliocene-Holocene volcanoes generated by E-ward subduction along W coast (Bataan- Mindoro arc) and reflect larger amounts of sediment available for subduction in S China Sea (slivers of continental Mindoro-N Palawan terrane apparently carried down to mantle depths after collision with arc in Miocene)

Knittel, U., C.H. Hung, T.F. Yang & Y. Iizuka (2010)- Permian arc magmatism in Mindoro, the Philippines: an early Indosinian event in the Palawan continental terrane. Tectonophysics 493, p. 113-117.
(online at: https://pdfs.semanticscholar.org/f035/70ff0cfb93c8e998273eb5e47e4b2af13594.pdf)
(Dating of zircons from metamorphic complex of NE Mindoro (=Palawan Continental Terrane) reveal episode of M-L Permian (250-270 Ma) magmatism, suggesting they are part of rifted margin of SE China rather than oceanic arc-dominated Philippine Mobile Belt. Magmatic episode here coincides with arc magmatism in Hainan (China), expanding known extent of that continental arc along SE margin of S China)

Knittel, U., A.G. Trudu, W. Winter, T.F. Yang & C. M. Gray (1995)- Volcanism above a subducted extinct spreading center: a reconnaissance study of the North Luzon Segment of the Taiwan-Luzon volcanic arc (Philippines). J. Southeast Asian Earth Sci. 11, p. 95-109.
(Ridge system of S China Sea, extinct since ~17 Ma, subducts below C part of Taiwan-Luzon volcanic arc. Buoyancy of crust of ridge system may be responsible for high elevation of arc. Volcanism in this part of arc characterized by small volumes of intermediate-felsic magma)

Knittel, U., M. Walia, S. Suzuki, C.B. Dimalanta, R. Tamayo, T.F. Yang & G.P. Yumul (2017)- Diverse protolith ages for the Mindoro and Romblon Metamorphics (Philippines): evidence from single zircon U-Pb dating. Island Arc 26, 1, e12160, p.
(Metamorphic complexes exposed in NE part of Palawan Continental Terrane considered to be rifted parts of Asian margin. Mindoro and Romblon Metamorphics with protoliths of variable age: Late Carboniferous-Late Permian in NE Mindoro; Eocene or younger in NW Mindoro; Miocene at S margin of Mindoro metamorphics (detrital zircon ages 22-56 Ma); and Cretaceous or later on Tablas (zircons as young as 112 Ma). Presence of non-metamorphic sediments of Late Eocene- E Oligocene age in Mindoro (Lasala Fm) suggests metamorphism of sediments of Mindoro result of Palawan terrane collision in Late Miocene (similarities in age spectra of zircons from Eocene-Miocene metamorphics with Eocene - E Miocene Lasala Fm))

Kobayashi, T. (1957)- A trigonian faunule from Mindoro in the Philippine islands. J. Faculty of Science, University of Tokyo, Sect. 2, 10, 3, p. 351-365.
(online at: http://umdb.um.u-tokyo.ac.jp/DKoseibu/pdf/Ref_0151_.pdf)
(Two Jurassic ammonite zones on SE coast of Mindoro: Callovian(?) with Macrocephalites and Oppelia and Oxfordian(?) black shale with perisphinctids (also described by Sato 1961;JTvG). Also probably latest Jurassic age Trigonia- Myophorella mollusc fauna from Agama River)

(E Cretaceous Balud Ophiolitic Complex on island of Masbate in C Philippines, with only upper crustal section exposed. Pillow basalts transitional mid-oceanic ridge basalt- island arc tholeiitic compositions. Low Bouguer gravity anomaly values suggest highly dismembered nature, as thin crustal slivers)

Manalo, P.C., C.B. Dimalanta, D.V. Faustino-Eslava, N.T. Ramos, K.L. Queano & G.P. Yumul (2015)- Crustal thickness variation from a continental to an island arc terrane: clues from the gravity signatures of the Central Philippines. J. Asian Earth Sci. 104, p. 205-214.
(Significant differences in gravity anomalies between Palawan Microcontinental Block and Philippine Mobile Belt, with islands of Palawan Block (Mindoro, Tablas, Romblon, Sibuyan, W Panay) registering lower Bouguer anomalies. Crustal thickness thickest (~32 km) in areas with ophiolitic units emplaced during arc-continent collision. Relatively thin crust (~21 km) in collision zone coincides with areas attenuated by intra-arc rifting)

Manalo, P., C. Dimalanta, N. Ramos, D. Faustino-Eslava, K. Queano & G. Yumul (2016)- Magnetic signatures and Curie surface trend across an arc-continent collision zone: an example from Central Philippines. Surveys in Geophysics 37, 3, p. 557-578.
(In C Philippines striking differences between magnetic signatures of islands with continental affinity (negative magnetic anomalies) and island arc terranes (positive anomalies over Philippine Mobile Belt). Linear features in magnetic anomaly map coincide with Philippine Fault and its splays. Deepest point of magnetic crust is under Mindoro at 32 km. Curie surface shallows to E and is 21 km deep between Sibuyan and Masbate, and 18 km deep at junction of Buruanga Peninsula and Panay Island (boundary of the arc-continent collision, with obduction of mantle rocks over continental basement. Coincidence of magnetic boundary and density boundary supports compositional boundary that reflects the crust- mantle interface)

('Fusion of oceanic crust in recent subduction/ collision zones: example of Mindanao, Philippines'. Adakites)

Maury, R.C., M.J. Defant, H. Bellon, D. Jacques, J.L. Joron, F. McDermott & P. Vidal (1998)- Temporal geochemical trends in northern Luzon arc lavas (Philippines); implications on metasomatic processes in the island arc mantle. Bull. Soc. Geologique France 169, p. 69-80.
(Neogene and Quaternary lavas from N Luzon arc (Batan, Babuyan de Claro, Camiguin, Calayan islands) display temporal increases in incompatible elements including Cs, Rb, Ba, K, La, Ce, Th, U, Ta, Hf and Zr from volcanoes >3 Ma to younger ones, suggesting hydrous fluids are not only metasomatic agents operating in mantle wedge but slab-derived melts (adakitic magmas) may also be involved)

McCabe, R., J. Almasco & W. Diegor (1983)- Geologic and paleomagnetic evidence for a possible Miocene collision in western Panay, Central Philippines. Geology 10, p. 325-329.
(Palawan metamorphic terrane, represented by Paleozoic basement on NW tip of Panay, collided with remainder of island between Late Oligocene and M Miocene. Evidence for collision is (1) juxtaposition of old

melange terrane against metamorphosed Paleozoic continental sediments similar to Palawan island, and (2) Miocene thrusting in melange terrane oriented parallel to suture. Paleomagnetic studies show Panay island rotated 20° CW since E Miocene, whereas N Philippines rotated CCW, consistent with collision of Philippine arc with NE-converging Palawan block)

McCabe, R., J.N. Almasco & G. Yumul (1985)- Terranes of the Central Philippines. In: D.G. Howell (ed.) Tectonostratigraphic terranes of the Circum Pacific Region, Circum-Pacific Council Energy and Mineral Resources, Earth Sci. Ser., p. 421-436.
(Philippine Archipelago is collection of volcanic arcs, ophiolite fragments and rifted continental blocks, welded together by Late Miocene. Five terranes in C Philippines: (1) C Philippine arc terrane with Lower Cretaceous-Recent island arc debris; (2) Mindoro-Panay disrupted terrane, related to Miocene collision between Philippine arc and N Palawan continental terrane; (3) N Palawan continental terrane with late Paleozoic and Mesozoic continental-derived sequences overlain by Cenozoic marine sediments; (4) S Palawan disrupted terrane and (5) Sulu-Zamboanga disrupted terrane. Two additional terranes classified as suspect: (1) East Luzon-Samar-Mindanao disrupted terrane and (2) Cagayan arc terrane, a volcanic ridge in central part of Sulu Sea, composed of Miocene volcanics and limestones)

McCabe, R., E. Kikawa, J.T. Cole, A.J. Malicse, P. Baldauf, J. Yumul & J. Almasco (1987)- Paleomagnetic results from Luzon and the Central Philippines. J. Geophysical Research 92, B1, p. 555-580.
(Plio-Pleistocene paleomagnetic data show no rotation, suggesting terranes that make up Philippine Arc behaved as single unit in past 5 My. Late Miocene sites two groups: W Luzon ~20° of CW rotation; Bicol region, Negros, Marinduque, and Mindanao not rotated. E Neogene results also two populations: Marinduque large CCW rotation, Panay, Cebu and Mindanao CW rotation. E Neogene data consistent with M-L Miocene collision of Palawan Continental Terrane and C Philippine Arc. Dikes of possible Oligocene age from Zambales Ophiolite rotated ~60° CW. VGP of Mindoro displaced S-ward from Late Jurassic VGP of S China, suggesting post-Jurassic S-ward migration of Mindoro)

McDermott, F., M.J. Defant, C.J. Hawkesworth, R.C. Maury & J.L. Joron (1993)- Isotope and trace element evidence for three component mixing in the genesis of the North Luzon lavas (Philippines). Contrib. Mineralogy Petrology 113, p. 9-23.
(Post-3Ma volcanics from N Luzon arc exhibit systematic variations in 87Sr/86Sr, 143Nd/144Nd and 208Pb/206Pb along arc over ~500 km. Reflect varying contributions from mantle wedge, slab-derived hydrous fluid, and isotopically enriched subducted S China Sea terrigenous sediment)

McMurtrie, G., R. Jason, C. Lambert & J. Pattillo (2011)- Deepwater potential the NW Palawan Basin, Philippines. Proc. SE Asia Petroleum Expl. Soc. (SEAPEX) Expl. Conf., Singapore 2011, Presentation 17, 24p. *(Abstract +Presentation)*
(Undrilled deep water NW of Palawan Island. Present-day shallow-water reservoir fairways like Nido Limestone, extend into deepwater. Outbord half grabens with potential source rocks modeled to be oil-mature. Seabed coring indicates widespread thermogenic microseepage. Inversion structures, gas chimneys, etc.))

Meresse, F.;D. Savva, M. Pubellier, S. Steuer, D. Franke, F. Cordey, C. Muller et al. (2012)- Late tectonic uplift of an inverted oceanic basin in South East Asia: the case of Palawan Island (western Philippines). EGU General Assembly, Vienna 2012, p. 11644. *(Abstract Only)*
(Palawan island bounded by two marginal basins (S China Sea to N, Sulu Sea to S) composed of remnants of inverted Proto-South China Sea basin, thrusted onto margin of continental terrane which rifted away from Chinese- Vietnamese margin. Island consists of: (1) Palawan wedge (deformed Cretaceous- Tertiary slope to ocean deposits; (2) ophiolite bodies on top of wedge, comprising Albian ribbon cherts, likely relicts of subducted Proto S China Sea; (3) central and southern parts of island large wavelength antiform of NE-SW trend, sealed by E Pliocene marls unit; (4) necking zones bordered by N-S trending transform faults)

Metrich, N., P. Schiano, R. Clocchiatti & R.C Maury (1999)- Transfer of sulfur in subduction settings: an example from Batan Island (Luzon volcanic arc, Philippines). Earth Planetary Sci. Letters 167, p. 1-14.

Middleton, C., A. Buenavista, B. Rohrlach, J. Gonzalez, L. Subang & G. Moreno (2004)- A geological review of the Tampakan copper-gold deposit, southern Mindanao, Philippines. In: Proc. PACRIM 2004 Conf., Adelaide 2004, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 173-187.
(Tampakan copper-gold deposit on SE Mindanao major high-sulfidation epithermal deposit superimposed on an underlying porphyry copper system. Hosted by subaerial andesitic flows of highly eroded andesitic stratavolcanic complex of Pliocene age. Four volcanic cycles/ centres that sequentially developed and eroded)

Militante-Matias, P.J. (1995)- *Orbitolina*-bearing rocks of Philippines. Proc. 15th Int. Symp. Kyungpook National University, p. 257-264.
(On Early Cretaceous Tethyan larger foram Orbitolina in Philippines)

Militante-Matias, P.J., M.M. de Leon & E.J. Marquez (2000)- Cretaceous environments of the Philippines. In: H. Okada & N.J. Mateer (eds.) Cretaceous environments of Asia, Developments in Palaeontology and Stratigraphy 17, Elsevier, p. 181-200.
(Cretaceous rocks in Philippines exposed in several areas in C Philippines and Palawan. Composed of metamorphic basement rocks, crust-mantle sequences (Ophiolites?) and magmatic-volcanic arc complexes, generally capped by deep water pelagic cherts and limestones. Late Cretaceous more common shallow marine, locally with Orbitolina, rudists, etc., all suggesting tropical environments. Cretaceous sediments and volcanics often unconformably overlain by Eocene)

Milsom, J., J.R. Ali & K.L. Queano (2006)- Peculiar geometry of northern Luzon, Philippines: implications for regional tectonics of new gravity and paleomagnetic data. Tectonics 25, p. 1-14.
(N termination of Philippine Archipelago remarkably abrupt. Paleomagnetic data favor possibility that in Paleogene Central Cordillera and Sierra Madre were combined as parts of arc at S margin of Philippine Sea. Sicalao Ridge interpreted as rift margin feature, created during detachment of Luzon from continental Sundaland. With plate reconstructions 45-20 Ma)

Milsom, J., J. Barretto, N. Aguda, D. Bringas, R. Ho & J. Aitchison (2009)- The gravity fields of Palawan and New Caledonia: insights into the subsurface geometries of ophiolites. J. Geol. Soc., London, 166, p. 985-988.
(Palawan and New Caledonia similar ophiolites, both emplaced during arc-microcontinent collision and both ended subduction and also ended oceanic spreading that displaced microcontinent. Gravity data suggest both ophiolites derived from root zones just offshore on both islands, resting on basal surfaces that change abruptly in depth by up to 5 km. Geometries of thrust sheets are as important to understanding emplacement histories as exposure patterns)

Mines and Geosciences Bureau (2010)- Geology of the Philippines (2nd Edition). Mines and Gesciences Bureau, Quezon City, p. 1-532.
(Revised textbook of Philippines geology. Part 1 discusses major geological features, incl. tectonics, major faults, sedimentary basins and present-day plate motions. Part 2 is discussion of stratigraphy and petrology based on stratigraphic groupings)

Miranda, F.E. (1975)- Data on Philippine mineral resources. Bureau of Mines, Republic of the Philippines, Manila, Information Circular 22, p. 1-60.

Mitchell, A.G.H. & G.R. Balce (1990)- Geological features of some epithermal gold systems, Philippines. J. Geochemical Exploration 35, p. 241-296.
(Philippines numerous epithermal gold deposits, mainly in Cenozoic and locally Cretaceous arc systems, built on ophiolite and metamorphic basement rocks. Epithermal gold deposits mostly Pliocene, along axes of volcanic arcs)

Mitchell, A.H.G., F. Hernandez & A.P. de la Cruz (1986)- Cenozoic evolution of the Philippine archipelago. J. Southeast Asian Earth Sci. 1, 1, p. 3-22.
(Late Cretaceous or earliest Tertiary detachment of ophiolite, W-ward subduction and subsequent accretion of arc and continental fragments to E Philippines was followed by mid-Miocene collision of this arc with SE-facing Sulu-Masbate arc. Ophiolites in Zambales, Mindoro, Panay and Palawan interpreted as remnants of single slab of Paleocene oceanic lithosphere, emplaced onto Asian margin during collision starting in Late Eocene. Continued convergence during Late Oligocene- E Miocene opening of S China Sea. E-ward subduction of S China Sea basin in Manila Trench resulted in Pliocene collision in Taiwan. Late Eocene collision accompanied by back-thrusting which initiated NW subduction of Celebes Sea in Sulu Arc. SE Sulu Sea and N extension through Panay opened in Oligocene by back-arc spreading behind Sulu Arc. Panay segment of Sea closed by Pliocene collision, following E-ward subduction in Negros Trench)

(Light oil proven present in seeps and shallow wells on Bondoc Peninsula, not in commercial quantities. Miocene Globigerina-rich Vigo Shale may be source of oil)

Pubellier, M., B. Deffontaines, R. Quebral & C. Rangin (1994)- Drainage network analysis and tectonics of Mindanao, southern Philippines. Geomorphology 9, p. 325-342.
(Mindanao, S Philippines, is site of arc-continent collision which began in Late Pliocene. Tectonic features not easily detectable due to cover of Pleistocene- Holocene sediments and volcanics. Study of drainage pattern in Agusan-Davao and Cotabato Basins compared with other data enables a correlation of distant seismic lines)

Pubellier, M., R. Quebral, M. Aurelio & C. Rangin (1996)- Docking and post-docking escape tectonics in the southern Philippines. In: R. Hall & D. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc, London, Spec. Publ. 106, p. 511-523.
(Philippine archipelago structure results from juxtaposition of volcanic belt against Eurasian margin fragments and associated marginal basins. Docking compression began in early Late Miocene. Post-dockingbegan in E Pleistocene, in N Mindanao represented by paired subduction zone and strike-slip fault)

Pubellier, M., R.D. Quebral, B. Deffontaines & C. Rangin (1993)- Neotectonic map of Mindanao Island Philippines (1:800,000). Explanatory notes, 22p.

Pubellier, M., R. Quebral, C. Rangin, B. Deffontaines, C. Muller & J. Butterlin (1991)- The Mindanao collision zone: a soft collision event within a continuous Neogene strike-slip setting. J. Southeast Asian Earth Sci. 6, p. 239-248.
(Two volcanic belts presently juxtaposed on Mindanao in S Philippines. To S collision still active in Molucca Sea zone of doubly verging subduction. Philippine Fault is neotectonic feature. Mindanao two composite terranes (1) W: Eurasian margin continental terrane (N-ward extension of Sangihe arc; Kudarat Plateau and Zamboanga Peninsula; (2) E: oceanic terrane (Philippine Mobile Belt- Halmahera arc). Since Late Pliocene- both terranes affected by NNE and E-W compression)

Queano, K.L. (2005)- Upper Miocene to Lower Pliocene Sigaboy Formation turbidites, on the Pujada Peninsula, Mindanao, Philippines: internal structures, composition, depositional elements and reservoir characteristics. J. Asian Earth Sci. 25, p. 387-402.
(Turbidites of U Miocene- Lw Pliocene Sigaboy Fm on Pujada Peninsula, SE Mindanao, overlie ophiolite. Channelized and unchannelized of submarine fan deposits, derived from Sangihe arc and its uplifted outer arc ridge (now Pujada Peninsula), following initial subduction of Snellius Plateau- Halmahera Arc in Mindanao (latest M Miocene) and prior to initiation of Philippine Trench (<5 Ma). Porosity very low, rarely >5%.)

Queano, K., J. Ali, J. Aitchison, G. Yumul, M. Pubellier & C. Dimalanta (2008)- Geochemistry of Cretaceous to Eocene ophiolitic rocks of the Central Cordillera: implications for Mesozoic-Early Cenozoic evolution of the Northern Philippines. Int. Geology Review 50, 4, p. 407-421.
(Central Cordillera in N Philippines underlain mainly by Cretaceous- Eocene ophiolitic basement, with supra-subduction signature and generated in back-arc setting. Relationships similar to Cretaceous- Eocene Lepanto Metavolcanics and Pugo Fm, comprising ophiolitic basement in S portions of range, suggesting C Cordillera floored by common volcanic basement)

Queano, K.L., J.R. Ali, J. Milsom, J.C. Aitchison & M. Pubellier (2007)- North Luzon and the Philippine Sea plate motion model: insights following paleomagnetic, structural, and age-dating investigations. J. Geophysical Research 112, B05101, p. 1-44.
(Paleomagnetic data from N Luzon show combination of major plate and local rotations in CW and CCW directions. Inclination data suggest N Luzon traveled as part of Philippine Sea Plate for most of Eocene-Pliocene history. N Luzon is placed on W edge of Philippine Sea Plate, just W of where Benham Plateau formed at ~40 Ma. Substantial N-ward migration since start of Neogene, with earlier interval stretching back to equatorial latitudes in mid-E Cretaceous. Post-15 Ma motion of plate involved indentation of Palawan microcontinent into W side of Philippine Archipelago)

Queano, K.L., J.R. Ali, M. Pubellier, G.P. Yumul & C.B. Dimalanta (2009)- Reconstructing the Mesozoic-early Cenozoic evolution of northern Philippines: clues from palaeomagnetic studies on the ophiolitic basement of the Central Cordillera. Geophysical J. Int. 178, 3, p. 1317-1326.
(First paleomagnetic data from Cretaceous Eocene ophiolitic basement (pillow basalts, diabase dykes) in C Cordillera on N Luzon suggest ophiolitic rocks formed at subequatorial latitudes (6.3°N ± 3.1°), close to where island was during E Cenozoic. These rocks could be relicts of proto-Philippine Sea Plate)

Queano, K.L. C.B. Dimalanta, G.P. Yumul, D.V. Faustino-Eslava, E.J. Marquez, N.T. Ramos, K. Ishida et al. (2012)- The Zambales Ophiolite Complex, Philippines revisited: implications for its Tethyan origin. Proc. First Int. Symposium of IGCP-589, Xi'an, China 2012, Acta Geoscientica Sinica 33, Suppl. 1, p. 58. (Abstract)
(Zambales Ophiolite Complex needs to be deconstructed into M Jurassic- Lower Cretaceous Acoje Ophiolite and Eocene Coto Ophiolite)

Queano, K.L. C.B. Dimalanta, G.P. Yumul, E.J. Marquez, D.V. Faustino-Eslava, S. Suzuki & K. Ishida (2017)- Stratigraphic units overlying the Zambales Ophiolite Complex (ZOC) in Luzon, (Philippines): tectonostratigraphic significance and regional implications. J. Asian Earth Sci. 142, p. 20-31.
(Zambales Ophiolite Complex on W Luzon several massifs. Coto Block overlain by clastic sediments previously dated as Eocene, with similar ages obtained from diabase, granodiorites, etc., suggesting Eocene age for ZOC. Radiolarian cherts in E-M Miocene clastics, derived from Acoje Block of ZOC, suggest Late Jurassic- E Cretaceous age)

Queano, K.L., E.J. Marquez, J.C. Aitchison & J.R. Ali (2013)- Radiolarian biostratigraphic data from the Casiguran Ophiolite, northern Sierra Madre, Luzon, Philippines: stratigraphic and tectonic implications. J. Asian Earth Sci. 65, p. 131-142.
(Cherts- limestones overlying Casiguran Ophiolite, Luzon, with Lower Cretaceous radiolarian assemblages (U Barremian- Aptian/Albian; incl. several 'Tan Sin Hok species'), older than U Cretaceous stratigraphic range previously reported in region, providing additional evidence for Mesozoic oceanic substratum upon which

Luzon and neighboring regions of Philippine archipelago were likely built. Age closely resembles ages of ophiolite in SE Luzon, oceanic crust of Huatung Basin E of Taiwan and ophiolites in E Indonesia)

Queano, K.L., E.J. Marquez, C.B. Dimalanta J.C. Aitchison, J.R. Ali & G.P. Yumul (2017)- Mesozoic radiolarian faunas from the northwest Ilocos region, Luzon, Philippines and their tectonic significance. Island Arc 26, 4, e12195, p. 1-10.
(Dos Hermanos melange in NW Ilocos Norte, NW Luzon, with peridotites and metamorphic rocks blocks in sheared sandy matrix. Thrust onto the Eocene Bangui Fm turbidite succession and capped by U Miocene Pasuquin Limestone. With uppermost Jurassic- Lower Cretaceous radiolarian assemblages in deep marine bedded chert blocks (incl. many 'Tan Sin Hok species'. Tectonic melanges in C Philippines attributed E-M Miocene arc-continent collision involving Philippine Mobile Belt and Palawan Microcontinental Block)

Quebral R., M. Pubellier & C. Rangin (1996)- The onset of movement on the Philippine fault in eastern Mindanao: a transition from a collision to strike slip environment. Tectonics 15, 4, p. 713-726.
(Evolution of Philippine fault in E Mindanao from zone of active arc-arc collision to strike-slip environment. Diachronous unconformity along Philippine Fault marking end of collision-related deformation reflects S-ward propagating nature of collision and provides limits on age of initiation of Philippine Fault)

Querubin, C.L. & G.P. Yumul (2001)- Stratigraphic correlation of the Malusok volcanogenic massive sulfide deposits, Southern Mindanao, Philippines. J. Resource Geology 51, 2, p. 135-144.

Reyes, R.A. (1979)- Hydrocarbon distribution and carbon isotope variations in the surface petroleum occurrences and potential sources rocks in Northwest Leyte. The Philippine Geologist (J. Geol. Soc. Philippines) 33, 1, p.

(Analyses of surface seeps and potential source rocks in NW peninsula of Leyte suggest: (1) land·derived organic matter contributed strongly to potential source of Taog, Tagnocot, Bata Fms (2) bitumen in Bata Fm sandstone not autochthonous and migrated from prolific source rock (3) surface hydrocarbon occurrences originated from common source, possibly from mature Taog Fm)

Reynolds, N.A., R. Ayres, R.N.McLean & G. Maude (2015)- The Mabilo copper-gold-iron deposit- a new skarn discovery in The Philippines. In: Proc. PACRIM 2015 Congress, Hongkong, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, Publ. Ser. 2/2015, p. 431-437.
(Mabilo skarn deposit in S of Pacarale mineral district in Luzon, 200km ESE of Manila. Mineralized skarn replaces dipping Tumbaga Fm Eocene limestone/ volcanics in aureole of Miocene quartz-diorite intrusion)

Ribeiro, J.M., R.C. Maury & M. Gregoire (2016)- Are adakites slab melts or high-pressure fractionated mantle melts? J. Petrology 57, 5, p. 839-862.
(Adakites are unusual felsic igneous rocks commonly associated with asthenospheric slab window opening or fast subduction of young (<25 Ma) oceanic plate that may allow slab melting at shallow depths (in forearc settings). Incl. examples from Philippines)

Ringenbach, J.C., N. Pinet, J.F. Stephan & J. Delteil (1993)- Structural variety and tectonic evolution of strike slip basins related to the Philippine fault system, northern Luzon, Philippines. Tectonics 12, 1, p. 187-204.
(N part of Philippine fault zone in Luzon complex system of left-lateral strike-slip faults, with strike-slip basins along main splays of fault zone. Those located along N striking cordilleran faults formed in late E Pliocene-Pleistocene time when Philippine fault initiated. Structural setting result of E Miocene collision between Benham Rise and E margin of Luzon, and subsequent inception of NW striking strand of Philippine fault)

Roberts, M. (1983)- Seismic example of complex faulting from NW shelf of Palawan. In A.W. Bally (ed.) Seismic expression of structural styles, American Assoc. Petrol. Geol. (AAPG), Studies in geology 15, 3, 4.2, p. 18-24.
(N Palawan-Calamian block separated from S China by N-S seafloor spreading beginning in M Oligocene. Spreading in ceased in E Miocene, but tectonism on NW shelf of NPC block continued into latest Miocene. Subsidence of at least outer shelf area in late E Miocene, synchronous with cessation of sea floor spreading, followed by M and L Miocene uplifts. Late Miocene events marked by high-angle basement faulting, here interpreted as wrench and reverse faulting, possibly resulting from collision between NPC block and main Philippine arc in SW Luzon-Mindoro-Panay region. Parts of crust of Mindoro and Panay may have been continuous with NPC block crust. Reed Bank and Dangerous Ground areas W and SW of NPC block, also thought to have separated from China (and Indochina) by sea-floor spreading, but drift not well documented)

Roeder, D. (1977)- Philippine arc system- collision or flipped subduction zone? Geology 5, p. 203-206.
(Between Taiwan and Molucca strait, an arc-arc collision migrating southward between Late Oligocene and E or M-Pliocene time was followed by renewed subduction at former sites of arc-associated wrenching. Possibly triggered by polarity changes along strike of collision, post-collisional trenches offset and of opposed polarity)

Roque, V.P., B.P. Reyes & B.A. Gonzales (1972)- Report on the comparative stratigraphy of the east and west sides of the mid-Luzon Central Valley, Philippines. Mineral Engin. Mag., September 1972, p. 11-51.

Rossman, D.L., G.C. Castanada & G.C. Bacuta (1989)- Geology of the Zambales ophiolite, Luzon, Philippines. Tectonophysics 168, p. 1-22.
(Zambales ophiolite complex of W Luzon. Age established by limiting strata is Late Eocene. Ophiolitic rocks exposed by uplift; ultramafic part exposed to erosion in earliest Miocene or Late Oligocene)

Rutland, R.W.R. (1967)- A tectonic study of part of the Philippine Fault Zone. J. Geol. Soc. London 123, p. 293-323.
(Philippine Fault Zone trends N40°W is major strike-slip fault comparable to San Andreas fault. In SE Luzon, low-grade metamorphic rocks, of probable pre-Tertiary age, occur on NE side of Rift. Two main episodes of

faulting: (1) Late Miocene on northerly faults and (2) Plio-Pleistocene on NW faults. Structural relations argue against major post-Miocene strike-slip movements)

Rutland, R.W.R. & M.R. Walter (1974)- Philippine Archipelago. In: A.M. Spencer (ed.) Mesozoic-Cenozoic orogenic belts, Geol. Soc., London, Spec. Publ. 4, p. 491-500.
(Brief review of Phillippines geology. Cretaceous-Tertiary orogen of the Philippines forms link between mobile regions of Taiwan to N and Sulawesi/W Irian to S. Basement of belt is Carboniferous -Permian ophiolitic rocks and flysch metamorphosed to amphibolite facies. Overlying basement are Triassic conglomerates and Jurassic greywackes and shales, locally with spilites. These were folded at end Jurassic and are overlain by Cretaceous)

Sajona, F., H. Bellon, R.C. Maury, M. Pubellier, J. Cotton & C. Rangin (1994)- Magmatic response to abrupt changes in geodynamic settings: Pliocene-Quaternary calc-alkaline and Nb-enriched lavas from Mindanao (Philippines). Tectonophysics 237, p. 47-72.

Sajona, F.G., H. Bellon, R.C. Maury, M. Pubellier, R.D. Quebral, J. Cotton et al. (1997)- Tertiary and Quaternary magmatism in Mindanao and Leyte (Philippines): geochronology, geochemistry and tectonic setting. J. Asian Earth Sci. 15, 2-3, p. 121-153.
(Several volcanic sectors in Leyte, Daguma and Mindanao. Composition of Tertiary-Recent arc magmatism linked to tectonic settings and used to refine reconstruction of tectonic history of Philippine archipelago. Identification of adakites used to date timings of subduction initiations and arc polarity reversals. In Daguma area (S Mindanao) Oligocene (30 Ma) arc tholeiitic diorites intrude older arc sequences. Miocene (17-7.7 Ma) calc-alkaline andesites with minor adakites at 18 Ma. Calc-alkaline volcanic substratum of Pliocene-Recent volcanoes(1.8 Ma -present) 8-6 Ma old. C Mindanao, Miocene andesites (20, 16 Ma), Pliocene (2.5 Ma) calk-alkaline volcanism and Quaternary lavas (1 Ma- present))

Sajona, F.G. & R.C. Maury (1998)- Association of adakites with gold and copper mineralization in the Philippines. Comptes Rendus Academie Sciences, Paris, IIA, 326, 1, p. 27-34.
(Adakites are intermediate- acidic volcanic and plutonic rocks derived from partial melting of subducted oceanic crust when subducting slab is young (< 20 Ma) and hot, at start and end of subduction. In Philippines most porphyry Cu and epithermal Au deposits related with these and related magmas (Nb-enriched basalts and adakite-linked andesites). E Luzon arc is example of adakite-Cu-Au area underthrusted by young crust)

Sajona, F.G., R.C. Maury, H. Bellon, J. Cotton & M. Defant (1996)- High field strengh element enrichment of Pliocene-Pleistocene island arc basalts, Zamboanga Peninsula, western Mindanao (Philippines). J. Petrology 37, p. 693-726.

Sajona, F.G., R. Maury, H. Bellon, J. Cotten, M. Defant & M. Pubellier (1993)- Initiation of subduction and the generation of slab melts in western and eastern Mindanao, Philippines. Geology 21, p. 1007-1010.
(Adakite in E and W Mindanao Island, with low heavy rare earth elements, high Sr/Y ratios, etc., considered to be result of melting of young subducted oceanic crust, leaving eclogite residue. Pliocene-Quaternary adakites from W Mindanao probably from melting of Miocene Sulu Sea crust, currently subducting under Zamboanga. In E Mindanao, Pliocene-Quaternary adakites mark trace of Philippine fault. Underlying Philippine Sea crust of Eocene age cannot melt under normal subduction thermal conditions, but thermal models indicate melting at start of subduction can occur. Subduction of Philippine Sea plate began at 3-4 Ma beneath E Mindanao)

Sajona, F.G., R.C. Maury, M. Pubellier, J. Leterrier, H. Bellon & J. Cotton (2000)- Magmatic source enrichment by slab-derived melts in a young post-collision setting, central Mindanao (Philippines). Lithos 54, p. 173-206.
(C Mindanao was place of Pliocene (4-5 Ma) arc- arc collision event followed by basaltic to dacitic magmatism starting at 2.3 Ma. Lavas calc-alkaline to shoshonitic, including adakites and Nb-enriched basalts. Chemistry attributed to interaction of slab-derived melts, i.e., adakites, with arc mantle)

Salapare, R.C., C.B. Dimalanta, N.T. Ramos, T. Noelynna, P.C. Manalo, D.V. Faustino-Eslava, K.L. Queano & G. Yumul (2015)- Upper crustal structure beneath the Zambales Ophiolite Complex, Luzon, Philippines inferred from integrated gravity, magnetic and geological data. Geophysical J. Int. 201, 3, p. 1522-1533.
(Zambales Ophiolite Complex in W Luzon, exposure of emplaced crust-upper mantle ophiolitic sequences. Two juxtaposed blocks: (1) Acoje Block (NW; M Jurassic- E Cretaceous; island arc tholeiite composition) with low Bouguer gravity (<135 mGal) and magnetic (<69 nT) anomalies and (2) Coto Block (SE; Eocene; transitional mid-oceanic ridge-basalt/island arc composition) with high Bouguer gravity (>150 mGal) and magnetic (>110 nT) anomalies. Blocks separated by Lewis Fault Zone, with right lateral and vertical displacements)

Saldivar-Sali, A. et al. (1983)- Geology of offshore NW Palawan. Oil and Gas J., Nov 30, 1983, p. 119-128.

Saldivar-Sali, A., N.L. Caagusan & R.S. Rieza (1981)- Paleogene petroleum possibilities in the Philippines. In: M.J. Valencia (ed.) Proc. EAPI/CCOP Workshop, Honolulu 1980, Energy 6, 11, p. 1207-1224.
(Older Paleogene section is most probable source rock for hydrocarbons produced from Lower Miocene carbonates in Philippines. Paleogene sandstone also probably cleaner (less volcanic) than Neogene sandstones. With Cretaceous- Recent stratigraphic section of Reed Bank well Sampaguita 1, S China Sea)

Saldivar-Sali, A., A.P. Madrid, R.A. Reyes & L.G. Flower (1987)- Tectonic setting and petroleum possibilities of Philippine sedimentary basins. In: M.K. Horn (ed.) Trans. 4th Circum Pacific Energy Mineral Resources Conf., Singapore 1986, p. 223-242.
(Philippines consist of island arc systems, microcontinental plates and 13 associated sedimentary basins. Basins classified as forearc, backarc (associated with arcs) and rift basins (associated with microcontinents). Numerous potential hydrocarbon plays. With Paleogene- Miocene paleogeographic maps and paleotectonic schematic profiles)

Sano, S.I., Y. Iba, P.W. Skelton, J.P. Masse, Y.M. Aguilar & T. Kase (2014)- The evolution of canaliculate rudists in the light of a new canaliculate polyconitid rudist from the Albian of the Central Pacific. Palaeontology 57, 5, p. 951-962.
(New polyconitid rudist Magallanesia canaliculata of probable Late Albian age from Pulangbato, C Cebu Island, Philippines and Takuyo-Daini Seamount, now in NW Pacific. It is similar to Praecaprotina Yabe and Nagao, 1926, a Japanese- C Pacific endemic genus of late Aptian- E Albian age. Cebu rudists few genera of polyconitids and a requieniid in 10m thick limestone in volcanoclastic sequence (not melange))

Santos, G. (1974)- Mineral distribution and geological features of the Philippines. In: W. Petrascheck (ed.) Metallogenetic and geochemical provinces, Symposium Leoben 1972, Osterreichische Akademie Wissenschaften, Vienna, Springer Verlag, p. 89-105.

(Philippine mineral deposits divided into two main groups: (1)' frontal arc suite': nickel, laterite, chromite and cupriferous massive sulfide, associated with ultrabasic and basic volcanics and subordinate intermediate intrusive-metamorphic (schist) rocks; (2) 'third arc suite': mainly gold-bearing copper sulfides with pyrite and minor magnetite and molybdenite, related to intermediate intrusives and volcanics. Sulu Sea Basin may have formed as result of extensional rifting of part of frontal arc)

Santos, R.A. (1997)- Chromite and platinum group mineralization in arc-related ophiolites: constraints from Palawan and Dinagat Ophiolite Complexes, Philippines. Ph.D. Thesis, University of Tokyo, p. 1-193. *(Unpublished)*

Sarewitz, D. & D.E. Karig (1986)- Processes of allochthonous terranes evolution in Mindoro Island, Philippines. Tectonics 5, 4, p. 525-552.
(Two tectonostratigraphic terranes on Mindoro Island, with unclear relationships: (1) N Palawan block rifted off S China in Oligocene, and comprises most of shallow S end of S China Sea. E part includesM-L Jurassic Mansalay Fm (NW dipping) and Eocene- E Oligocene Caguray Fm quartz-rich clastics and limestone, thick Lumintao complex mid-Oligocene submarine rift basalts and U Oligocene-Miocene graben fill deposits. (2) Mindoro block, with lower greenschist facies metamorphic basement (protoliths submarine arc volcanics?) with tectonic slices of serpentinite, overlain by U Cretaceous and U Eocene strata, recording several episodes of intense deformation of Mesozoic and Tertiary age. Mindoro Suture steeply dipping faults with serpentinized ultramafic rock, amphibolite, and rocks derived from both bounding terranes, probably mid-Tertiary transcurrent faulting. W side of C Philippine archipelago was left-lateral transform boundary)

Sarewitz, D.R. & D.E. Karig (1986)- Geologic evolution of western Mindoro Island and the Mindoro suture zone, Philippines. J. Southeast Asian Earth Sci. 1, p. 117-141.
(Two tectonostratigraphic terranes on Mindoro Island: N Palawan and Mindoro blocks, separated by steeply-dipping Mindoro Suture Zone. N Palawan block is continental fragment rifted off Eurasia when S China Basin opened in mid Tertiary, with evidence of crustal stretching starting in Late Eocene or earlier. Large volumes of basalt extruded in mid Oligocene. Mindoro block with pre-upper Cretaceous Mindoro Metamorphic basement. Mindoro Suture Zone active in Late Paleogene- E Neogene. Numerous large bodies of serpentinized ultramafic rock along suture. Interpreted as strike-slip boundary, juxtaposing Mindoro and N Palawan blocks in M-L Miocene. Subsequent latest Miocene and younger W-vergent thrust faulting between Mindoro Suture Zone and Manila Trench)

Sarewitz, D.R. & S.D. Lewis (1991)- The Marinduque intra-arc basin, Philippines: Basin genesis and in situ ophiolite development in a strike-slip setting. Geol. Soc. America (GSA) Bull. 103, 5, p. 597-614.
(Marinduque marine intra-arc basin in N-C Philippine volcanic arc system. Rhombic in shape, with long axis trending N-NW, with ENE trending volcanic ridge dividing it into two depocenters. Magnetic anomalies parallel to central volcanic ridge indicate it formed by extension in N-S direction by process analogous to sea-floor spreading. Marinduque basin is composite pull-apart basin whose floor is in part composed of oceanic-type crust. Evolution of central volcanic ridge presents actualistic model for development and emplacement of ophiolites in island-arc setting. Overall history of Marinduque basin suggests strike-slip processes may play important role in origin of intra-arc basins)

Sato, T. (1961)- Les ammonites oxfordiennes de l'ile de Mindoro. Japan J. Geol. Geography 32, 1, p. 141-143.
('The Oxfordian ammonites of Mindoro Island'. Incl. Parawedekindia arduennensis, Pseudopeltoceras from thick (but intensely folded) interbedded sandstone-shales in Mansalay area of SE Mindoro. First ammonites described from Philippines (see also Sato et al. 2012))

Sato, T., T. Kase, Y. Shigeta, R.S.P. De Ocampo, P.A. Ong, Y.M. Aguilar & W. Mago (2012)- Newly collected Jurassic ammonites from the Mansalay Formation, Mindoro Island, Philippines. Bull. Natl. Museum Natural Sci., Taiwan, Ser. C, 38, p. 63-73.
(online at: www.kahaku.go.jp/research/researcher/papers/123549.pdf)
(Four species of Jurassic ammonite from Mansalay area in SE Mindoro Island, Philippines: Physodoceras cf. gortanii and Perisphinctes (Liosphinctes) sp. from Amaga River valley near Mansalay, and P. (L.) cf.

laevipickeringius and unidentifiable perisphinctid from Colasi Point. Assemblage indicative of M Oxfordian age and close affinity with Tethys-Pacific faunas)

Sato, T. & Y. Seki (1972)- Finding of lawsonite-bearing rock as a pebble in a Jurassic conglomerate bed in the southeastern part of Mindoro Island, Philippines. Proc. Japan Academy 48, 7, p. 495-499.
(online at: https://www.jstage.jst.go.jp/article/pjab1945/48/7/48_7_495/_pdf

Balce (2005)- Geology, geochemistry and U-Pb SHRIMP age of the Tacloban Ophiolite Complex, Leyte Island (Central Philippines): implications for the existence and extent of the Proto-Philippine Sea Plate. Resource Geology 55, 3, p. 207-216.
(Age and origin of oceanic basement of C Philippines ophiolitic massifs debated. Tacloban Ophiolite Complex NW-SE trending massif in NE Leyte Island, with U-Pb ages of zircons in gabbro of ~145 and 125 Ma (E Cretaceous). Overlain by several 10's m of Cretaceous red siliceous pelagic Palanog Sediments, unconformably overlain by Miocene-Pliocene marine sediments and Pleistocene volcaniclastics. Ophiolite suite of subduction-related origin, generated in marginal basin, with Late Miocene minimum age of emplacement. E Cretaceous age limits possible progenitor of ophiolite to proto-Philippine Sea Plate)

Suggate, S.M., M.A. Cottam, R. Hall, I. Sevastjanova, M.A. Forster, L.T. White, R.A. Armstrong, A. Carter & E. Mojares (2014)- South China continental margin signature for sandstones and granites from Palawan, Philippines. Gondwana Research 26, 2, p. 475-491.
(online at: http://searg.rhul.ac.uk/pubs/suggate_etal_2014%20Palawan.pdf)
(N Palawan Continental Terrane metasediments derived mainly from granitic and metamorphic rocks of continental character, with zircons indicating Late Cretaceous maximum depositional age and S China origin. S Palawan Terrane Miocene sandstones similar heavy mineral assemblages. Also similar to Lower Miocene Kudat Fm sandstones of N Borneo, suggesting short-lived episode of sediment transport from Palawan to Borneo in E Miocene following arc-continent collision. U-Pb dating of zircons show Central Palawan granite is Eocene (42 Ma). Capoas granite 13.8- 13.5 Ma. Inherited zircon ages from Capoas granite imply melting of continental crust from S China margin and Cenozoic rift-related and arc material)

Suppe, J. (1988)- Tectonics of arc-continent collision on both sides of the South China Sea: Taiwan and Mindoro. Acta Geol. Taiwanica 26, p. 1-18.

(N Luzon in central part of Philippine Mobile Belt with pre-Paleocene ophiolitic complex, Eocene sediments, Eocene-Oligocene igneous complex and late Oligocene-E Pliocene sediments. In M Eocene PMB was primitive island arc. Late Oligocene- E Miocene time volcanic island arc setting. In M Miocene- Pliocene remained as mafic volcanic island arc)

Suzuki, S., S. Takemura, G.P. Yumul, D.D. Sevillo & D.K. Asiedu (2000)- Composition and provenance of the Upper Cretaceous to Eocene sandstones in Central Palawan, Philippines: constraints on the tectonic development of Palawan. The Island Arc 9, 4, p. 611-626.
(U Cretaceous- Eocene turbiditic sandstones from C Palawan common quartz, acidic volcanics, K-feldspar and granitic rock fragments. Derived from continental source region, probably continental margin of S China)

Suzuki, S., G.P. Yumul, C.B. Dimalanta, R.E. Pena, T. Tam & K. Isihida (2013)- Sandstone composition of the upper Cretaceous to Neogene successions of the Philippine Mobile Belt and the Palawan Continental Block. Proc. 2nd lnt. Symposium Int. Geoscience Programme (IGP) Project 589, Borocay Island, p. 28-31. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/2nd%20Symposium/Abstract%20volume.pdf)
(Sandstone compositions of Philippine Mobile Belt suggest it formed in Eocene as primitive basaltic volcanic arc and developed to basaltic-andesitic arc in Oligocene-Pliocene time. Sandstones from U Cretaceous in Palawan Continental Block rich in quartz and felsic volcanic rock fragments, suggesting PCB was part of continent and supports idea that PCB collided with PMB to form Philippine Archipelago)

Taguibao, K.J.L. & R. Takahashi (2018)- Whole-rock geochemistry of host rocks and K/Ar Age of hydrothermal mineral of the Co-O epithermal gold deposit, Mindanao, Philippines. Open J. of Geology 8, p. 383-398.
(online at: https://file.scirp.org/pdf/OJG_2018041215444466.pdf)
(Co-O epithermal gold deposit located along Pliocene-Quaternary calc-alkaline magmatic zone at E Mindanao. Intermediate sulfidation epithermal Au quartz vein type, hosted in Eocene- Oligocene island arc basaltic-andesitic volcanics and volcaniclastic rocks. K/Ar ages of hydrothermal minerals ~28.6 Ma (Late Oligocene) and ~31.7 Ma (E Oligocene))

Takanyagi, Y., T. Takayama & M. Oda (1977)- Notes on the Late Cenozoic planktonic foraminifera and calcareous nannofossils from Panay, Philippines. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 18, p. 77-86.

Tamayo, R.A., P.Y. Graciano, R.C. Maury, H. Bellon, J. Cotten, M. Polve T. Juteau & C. Querubin (2000)- Complex origin for the south-western Zamboanga metamorphic basement complex, western Mindanao, Philippines. The Island Arc 9, p. 638-652.
(N portion of SW Zamboanga metamorphic basement complex, W Mindanao, amphibolites with relict textures from cumulate gabbro protoliths and with magmatic arc-related signature. Unconformably overlain by metasedimentary quartz-muscovite-feldspar-kyanite schist of continental basement origin. Metamorphism at T 550-700°C and P of 5-9 kbar. K-Ar ages of metamorphic event 24.6, 22.2 and 21.2± 1.2 Ma. Results in agreement with plate tectonic models describing SW Zamboanga metamorphic basement as continental terrane with slivers of magmatic arc crust)

Tamayo, R.A., R.C. Maury, G.P. Yumul, M. Polve, J. Cotten, C.B. Dimalanta & F.O. Olaguera (2004)- Subduction-related magmatic imprint of most Philippine ophiolites: implications on the early geodynamic evolution of the Philippine archipelago. Bull. Soc. Geologique France 175, 5, p. 443-460.
(Basement complexes of Philippines at least 20 ophiolitic complexes, with volcanic sequences similar to MORB, transitional MORB-island arc tholeiites and arc volcanic rocks originating from modern Pacific-type oceans, back-arc basins and island arcs. Most volcanic sequences in Philippine ophiolites formed in subduction settings. Associated gabbros and peridotites tie to supra-subduction zone environments. Early geodynamic evolution of Philippines dominated by opening and closing of oceanic basins, providing substratum of Cretaceous -Recent volcanic arcs)

Tamayo, R.A., G.P. Yumul, R.C.Maury, M. Polve, M. Cotton & M. Bohn (2001)- Petrochemical investigation of the Antique Ophiolite (Philippines): implications on volcanogenic massive sulfide and podiform chromitite deposits. Resource Geology 51, p. 145-164.
(Antique Ophiolite of W Panay in E Miocene suture zone between Philippine Mobile Belt and 'Eurasian' N Palawan Block, E of Sulu Sea/ Negros Trench. Includes dismembered fragments of basaltic sequence, sheeted dikes, gabbros, mafic-ultramafic rock sequences and serpentinites, mostly as clasts and blocks within serpentinites. Ophiolite probably represents mix of oceanic ridge and fore-arc crust fragments. Overlying basal conglomerate of M Miocene age, suggesting exhumation no later than M Miocene. Volcanic rock chemistry intermediate between MORB and island arc basalt. Volcanogenic massive sulfide-copper deposits occur near the contact between pillow basalts and overlying sediments or interbedded with sediments)

Tamesis, E.V. (1981)- Hydrocarbon potential of Philippine basins. In: M.J. Valencia (ed.) Proc. EAPI/CCOP Workshop, Honolulu 1980, Energy 6, 11, p. 1181-1206.
(First oil exploration well in Philippines in 1896 in Visayan Region, Cebu Island. Since then >367 exploratory wells drilled in 12 basins. First commercial oil discovery 1976 Nido field off Palawan. Philippine sedimentary basins in complexly deformed zone between Philippine Sea Plate and Eurasian Plate. Main plays pursued are Oligocene- M Miocene carbonate buildups. Clastic reservoir plays in structural traps not encouraging due to rapid facies changes and low permeabilities of sands, mostly derived from volcanic detritus)

(Silicic volcanic deposits relatively abundant in Macolod Corridor, SW Luzon. Possibly from partial melting of mantle-derived, moderate to K-rich calc-alkaline magmas that ponded and crystallized in mid-crust)

Walia, M., U. Knittel, S. Suzuki, S.L. Chung, R.E. Pena & T.F. Yang (2012)- No Paleozoic metamorphics in Palawan (the Philippines)? Evidence from single grain U-Pb dating of detrital zircons. J. Asian Earth Sci. 52, p. 134-145.
(Palawan Continental Terrane is fragment of margin of SE China that drifted S as result of Cenozoic opening of S China Sea. Presence of non-metamorphic Permian and Triassic sediments in N of island suggested Paleozoic

age for metamorphics. Detrital zircons as young as 80-98 Ma in all metamorphic units, suggesting Late Cretaceous or younger age, so Caramay Schist not basement for rest of units in C Palawan. Zircon ages two major peaks, at ~115 Ma and 1.8 Ga. Source of zircons N part of Cathaysia Block, S China)

Walia, M., T.F. Yang, U. Knittel, T.K. Liu, C.H. Lo, S.L. Chung, L.S. Teng, C.B. Dimalanta, G.P. Yumul & W.M. Yuan (2013)- Cenozoic tectonics in the Buruanga Peninsula, Panay Island, Central Philippines, as constrained by U-Pb,40Ar/39Ar and fission track thermochronometers. Tectonophysics 582, p. 205-220.
(Buruanga Peninsula at westernmost Panay Island is part of Palawan Continental Terrane, formerly attached to SE China. Collided with Philippine Mobile Belt. Paleoproterozoic and Permian zircon U-Pb ages from Saboncogon Fm emphasize derivation from SE China. Zircon and AFT ages of 51 Ma and 16 Ma constrain exhumation age. Age data suggest tectonic events at ~14 Ma, ~11-12 Ma and ~7-8 Ma, following intrusive activity at ~18 Ma (Patria-Diorite). Collision started at ~14-15 Ma and ended before 8 Ma)

Walston, V.A. & H. Oesterle (1992)- Geology of the West Linapacan 'A' Field, Offshore Palawan, Philippines. In: 9th Offshore Southeast Asia Conf., Singapore 1992, Proc. SE Asia Petroleum Expl. Soc. (SEAPEX) 10, OSEA 92171, p. 67-74.
(West Linacapan A field 1990 discovery off N tip Palawan Structure is large wrench fault-related anticline. Hydrocarbons in Lower Miocene Galoc Fm deep water sands and underlying fractured deep water Linacapan Limestone, which is rich in planktonic foraminifera (zones N4-N6). Oil API gravity 28.5°, sulfur content 2.6%. Recoverable reserves ~100 MBO (but cumulative production 1992-1996 only 8.6 MBO, then shut-in; JTvG))

Walther, H.W., H. Forster, W. Harre, H. Kreuzer, H. Lenz, P. Muller & H. Raschka (1981)- Early Cretaceous porphyry copper mineralization on Cebu island, Philippines, dated with K/Ar and Rb/Sr methods. Geol. Jahrbuch D48, p. 21-35.
(K/Ar dates on biotites from Tapian mine, Marinduque (21 Ma) and Sipalay mine, Negros Occidental (30 Ma) in agreement with geological knowledge. On Cebu Island Atlas porphyry-Cu mineralization dated by K/Ar and Rb/Sr methods as late Early Cretaceous (~108 Ma= Albian), probably related to conformity between E Cretaceous Cansi Fm and overlying Pandan Fm)

Waters, P.J., D.R. Cooke, R.I. Gonzales & D. Phillips (2011)- Porphyry and epithermal deposits and 40Ar/39Ar geochronology of the Baguio District, Philippines. Economic Geology and Bull. Soc. Econ. Geol. 106, 8, p. 1335-1363.
(Baguio district in C Cordillera of N Luzon numerous Pliocene-Pleistocene porphyry copper-gold, epithermal gold-silver and skarn gold-lead-zinc deposits. District floored by Cretaceous-Eocene metavolcanic and metasediments, overlain by E Miocene-Pliocene sediments and volcanics. Arc magmatism related to E-directed subduction of S China Sea plate along Manila Trench produced major E Miocene batholith (Ar/Ar ages ~20-23 Ma). Porphyry copper-gold and skarn deposits formed around 3.1-2.8 Ma, 1.5 Ma, 1.1 Ma and 0.5 Ma. Mineralization in district triggered by E-directed subduction of Scarborough Ridge, causing decrease in subduction angle. Fertile magmas emplaced into transtensional strike-slip relay basins)

Wehner, H. (1989)- Organic-geochemical studies in Visayan Basin, Philippines. In: H. Porth & C.H. von Daniels (eds.) On the geology and hydrocarbon prospects of the Visayan Basin, Philippines, Geol. Jahrbuch B70, p. 317-348.

Yan, Y., D. Yao, Z. Tian, C. Huang, W. Chen, M. Santosh, G.P. Yumul, C.B. Dimalanta & Z. Li (2018)- Zircon U-Pb chronology and Hf Isotope from the Palawan-Mindoro Block, Philippines: implication to provenance and tectonic evolution of the South China Sea. Tectonics 37, 4, p. 1063-1076.
(Palawan-Mindoro Block drifted from mainland Asia with spreading of S China Sea. U-Pb age and Hf isotopic data on detrital zircon grains from Eocene-Miocene sediments in Palawan-Mindoro Block show four major age groups (80-120, 160-180, 1600-2100 and 2200-2700 Ma). Eocene samples from Palawan-Mindoro similar to Taiwan, suggesting P-M Block still attached to South China margin in Eocene. Different zircons in Miocene samples reflect S-ward drifting of Palawan-Mindoro Block at or before that time)

Yang, T.F., T. Lee, C.H. Chen, S.N. Cheng, U. Knittel, R.S, Punongbayan & A. Rasdas (1996)- A double island arc between Taiwan and Luzon: consequence of ridge subduction. Tectonophysics 258, p. 85-101.
(Taiwan-Luzon Arc between Taiwan and Luzon double arc structure: two volcanic chains separated by 50 km N of Luzon (18°N), and converge near 20°N. Islets in W chain older and mainly Miocene- Pliocene volcanics; E chain mainly Quaternary active volcanoes. Double arc structure where Benioff zone suddenly changes, and possibly tectonic manifestation of subduction of Scarborough Seamount Chain, the extinct mid-ocean ridge of S China Sea. When ridge reached subduction zone at 5-4 Ma, its buoyancy temporarily interrupted subduction,

caused regional uplift and massive reef formation in W chain. When subduction started again, dip angle became shallower in response to buoyancy of downgoing ridge, leading to E-ward shift of volcanic front)

(online at: http://web2.nmns.edu.tw/PubLib/Library/research/199012-1.pdf)
(Liminangcong Fm bedded chert on SE Busuanga Island often with rich M-U Triassic radiolaria. Three assemblages: Ladinian Busuanga cheni, Carnian Trialatus megacornutus and Upper Norian Livarella sp. assemblages (part of continuous L Permian- Jurassic deep sea series with radiolaria; part of convergent margin of SE Asia that stretches from Japan to Borneo)

Yeh, K.Y. (1992)- Triassic radiolaria from Uson Island, Philippines. Bull. Natl. Museum Natural Sci., Taiwan, 3, p. 51-91.
(online at: http://web2.nmns.edu.tw/PubLib/Library/research/199205-51.pdf)
(Late Ladinian- E Rhaetian radiolaria from bedded chert on S Uson island, just S of Busuanga Island. Cherts lithologically similar to those from Busuanga island and believed to be part of Late Permian-Jurassic Liminangcong cherts of N Palawan Block)

Yeh, K.Y. & Y.N. Cheng (1996)- An Upper Triassic (Rhaetian) radiolarian assemblage from Busuanga Island, Philippines. Bull. Natl. Museum Natural Sci., Taiwan, 7, p. 1-43.
(E Rhaetian radiolarian faunas from red chert on Busuanga Island, NW Philippines, closely resemble Rhaetian radiolaria from Japan)

Yeh, K.Y. & Y.N. Cheng (1996)- Jurassic radiolarians from the Northwest Coast of Busuanga Island, North Palawan Block, Philippines. Micropaleontology 42, 2, p. 93-124.
(M Jurassic (Aalenian) radiolarians from Liminangcong red ribbon chert in Palawan olistostrome (part of Late Permian-Late Jurassic ocean plate stratigraphy at edge of N Palawan block). 56 species, with multicyrtid nassellarians (Praeparvicingula, H suum, Elodium). Similar to C and SW Japan. Presence of common Praeparvicingula and abundant pantanellids indicates N Tethyan or S Tethyan assemblage (~22-30°N or S)

Yeh, K.Y. & Y.N. Cheng (1998)- Radiolarians from the Lower Jurassic of the Busuanga Island, Philippines. Bull. Natl. Museum Natural Sci., Taiwan, 11, p. 1-65.

Yokoyama, K., Y. Tsutsumi, T. Kase K.L. Queano & M.A. Yolanda (2012)- Provenance study of Jurassic to Early Cretaceous sandstones from the Palawan Microcontinental Block, Philippines. Mem. Nat. Museum Nat. Science, Tokyo, 48, p. 177-199.
(online at: http://www.kahaku.go.jp/research/publication/memoir/download/48/4811.pdf)
(Palawan microcontinental block in Philippines separated from SW coast of Asian continent during opening of S China Sea in Oligocene-Miocene times. Jurassic- E Cretaceous sandstones from Palawan block (Busuanga, Mindoro, Panay islands) with bimodal age distribution of detrital monazites: 140-260 Ma and 1800-2000 Ma. Pattern unlike SE China Sea or Indochina Peninsula, but similar to Korean Peninsula and in Zhejiang Province in E China. Jurassic- E Cretaceous sandstones of Palawan area deposited on E side of present-day Taiwan?)

Yoshida, K., N. Pulido & E. Fukuyama (2016)- Unusual stress rotations within the Philippines possibly caused by slip heterogeneity along the Philippine fault. J. Geophysical Research, Solid Earth, 121, 3, p. 2020-2036.

Yu, S.B, Y.J. Hsu, T. Bacolcol, C.C. Yang, Y.Ch. Tsai & R. Solidum (2013)- Present-day crustal deformation along the Philippine Fault in Luzon, Philippines. J. Asian Earth Sci. 65, p. 64-74.
(Left-lateral Philippine Fault results from oblique convergence between Philippine Sea Plate and Sunda Block/Eurasian Plate, transecting Philippine archipelago from NW corner of Luzon to SE end of Mindanao for about 1200 km. GPS results show horizontal velocities with respect to Sunda Block gradually decrease from N to S along W Luzon at rates of 85-49 mm/yr in WNW direction)

Yumul, G.P. (1993)- Angat Ophiolitic Complex, Luzon, Philippines: a Cretaceous dismembered marginal basin ophiolitic complex. In: B.K. Tan et al. (eds.) Proc. 7th Conf. Geology, Mineral and Energy Res. SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 529-537.
(Geochemistry of Angat Ophiolite Complex suggests formation in environment with both Mid-Ocean Ridge Basalt and Island Arc tholeiite signatures, probably in marginal basin setting)

Yumul, G.P. (1994)- A Cretaceous to Paleocene- Eocene South China Sea Basin origin for the Zambales Ophiolite Complex, Luzon, Philippines? Island Arc 3, 1, p. 35-47.
(Eocene Zambales Ophiolite Complex with transitional mid-ocean ridge basalt/ island arc tholeiite characteristics, formed in subduction-related marginal basin. Geophysical evidence suggests SW sub-basin of S China Sea Basin is probably Cretaceous to Paleocene-Eocene in age; Zambales Ophiolite Complex could have come from this sub-basin)

Yumul, G.P. (1994)- A marginal basin crust basement for the Baguio Mining District, Luzon, Philippines. J. Geol. Soc. Philippines 49, p. 79-87.

Yumul, G.P. (1994)- The Acoje Block platiniferous dunite horizon, Zambales Ophiolite Complex, Philippines: melt type and associated geochemical controls. Resource Geology 51, 2, p. 165-174.
(Zambales Eocene-age supra-subduction zone ophiolite complex made up of mid-ocean ridge-related Coto block and island arc-related Acoje block. Platinum-group elements in Acoje block in nickel sulfides and chromitite deposits of high-MgO basalt to boninitic magmas. Main platiniferous zone in Acoje block transition zone dunite)

Yumul, G.P. (2003)- The Cretaceous Southeast Bohol ophiolite complex, Central Philippines: a highly disaggregated supra-subduction zone ophiolite. J. Asian Earth Sci. 21, 8, p. 957-965.
(SE Bohol (NW of Mindanao) Ophiolite Complex complete ophiolite sequence with pelagic chert cap yielding E Cretaceous age. Basement is Cretaceous-Paleogene Alicia Schist. Peridotite suite dominated by harzburgite with rare lherzolite and dunite pods. Includes sheeted dike complex and preponderance of sheet flows over pillow lavas in volcanic section. Geochemical affinities transitional between Mid-Ocean Ridge basalt and island arc tholeiite, suggesting formation in subduction-related marginal basin. Formed in a fast-spreading center, emplacemed as forearc ophiolite)

Yumul, G.P. (2007)- Westward younging disposition of Philippine ophiolites and its implication for arc evolution. Island Arc 16, 2, p. 306-317.
(Philippine island arc system made up of 2 main blocks: Philippine Mobile Belt and Palawan microcontinental block in W. Ophiolites in Mobile Belt younging W-ward, resulting from CW rotation of Philippine arc system during NW-ward translation in Eocene, resulting in W boundary collision with Sundaland-Eurasian margin, causing accretion of ophiolites/ melanges along W side. New zonation with four belts: (1) Late Cretaceous ophiolite complexes/ metamorphic soles along E Philippines; (2) Cretaceous dismembered ultramafic-mafic complexes/ melanges exposed W of E Philippines; (3) Cretaceous- Eocene to Oligocene ophiolites, emplaced between Philippine Mobile Belt and Sundaland-Eurasian margin; (4) ophiolite complexes emplaced along continental margins (Palawan and Zamboanga-Sulu). Whole Philippine Mobile Belt, except strike-slip fault bounded Luzon Eocene Zambales ophiolite complex, may be underlain by Cretaceous proto-Philippine Sea Plate fragments)

Yumul, G.P. & G.R. Balce (2003)- Supra-subduction zone ophiolites as favorable hosts for chromitite, platinum and massive sulfide deposits. J. Southeast Asian Earth Sci. 10, p. 65-97.
(Supra-subduction zone ophiolites, as exemplified by Zambales Ophiolite Complex, Philippines, host extensive chromitite, volcanic-hosted massive sulfide deposits and, to a lesser degree, platinum-group minerals. Mid-ocean ridge basalt ophiolites almost barren of economic mineral deposits. Marginal basins more easily emplaced than large, open sea oceanic basin ophiolites which are usually subducted)

Yumul, G.P., G.R. Balce & R.T. Datuin (1993)- Ophiolites and ophiolitic complexes in the Philippines as viable exploration targets. J. Geol. Soc. Philippines 48, p. 35-54.

(Twenty ophiolitic complexes in Philippines. Ultramafic-mafic complexes with complete oceanic crust-mantle sequences classified as Tethyan, incomplete dismembered ones grouped as Cordilleran. Majority of Philippine ophiolitic complexes are supra- subduction zone (SSZ) ophiolites, exhibiting subduction related affinity. Most of` economically viable chromitite, massive nickel- copper sulfides and platinum group minerals hosted by these SSZ ophiolites)

Yumul, G.P., G.R. Balce, C. Dimalanta & R.T. Datuin (1997)- Distribution, geochemistry and mineralization potentials of Philippine ophiolite and ophiolitic sequences. Ofioliti 22, p. 47-56.
(Philippines ophiolites range from complete oceanic crust-mantle sequences (Tethyan type) to incomplete dismembered ones (Cordilleran type). Majority subduction-related. With viable chromitite, volcanic/ ultramafic-hosted massive nickel-copper sulfide and platinum-group mineral deposits. Subduction-related ophiolitic sequences better exploration targets for metallic mineral deposits than mid-ocean ridge ophiolites)

Yumul, G.P., W.W. Brown, C.B. Dimalanta, C.A. Ausa, D.V. Faustino-Eslava, B.D. Payot, N.T. Ramos, A.N.L. Lizada et al. (2017)- Adakitic rocks in the Masara gold-silver mine, Compostela Valley, Mindanao, Philippines: different places, varying mechanisms? J. Asian Earth Sci. 142, p. 45-55.

(Baguio gold-copper mining district rocks evidence evolution from subduction-related marginal basin to island arc setting. E- M Miocene arc polarity reversal from E (termination of subduction along proto-E Luzon Trough) to W (initiation of subduction along Manila Trench))

Yumul, G.P., C.B. Dimalanta & R.A. Tamayo (2005)- Indenter-tectonics in the Philippines: example from the Palawan microcontinental block- Philippine Mobile Belt collision. Resource Geology 55, 3, p. 189-198.
(Aseismic Palawan microcontinental block collided with Philippine Mobile Belt since E Miocene. Tectonic microblocks N (Luzon) and S (W Visayas Block) of collision front rotated in opposite senses. Rotation converted adjacent strike-slip faults to subduction zones (Manila and Negros Trenches))

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo & J.A.L. Barretto (2000)- Contrasting morphological trends of islands in Central Philippines: speculation on their origin. The Island Arc 9, 4, p. 627-637.
(Palawan microcontinental block collided with Philippine Mobile Belt, resulting in CCW rotation of Mindoro-Marinduque and CW rotation of Panay. Collision also caused CW rotation of NE Negros, Cebu, NW Masbate and Bohol (W Visayan block), resulting into present-day NE-SW trend. SE Sulu Sea sub-basin is inferred to have undergone CW rotation which can account for E-W magnetic lineations. Paleomagnetic data suggest collision-related rotation commenced during E -M Miocene and had ceased by Late Miocene)

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo & H. Bellon (2003)- Silicic arc volcanism in Central Luzon, Philippines: characterization of its space, time and geochemical relationship. The Island Arc 12, 2, p. 207-218.
(In C Luzon volcanic centers dated to ~5 Ma are silicic in composition, those between 5- 1 Ma expose basaltic to andesitic rocks. Volcanic centers of <1 Ma range from basaltic through andesitic to dacitic. Also W-ward shift in location of volcanic centers, attributed to changes in dip of subduction of S China Sea crust along Manila Trench. Flat subduction resulted from subduction of Scarborough Seamount Chain along Manila Trench W of N Luzon)

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo & D.V. Faustino-Eslava (2013)- Geological features of a collision zone marker: The Antique Ophiolite Complex (Western Panay, Philippines). J. Asian Earth Sci. 65, p. 53-63.
(Antique Ophiolite Complex exposed on W side of Panay, C Philippines, derived from Jurassic- Cretaceous proto-S China Sea oceanic leading edge of Palawan microcontinental block. Closure of ocean basin resulted in emplacement of ophiolite fragment along boundary of microcontinental block and Philippine mobile belt. Transitional mid-ocean ridge-island arc geochemistry characterize ophiolite rocks)

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo & R.C. Maury (2003)- Collision, subduction and accretion events in the Philippines: a synthesis. The Island Arc 12, p. 77-91.
(Baguio District in N Luzon, Palawan-Central Philippine region and Mati-Pujada area in SE Mindanao resulted from events related to subduction polarity reversal leading to trench initiation, continent-arc collision and autochthonous oceanic lithosphere emplacement. Baguio District E Miocene trench initiation for E-dipping Manila Trench after Late Oligocene cessation of subduction alongW-dipping proto- E Luzon Trough. Manila Trench initiation attributed to collision of Palawan microcontinental block with Philippine Mobile Belt. Several collision-related accretionary complexes in Palawan- C Philippine region)

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo, R.C. Maury, R.C. Bellon, M. Polve et al. (2004)- Geology of the Zamboanga Peninsula, Mindanao, Philippines: an enigmatic South China continental fragment? In: J. Malpas et al. (eds.) Aspects of the tectonic evolution of China, Geol. Soc., London, Spec. Publ. 226, p. 289-312.
(Mindanao Island in S Philippines two blocks: (1) E-C Mindanao island arc block and (2) continental Zamboanga Peninsula with several ophiolitic bodies and melanges, separated by NW-SE M Miocene Siayan-Sindangan collision suture zone, a subduction zone complex reactivated as sinistral strike-slip fault. M-Late Miocene lava flows from Zamboanga Peninsula consistent with possible existence of E Miocene Sulu Trench. Zamboanga Peninsula possibly part of Palawan microcontinental block)

Yumul, G.P., C.B. Dimalanta, R.A. Tamayo & M.F. Zhou (2006)- Geology and geochemistry of the Rapu-Rapu Ophiolite Complex, Eastern Philippines: possible fragment of the Proto-Philippine Sea Plate. Int. Geology Review 48, 4, p. 329-348.
(E Cretaceous Rapu-Rapu ophiolite complex is dismembered ophiolite, formed at intermediate- fast spreading center and interpreted as supra-subduction zone ophiolite. Volcanic and gabbroic rocks show predominance of a marginal basin geochemical signature, but spinels more indicative of mid-ocean ridge affinities. Together with other fragments of oceanic lithosphere exposed along E Philippine Ophiolite belt, probably derived from proto-Philippine Sea plate)

Yumul, G.P., F.T. Jumawan & C.B. Dimalanta (2009)- Geology, geochemistry and chromite mineralization potential of the Amnay ophiolitic complex, Mindoro, Philippines. Resource Geology 59, 3, p. 263-281.
(Amnay Ophiolitic Complex in Mindoro emplaced Cenozoic S China Sea oceanic lithosphere as result of collision between Palawan microcontinental block and Philippine mobile belt. M Oligocene sediments intercalated with MORB-like pillow lavas suggest generation of ophiolite complex in spreading ridge in back-arc basin setting. Volcanic rock geochemistry suggests supra-subduction zone ophiolite)

Yumul, G.P., M.F. Zhou, R.A. Tamayo, R.C. Maury, D.V. Faustino, F.O. Olaguera & J. Cotton (2001)- Onramping of a cold oceanic lithosphere in a forearc setting, the Southeast Bohol Ophiolite Complex, Central Philippines. Int. Geology Review 43, p. 850-866.
(E Cretaceous ophiolite complex on SE Bohol island formed in subduction-related marginal basin. Negative Nb, Zr, and Ti anomalies, suggest island-arc affinity. Ophiolite thrust on top of Cansiwang tectonic melange,

which is thrust over Alicia Schist (metamorphosed oceanic crust sliver of chlorite, amphibolite and quartz-sericite schist). Serpentinite between ophiolite and Alicia Schist indicates amphibolite schists not emplacement-related metamorphic sole of ophiolite. Crust-mantle sequence emplaced at relatively low T (<500°C). Onramping of SE Bohol Ophiolite Complex as forearc ophiolite, followed by collision and suturing with Alicia Schist in Late Cretaceous. Ophiolite may represent fragment of Cretaceous proto-Philippine Sea plate)

Zamoras, L.R. (2000)- Jurassic-Early Cretaceous accretionary complex in the Calamian Islands, North Palawan Block (Philippines). Ph.D. Thesis, Niigata University, p. 1-120. *(Unpublished)*
(Study of part of Jurassic- E Cretaceous 'East Asian subduction zone' on SE margin of Indochina and S China blocks, now NE part of Palawan Block (Late Permian- Late Jurassic/E Cretaceous deep marine sediments of NNW-traveling Izanagi oceanic plate, imbricated in Jurassic- Cretaceous)

Zamoras, L.R. (2013)- Accretion and post-accretion tectonics of the North Palawan Block. Proc. 2nd lnt. Symposium lnternational Geoscience Programme (IGP) Project 589, Borocay Island, p. 19-20. *(Abstract)*
(online at: http://igcp589.cags.ac.cn/2nd%20Symposium/Abstract%20volume.pdf)
(N Palawan Block 4 episodes: M Permian- Jurassic oceanic plate travel, with deposition of chert and clastics; (2) M-Jurassic- E Cretaceous accretion of chert-clastic sequences at E Asian continental margin during Paleo-Pacific subduction; (3) M Oligocene- E Miocene opening of S China Sea, resulting in S-ward movement of N Palawan Block; (4) M Miocene collision between N Palawan Block and Philippine Island Arc)

Zamoras, L.R. & A. Matsuoka (2000)- Early Late Jurassic radiolarians from the clastic unit in Busuanga Island, North Palawan, Philippines. Science Reports, Niigata University, E (Geology), 15, p. 91-109.
(At least 60 species of radiolarians in siliceous mudstone of Tulbuan Plain, Busuanga Island. Assemblages dominated by smaller nassellarians. Abundance of Stylocapsa(?) spiralis indicates zone JR6 of Matsuoka (1995). Associated occurrence of Stylocapsa tecta, Dicolocapsa conoformis, Guexella nudata, etc., narrows age down to lower part of zone, of Late Callovian or E Oxfordian age (see also Marquez et al. 2006; JTvG))

Zamoras, L.R. & A. Matsuoka (2001)- Malampaya Sound Group: a Jurassic-Early Cretaceous accretionary complex in Busuanga Island, North Palawan Block (Philippines). J. Geol. Soc. Japan, 107, p. 316-336.
(online at: https://www.jstage.jst.go.jp/article/geosoc1893/107/5/107_5_316/_pdf/-char/en)
(Busuanga Island accretionary complex, collectively called Malampaya Sound Gp, with M Permian- Jurassic radiolarian cherts, M Jurassic- E Cretaceous clastics and various-age limestones, with minor melange bodies. Incl. M Permian limestone with fusulinids (Verbeekina verbeeki, Neoschwagerina spp.) and U Jurassic limestone with Cladocoropsis miriabilis, Pseudocyclammina lituus, Salpingoporella. Rocks are off scraped sedimentary deposits from subducted oceanic plate, imbricated during Jurassic- E Cretaceous accretion. Transition from chert to siliceous mudstone to terrigenous clastics indicates change from open ocean to subduction zone sedimentation, and is younging to N)

Zamoras, L.R. & A. Matsuoka (2004)- Accretion and postaccretion tectonics of the Calamian Islands, North Palawan Block (Philippines). Island Arc 13, p. 506-519.
(Accretionary complex of N Palawan block with U Paleozoic-Mesozoic sequences of chert (Liminangcong Fm), clastics (Jurassic-Cretaceous Guinlo Fm) and limestones. Three accretionary belts on Busuanga Island (all with N-dipping beds, steepest in N; extent of complex ~22-25 km): (1) N Busuanga Belt (M Jurassic; with Permian- Aalenian pelagic sediments and Bathonian- Callovian clastics), (2) M Busuanga Belt (Late Jurassic; with M Permian- Bajocian cherts, overlain by Bathonian- Oxfordian clastics) and (3) S Busuanga Belt (E Cretaceous; with Triassic- Jurassic cherts, U Tithonian sandstones). Age progression reflects facies changes by gradual plate movement from remote oceanic environment towards subduction zone. Limestone blocks that formed over seamounts became juxtaposed with chert-clastic sequence during accretion. In Late Cretaceous accretion-subduction along E Asian margin subsided. M Oligocene seafloor spreading disconnected N Palawan block from Asian mainland, which then migrated S. Collision between N Palawan block and Philippine Island Arc in M Miocene generated megafold structure in Calamian Islands as result of CW turn of accretionary belts in E Calamian from NE-SW to NW-SE)

Zhu, J., Z. Sun, H. Kopp, X. Qiu, H. Xu, S. Li & W. Zhan (2013)- Segmentation of the Manila subduction system from migrated multichannel seismics and wedge taper analysis. Marine Geophysical Res. 34, 3-4, p. 379-391.

Zamoras, L.R., M.G.A. Montes, K.L. Queano, E.J. Marquez, C.B. Dimalanta, J.A.S. Gabo & G.P. Yumul (2008)- Buruanga Peninsula and Antique Range: two contrasting terranes in Northwest Panay, Philippines, featuring an arc- continent collision zone. Island Arc 17, 4, p. 443-457.
(Buruanga Peninsula of NW Panay with Jurassic pelagic rocks as part of ocean plate stratigraphy of N Palawan terrane. Differ from Antique Range M Miocene basaltic to andesitic pyroclastic and lava flow deposits with reefal limestone and arkosic sandstone of Philippine Mobile Belt (see also Ishida et al. 2015; Jurassic pelagics= M-L Triassic?; JTvG))

Zhu, J., Z. Sun, H. Kopp, X. Qiu, H. Xu, S. Li & W. Zhan (2013)- Segmentation of the Manila subduction system from migrated multichannel seismics and wedge taper analysis. Marine Geophysical Res. 34, 3-4, p. 379-391.
(Manila subduction system three segments: (1) N Luzon, (2) seamount chain segment and (3) Luzon segment)

IX.9. South Philippines (Celebes Sea, Sulu Sea, Sandakan)

Abando, R.P. & G.H. Ansay (2002)- Sulu Sea- East Palawan Basins: frontier basin case study. Coord. Comm. Geosc. Programs in East and SE Asia, 15p.
(at: www.ccop.or.th/projects/PPM/Case_Study_Phillipines_files/SuluSeaBasin.pdf)
(Discussion of petroleum potential in Sulu Sea (Sandakan sub-basin) and East Palawan Basin (Balabac and Bancauan subbasins))

Andrews, J.E. (1980)- Morphologic evidence for Celebes and Sulu marginal basins: constraints from ODP Leg 124. Geology 8, p. 140-143.

Beddoes, L.R. (1976)- The Balabac Sub-Basin, Southwestern Sulu Sea, Philippines. Offshore South East Asia Conf. 1976, Singapore, SE Asia PetroleumExpl. Soc. (SEAPEX), Paper 15, p. 1-22.
(Balabac sub-basin rel. small wrench-faulted M Miocene- E Pliocene depression in NW Sulu Sea, with up to 7000m of sediments. Underlain by E Miocene deep-water shale (probably deformed Rajang Gp; Hutchison 2005), acting as 'acoustic basement'. Overlain by Late Pliocene- Recent shallow water carbonates)

Beiersdorf, H. (1993)- Tectonic and sedimentary processes at the submarine Antique Ridge and the accretionary wedge of Negros (Sulu Sea, Philippines): results of an underwater television and photographic survey by R/V Sonne. The Island Arc 2, 3, p. 116-125.
(Numerous Neogene/Quaternary marl outcrops of submarine Antique Ridge and S Negros accretionary complexes (Sulu Sea, Philippines) formed by oversteepening of slope by collision with Cagayan Ridge and Cuyo Platform and by erosion)

Beiersdorf, H., W. Bach, G. Delisle, E. Faber, P. Gerling, K. Hinz et al. (1997)- Age and possible modes of formation of the Celebes Sea basement, and thermal regimes within the accretionary complexes off SW Mindanao and N Sulawesi. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 1, p. 369-387.
(E Celebes Sea floor generated by seafloor spreading. Crustal age of 43 Ma at ODP Sites 767 and 770 places chron 20 along latitude 5°30' N. Celebes Sea crust moved over hotspot along E-W path, still active around 40 Ma (seamount chain near latitude 3°N). New anomaly pattern places central seafloor spreading anomaly at 4°N, created possibly at 39 Ma (chron 18). Positive magnetic anomalies N and S of chron 20 identified as chron 21 and provide highest age of E Celebes Sea crust (~48 Ma), with spreading rate of 4 cm/yr. Cessation of seafloor spreading between 34-40 Ma. Central seafloor anomaly obscured by NW-trending wrench fault. Possible large crustal splinter of oceanic crust in accretionary prism off Mindanao. Locally high methane concentrations at lower slope off Sulawesi)

Bell, R.M. & R.G.C. Jessop (1974)- Exploration and geology of the west Sulu Sea, Philippines. The Australian Petrol. Explor. Assoc. (APPEA) J. 14, 1, p. 21-28.
(West Sulu Basin in W part of Sulu Sea. Minor M-L Miocene inversion and wrench structures in Sandakan and Bancauan basins)

Bellon, H. & C. Rangin (1991)- Geochemistry and isotopic dating of Cenozoic volcanic arc sequences around the Celebes and Sulu Seas. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 124, p. 321-338
(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_23.pdf)
(K-Ar ages >50 igneous rocks from onshore Philippines, Sabah and N Sulawesi. Onshore ages 32- near 0 Ma. Two types of island arcs: those related to progressive closing of Celebes and Sulu marginal basins and those belonging to Philippine Sea Plate. Sulu Sea/ Cagayan Ridge volcanics E-M Miocene, 13.8- 21 Ma)

Belviso, S., P. Jean-Baptiste, B.C. Nguyen, L. Merlivat & L. Labeyrie (1987)- Deep methane maxima and 3He anomalies across the Pacific entrance to the Celebes Basin. Geochimica Cosmochimica Acta 51, 10, p. 2673-2680

(Several methane seeps along flanks of two S Mindanao submarine ridges (Sangihe and Talaud East-Mindanao), at 2000-3000 meter depth. Isotopic ratio of added δ3He indicates input of hydrothermal fluids, both mantle and crustal/ sedimentary components. Methane anomalies partially associated with 3He excess, comparable to observed in spreading axis hydrothermal fields. Also major methane anomaly few 10's of km from Sangihe Ridge with no 3He enrichment, that could originate largely from shallow sedimentary layers)

Berner, U. & P. Bertrand (1991)- Light hydrocarbons in sediments of the Sulu Sea basin (Site 768); genetic characterization by molecular and stable isotope composition. Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 227-231.
(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_16.pdf)
(Gases and interstitial waters from ODP Site 768 in Sulu Trench/Philippines points in-situ generation of methane down to sub-bottom depth of ~720m. Below this depth hydrogen isotope data indicate migration of light hydrocarbons into sediments. Occurrence of propane-pentane coincides with vertical distribution of mature organic matter. Gases in this zone of mixed microbial and thermal origin)

Bertrand, P., U. Berner & E. Lallier-Verges (1991)- Organic sedimentation in Celebes and Sulu basins: type of organic matter and evaluation of organic carbon accumulation rates. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP) 124, Scient. Results, p. 217-225.
(online at: www-odp.tamu.edu/publications/124_sr/volume/chapters/sr124_15.pdf
(Organic matter in wells of ODP sites 767 (Celebes Sea) and Site 768 (Sulu Sea) mainly of terrestrial origin with the highest TOC in M Miocene turbiditic sequences that reflect major compressive event between Philippine Mobile Belt and Palawan, Cagayan, and Sulu Ridges. Eocene and Lower Miocene in Celebes Sea low TOC and only highly degraded terrestrial particles, suggesting poor preservation conditions for organic carbon during open-ocean phase of Celebes Basin. Better preservation in younger sediments)

Bertrand, P., E. Lallier-Verges, F. Laggoun-De Farge, M. Pubeller, U. Berner, M. von Breymann & A. Desprairies (1996)- Organic sedimentation response to tectonic and paleogeographic influences in Celebes and Sulu basins, West Pacific (ODP Leg 124). In: G.P. & A.C. Salisbury (eds.) Trans. 5th Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1990, Gulf Publishing, Houston, p. 23-29.
(In Celebes (Site 767) and Sulu Sea (Site 768) sediments organic matter mainly of terrestrial origin, with highest concentrations and accumulation rates in M Miocene turbiditic sequences; autochthonous marine amorphous organic material more common in younger sediments. Massive turbiditic inputs related to major compressive event between Philippine Arc and Palawan/Cagayan/ Sulu ridges in M-L Miocene times. Thermal maturities indicates much higher paleogeothermal gradient in Sulu than in Celebes Sea)

Betzler, C., A.J. Nederbragt & G.J. Nichols (1991)- Significance of turbidites at Site 767 (Celebes Sea) and Site 768 (Sulu Sea). In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 124, p. 431-446.
(online at: www-odp.tamu.edu/Publications/124_SR/VOLUME/CHAPTERS/sr124_32.pdf)
(Mio-Pliocene turbidites deposition in Celebes- Sulu Sulu Seas tied to eustatic and tectonic events. Three types of source of siliciclastics in Celebes Sea Site 767: (1) dominated by mature quartz and quartz-lithic clasts with abundant plant debris, probably reworked shallow marine/continental environment with abundant vegetation; (2) change in source area indicated by paucity of quartz in upper system B and relative abundance of chert and other rock fragments (Sabah?); (3) clastic source from volcanic terrain. Also carbonate turbidites)

Burton, C.K. (1986)- Geological evolution of the Southern Philippines.In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 87-102.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986008.pdf)
(Philippines is collage of geologic terranes of disparate origin, with at least one continental fragment)

Castillo, P.R., P.E. Janney & R. Solidum (1999)- Petrology and geochemistry of Camiguin Island, southern Philippines: insights into the source of adakite and other lavas in a complex arc tectonic setting. Contrib. Mineralogy Petrology 134, 1, p. 33-51.

(Some young Camiguin high-silica lavas similar to high-silica lavas from Mindanao, formerly identified as 'adakites', derived from direct melting of subducted basaltic crust (butMindanao adakites not pure slab melts))

Castillo, P.R., S.J. Rigby & R.U. Solidum (2007)- Origin of high field strength element enrichment in volcanic arcs: geochemical evidence from the Sulu Arc, southern Philippines. Lithos 97, 3, p. 271-288.
(Lavas from active Sulu Arc, S Philippines, enriched in high field strength elements (HFSE), not typical volcanic arc geochemical signature. May be from metasomatism of mantle wedge peridotites by melts derived from subducting oceanic lithosphere, through formation of amphibole, etc.. From subduction of Sulu Sea crust)

Castillo, P.R. , R.U. Solidum & R.S. Punongbayan (2002)- Origin of high field strength element enrichment in the Sulu Arc, Southern Philippines, revisited. Geology 30, p. 707-710.
(HFSE enrichment in Sulu Arc lavas unlikely sourced from subducted Sulu Sea basaltic crust, but from melting of geochemically enriched component in mantle wedge)

Desprairies, A., M. Riviere & M. Pubellier (1991)- Diagenetic evolution of Neogene volcanic ashes (Celebes and Sulu Seas). In: E.A.Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 124, p. 489-503.
(online at: www-odp.tamu.edu/publications/124_sr/volume/chapters/sr124_36.pdf)
(Forty Late Miocene (8 Ma)- Pleistocene ash layers in Celebes and Sulu Seas Sites 767, 768, 769. Replacement of volcanic glass by smectite-phillipsite in tephra layers dated at 3.5-4 Ma. Also M Eocene to E Miocene ash beds in brownish pelagic claystones from Celebes Sea Site 767. In M Miocene no volcanic activity)

(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_34.pdf)
(In Eocene and Oligocene Celebes Basin recorded activity of large volcanic arc that could be Philippine or more likely Sunda arc. W Philippine Basin decrease of ash component in E Oligocene, with no volcanic activity until latest Miocene except pyroclastic flows on flank of Cagayan Ridge and Sulu Basin. Volcanic series known in Philippines and on Sabah in E Miocene (21-17 Ma) and M Miocene (15-11 Ma) may not have produced explosive volcanism. E Pliocene basaltic tephras may tie to volcanic ridges of N Zamboanga. Pleistocene renewal of volcanic activity from two different magmatic series compatible with incipient volcanism along Cotabato Trench and with basaltic plateaus of Central cordillera of Mindanao. New geodynamic framework consistent with new subduction along Philippine Trench around 4 Ma)

Rabinowitz, P.D., F.H. Syed & R. McCabe (1998)- Gravity studies across the Sula Arc. Proc. Offshore Technology Conf. (OTC), Houston 1998, 1, 8891-MS, p. 647-656.
(Should be Sulu arc. Three models proposed for tectonic origin of Sulu and Celebes Seas basins: (1) trapped fragments of oceanic plate, (2) back-arc spreading, and (3) rifting from SE Asia margin. Basins are separated by shallow partly emerged Sulu volcanic Ridge extending from W Mindano to NE Borneo. Gravity observations across Sulu Arc and adjacent basinal structures consistent with subduction zones along both flanks of Sulu Arc and also that extinct spreading centers exist in both Sulu and Celebes Seas)

Rangin, C. (1989)- The Sulu Sea, a back-arc basin setting within a Neogene collision zone. Tectonophysics 161, p. 119-141.
(SE Sulu Sea small oceanic basin that opened in M Miocene in back-arc setting along Sundaland margin during subduction of Celebes Sea plate beneath Sulu arc. Back-arc extension post-dates early M Miocene compression. Progressive, still incomplete closing of basin, initiated in Late Miocene, result of collision of exotic terranes with Sundaland margin, which also induced flipping of the Sulu subduction zone. Evolution of Sulu Sea modern example of how young oceanic crust can be incorporated in orogenic belt. Nice geologic cross-sections)

Rangin, C. (1991)- Southeast Asian marginal basins (South China, Sulu and Celebes Seas): new data and interpretations. CCOP Techn. Publ. 24, 25th Anniversary Volume, p. 156-174.
(Celebes and S China Seas rifted from Asian continental margin in Paleogene. Proto-South China Sea, now completely subducted, probably had same origin. Paleogene was period of intense stretching of Eurasian

margin and opening of marginal basins, Neogene corresponds to progressive subduction of these oceanic basins)

Rangin, C. & E.A. Silver (1991)- Geological setting of the Celebes and Sulu Sea. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Initial Reports, 124, p. 35-42.
(online at: www-odp.tamu.edu/Publications/124_IR/VOLUME/CHAPTERS/ir124_03.pdf)
(Celebes and Sulu Seas are deep restricted basins between Borneo and Philippine Archipelago. They are part of succession of trending NE subparallel oceanic basins. Separating basins from S China to Banda are ridges such as Cagayan Ridge, Palawan and Sulu archipelagos, arms of Sulawesi, and Sula platform)

Rangin, C. & E.A. Silver (1991)- Neogene tectonic evolution of the Celebes-Sulu basins: new insights from Leg 124 drilling. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 51-63.
(online at: www-odp.tamu.edu/publications/124_sr/volume/chapters/sr124_04.pdf)
(Synthetic cross section from S China Sea to Sulawesi, and correlation of major magmatic and tectonic events. Basins and their margins (Celebes-Sulu block) collided with rifted margin of China (Reed Bank) around 16 Ma. Submarine pyroclastics emplacement coincided with this collision. Sulu Basin probably opened in back-arc position for Cagayan volcanic arc in Early Miocene. Incipient closing of Sulu and Celebes basins still active)

Rangin, C., E. Silver and Leg 124 Team (1989)- Forages dans les bassins marginaux du SE Asiatique: resultats preliminaires du leg 124 (Ocean Drilling Program), Comptes Rendus Academie Sciences, Paris, Ser. II, 309, 12, p. 1333-1339.
('Wells in the marginal basins of SE Asia: preliminary results of ODP Leg 124'. ODP Leg 124 determined ages of Sulu Sea (E Miocene or E-M Miocene boundary) and Celebes Sea (M Eocene). Both basins record significant and synchronous influx of quartz-rich terrigeneous material at end of M Miocene, in response to major compressive tectonic event corresponding to closure of these SE Asian marginal basins (see also Rangin and Silver 1991)

Shyu, J.P. & C.M. Mueller (1991)- Calcareous nannofossil biostratigraphy of the Celebes and Sulu Seas. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 133-159.

(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_10.pdf)
(Sites 767 and 771 in Celebes Sea post-Oligocene sediments below carbonate compensation depth (CCD) and calcareous nannofossils recovered only from turbidites. From late M Eocene to Late Oligocene Site 771 was above CCD and accumulated pelagic clay. Highest occurrence of Chiasmolithus grandis just above basement and indicates late M Eocene age for Celebes Sea Basin crust. In SE Sulu Basin nannofossils preserved only in post- early M Miocene. Base Gephyrocapsa oceanica s.l. closest datum to top Olduvai paleomagnetic event and most suitable biohorizon for approximating Pliocene-Pleistocene boundary in Celebes and Sulu Seas)

Silver, E.A. & C. Rangin (1989)- Celebes and Sulu marginal basins: constraints from ODP Leg 124. EOS Transactions, AGU, 70, 43, p. 1365.
(Sites 767 and 770 in Celebes basin recovered M Eocene radiolarian red clay above MORB-type basaltic basement. Paleomag shows little change in latitude throughout its history. Site 768 in Sulu basin drilled 1271m, including 222m of basaltic basement, transitional between MORB and arc tholeite. Late E or early M Miocene brown claystone above and below 200m of rhyolitic pyroclastic deposits. Sites 769 and 771 on Cagayan ridge M Miocene and younger pelagic sediments above andesitic- basaltic tuffs, indicating cessation of Cagayan arc volcanism close to time of formation of Sulu basin. Both basins abundant terrigenous turbidites in M Miocene, with quartz sands and wood fragments, indicating a major collision event in Borneo or Philippines)

Silver, E.A. & C. Rangin (1991)- Leg 124 tectonic synthesis. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 3-9.
(online at: www-odp.tamu.edu/Publications/124_SR/VOLUME/CHAPTERS/sr124_01.pdf)
(Plate tectonic setting of M Eocene Celebes Sea oceanic crust ambiguous, but do not favor origin as fragment of Indian Ocean or W Philippine Sea plates. We cannot exclude origin as fragment of mostly subducted Molucca Sea Plate or basin rifted from edge of E Asian mainland. Sulu Sea likely to formed by back-arc spreading behind Cagayan Ridge in E Miocene. Cessation of spreading in Sulu Sea and volcanic activity on Cagayan Ridge were coeval, possibly related to collision between Palawan and Cagayan ridges)

Silver, E.A. & C. Rangin (1991)- Development of the Celebes Basin in the context of Western Pacific marginal basin history. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 39-49.
(online at: www-odp.tamu.edu/Publications/124_SR/VOLUME/CHAPTERS/sr124_03.pdf)
(Celebes Sea marginal basin origin still uncertain.Little paleomagnetic evidence of latitudinal change. Clay minerals no change from red to green claystones. Eocene-Oligocene sediments indicate open ocean origin for early basin history. If formed by rifting of edge of SE Asia, it did so without terrigenous input and allowed free interchange with ocean waters. Celebes Sea presently subducting, as are many W Pacific marginal basins)

Silver, E.A. & C. Rangin (1996)- Origin and history of the Sulu and Celebes basins: ODP Leg 124. In: G.P. & A.C. Salisbury (eds.) Trans. 5th Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1990, Gulf Publishing, Houston, p. 51-60.
(Celebes basin formed in M Eocene time in environment protected from terrigenous sedimentation (red clay deposition until E Miocene. Gradually increasing influx of terrigenous sediments to high sedimentation rates in late M Miocene. Basement rocks MORB tholeiites, including pillow basalts, sheet flows, and sills. SE Sulu basin formed in intra-arc environment (200m of rhyolitici dacitic tuffs above basement in radiolarian brown claystone section. Activity in adjacent Cagayan arc ceased shortly after the opening of Sulu Sea. Both basins high rates of terrigenous turbidites in M Miocene, correlative with tectonism in Sabah and possibly Philippines)

Smith R.B., G.W. Betzler, G.W. Brass, Z. Huang et al. and Leg 124 Scientific Party (1990)- Depositional history of the Celebes Sea from ODP Sites 767 and 770. Geophysical Research Letters 17, 11, p. 2065-2068.
(Sites 767 and 770 in N Celebes Sea reached late M Eocene basaltic basement. From late M Eocene to Early Miocene pelagic sedimentation prevailed with little influence from continental or volcanic arc sources. First major continental influence in M Miocene time as thick sequence of quartzose turbidites on basin floor, possibly in response to M Miocene orogeny in N Borneo.Late Miocene arc volcanism began to contribute hemipelagic sediments and ash layers and remained dominant sediment to present. Celebes Sea now surrounded by volcanic arcs, but absence of volcanoclastics in Eocene- E Miocene suggests basin did not form by back-arc spreading)

Smith R.B., M. von Breymann & Z. Huang (1991)- Site backtracking and the Eocene- Oligocene calcite compensation depth in the Celebes Sea. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling program (ODP), Scient. Results 124, p. 447-457.
(online at: www-odp.tamu.edu/publications/124_sr/volume/chapters/sr124_33.pdf)
(Oceanic crust at Sites 767 and 770 in N Celebes Sea overlain by Eocene-Oligocene pelagic sediments. Brown clay accumulated below the calcite compensation depth (CCD) at deeper Site 767 throughout this time interval. Shallower Site 770 brief episode of non-calcareous clay deposition in earliest Oligocene, indicating abrupt lowering of the CCD by 500m, synchronous with drop in CCD in Pacific and Atlantic Oceans, showing open deep-water connections between Celebes Sea and Pacific or Indian Oceans in Eocene-Oligocene)

Smith, T.E., C.H. Huang & F.G. Sajona (1991)- Geochemistry and petrogenesis of basalts from Holes 767C, 770B and 770C, Celebes Sea. In: E.A. Silver, C. Rangin et al. (eds.) Proc. Ocean Drilling program (ODP), Scient. Results 124, p. 311-320.
(online at: www-odp.tamu.edu/Publications/124_SR/VOLUME/CHAPTERS/sr124_22.pdf)
(Compositionally Celebes Sea basalts very similar to normal mid-ocean ridge basalts. Celebes Sea interpreted as fragment of basement of Jurassic Argo abyssal plain trapped during Eocene (most unlikely; JTvG)).

Spadea, P., L. Beccaluva, L. Civetta, M. Coltorti, J. Dostal et al. (1991)- Petrology of basic igneous rocks from the floor of the Sulu Sea. In: E.A. Silver, C. Rangin et al. (eds.) Proc. Ocean Drilling program (ODP), Scient. Results 124, p. 251-269.
(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_19.pdf)
(Sulu Sea basement rocks, cored for ~220m beneath late E Miocene pelagic sediments, consist of pillow basalts, dolerite microgabbro. Basalts and dolerites suffered seawater alteration (secondary fill of cracks and amygdaloidal textures by carbonate, zeolites, and clay minerals) and low-grade greenschist facies oceanic metamorphism (chlorite, serpentine, etc.). E Miocene oceanic crust creation in Sulu Basin (Site 768) from basaltic MORB-like mantle sources, modified by subduction-related geochemical components)

Spadea, P., M. D'Antonio & M.F. Thirlwall (2004)- Source characteristics of the basement rocks from the Sulu and Celebes Basins (Western Pacific): chemical and isotopic evidence. Contrib. Mineralogy Petrology 123, 2, p. 159-176.
(Sulu Basin developed ~18 Ma as backarc basin, associated with Cagayan Ridge Arc. Celebes Sea Basin formed ~43 Ma, subsequently developing as open ocean until M Miocene. In both basins late M Miocene collision and Late Miocene onset of volcanic activity on adjacent arcs. Sulu and Celebes Sea Basins basalts isotopically similar to depleted Indian Ocean MORB, and distinct from E Pacific Rise MORB. Signature possibly inherited by Indian Ocean mantle during rupture of Gondwanaland, when fragments of this mantle may have migrated to position of Celebes, Sulu and Cagayan sources)

Subandrio, A.S., Y. Jayadiharja & B.M. Ganie (1999)- Petrogenesis of basaltic rock of Celebes Sea floor. Proc. 28th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. .

Szarek, R., H. Nomaki & H. Kitazato (2007)- Living deep-sea benthic foraminifera from the warm and oxygen-depleted environment of the Sulu Sea. Deep Sea Research, II, 54, p. 145-176
(Sulu Sea is semi-enclosed oceanic basin with warm (~10°C) and oxygen depleted deep waters. Samples from water depths 534-4635m. Foraminifera assemblages above 3000m dominated by Angulogerina, bolivinids (Bolivina pacifica, B. spathulata) and uvigerinids (U. auberiana, Neouvigerina ampullacea). Below 3000m foram faunas mainly agglutinants (Spiroplectammina, Ammoscalaria, Reophax). Most living foraminifera in top 2cm of sediment, except Valvulineria and Globobulimina pacifica. Tubular arenaceous tubular forams (e.g. Hyperammina, Rhabdammina, Rhizammina) common at all sites)

Tamesis, E.V. (1990)- Petroleum geology of the Sulu Sea Basin, Philippines. In: 8th Offshore South East Asia Conf., Proc. SE Asia Petroleum Expl. Soc. (SEAPEX), Singapore, 9, p. 45-54.
(Sulu Sea several NE trending sub-basins (NW and SW Sulu) and three W Sulu small basins on Sabah shelf (Balabac, Bancauan, Sandakan). W Sulu Sea 21 wells. Basins inception in Late Paleogene, followed by

Neogene subsidence. Miocene- Pliocene fluvio-deltaics with oil and gas shows and Pliocene regional marine transgression with Late Pliocene- Pleistocene carbonate deposition)

Trinidad, N.D. & R.T. Barcelona (1999)- Notes on the geology and hydrocarbon potential of the Sibutu block, southern Philippines. In: Proc. Palawanõ99 Int. Conf. Tectonics, stratigraphy and petroleum and mineral systems of Palawan, Borneo and surrounding areas, Palawan Island, Philippines, 8p.

Van der Kaars, W.A. (1991)- Palynological aspects of Site 767 in the Celebes Sea. In: E.A. Silver et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 124, p. 369-374.
(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_27.pdf)
(Palynological study of ODP Site 767 in Celebes Sea indicates presence of extensive wetlands in area in Middle and Late Miocene. At start of Late Pleistocene montane vegetation expanded, probably due to tectonic upheaval)

Walker, T.R., A.F. Williams, D. Wong, M. Kadir, A. Khair & R.H.F. Wong (1992)- Hydrocarbon potential of the southern Sandakan Basin, Eastern Sabah, Malaysia. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015. *(Abstract only)*
(Sandakan Basin is largest of three basins in SW Sulu Sea, with up to 6-8 km of Lower Miocene -Recent sediments. Complex history involving Paleogene arc tectonism and subbasin formation punctuated by obduction and transpressional events. Deltaic sedimentation with outer shelf reef growth characterized Neogene. Reservoir and intra-formational seals are ubiquitous. Source rocks are deltaics, similar to Baram and Mahakam Deltas. 15 exploration wells, 11 of these invalid tests. Similarities in stratigraphic and structural style between Baram Delta and Sandakan Basin suggest significant hydrocarbon potential)

Weissel, J.K. (1980)- Evidence for Eocene oceanic crust in the Celebes Basin. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian Seas and Islands- I. American Geophys. Union (AGU), Geophys. Monograph 23, p. 37-47.
(Celebes Sea magnetic lineations striking N65°E mapped as anomalies 18-20, suggesting oceanic crust is of Eocene age. Magnetic anomaly shapes suggests little net change in latitude since Eocene. Intermediate heatflow of 1.58 HFU average corresponds to age of 51 Ma)

IX.10. SW Pacific (incl. New Caledonia, Solomon Islands)

Acharya, H.K. (1979)- Seismicity of the Southern Philippine Sea. Marine Geology 29, p. 25-32.
(Philippine Sea Plate almost completely surrounded by island arcs. Earthquake activity in S Philippine Sea at low-to-moderate levels at Palau-Kyushu Ridge, Central Basin Fault and W Philippine Basin)

Adachi, Y., H. Inokuchi, Y. Otofuji, N. Isezaki & K. Yaskawa (1987)- Rotation of the Philippine Sea Plate inferred from paleomagnetism of the Palau and Yap islands. Rock magnetism and paleogeophysics, Japan, 14, p. 72-74.
(online at:
http://peach.center.ous.ac.jp/rprep/Rock%20Magnetism%20and%20Paleogeophysics%20vol14%201987.pdf)
(Paleomag work on 16 sites in Palau Islands on S end of Kyushu-Palau Ridge suggest ~60°CW rotation, similar to results from other parts of W Philippine Sea)

Adams, C.J. (2010)- Accretionary complexes in eastern Australia and New Zealand: matching their sediment sources and destinations. In: S. Buckman & P.L. Blevin (eds.) Proc. Conf. New England Orogen 2010 (NEO 2010), Armidale, p. 5-11.
(Accretionary rocks of Carboniferous-Cretaceous in Torlesse Terrane of New Zealand derived from continental sources of plutonic and metamorphic rocks. Sources must be dominated by Permian-Triassic granitoids, and thought to originate at E Australian continental margin. Detrital zircon age patterns in sandstones from New England Orogen (NEO) and Torlesse Terrane suggest common sediment sources in Carboniferous magmatic arcs in NEO, but Late Permian-Cretaceous of Torlesse with major 230-265 Ma age peak suggests displacement of accretionary activity, outboard of NEO in Middle-Late Permian, after E Permian rift event)

Adams, C.J. (2011)- Lost terranes of Zealandia: possible development of late Paleozoic and early Mesozoic sedimentary basins at the Southwest Pacific margin of Gondwanaland, and their destination as terranes in southern South America. Andean Geol. 37, 2, p. 442-454.
(Metasedimentary rocks in Chilean archipelago have significant Mesoproterozoic, latest Neoproterozoic-Cambrian and Devonian-Carboniferous detrital zircon age components in common with 'lost terranes of Zealandia')

Adams, C.J., M.E. Barley, I.R. Fletcher & A.L. Pickard (1998)- Evidence from U-Pb zircon and 40Ar/39Ar muscovite detrital mineral ages in metasandstones for movement of the Torlesse suspect terrane around the eastern margin of Gondwanaland. Terra Nova 10, 4, p. 183-189.
(Detrital zircon and Ar/Ar muscovite ages from Triassic metasandstones of New Zealand Torlesse Terrane four components: (1) major Triassic-Permian (210-270 Ma), (2) minor Permian-Carboniferous (280-350 Ma) granitoids, (3) minor E-M Paleozoic metamorphics (420-460 Ma) and (4) minor Late Precambrian-Cambrian igneous and metamorphic complexes (480-570 Ma). Ages compatible with granitoid terranes of N New England Orogen in NE Australia. Torlesse Terrane originated at NE Australian margin, then moved 2500 km S by Late Cretaceous (90 Ma) (Conclusion questioned by Murray (2003): although similar age range, little or no muscovite in Permian Triassic granites of New England foldbelt))

Adams, C.J., H.J. Campbell, I.J. Graham & N. Mortimer (1998)- Torlesse, Waipapa and Caples suspect terranes of New Zealand: integrated studies of their geological history in relation to neighbouring terranes. Episodes 21, 4, p. 235-240.
(Review of Permian-Cretaceous of Torlesse, Waipapa and Caples sedimentary terranes of E New Zealand, originally part of E Gondwana margin)

Adams, C.J., H.J. Campbell & W.L. Griffin (2007)- Provenance comparisons of Permian to Jurassic tectonostratigraphic terranes in New Zealand: perspectives from detrital zircon age patterns. Geol. Magazine 144, 4, p. 701-729.
(Zircon ages for 20 Cretaceous-Carboniferous sandstones from 7 terranes of E New Zealand. Persistent, large Triassic-Permian (main peaks in ~240-265 Ma range) and few Devonian-Silurian populations. Extensive

Triassic-Permian zircon sources only in New England Fold Belt and Hodgkinson Province of NE Australia and continuations into Tasman Sea)

Adams, C.J., H.J. Campbell, N. Mortimer & W.L. Griffin (2016)- Perspectives on Cretaceous Gondwana break-up from detrital zircon provenance of southern Zealandia sandstones. Geol. Magazine 154, 4, p. 661-682.
(online at: https://www.cambridge.org/core/services/aop-cambridge-core/content/view/ etc.)
(Detrital zircon U-Pb ages in from late Early- Late Cretaceous marine and non-marine sandstones across S Zealandia indicate provenance from local basement within present-day Zealandia, which fits interpretation of Late Cretaceous deposition in rift-controlled basins during pre-Gondwana break-up regional extension)

Adams, C.J., D. Cluzel & W.L. Griffin (2009)- Detrital-zircon ages and geochemistry of sedimentary rocks in basement Mesozoic terranes and their cover rocks in New Caledonia, and provenances at the eastern Gondwanaland margin. Australian J. Earth Sci. 56, p. 1023-1047.
(Older (>250 Ma), zircons in New Caledonia sediments >90% Early Paleozoic and Precambrian ages (500-700 Ma). Surprisingly few zircons in M Permian- E Triassic (245-270 Ma) age range, presumably due to depocenters and barriers between area and New England Orogen)

Adams, C.J. & S. Kelley (1998)- Provenance of Permian-Triassic and Ordovician metagraywacke terranes in New Zealand: evidence from 40Ar/39Ar dating of detrital micas. Geol. Soc. America (GSA) Bull. 110, p. 422-432.
(Permo-Triassic ages of detrital muscovite in New Zealand Torlesse terrane similar to ages of granites in New England foldbelt (but these granites contain very rare muscovite; Murray 2003))

Adams, C.J., R.J. Pankhurst, R. Maas, I.L. Millar (2005)- Nd and Sr isotopic signatures of metasedimentary rocks around the South Pacific margin and implications for their provenance. Geol. Soc., London, Spec. Publ. 246, p. 113-141.
(Nd-Sr isotope database of Paleozoic- Mesozoic metasedimentary successions enables characterization of New Zealand terranes)

Agard, P. & A. Vitale-Brovarone (2013)- Thermal regime of continental subduction: the record from exhumed HP-LT terranes (New Caledonia, Oman, Corsica). Tectonophysics 601, p. 206-215.
(Thermal evolutions of shift from oceanic subduction to continental collision retrieved from three well-documented fossil settings, incl. New Caledonia, that were not modified by later collision or metamorphism. Continental cover units subducted over short time (~10 My) represent cold underplated material that buffers subduction thermal regime)

Aitchison, J.C., G. L. Clarke, S. Meffre & D. Cluzel (1995)- Eocene arc-continent collision in New Caledonia and implications for regional southwest Pacific tectonic evolution. Geology 23, 2, p. 161-164.
(New Caledonia geology four main tectonic phases: (1) E Mesozoic development of subduction-related terranes and accretion to Gondwana (NE Australia) margin; (2) Late Cretaceous passive margin development and sea-floor spreading during Gondwana breakup; (3) Late Eocene arrival of thinned Gondwana margin crust at SW-facing subduction zone (Loyalty-D'Entrecasteaux arc), resulting in collisional orogenesis and obduction of ophiolitic nappe from NE; and (4) detachment faulting during extensional collapse, resulting in unroofing of metamorphic core complexes)

Aitchison, J.C., T.R. Ireland, G.L. Clarke, D. Cluzel, A.M.Davis & S. Meffre (1998)- Regional implications of U/Pb SHRIMP age constraints on the tectonic evolution of New Caledonia. Tectonophysics 299, 4, p. 333-343.
(Ages for zircons from plagiogranites (considered to be late stage differentiates of basic magma in ophiolite complex) indicate latest Carboniferous- earliest Permian age for basement of Koh terrane in Central Chain Mts of New Caledonia (pre-Upper Cretaceous obduction). Ophiolites ages of 302±7 Ma and 290±5 Ma, respectively. Similar to plagiogranites in Dun Mountain Ophiolite Belt/ Maitai terrane of New Zealand)

Aitchison, J.C., S. Meffre & D. Cluzel (1995)- Cretaceous/Tertiary radiolarians from New Caledonia. Geol. Soc. New Zealand, Misc. Publ. 81A, p. 1-70.

Ali, J.R. & J.C. Aitchison (2000)- Significance of palaeomagnetic data from the oceanic Poya Terrane, New Caledonia, for SW Pacific tectonic models. Earth Planetary Sci. Letters 177, p. 153-161.
(Paleomagnetic study of pillow basalts and associated pelagic sediments of Late Cretaceous-Paleocene Poya Terrane nappe that was thrust SW over New Caledonia island in M Eocene. Data from four outcrops suggests formation at ~37.8° (± 12.1°). S. Poya Terrane formed close to New Caledonian portion of Indo-Australia plate, consistent with tectonic models suggesting Poya Terrane formed in marginal basin NE of New Caledonia during break-up of E Gondwana)

Ali, J.R. & J.C. Aitchison (2002)- Paleomagnetic-tectonic study of the New Caledonia Koh Ophiolite and the mid-Eocene obduction of the Poya Terrane. New Zealand J. Geol. Geophysics 45, p. 313-322.
(online at: www.tandfonline.com/doi/pdf/10.1080/00288306.2002.9514976)
(Paleomagnetic study on allochthonous Late Paleozoic Koh Ophiolite of New Caledonia. Large spread of directions, impossible to deduce latitude of ophiolite formation: 'subequatorial to mid-latitude S Hemisphere location' strongest justifiable statement. Overprint equates to paleolatitude of 37.6 ± 6.2°S and may correspond to position of New Caledonia when overthust by oceanic Poya Terrane in M Eocene)

Aronson, J.L. & G.R. Tilton (1971)- Probable Precambrian detrital zircons in New Caledonia and Southwest Pacific continental structure. Geol. Soc. America (GSA) Bull. 82, p. 3449-3456.
(Detrital zircons from Cretaceous arkosic sandstone of SW New Caledonia mainly clear, euhedral and of Late Cretaceous ago. Also 1% rounded colored grains, probably with age of 1000 Ma or more. Old grains probably derived from Lord Howe Rise, a foundered extension of Australian continent)

Audet, M.A. (2009)- Le massif du Koniambo, Nouvelle-Caledonie. Formation et obduction dŏun complexe ophiolitique du type SSZ. Enrichissement en nickel, cobalt et scandium dans les profils residuels. Doct. Thesis Universite de Quebec, Montreal, p. 1-294. *(Unpublished)*
(online at: http://portail-documentaire.univ-nc.nc/userfiles/TheseMarcAntoineAudet2008.pdf)
(On Koniambo ophiolitic complex in New Caledonia and distribution of nickel, cobalt, scandium in weathered profile. Various geological units in study area are inverted structural assemblages of ophiolite suite, affected by passage through supra-subduction environment. Contrast with less dismembered ultramafic sequences of Massif du Sud. Late Eocene obduction)

Auzende, J.M., G. Beneton, G. Dickens, N. Exon, C. Francois, D. Hodway, F. Juffroy, Y. Lafoy, A. Leroy, S. van de Beuque & O. Voutay (2000)- Mise en evidence de diapirs mesozoiques sur la bordure orientale de la ride de Lord Howe (Sud-Ouest Pacifique): campagne ZoNeCo 5. Comptes Rendus Academie Sciences, Paris, Ser. 2, 330, 3, p. 209-215.

Auzende, J.M., G.R. Dickens, S. Van de Beuque, N.F. Exon, C. Francois, Y. Lafoy & O. Voutay (2000)- Thinned crust in southwest Pacific may harbor gas hydrate. EOS, Trans. AGU, 81, 17, p. 182-185.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/00EO00127/pdf)
(Lord Howe Rise large, complex, and poorly studied fragment of thinned continental crust submerged 750-3000m beneath C Tasman Sea. Deep seismic profiles revealed extensive bottom simulating reflector at E slope of LHR, likely representing base of gas hydrate)

Auzende, J.M., L. Kroenke, J. Collot, Y. Lafoy & B. Pelletier (1996)- Compressive tectonism along the eastern margin of Malaita Island (Solomon Islands). Marine Geophysical Res. 18, p. 289-304.

Auzende, J.M., S. Van de Beuque, M. Regnier, Y. Lafoy & P. Symonds (2000)- Origin of the New Caledonian ophiolites based on a French- Australian seismic transect. Marine Geology 162, p. 225-236.
(New deep-seismic profiles between New Hebrides Arc and Australian margin S of New Caledonia image S prolongation of overthrusted ophiolites and allow new interpretation of Eocene compressive tectonism along New Caledonia-Norfolk Ridge. Obduction of entire oceanic lithosphere of Loyalty Basin is consistent with age

and origin of ophiolite. Variations in tectonic style along strike in N-S trending part of Norfolk Ridge produced ophiolite exposures related to uplifted and partially overthrust upper mantle slivers in S part of Loyalty Basin)

Avias, J. (1953)- Contribution a l'etude stratigraphique et paleontologique de la Nouvelle-Caledonie centrale. Sciences de la Terre, Nancy 1, p. 1-276.
('Contribution to the study of the stratigraphy and paleontology of Central New Caledonia'. Stratigraphy of mainly NE dipping sediments outcropping SW of main ophiolite belt. Youngest folded sediments of Eocene age, unconformably overlain by ?Miocene. Carboniferous-Permian multi-colored tuffs and greywackes with mollusc Maitaia trechmanni (=Atomodesma), M-Late Triassic greywackes with Halobia and Spiriferina, etc., Late Triassic greywackes with Monotis and Clavigera, E Jurassic greywackes with ammonites (Arnioceras and others), Late Jurasic greywackes with Belemnopsis, Cretaceous sands and carbonaceous shales with Kossmaticeratidae, Trigoniidae, etc., Eocene shales and tuffs with calcareous lenses, etc.)

Avias, J. (1961)- On some new points of view adopted concerning the stratigraphic and correlative knowledge of the sedimentary structures of New Caledonia. Proc. 9th Pacific Science Congress Bangkok 1957, 12, p. 325-327.
(online at: http://archive.org/details/geologyandgeophy032600mbp)
New review of cephalopods from New Caledonia confirms presence of Lower Triassic Meekoceras. Great similarities between U Permian and Lw Trias of New Caledonia and "ceratites sandstones" of Himalayan Salt Range and rocks of same age on Timor. During most of Cretaceous New Caledonia was emerged, with sedimentation re-starting with great Senonian transgression. Main time of folding is Oligocene. Angular unconformity at base U Triassic suggest orogenic phase similar to Lower Bowen orogeny in E Australia)

Avias, J. (1967)- Overthrust structure of the main ultrabasic New Caledonian massives. Tectonophysics 4, p. 531-541.
(Great New Caledonian ultrabasic massifs are E-to-W overthrusted masses of peridotites on sedimentary and volcano-sedimentary basement of island)

Bache, F., N. Mortimer, R. Sutherland, J. Collot, P. Rouillard, V. Stagpoole & A. Nicol (2014)- Seismic stratigraphic record of transition from Mesozoic subduction to continental breakup in the Zealandia sector of eastern Gondwana. Gondwana Research 26 (2014) 1060ï 1078.
(SW Pacific between Australia, New Zealand and New Caledonia is block of continental crust (Zealandia) that moved away from Australia and Antarctica after long period of subduction beneath E Gondwana. Seismic-profiles identify intra-continental basins related to Gondwana margin, overlain by ~mid-Cretaceous breakup/ separation erosional unconformity and Cretaceous- Eocene retrogradational megasequence, overlain by pelagic carbonate rocks)

Baker, P.E., M. Coltorti, L. Briqueu, T. Hasenaka, E. Condliffe & A.J. Crawford (1994)- Petrology and composition of the volcanic basement of Bougainville Guyot, Site 831. In: J.Y. Collot et al. (eds.) Proc. Ocean Drilling Program (ODP), Initial Reports 134, p. 363-373.
(online at: www-odp.tamu.edu/publications/134_sr/volume/chapters/sr134_18.pdf)
(Basement of Bougainville Guyot andesitic hyalobreccias derived from submarine arc volcano. Dated by K/Ar at ~37Ma. Formation attributed to reaction of andesitic magma and seawater. More mafic andesites at base, to overlying more acid andesites. Andesites have affinities with low-K arc tholeiite series. Bougainville Guyot may form part of Eocene proto-island arc along S side of d'Entrecasteaux Zone, above S-dipping subduction zone)

Baldwin, S.L., T. Rawling & P.G. Fitzgerald (2007)- Thermochronology of the New Caledonia high-pressure terrane: implications for Middle Tertiary plate boundary processes in the Southwest Pacific. In: M. Cloos et al. (eds.) Convergent margin terranes and associated regions, Geol. Soc. America, Spec. Publ. 419, p. 117-134.
(Young blueschist- eclogite facies rocks in NE New Caledonia record Eocene subduction metamorphism (44 Ma) and exhumation (40-34 Ma) and Oligocene (<34 Ma) juxtaposition against other basement terranes)

Ballance, P.F. (1999)- Simplification of the Southwest Pacific Neogene arcs: inherited complexity and control by a retreating pole of rotation. In: C. MacNiocaill (ed.) Continental tectonics, Geol. Soc. London, Spec. Publ. 164, p. 7-19.
(Neogene arc activity in SW Pacific began simultaneously at 25 Ma on three differently oriented sectors, Norfolk-Three Kings, Colville, Northland-Reinga. Inception of arc magmatism at 25 Ma triggered by 20° increase in convergence angle between N- moving Australia and NW-moving Pacific plate, and increase in convergence rate from ~20 to 30-40 mm/yr. Between 25-15 Ma three subduction zones required)

Ballance, P.F., D.W. Scholl, T.L. Vallier, A.J. Stevenson, H. Ryan & R.H. Herzer (1989)- Subduction of a Late Cretaceous seamount of the Louisville chain at the Tonga Trench: a model of normal and accelerated tectonic erosion. Tectonics 8, p. 953-962.
(Louisville Ridge is 4000 km long, NNW-trending chain of seamounts (2-2.5 km high, 10-40 km diameter), with underlying crustal swell (1.5 km high and 100+ km wide) in SW Pacific. NW end of Ridge collides with deep Tonga Trench (>10 km), which lacks accretionary complex. Effects of hotspot-ridge collision with sediment-starved trench: (1) impacting seamounts are subducted rather than accreted; (2) inner trench wall is tectonically eroded arc-ward, possibly at 50 km/My. Arc substrate rocks uplifted by impacting seamounts)

Barclay, W., J.A. Rodd, J.C. Pflueger, K.R. Havard & S.P. Helu (1993)- Oil plays in the kingdom of Tonga, Southwest Pacific. Petroleum Expl. Soc. Australia (PESA) Journal 21, p. 79-92.
(Tonga area in SW Pacific in E part of long Tertiary island-arc chain extending from PNG to New Zealand. Within chain basins with Tertiary reef developments, some with commercial oil and gas accumulations. On Tongatapu Island five wells drilled near oil seeps, but none reached Eocene reef limestone target)

(online at: www.tandfonline.com/doi/pdf/10.1080/03036758.1974.10419387)
(Globular fossils with vermicularly-sculptured surfaces identified as pelagic hydrozoan Heterastridium conglobatum in Upper Norian Monotis shell bed on l'Ile Hugon, New Caledonia. Less well-preserved specimens in Nelson and Southland, New Zealand (also known from U Triassic limestones on Timor, Ceram, Hallstatt Limestone of Alps, etc.; JTvG)

Carson, C.J., G.L. Clarke & R. Powell (2000)- Hydration of eclogite, Pam Peninsula, New Caledonia. J. Metamorphic Geol. 18, p. 79-90.
(Garnet glaucophanite and greenschist facies assemblages formed by recrystallization of barroisite-bearing eclogite facies metabasites in N New Caledonia. Eclogite preserved in domains that experienced no fluid influx following loss of this fluid. Garnet glaucophanite formed at P≈16 kbar during semi-pervasive fluid influx. Fluid influx focused in shear zones resulted in chlorite-albite greenschist facies minerals that reflect P≈9 kbar)

Carson, C.J., R. Powell & G.L. Clarke (1999)- Calculated mineral equilibria for eclogites in CaO-Na2O-FeO-MgO-Al2O3-SiO2-H2O: application to the Pouebo Terrane, Pam Peninsula, New Caledonia. J. Metamorphic Geol.17, 1, p. 9-24.
(High-P, medium T metamorphics of Pouebo terrane of Pam Peninsula, NE New Caledonia with barroisite- and glaucophane-bearing eclogite. Metamorphic evolution experienced clockwise P-T path that reached P=19 kbar and T =600°C. Eclogitic mineral assemblages preserved because decompression consumed rocks' fluid. (19 kbar = ~70 km at 10 kbar per 35-40km; JTvG))

Cathelineau, M., B. Quesnel, P. Gautier, P. Boulvais, C. Couteau & M. Drouillet (2016)- Nickel dispersion and enrichment at the bottom of the regolith: formation of pimelite target-like ores in rock block joints (Koniambo Ni deposit, New Caledonia). Mineralium Deposita 51, 2, p. 271-282.
(In New Caledonia richest Ni silicate ores occur in fractures within bedrock and saprolite, generally several 10's- 100m below present-day surface)

Cawood, P.A., C.A. Landis, A.A. Nemchin & S. Hada (2002)- Permian fragmentation, accretion and subsequent translation of a low latitude Tethyan seamount to the high-latitude east Gondwana margin: evidence from detrital zircon age data. Geol. Magazine 139, p. 131-144.
(New Zealand S Island Te Akatarawa Terrane, enclosed in Torlesse Terrane: Late Permian detrital zircons from turbidites above fusulinid-coral limestone block melange 15 My younger than Kungurian fusulinid limestone, indicating collapse of Permian oceanic seamount on entering subduction zone along Gondwana Pacific margin. N New England Orogen most likely source for Te Akatarawa sandstones. Turbidites differ from adjoining Torlesse Permian- M Triassic sands, which also have colder water affinities. Warm-water limestones and 15 My period between sedimentation and accretion onto continental margin require limestone formed in low-latitude, probably off NE Australian- New Guinea margin)

Chablais, J., T. Onoue & R. Martini (2010)- Upper Triassic reef-limestone blocks of southwestern Japan: new data from a Panthalassan seamount. Palaeogeogr. Palaeoclim. Palaeoecology 293, p. 206-222.
(Norian-Rhaetian reef-limestone in Sambosan Accretionary Complex, S Japan formed in atoll-type system on mid-oceanic seamount surrounded by deep-water radiolarian cherts in Panthalassic Ocean. Reef-boundstone facies framebuilders are abundant coralline sponges and microbial crusts. Rare corals and algae. Similarities with coeval Upper Triassic reefs of S Peri-Tethys area, especially with Omani seamounts, suggest more S Hemisphere origin for U Triassic Japanese reefs than predicted by previous reef studies)

Chaisson, W.P. & R.M. Leckie (1993)- High resolution Neogene planktonic foraminifer biostratigraphy of Site 806, Ontong Java Plateau (Western Equatorial Pacific). In: W.H. Berger et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 130, College Station, Texas, p. 137-178.
(online at: www-odp.tamu.edu/publications/130_SR/VOLUME/CHAPTERS/sr130_10.pdf)
(E Miocene- Pliocene planktonic foram biostratigraphy of Site 806. Dominance of surface dwellers (P. kugleri, P. mayeri, D. altispira, Globigerinoides spp.) in E-M Miocene replaced by more equitable distribution of

surface, intermediate (G. menardii), and deep (Streptochilus spp.) dwellers in Late Miocene, reflecting shoaling of thermocline along Equator following closing of Indo-Pacific Seaway (Late Miocene, ~8-10 Ma) and initiation of large-scale glaciation in Antarctic (latest Miocene; ~5-6 Ma))

Challinor, A.B. & J.A. Grant-Mackie (1989)- Jurassic Coleoidea of New Caledonia. Alcheringa 13, 4, p. 269-304.
(Coleoid belemnites of New Caledonia widespread in W Coast M Jurassic tuffaceous sst, but rare in Central Chain U Jurassic offshore facies. Strong development of Dicoelites suggests Indonesian affinity, but New Caledonian taxa cannot be confidently assigned to either New Zealand or Indonesian belemnite subprovince)

(Ontong Java Plateau paleolatitudes suggest ~40° of CW rotation since formation at ~123 Ma. Mean paleolatitude value of Ontong Java remains largely unchanged)

Chapman, F. (1932)- On a rock containing *Discocyclina* and *Assilina* found near Mt. Oxford, South Island, New Zealand. Records Canterbury (N.Z.) Museum 3, p. 483-489.
(Records of Assilina, Heterostegina, and Discocyclina from Eyre River, N Canterbury. With new species Discocyclina speighti and D. novaezelandiae (all seven species united in Asterocyclina speighti by Finlay (1946) and Cole (1962))

Chaproniere, G.C.H. (1994)- Middle and Late Eocene larger foraminifers from Site 841 (Tongan Platform). In: J. Hawkins et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 135, p. 231-243.
(online at: www-odp.tamu.edu/publications/135_SR/VOLUME/CHAPTERS/sr135_15.pdf)
(Eocene (Lutetian) larger foraminifera Nummulites, Discocyclina, Asterocyclina, Halkyardia in ODP Hole 841B, NE of New Zealand. Lack of Pellatispira- Spiroclypeus suggests zone Ta. Reworked Eocene Pellatispira in Upper Miocene)

Chaproniere, G.C.H. (1994)- Middle and Late Eocene, Neogene and Quaternary foraminiferal faunas from Eua and Vavau islands, Tonga Group. In: A.J. Stevenson et al. (eds.) Geology and submarine resources of the Tonga-Lau-Fiji region. SOPAC Techn. Bull. 8, p. 21-44.
(Two larger foram assemblages in Eocene limestones on Eua Island, Tonga: (1) late M Eocene zones Ta3/ P14 without Pellatispira and (2) latest Eocene/Tb/P17 with Pellatispira). M Miocene/N14 deep-water volcaniclastics with evidence for reworking from Zones N9 -N10. Pliocene-Pleistocene reefal limestones often contain larger forams from Eocene. All samples from Vavau with Plio-Pleistocene shallow water forams)

Chaproniere, G.C.H. & C. Betzler (1993)- Larger foramineral biostratigraphy of Sites 815, 816, and 826, Leg 133, northeastern Australia. In: J.A. McKenzie et al. (eds.) Proc. Ocean Drilling Project (ODP), Scient. Results 133, p. 39-49.
(Marion Plateau large carbonate platform off NE Queensland. Shallow water carbonates of early M Miocene (N9-N12) age (lower Tf stage). Coralline algae and Halimeda main bioclasts)

Chardon, D., J.A.J. Austin, G. Cabioch, B. Pelletier, S. Saustrup & F. Sage (2008)- Neogene history of the northeastern New Caledonia continental margin from multichannel reflection seismic profiles. Comptes Rendus Geoscience 340, 1, p. 68-73.
(Seismic profiles along NE margin of New Caledonia Ridge show Late Miocene extensional faulting that disrupted E-M-Miocene clastic wedge, etc.)

Chardon, D. & V. Chevillotte (2006)- Morphotectonic evolution of the New Caledonia Ridge (Pacific southwest) from post-obduction tectonosedimentary record. Tectonophysics 420, p. 473-491.
(Study of two post-obduction fluvial sedimentary systems on mainland New Caledonia and offshore seismic lines. Two regional river aggradation cycles, each preceded by deep river incision phase, in Chattian and in E Miocene. Extensional tectonics initiated in E Neogene led to collapse of latest Oligocene phase of planation. Early slip on normal faults associated with ridge-normal extension, later faults ridge-parallel to ridge-oblique extension, resulting from shift to transtensional regime driven by initiation of E-verging subduction of Australian plate beneath Pacific plate starting in late M Miocene)

Chen, M.C., C. Frohlich, F.W. Taylor, G. Burr & A. Quarles van Ufford (2011)- Arc segmentation and seismicity in the Solomon Islands arc, SW Pacific. Tectonophysics 507, p. 47-69.
(16 segments identified in Solomon Islands Arc, mainly based on seismicity patterns and drowning/ uplift of coral reef terraces. Average length 75km (30-130km). Grouped in 3 supersegments correspond to forearc areas of the Bougainville Islands, New Georgia islands and Guadalcanal-Makira. Main convergence from SSW (San Cristobal Trench), but before ~5 Ma subduction polarity reversal mainly from NNE? (North Solomons Trench))

Chevillotte, V., D. Chardon, A. Beauvais, P. Maurizot & F. Colin (2006)- Long-term tropical morphogenesis of New Caledonia (Southwest Pacific): importance of positive epeirogeny and climate change. Geomorphology 81, 3-4, p. 361-375.
(Mapping of relict lateritic land surfaces over 1600m of relief of mainland New Caledonia to evaluate morphogenesis of island since emergence in E Oligocene. Eight island-scale erosion levels)

Chevillotte, V., P. Douillet, G. Cabioch, Y. Lafoy, Y. Lagabrielle & P. Maurizot (2005)- Evolution geomorphologique de l'avant-pays du Sud-Ouest de la Nouvelle-Caledonie durant les derniers cycles glaciaires. Comptes Rendus Geoscience 337, 7, p. 695-701.
('Geomorphological evolution of the foreland of SW New Caledonia during the last glacial cycles')

Chun, Y.Y. & L.W. Kroenke (1993)- A plate tectonic reconstruction of the Southwest Pacific, 0-100 Ma. Proc. Ocean Drilling Project (ODP), Leg 130, Scient. Results, p. 697-709.
(online at: www-odp.tamu.edu/publications/130_SR/VOLUME/CHAPTERS/sr130_43.pdf)
(Reconstructions of SW Pacific paleogeography back to 100 Ma. Successive periods of convergence along five paleo-subduction zones that formed concomitantly with changes in Indo-Australia and Pacific plate motions from Eocene to Late Miocene. Episodes of basin formation along W and SW margins of Pacific Plate and along E and NE margins of Indo-Australian Plate since Late Cretaceous include Tasman (85-55 Ma), New Caledonia (74-65 Ma), Coral Sea (63-53 Ma), Loyalty (52-40 Ma), d'Entrecasteaux (34-28 Ma), Caroline (34-27 Ma), Solomon Sea (34-28 Ma), S Fiji (34-27 Ma), N Fiji (10-0 Ma), and Lau, Woodlark, and Manus (5.5-0 Ma) basins. Seamount chains developed over Tasmantid, Lord Howe, Louisville and Samoa hotspots)

Cisowski, S.M., M. Fuller, R.B. Haston & M. Koyama (1990)- Paleomagnetic evidence from land-based and ODP cores for clockwise rotation and northward translation of the Phillippine Sea plate. In: Fifth Circum-Pacific Energy and Mineral Resources Conference, Honolulu, Hawaii, AAPG Search and Discovery Art. 90097. *(Abstract only)*
(Onland and deep-sea core paleomagnetic data from around Philippine Sea plate. Data from Palau islands suggest 70°CW rotation and N-ward translation since M Oligocene. Data from Guam, Saipan, ODP Leg 126, all support 70-110° CW rotation and ~15° N-ward translation of W Philippine Sea plate since M Oligocene of the Philippine Sea plate since the mid-Oligocene. N-ward translation and clockwise rotation of Philippine Sea plate established oblique subduction along proto-Philippine margin, which could account for 600 km of subducted slab beneath E Celebes Sea)

Clarke, G.L., J.C. Aitchison & D. Cluzel (1997)- Eclogites and blueschists of the Pam Peninsula, NE New Caledonia: a reappraisal. J. Petrology 38, 7, p. 843-876.
(online at: http://petrology.oxfordjournals.org/content/38/7/843.full.pdf+html)
(Late Eocene high-P rocks of Pam Peninsula three zones: (1) uppermost ferroglaucophane-lawsonite zone of Cretaceous-Eocene metasediments and metavolcanics (2) blueschist facies (3) lowermost metabasic eclogites of

uncertain age. Metamorphism and deformation tied to 44-51 Ma (M Eocene) thrusting of sedimentary and ophiolitic nappes over eclogites in SW direction. Mica ages constrain end of metamorphism by 37 Ma)

Cloud, P.E., R.G.Schmidt & H.W. Burke (1956)- Geology of Saipan, Mariana Islands; Part 1, General geology. U.S. Geol. Survey (USGS) Prof. Paper, 280-A, p. 1-123.
(online at: http://pubs.usgs.gov/pp/0280a/report.pdf
(Saipan is one of more southerly of Mariana Islands at E side of Philippine Sea. Consists of Eocene volcanic core enveloped by Late Eocene- Early Miocene limestones. See also papers on smaller and larger foraminifera (Todd 1957, Cole 1957, calcareous algae (Johnson 1957) etc.))

Cluzel, D. (1998)- Le 'flysch post-obduction' de Nepoui, un bassin transporte? Consequences sur l'age et les modalites de l'obduction tertiaire en Nouvelle-Caledonie (Pacifique sud-ouest). Comptes Rendus Academie Sciences, Paris, IIA, 327, 6, p. 419-424.
('The 'post-obduction flysch' of Nepoui, a transported basin? Inference on age and setting of the Tertiary obduction in New Caledonia (SW Pacific)'. Bartonian Nepoui flysch not of post-obduction character; only Miocene conglomerate with erosion products of ophiolitic nappe. Nepoui flysch older than parts of autochthonous terranes and unlikely post-dates obduction. May be piggy-back basin transported by Poya Nappe during obduction. Obduction probably younger than previously postulated pre-U Bartonian age)

Cluzel, D., C.J. Adams, S. Meffre, H. Campbell & P. Maurizot (2010)- Discovery of Early Cretaceous rocks in New Caledonia: new geochemical and U-Pb zircon age constraints on the transition from subduction to marginal breakup in the Southwest Pacific. J. Geology 118, 4, p. 381-397.
(Zircon dating of Permian-Mesozoic arc volcanics suggests subduction in New Caledonia not extinct in Late Jurassic (~150 Ma), but still active in late Early Cretaceous (~130-95 Ma). Rift magmatism that preceded margin breakup migrated E from ~130 Ma in E Australia to 110 Ma (110-82 Ma) in New Zealand, to ~89 Ma (89-83 Ma) in New Caledonia, generating large volumes of silicic magma. Marginal basins opened synchronously at ~83 Ma. Australian marginal breakup final effect of S-ward unzipping of Gondwana)

Cluzel, D., C.J. Adams, P. Maurizot & S. Meffre (2011)- Detrital zircon records of Late Cretaceous syn-rift sedimentary sequences of New Caledonia: an Australian provenance questioned. Tectonophysics 501, p. 17-27.
(Late Cretaceous coastal clastics of New Caledonia contemporaneous with latest stages of E Australian marginal rifting. Detrital zircon populations dominated by E Cretaceous, E Paleozoic and Precambrian and may be local recycled provenance. New Caledonia already isolated from Australia in Coniacian (~89-85 Ma), consistent with faunal and floral endemism at that time)

Cluzel, D., J.C. Aitchison, G.L. Clarke, S. Meffre & C. Picard (1994)- Point de vue sur lœvolution tectonique et geodynamique de la Nouvelle-Caledonie. Comptes Rendus Hebd. Seances Academie Sciences, Paris, ser. 2, 319, p. 683-690.
(Brief summary of tectonic-geodynamic evolution of New Caledonia: (1) Permian- Late Jurassic intra-oceanic arc deposits obducted onto 'pre-Permian' metamorphic terrane; (2) accretion to E Gondwana in latest Jurassic; (3) Late Cretaceous- Paleocene breakup of Gondwana margin; (4) collision with Eocene subduction zone of Loyalty Basin; (5) Late Eocene ophiolite obduction)

Cluzel, D.J., C. Aitchison & C. Picard (2001)- Tectonic accretion and underplating of mafic terranes in the Late Eocene intraoceanic fore-arc of New Caledonia (Southwest Pacific): geodynamic implications. Tectonophysics 340, p. 23-59.
(Late Eocene tectonic accretion, subduction, underplating and obduction of mafic terranes in intra-oceanic forearc setting in New Caledonia. Late Eocene tectonic complex three major terranes: (1) overlying ultramafic mainly harzburgitic allochthonous Ophiolitic Nappe (2) Poya Terrane intermediate mafic, mainly basaltic off-

scraped melange with km-scale slices of oceanic upper crust, (originally formed as Campanian- Late Paleocene S Loyalty oceanic marginal basin that opened at same time as Tasman Sea), parts of which metamorphosed into eclogite/blueschist facies metamorphic complex (Pouebo Terrane) and (3) lower, continental basement, which is northern part of the Norfolk Ridge terrane(s))

Cluzel, D., D. Bosch, J.L. Paquette, Y. Lemennicier et al. (2005)- Late Oligocene post-obduction granitoids of new Caledonia: a case for reactivated subduction and slab break-off. The Island Arc 14, p. 254-271.
(In S New Caledonia, Late Oligocene granodiorite and adamellite intruded into ultramafic allochthon emplaced in Late Eocene. High-medium-K calc-alkaline granitoids geochemical and isotopic features of volcanic arc magmas uncontaminated by crust-derived melts, probably generated in post- Eocene and pre-Miocene subduction. Late Oligocene subduction described here may be extended S into N New Zealand allochthons)

Cluzel, D., D. Chiron & M.D. Courme (1998)- Discordance de lôEocene superier et evenements pre-obduction en Nouvelle-Caledonie (Pacifique sud-ouest). Comptes Rendus Academie Sciences, Paris 327, p. 485-491.
('Upper Eocene unconformity and pre-obduction events on New Caledonia'. New Caledonia intra-Eocene unconformity with ~50m thick U Eocene (Tb) carbonates and >400m of Upper Priabonian flysch and olistostrome unconformably overlies eroded pre-Cretaceous- M Eocene rocks (in pelagic facies) (= foreland basin phase during ophiolite obduction?; JTvG))

Cluzel, D., F. Jourdan, S. Meffre, P. Maurizot & S. Lesimple (2012)- The metamorphic sole of New Caledonia ophiolite; 40Ar/39Ar, U-Pb, and geochemical evidence for subduction inception at a spreading ridge. Tectonics 31, 3, TC3016, p. 1-16.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2011TC003085/pdf)
(Amphibolite lenses below serpentinite sole at base of Peridotite Nappe recrystallised in high-T amphibolite facies, unlike blueschists and eclogites of Eocene metamorphic complex. Amphibolites MORB geochemical features, similar to Late Paleocene-Eocene BABB components of allochthonous Poya Terrane. Mafic rocks recrystallised at ~56 Ma and belong to oceanic crust of lower plate of subduction/obduction system and recrystallised when subducted below young-hot oceanic lithosphere. This and occurrence of slab melts at ~53 Ma suggest subduction inception near spreading ridge of S Loyalty Basin at ~58 Ma)

Cluzel, D., P. Maurizot, J. Collot & B. Sevin (2012)- An outline of the geology of New Caledonia; from Permian-Mesozoic Southeast Gondwanaland active margin to Cenozoic obduction and supergene evolution. Episodes 35, 1, p. 72-86.
(online at: www.episodes.co.in/Contents/2012/march/p72-86.pdf)
(Recent review of New Caledonia geology. Three phases: (1) E Permian-E Cretaceous Gondwanan phase, marked by subduction along SE Gondwaland margin, with New Caledonia located in fore-arc region in which volcanic-arc detritus accumulated; (2) Late Cretaceous- Eocene marginal rifting isolated with short period of shallow water terrigenous sedimentation associated with minor volcanic activity, followed by pelagic sediments; (3) NE-dipping Eocene subduction zone to E of New Caledonia consumed E Australian Plate and ended with Late Eocene obduction when Norfolk Ridge blocked subduction zone)

Cluzel, D. & S. Meffre (2002)- L'unite de la Boghen (Nouvelle-Caledonie, Pacifique sud-ouest): un complexe d'accretion jurassique. Donnees radiochronologiques preliminaires U-Pb sur les zircons detritiques. Comptes Rendus Geoscience 334, p. 867-874.
('The Boghen terrane (New Caledonia, SW Pacific): a Jurassic accretionary complex; preliminary U-Pb radiochronological data on detrital zircons'. Presence of 191-200 Ma detrital zircons in Boghen terrane metasediments that were metamorphosed at 150 Ma suggests Jurassic sedimentary precursors (probably as Jurassic accretionary complex along E Gondwana active margin), metamorphosed soon after deposition. Terrane formerly considered 'pre-Permian basement'. Detrital zircons three zircon age populations: Late Carboniferous- Liassic (190-305 Ma; 23%), Neo- Mesoproterozoic (540-1400 Ma; 54%) and Paleoproterozoic (1800-2300 Ma; 23%), consistent with derivation from Permian- Mesozoic SE Gondwana arc system and Antarctic continent)

Cluzel, D., S. Meffre, P. Maurizot & A.J. Crawford (2006)- Earliest Eocene (53 Ma) convergence in the Southwest Pacific: evidence from pre-obduction dikes in the ophiolite of New Caledonia. Terra Nova 18, 6, p. 395-402.
(Chemistry and age of mafic and felsic dikes of supra-subduction zone character in mantle peridotite of S New Caledonia ophiolite, with zircon ages of 52.8 ± 0.2 Ma (no inherited zircons). Suggest subduction-related magmatism began before 53 Ma. Obduction in SW Pacific unrelated to reorientation of Pacific plate motion at ~43 Ma. Post-obduction granitoids intruded ophiolite and autochthonous basement at ~27-24 Ma)

Cluzel, D., M. Ulrich, F. Jourdan, S. Meffre, J.L. Paquette, M.A. Audet, A. Secchiari & P. Maurizot (2016)- Early Eocene clinoenstatite boninite and boninite-series dikes of the ophiolite of New Caledonia; a witness of slab-derived enrichment of the mantle wedge in a nascent volcanic arc. Lithos 260, p. 429-442.
(Clinoenstatite-bearing boninites from serpentinite sole of Cenozoic ophiolite of New Caledonia Ar/Ar dated as ~47.4 and 50.4 Ma. Coarser grained, similar felsic dikes with U-Pb zircon ages of ~54 Ma. Geochemical features similar to Cape Vogel boninites and similarly generated by hydrous melting of depleted peridotite. Magmas generated by slab melting during early stages of intra-oceanic subduction)

Cluzel, D., M. Whitten, S. Meffre, J.C. Aitchison & P. Maurizot (2018)- A reappraisal of the Poya Terrane (New Caledonia): accreted Late Cretaceous-Paleocene marginal basin upper crust, passive margin sediments, and Early Eocene E-MORB sill complex. Tectonics 37, p. 48-70.
(online at: https://espace.library.uq.edu.au/view/UQ:725361/UQ725361_OA.pdf)
(Poya Terrane mafic allochthon of New Caledonia under Peridotite Nappe. Composed of (1) Campanian-Paleocene mid-ocean ridge basalt, back-arc basin basalt and abyssal argillite and (2) Coniacian-Santonian sandstone, turbidites, and abyssal argillite (Kone Facies), intruded by E Eocene E-MORB sills. Poya Terrane was eventually thrust onto Norfolk Ridge when latter reached subduction zone and debris from thrust sheet fed M-L Eocene syntectonic basins. Mafic portions of Poya Terrane were subducted and recrystallized into eclogite facies, mixed with serpentinite (Pouebo melange), then exhumed in fore-arc region)

Coleman, P.J. (1962)- An outline of the geology of Choiseul, British Solomon Islands. J. Geol. Soc. Australia 8, 2, p. 135-157.
(Choiseul island 100 x 20 miles in size, one of larger of Solomon Islands. Structurally the island is a mass of fault blocks, active from E Miocene -present. Basement amphibolite schists, overlain by >2000' thick andesites, basalts and basaltic pillow lavas, with minor intrusives; Lower Miocene grits and ~300' thick biostromal calcarenite on lavas; >1000' of subgreywackes and volcanic sandstones; ~2000' of Pliocene calcarenites and calcilutites; Quaternary volcanics from two extant volcanic cones and slabs of uplifted limestone reef masses. Also slab-like body of flat-lying, ~500' thick pre-Miocene? Siruka serpentinitic peridotites overlying schists)

Coleman, P. (1963)- Tertiary larger Foraminifera of the British Solomon Islands, Southern Pacific. Micropaleontology 9, p. 1-38.
(U Oligocene- Recent sedimentary successions in British Solomon Islands with 32 species of larger foraminifera, including Cycloclypeus, Katacycloclypeus, Lepidocyclina, Miogypsina, Miogypsinoides and Spiroclypeus. Three distinct faunas: Aquitanian, Burdigalian and Pliocene-Recent)

Coleman, P.J. (1966)- Upper Cretaceous (Senonian) bathyal pelagic sediments with *Globotruncana* from the Solomon Islands. J. Geol. Soc. Australia 13, 2, p. 439-447.
(Pelagic oozes overlying basal basaltic lavas on Malaita, Solomon Islands, contain up to 20% planktonic foraminifera, <5% acid-insoluble clay, associated with radiolarian chert and with finely disseminated manganese. Foraminifera include Globotruncana arca, G. havanensis, G. lapparenti and G. tricarinata, indicating probably Late Senonian age. These sediments are oldest in Solomon group)

Coleman, P.J. (1966)- The Solomon Islands as an island arc. Nature 211, p. 1249-1251.
(Solomon Islands ~800 mile long chain in SW Pacific, mainly composed of arc volcanics. On Pacific side (north) with Lower Cretaceous- Eocene basic, submarine lavas. Central region with widespread Lower Eocene metamorphics (Choiseul schists), intruded and overlain by U Eocene- Oligocene andesites. Etc.)

Coleman, P.J. (1970)- Geology of the Solomon and New Hebrides Islands as parts of the Melanesian re-entrant, Southwest Pacific. Pacific Science 24, p. 284-314.
(Solomon Islands and New Hebrides Archipelago examples of fractured island arcs. Both are crustal blocks, 20-30 km thick, and isolated from neighboring blocks. Their generalized stratigraphic columns remarkably similar and complete. Deep fracturing is dominant structural style, with differential uplifts of up to 6000m)

Coleman, P.J. (1978)- Reflections on outer Melanesian Tertiary larger foraminifera. Bull. Bureau Mineral Res. Geol. Geophys. 192 (Crespin Volume), p. 31-36.
(Four main Tertiary larger foraminifera assemblages between N coast New Guinea and Fiji: Late Eocene, Late Oligocene- E Miocene, E-M Miocene and Late Miocene)

Coleman, P.J. (1980)- Plate tectonics background to biogeographic development in the Southwest Pacific over the last 100 million years. Palaeogeogr. Palaeoclim. Palaeoecology 31, p. 105-121.
(India, Australia, Greater New Zealand and Antarctica all part of Gondwana in Jurassic. N margin of NE Gondwana (New Guinea), E (New Caledonia-Norfolk Ridge) and SE margins (New Zealand) were active margins. New Guinea edge was volcanic island arc setting. Bordering arc system along New Caledonia- New Zealand E edge made up Inner Melanesian Arcs. Rangitata Orogeny culminated in E Cretaceous, followed by uplift, metamorphism and regression, over much of Greater New Zealand. Regression in Australia in Late Cretaceous (100-65 m.y.). Main Late Cretaceous event was creation of Tasman Sea (78-56 Ma). Coral Sea opened by spreading and sinistral strike-slip of part of New Guinea N of Papuan Mobile Belt at same time)

Coleman, P.J. (1989)- Petroleum potential of Solomon Islands, a review of opportunities for exploration. Bureau Mineral Res., Canberra, p. 1-24.
(online at: http://ict.sopac.org/VirLib/CP0011a.pdf)
(Solomon Islands arc system has an igneous basement of arc tholeiites and basalts and intrusives, mostly of E Tertiary age, overlain by sedimentary-volcanic section extending through Holocene. Most of basinal areas younger than Late Oligocene)

Coleman, P.J. (1991)- Dynamic strike-slip fault systems with respect to the Solomon Islands, and their effect on mineral potential. Marine Geology 98, p. 167-176.
(Solomon Islands example of volcanic arc split by major strike-slip faults along obliquely convergent boundary)

Coleman, P.J. & G.H. Packham (1976)- The Melanesian borderlands and India-Pacific platesô boundary. Earth-Science Reviews 12, p. 197-233.
(Melanesian Borderlands extend from New Guinea to Tonga and occupy border position between India and Pacific plates. Seven regions: Bismarck Sea, Solomon Block, Coral Sea, New Hebrides and S Fiji Basins, New Hebrides Block, Fiji Plateau and Lau Basin, Fiji Platform and Lau and Tonga Ridges)

Coleman, R.G. (1967)- Glaucophane schists from California and New Caledonia. Tectonophysics 4, 4-6, p. 479-498.
(In California and New Caledonia outcrop patterns and structures show belt of blueschist facies metamorphism of eugeosynclinal rocks parallel to large ultramafic bodies, indicating tectonic relationship between metamorphism and tectonic emplacement. Mineral assemblages in blueschist facies under conditions where pressure is dominant over temperature, requiring extremely low thermal gradients. In New Caledonia age of metamorphism 21-38 Ma from radiometric dating of on muscovite and glaucophane in high-P schist belt)

Coleman, R.G. (1971)- Plate tectonic emplacement of upper mantle peridotites along continental edges. J. Geophysical Research 76, 5, p. 1212-1222.
(Large oceanic-mantle crustal slabs thrust over or into continental edges contemporaneously with blueschist metamorphism in New Caledonia and New Guinea. 'Obduction' zones lack volcanic activity, and may result from initial stage of compressional impact between oceanic and continental lithospheric plate. Serpentinites represent alteration developed during tectonic emplacement into wet sediments of continental plate, which produces less dense and plastic envelope that facilitates further tectonic movement)

Colley, H. (1984)- An ophiolite suite in Fiji? In: Ophiolites and oceanic lithosphere, Geol. Soc. London, Spec. Publ. 13, p. 333-340.
(In SW Viti Levu rocks formerly described as part of island-arc succession may be upper part of ophiolite suite. Foraminiferal oozes, cherts, red clays, Fe-Mn metalliferous sediments, fine-grained volcanic turbidites and reworked polymict lapillistones can be equated with Layer 1 of oceanic lithosphere)

Colley, H. & W.H. Hindle (1984)- Volcano-tectonic evolution of Fiji and adjoining marginal basins. In: B.P. Kokelaar & M.F. Howells (eds.) Marginal basin geology: volcanic and associated sedimentary and tectonic processes in modern and ancient marginal basins, Geol. Soc., London, Spec. Publ. 16, p. 151-162.
(From Eocene- M Miocene, Fiji was part of N-facing Outer Melanesia arc system, stretching from PNG to Tonga. Oligocene back-arc spreading S of Fiji led to formation of Minerva Plain (S Fiji Basin). M Miocene polarity reversal in arc segments W of Fiji. Fiji compressive event followed by progressive isolation from subduction regime as arc segments rotated away. Change in Fiji volcanism from arc andesites and tholeiites to alkalic ocean island basalts. Most recent arc rotation resulted in opening of Lau Basin between Fiji and Tonga, and divorce of Fiji from subduction influence with start of ocean island basalt volcanism in M Pliocene)

De Jersey, N.J. & J.A. Grant-Mackie (1989)- Palynofloras from the Permian, Triassic and Jurassic of New Caledonia. New Zealand J. Geol. Geophys. 32, p. 463-476.
(online at: www.tandfonline.com/doi/abs/10.1080/00288306.1989.10427554)
(Late Permian- M Jurassic palynomorphs from 33 marine sediment samples, similar to age-equivalent floras from New Zealand and E Australia. Triassic palynoflora assigned to cool-temperate Ipswich microflora, compositionally intermediate between SE Queensland and New Zealand palynofloras. Oldest sample Permian with Alisporites (= Falcisporites) australis, and without Lunatisporites pellucidus, suggesting upper Upper Stage 5 or Playfordiaspora crenulata and Protohaploxypinus microcorpus Zone. Also E Triassic P. samoilovichii Zone, without Alisporites australis. Etc.)

Deprat, J. (1905)- Les depots eocenes neo-caledoniens et leur analogie avec ceux de la region de la Sonde. Bull. Soc. Geologique France, ser. 4, 5, p. 485-516.
(online at: http://ia802704.us.archive.org/2/items/bulletindelasoci451905soci/bulletindelasoci451905soci.pdf)
'The Eocene deposits of New Caledonia and their analogy to the Sunda region'. Conglomerates, sandstones, tuffs and limestones with Eocene LF Orthophragmina (= Discocyclina and Asterocyclina; incl. new species umbilicata), Nummulites and rare Alveolina. Faunas very similar to those described from Java by Verbeek)

Deprat, J. (1909)- Sur la presence de *Pellatispira* dans lŒocene de Nouvelle Caledonie. Bull. Soc. Geologique France, ser. 4, 9, p. 288-289.
('On the presence of Pellatispira in the Eocene of New Caledonia'. Short note on occurrence of Eocene larger foram Pellatispira, associated with Discocyclina and Nummulites in New Caledonia)

Deschamps, A. & S. Lallemand (2002)- The West Philippine Basin: an Eocene to Early Oligocene back arc basin opened between two opposed subduction zones. J. Geophysical Research 107, B12, p. 1-24.
(W Philippine Basin back arc basin developed between two opposed subduction zones. Rifting started at 55 Ma, spreading ended at 33/30 Ma. Initial spreading axis parallel to paleo-Philippine Arc, new spreading ridge propagated from E part of basin. Spreading mainly from second axis with CCW rotation of spreading direction. Gagua and Palau-Kyushu ridges transform margins accommodating opening. Arc volcanism along Palau-Kyushu Ridge (E margin) during opening, paleo-Philippine Arc decreased activity between 43-36 Ma. W margin compressive event in Late Eocene- E Oligocene. In W of basin, spreading system disorganized due to presence of mantle plume. After end of spreading, amagmatic extension between 30-26 Ma in central basin)

Deschamps, A. & S. Lallemand (2003)- Geodynamic setting of Izu-Bonin-Mariana boninites. In: R.D. Larter & P.T. Leat (eds.) Intra-oceanic subduction systems; tectonic and magmatic processes, Geol. Soc., London, Spec. Publ. 219, p. 163-185.
(online at: www.gm.univ-montp2.fr/IMG/pdf/Deschamps_Lallemand_2003_GeolSocLondon.pdf)
(Izu-Bonin-Mariana forearc characterized by occurrence of boninite-like lavas (mainly M-L Eocene age). Three tectonic settings that favor formation of boninites in back-arc basins. Boninites in Bonin Islands probably formed near termination of volcanic arc, at transition between subduction zone and transform fault)

Deschamps, A., S. Lallemand & S. Dominguez (1999)- The last spreading episode of the West Philippine Basin revisited. Geophysical Research Letters 26, 14, p. 2073-2076.
(Bathymetric data and backscatter imagery reveal fine structures of fossil spreading axis, from which we infer episodes of oblique deformation and diminished magmatic supply resulting from cessation of spreading. NE-SW seafloor fabric NE of Benham volcanic plateau, oblique to more common E-W and NW-SE fabrics known in WPB. Cross-cut during final, amagmatic, extensional phase to produce a N130° -trending deep rift valley)

Deschamps, A., P. Monie, S. Lallemand, K. Hsu & K.Y. Yeh (2000)- Evidence for Early Cretaceous oceanic crust trapped in the Philippine Sea Plate. Earth Planetary Sci. Letters 179, p. 503-516.
(online at: www.gm.univ-montp2.fr/IMG/pdf/Deschamps.pdf)
(N Huatung Basin small oceanic basin E of Taiwan. New Early Cretaceous Ar/Ar ages of gabbros dredged on oceanic basement highs. Old ages consistent with E Cretaceous ages of Lanyu Island (Luzon Arc) radiolarian assemblages. Best fit of magnetic anomalies is opening of Huatung Basin in E Cretaceous (131-119 Ma). Basin may be fragment of 'proto-South China Sea' or possibly 'New Guinea Basin' trapped by Philippine Sea Plate)

Deschamps, A., K. Okino & K. Fujioka (2002)- Late amagmatic extension along the central and eastern segments of the West Philippine Basin fossil spreading axis. Earth Planetary Sci. Letters 203, p. 277-293.
(Tectono-magmatic processes along spreading axis of W Philippine Basin during conclusion of last spreading phase at 33/30 Ma. Opening from E-W-trending spreading system followed by late phase of NE-SW extension in C and E parts of basin. Late event probably associated with onset of E-W opening of Parece-Vela Basin along E border of WPB at 30 Ma)

Deschamps, A., R. Shinjo, T. Matsumoto, C.S. Lee, S.E. Lallemand & S. Wu (2008)- Propagators and ridge jumps in a back-arc basin, the West Philippine Basin. Terra Nova 20, 4, p. 327-332.

(New bathymetric data from western W Philippine Basin suggests 5 sequences of propagating rifts, probably triggered by mantle flow away from thermal anomaly responsible for origin of Benham and Urdenata plateaus. NE of Benham plateau, a left-lateral fracture zone turned into NE-SW-trending spreading axis)

Dickinson W.R. (2008)- Tectonic lessons from the configuration and internal anatomy of the Circum-Pacific orogenic belt. In: J.E. Spencer & S.R. Titley (eds.) Ores and orogenesis: Circum-Pacific tectonics, geologic evolution and ore deposits, Arizona Geol. Soc. Digest 22, p. 5-18.

Diessel, C., R. Brothers & P. Black (1978)- Coalification and graphitization in high-pressure schists in New Caledonia. Contrib. Mineralogy Petrology 68, p. 63-78.
(N portion of Tertiary high P schist belt in New Caledonia metamorphic progression from W to E from lawsonite-albite facies through glaucophanitic greenschists to eclogitic albite-epidote amphibolites: Belt flanked to W by Upper Cretaceous-Eocene metasediments of prehnite-pumpellyite grade, with abundant carbonaceous material showing progressive metamorphism from coal to graphite. In prehnite-pumpellyite metasediments phytoclasts progressively coalified to anthracite. Graphite first appears at lawsonite isograd. Beyond ferroglaucophane isograd all phytoclasts completely graphitized)

Dimalanta, C., A. Taira, G.P. Yumul, H. Tokuyama & K. Mochizuki (2002)- New rates of western Pacific island arc magmatism from seismic and gravity data. Earth Planetary Sci. Letters 202, p. 105-115.
(Oceanic island arcs in SW Pacific study area with crustal thickness of 20-30 km. Arc magmatic addition rates of 30-95 km3/km/Myr, nearly twice as high as previous estimates of arc magmatic addition rates)

Dubois, J., J. Launay & J. Recy (1974)- Uplift movements in New Caledonia- Loyalty Islands area and their plate tectonics interpretation. Tectonophysics 25, p. 133-150.
(Four phases of uplift identified on New Caledonia: (1) Peneplanation of peridotites: peridotites subjected to intense erosion since E Miocene; (2) Post-Miocene asymmetrical uplift after peneplanation to elevations up to 1300m and possible tilt to W, possibly partly post-erosional isostatic re-equilibrium; (3) Recent subsidence phase of ~200m and (4) Recent uplifted coastal terraces 2-6m asl. Loyalty Archipelago series of uplifted atolls since 2 Ma, with decreasing altitudes from SE to NW)

Dugas, F. & J.F. Parrot (1978)- Reconstitution de la ceinture eocene du Sud-Ouest Pacifique. Comptes Rendus Academie Sciences, Paris, D 287, 7, p. 671-674.
(online at: http://horizon.documentation.ird.fr/exl-doc/pleins_textes/pleins_textes_5/b_fdi_08-09/09434.pdf)
('Reconstruction of the Eocene belt of the SW Pacific'. Originally straight and continuous NE-dipping Eocene subduction zone from E New Guinea to Solomon Islands, New Hebrides and New Caledonia, now modified by Oligo-Miocene and Recent subduction zones and transcurrent faults. Ophiolitic massifs and metamorphic soles obducted to S/ SW linked to this Eocene intra-oceanic subduction zone)

Dupuy, C., J. Dostal & M. Leblanc (1981)- Geochemistry of an ophiolitic complex from New Caledonia. Contrib. Mineralogy Petrology 76, p. 77-83.
(Ophiolites of New Caledonia composed of ultramafics overlain by mafic rocks, all affected by low P metamorphism. Mafic rocks similar to recent mid-ocean ridge rocks)

Eade, J.V. (1988)- The Norfolk Ridge system and its margins. In: A.E.M. Nairn, F.G. Stehli & S. Uyeda (eds.) The ocean basins and margins 7, The Pacific Ocean, Plenum Press, New York, p. 303-324.

Eissen, J.P., A.J. Crawford, J. Cotten S. Meffre, H. Bellon & M. Delaune (1998)- Geochemistry and tectonic significance of basalts in the Poya Terrane, New Caledonia. Tectonophysics 284, p. 203-219.
(Widespread 'West Coast basalt' part of 20-500m-thick nappe below ophiolite nappe of New Caledonia (Poya Terrane basalts; PTB). Interbedded radiolarian cherts of Late Cretaceous (Campanian) age, but K-Ar ages

almost all Eocene (~39-49 Ma), presumably reflecting resetting related to emplacement of overriding harzburgite nappe. PTB form parautochthonous sheet below main harzburgitic nappe of New Caledonian ophiolite, genetically unrelated to ophiolite, and interpreted to be 70-85-Ma-old rift tholeiites formed during opening E New Caledonia Basin)

Emery, K.O., J.I. Tracey & H.S. Ladd (1954)- Geology of Bikini and nearby atolls, Marshall Islands. U.S. Geol. Survey (USGS) Prof. Paper 260-A, p. 1-264.
(online at: http://pubs.usgs.gov/pp/0260a/report.pdf)
(Drilling on Bikini island to depth of 2556', encountered Oligocene (?)- Recent limestone: 0-850', Recent and Plio-Pleistocene- Recent; 850-2070' Miocene; 2070-2556' Oligocene(?). Entire section accumulated in shallow water, lagoonal environment, indicating continuing or periodic submergence)

Exon, N.F., G.R. Dickens, J.M. Auzende, Y., Lafoy, P.A. Symonds & S. Van de Beuque (1998)- Gas hydrates and free gas on the Lord Howe Rise, Tasman Sea. Petroleum Expl. Soc. Australia (PESA) Journal 26, p. 148-158.

Exon, N.F., Y. Lafoy, P.J. Hill, G.R. Dickens & I. Pecher (2007)- Geology and petroleum potential of the Fairway Basin in the Tasman Sea. Australian J. Earth Sci. 54, 5, p. 629-645.
(Fairway Basin poorly known N-S-trending basin in 1500-3000m of water on E slope of Lord Howe Rise. Three segments, probably formed by thinning of continental crust during Late Cretaceous- Paleocene breakup of Lord Howe Rise and surrounding continental ridges. Eocene compression (tied to overthrusting on New Caledonia?) lead to uplift and erosion of N Lord Howe Rise, and reversal of faulting in basin. By Oligocene time area again in bathyal depths, with pelagic ooze and turbidites accumulation. Cretaceous- Recent sediments 2000-4000m thick)

Exon, N.F., P.G. Quilty, Y. Lafoy, A.J. Crawford & J.M. Auzende (2004)- Miocene volcanic seamounts on northern Lord Howe Rise: lithology, age and origin. Australian J. Earth Sci. 51, 2, p. 291-300.
(Small volcanic cones on NE Lord Howe Rise in water depths 750-1150m. Interbedded E Miocene micrites(N8?; ~16-15 Ma) in upper volcaniclastics represent calcareous ooze deposited with (or later than) volcanic pile, in pelagic depths. Covered with ferromanganese crust up to 7cm thick)

Falloon, T.J., L.V. Danyushevsky, A.J. Crawford, S. Meffre, J.D. Woodhead & S.H. Bloomer (2008)- Boninites and adakites from the northern termination of the Tonga Trench: implications for adakite petrogenesis. J. Petrology 49, 4, p. 697-715.
(online at: https://academic.oup.com/petrology/article/49/4/697/1467522/Boninites-and-Adakites-from-the-Northern)
(Adakitic rocks dredged from N termination of Tonga Trench. Zircon ages 2.5 Ma, contemporaneous with boninite magmatism in area. High-SiO2 adakites in area where transition from steep Pacific subduction to transform fault plate boundary created slab window/ slab edge. Adakites result from direct melting of slab edge as result of juxtaposition of subducting slab against hot mantle derived from Samoan plume)

Falvey, D.A., J.B. Colwell, P.J. Coleman, H.G. Greene et al. (1991)- Petroleum prospectivity of the Pacific island arcs: Solomon islands and Vanuatu. Australian Petrol. Expl. Assoc. (APEA) J. 1991, p. 191-212.

Fang, Y., J. Li, M. Li, W. Ding & J. Zhang (2011)- The formation and tectonic evolution of Philippine Sea Plate and KPR. Acta Oceanologica Sinica 30, 4, p. 75-88.
(Philippine Sea Plate oceanic plate almost entirely surrounded by subduction zones. Kyushu-Palau Ridge believed to be remnant arc on oceanic plate, formed during opening of Parece Vela and Shikoku Basins)

Fisher, M.A., J.Y. Collot & E.L. Geist (1991)- Structure of the collision zone between Bougainville Guyot and the accretionary wedge of the New Hebrides island arc, southwest Pacific. Tectonics 10, 5, p. 887-903.
(Bougainville guyot fills New Hebrides trench, stands ~3 km above abyssal ocean plain, and is capped by broad carbonate platform Seismic data showing structure in island arc-guyot collision zone. Contact zone marked by discontinuous antiforms)

Fisher, M.A., J.Y. Collot & E.L. Geist (1991)- The collision zone between the North d'Entrecasteaux Ridge and the New Hebrides Island Arc. Part 2: Structure from multichannel seismic data. J. Geophysical Research 96, B3, p. 4479-4495.
(D'Entrecasteaux zone (DEZ) collides with C New Hebrides island arc and consists of two subparallel ridges that strike east-west, stand 1-2 km above the surrounding oceanic plate, and subduct obliquely (15°)N-ward beneath arc. Rocks dredged from N ridge indicates volcanic origin. Mass wasting deposits locally make up most of accretionary wedge)

Fitton, J.G. & M. Godard (2004)- Origin and evolution of magmas on the Ontong Java Plateau. In: J.G. Fitton, et al. (eds.) Origin and evolution of the Ontong Java Plateau. Geol. Soc. London, Spec. Publ. 229, p. 151-178.
(E Cretaceous basalts of oceanic Ontong Java Plateau homogeneous composition, mainly low-K tholeiite. Formed in short time (<10 My) around 122 Ma. Most or all of volcanics erupted well below sea level)

Fitton, J.G., J.J. Mahoney et al. (eds.) (2004)- Origin and evolution of the Ontong Java Plateau. Geol. Soc. London, Spec. Publ. 229, p. 1-374.
(Collection of papers on Ontong Java Plateau in W Pacific, world's largest igneous province in oceanic environment. Mainly formed around 120- 90 Ma, mid-Cretaceous)

Fitton, J.G., J.J. Mahoney, P.J. Wallace & A.D. Saunders (2004)- Leg 192 synthesis: origin and evolution of the Ontong Java Plateau. In: J.G. Fitton et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 192, p. 1-18.
(online at: www-odp.tamu.edu/publications/192_SR/VOLUME/SYNTH/SYNTH.PDF)
(Mid-Cretaceous Ontong Java Plateau is most voluminous of world's large igneous provinces and represents by far largest known magmatic event on Earth (comparable in size to W Europe). Formed rapidly around 120 Ma (122- >112 Ma). Collision with old Solomon arc resulted in uplift of OJP S margin to create onland exposures of basaltic basement in Solomon Islands (Malaita, Santa Isabel, San Cristobal). Biostratigraphic dating of pelagic sediment intercalated with lava flows suggests magmatism on high plateau extended from ~122–112 Ma, but ReOs isotopic data on basalts from same sites single isochron age of 121.5 ± 1.7 Ma)

Fitzherbert, J.A., G.L. Clarke & R. Powell (2003)- Lawsonite-omphacite-bearing metabasites of the Pam Peninsula, NE New Caledonia: evidence for disrupted blueschist- to eclogite-facies conditions. J. Petrology 44, 10, p. 1805-1831.
(online at: https://academic.oup.com/petrology/article/44/10/1805/1493887)
(Diahot terrane of N New Caledonia with interbedded Cretaceous-Eocene metasediments and metavolcanics that experienced late M Eocene (~40 Ma) high-P metamorphism. Steeply SW-dipping S2 foliation progressively more intense to NE over 15 km. Four zones of metabasites, from SW to NE: (1) Lawsonite blueschist (with omphacite, glaucophane; P=1.0 GPa, T=400°C); (2) Epidote blueschist (lawsonite-clinozoisite-spessartine; 1.4-1.5 GPa, 450-500°C); (3) Almandine-hornblende blueschist (clinozoisite-hornblende–almandine; 1.5-1.6 GPa, 550-580°C); (4) Hornblende-paragonite eclogite (clinozoisite-almandine-omphacite; 1.7 GPa, 600-620°C). P-T array disrupted by tectonic thinning during exhumation. Adjacent Pouebo terrane metabasic eclogite/ glaucophanite (1.9 GPa, 590°C), developed at similar depths of 50-60km in subducted leading edge)

Fitzherbert, J.A., G.L. Clarke & R. Powell (2005)- Preferential retrogression of high-P metasediments and the preservation of blueschist to eclogite facies metabasite during exhumation, Diahot terrane, NE New Caledonia. Lithos 83, p. 67-96.
(High-P metabasites of Diahot terrane, N New Caledonia occur as spatially restricted lenses, boudins and layers in psammitic to pelitic metasediments. Although interlayered, two types preserve distinct, tectonically disrupted metamorphic profiles in transition from lawsonite blueschist in SW to low-T eclogite in NE)

Folcher, N., B. Sevin, F. Quesnel, V. Lignier, M. Allenbach, P. Maurizot & D. Cluzel (2015)- Neogene terrestrial sediments: a record of the post-obduction history of New Caledonia. Australian J. Earth Sci. 62, 4, p. 479-492.

(Thin, poorly studied iron-rich fluvio-lacustrine sediments, mainly derived from erosion of ultramafic regolith in S part of Grande Terre of New Caledonia, document 25 Ma of geological history of island. Ages of formation poorly constrained. Several episodes of post-obduction erosion and sediment fill. Correlation with E Miocene slab break-off, which may have triggered first stage of erosion. Etc.)

Freinex, S. (1980)- Bivalves neocretaces de Nouvelle-Caledonie. signification biogeographique, biostratigraphique, paleoecologique. Annales Paleontologie (invertebres) 66, 2, p. 67-134.
('Late Cretaceous bivalves of New Caledonia; biogeographic and paleoecologic significance')

Freinex, S. (1981)- Faunes de bivalves du Senonien de Nouvelle-Caledonie. Analyses paleobiogeographique, biostratigraphique, paleoecologique. Annales Paleontologie (invertebres) 67, 1, p. 13-32.
('Senonian bivalves of New Caledonia; paleobiogeographic, biostratigraphic and paleoecologic analysis')

Freinex, S., J.A. Grant-Mackie & J. Lozes (1974)- Presence de *Malayomaorica* (Bivalvia) dans le Jurassique superieur de la Nouvelle-Caledonie. Bull. Soc. Geologique France, 16, 4, p. 456-464.
('Presence of Malayomaorica malayomaorica in the Upper Jurassic of New Caledonia'. New subspecies novocaledonica. This Kimmeridgean bivalve genus (originally assigned to Aucella, then Buchia) is widely distributed along margins of Late Jurassic Gondwanaland; JTvG)

Frost, B. R. K.A. Evans, S.S. Swapp, J.S. Beard & F.E. Mothersole (2013)- The process of serpentinization in dunite from New Caledonia. Lithos 178, p. 24-39.

Fryer, P.B., & M.H. Salisbury (2006)- Leg 195 synthesis: Site 1200- Serpentinite seamounts of the Izu-Bonin/Mariana convergent plate margin (ODP Leg 125 and 195 drilling results). In: M. Shinohara et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 195, p. 1-30.
(online at: www-odp.tamu.edu/publications/195_SR/VOLUME/SYNTH/SYNTH1.PDF)
(Izu-Bonin/Mariana convergent plate margin characterized by non-accretionary forearc with numerous serpentinite seamounts distributed over 90 km wide zone in Mariana system. Seamounts formed primarily by mud volcanism. Mud flows with altered mafic rocks of oceanic plate and island arc origin and slab-derived fragments of high P- low T metabasites (incl. glaucophane schist) that reflect conditions of subduction zone.)

Gautier, P., B. Quesnel, P. Boulvais & M. Cathelineau (2016)- The emplacement of the peridotite nappe of New Caledonia and its bearing on the tectonics of obduction. Tectonics 35, 12, p. 3070-3094.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2016TC004318/pdf)
(Peridotite Nappe of New Caledonia one of few ophiolites worldwide that escaped collisional orogeny after obduction. Klippes of peridotite nappe in NW New Caledonia flat lying and involve S/SW vergent reverse-slip shear zones of compressional origin. Further NE nappe folded in association with steep schistosity in low-grade metasediments. Peridotite Nappe experienced compression at greater depths toward root zone, suggesting "push from the rear" mechanism of emplacement. Obduction in New Caledonia occurred through dextral oblique convergence between subduction trench and continental ribbon)

Genna, A., P. Maurizot, Y. Lafoy & T. Auge (2005)- Controle karstique de mineralisations nickliferes de Nouvelle-Caledonie. Comptes Rendus Geoscience, Paris, 337, 3, p. 367-374.

('First radiometric dates on the basalts of New Caledonia, their relationships with the great events of the structural history of the internal Melanesian arc in the Cenozoic'. Includes 32 Ma date for plagiogranite (viewed as 'thrusting intrusions by Parrot and Dugas 1980?))

Guillon, J.H. & P. Routhier (1971)- Les stades d'evolution et de mise en place des massifs ultramafiques de Nouvelle Caledonie. Bull. Bur. Rech. Geol. Minieres (France) 15, IV, 2, p.
(The stages of evolution and emplacement of the ultramafic massifs of New Caledonia'. Emplacement of peridotites-basalts of New Caledonia, which cover 7000km2 of island, probably in Oligocene time)

Hackney, R., R. Sutherland & J. Collot (2012)- Rifting and subduction initiation history of the New Caledonia Trough, southwest Pacific, constrained by process-oriented gravity models. Geophysical J. Int. 189, p. 1293-1305.
(New Caledonia Trough 200-300 km wide, 2300 km long and 1.5-3.5 km deep between New Caledonia and New Zealand. Stratigraphic units: Cretaceous rift sediments, Late Cretaceous- Eocene pelagic drape and ~1.5 km thick Oligocene-Quaternary trough fill contemporaneous with Tonga-Kermadec subduction. Positive free-air gravity anomaly associated with Trough best explained by two-phase model with initial Cretaceous crustal thinning. May also be related to Eocnee onset of Tonga-Kermadec subduction zone)

Hamburger, M.W. & B.L.Isacks (1988)- Diffuse backarc deformation in the Southwestern Pacific. Nature 332, p. 599-604.
(Earthquake distribution and focal mechanisms from Lau and N Fiji back-arc basins indicate diffuse and shear-dominated deformation. Back-arc region between Tonga and New Hebrides arcs more realistically modelled as giant pull-apart basin, along left step in transform boundary between Pacific Indo-Australian plates)

Hammarstrom, J.M., C.L. Dicken, G.R. Robinson & A.A. Bookstrom (2013)- Porphyry copper assessment for Tract 009pCu7210, Outer Melanesian Arc II- Melanesia (Solomon Islands, Vanuatu, and Fiji). In: J.M. Hammarstrom et al., Porphyry copper assessment of Southeast Asia and Melanesia, U.S. Geol. Survey, Scient. Invest. Rept. 2010-5090-D, Appendix V, p. 303-329.
(online at: http://pubs.usgs.gov/sir/2010/5090/d/sir2010-5090d_text.pdf)
(Assessment of Eocene-Oligocene to late Miocene-Pleistocene porphyry coppers in Outer Melanesian magmatic arc in Solomon Islands, Vanuatu, and Fiji. Originally part of Eocene- E-M Miocene 'Vitiaz Arc, formed by subduction of Pacific Plate beneath Indo-Australian Plate along Vitiaz-Tonga Trench system until subduction reversal due to E-M Miocene collision of Ontong Java Plateau (incl. included New Ireland, Bougainville, Solomon Islands, Vanuatu, Fiji). Three known Pliocene porphyry copper deposits: Mt Koloula (Guadalcanal in Solomon Islands), Namosi and Waivaki (Viti Levu, Fiji) (Outer Melanesian in PNG with Panguna deposit on Bougainville and Arie deposit on Manus). Many other prospects))

Hanzawa, S. (1947)- Eocene foraminifera from Haha-Jima (Hillsborough Island). J. Paleontology 21, 3, p. 254-259.
(Haha-jima (Bonin Islands) entirely formed of Eocene rocks. Uppermost horizon Priabonian limestone with Biplanispira. Underlying Lutetian friable rock with Nummulites boninensis n.sp. in lower half, Aktinocyclina predominant in upper half, Alveolina javanus var. and Eorupertia boninensis persist throughout Lutetian (see also Ujie & Matsumaru, 1977))

Hanzawa, S. (1957)- Cenozoic foraminifera from Micronesia. Geol. Soc. America (GSA) Mem. 66, p. 1-163.

Hanzawa, S. (1961)- Facies and micro-organisms of the Paleozoic, Mesozoic and Cenozoic sediments of Japan and her adjacent islands. Brill, Leiden, p. 1-420.

Hanzawa, S. (1967)- Three new Tertiary foraminiferal genera from Florida, Saipan and Guam. Trans. Proc. Paleont. Soc. Japan, N.S., 65, p. 19-25.
(online at: https://www.jstage.jst.go.jp/article/prpsj1951/1967/65/1967_65_19/_pdf)
(Incl. new genus Tayamaia from Aquitanian of Saipan and Quasirotalia from Pliocene of Guam)

Harrington, H.J. (1998)- The basement geology of Lord Howe Rise and Norfolk Ridge predicted by projections from Australia, New Zealand and New Caledonia. South Pacific Technology Conference Abstracts, South Pacific Commission, Suva, p. 33-36.

Haston, R.B. & M. Fuller (1991)- Paleomagnetic data from the Philippine Sea Plate and their tectonic significance. J. Geophysical Research- Solid Earth, 96, B4, p. 6073-6098.
(Paleomagnetic data from Guam and Saipan can be interpreted as (1) small scale local rotation of blocks along plate margin, or (2) rotation of Philippine Sea plate as a whole. Reconstruction model suggests Philippine Sea plate rotated up to 80° CW and moved N ~20° since Eocene. Data cannot distinguish between backarc origin or trapped crust origin for W Philippine Sea province)

Haston, R., M. Fuller & E. Schmidtke (1988)- Paleomagnetic results from Palau, West Caroline islands: a constraint on Philippine Sea plate motion. Geology, 16, p. 654-657.
(Paleomagnetic results from the Palau Islands indicate 60°-70° CW rotation since M Oligocene time. Rotation interpreted to represent motion of Philippine Sea plate and not local rotation (ubiquitous CW rotations in paleomagnetic data from around Philippine Sea plate. This strong clockwise rotation of the Philippine Sea plate provides a mechanism for oblique subduction and related transcurrent motion along the margin of the Philippine archipelago)

Hegarty, K.A. & J.K. Weissel (1988)- Complexities in the development of the Caroline plate region, western equatorial Pacific. In: A.E.M. Nairn & F.G. Stehli (eds.) The Ocean Basins and Margins 7B, The Pacific Ocean, Plenum, New York, p. 277-301.

Hermelin, J.O.R. (1989)- Pliocene benthic foraminifera from the Ontong-Java plateau (Western Equatorial Pacific Ocean): faunal response to changing paleoenvironments. Cushman Foundation Foraminiferal Research, Spec. Publ. 26, p. 1-143.
(online at: www.cushmanfoundation.org/specpubs/sp26.pdf)
(Pliocene benthic foraminifera from DSDP Hole 586A on Ontong Java Plateau, NE of New Guinea. Benthic fauna 262 taxa. Three assemblages: (1) Nuttallides umbonifera-dominated assemblage, reflecting well-oxygenated water, undersaturated with respect to calcite, (2) Cibicidoides wuellerstorfi, Epistominella exigua, Globocassidulina subglobosa, Oridorsalis umbonatus and Pullenia bulloides, similar to present fauna on Ontong Java Plateau, associated with deep oxygen minimum layer of Pacific Intermediate Water, reflecting reduced O2 content associated with episodes of upwelling; (3) Uvigerina peregrina-dominated assemblage reflects episodes of further depletion in O2 due to intensified upwelling or changes in thermohaline circulation)

Hickey-Vargas, R. (1991)- Isotope characteristics of submarine lavas from the Philippine Sea: implications for the origin of arc and basin magmas of the Philippine tectonic plate. Tectonophysics 107, p. 290-304.

(Igneous rocks from Philippine Sea tectonic plate from DSDP Legs 31, 58 and 59 analyzed for Sr, Nd and Pb isotope ratios. Four geochemically distinct magma sources required for Philippine plate magmas).

Hickey-Vargas, R. (1998)- Origin of the Indian Ocean-type isotopic signature in basalts from Philippine Sea plate spreading centers: an assessment of local versus large-scale processes. J. Geophysical Research 103, B9, p. 20963-20979.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/98JB02052/epdf)
(Basalts erupted from spreading centers on Philippine Sea plate between 50 Ma- present have the distinctive isotopic characteristics of Indian Ocean mid-ocean ridge basalt, such as high 208Pb/204Pb and low 143Nd/144Nd. This may indicate that upper mantle of Philippine Sea plate originated as part of existing Indian Ocean domain, or, less likely, that local processes duplicated these isotopic characteristics in sub-Philippine Sea plate upper mantle. Philippine Sea plate MORB likely originated over rapidly growing Indian Ocean upper mantle domain that had spread into area between Australia/New Guinea and SE Asia before 50 Ma)

Hickey-Vargas, R. (2005)- Basalt and tonalite from the Amami Plateau, northern West Philippine Basin: new Early Cretaceous ages and geochemical results, and their petrologic and tectonic implications. Island Arc 14, p. 653-665.
(Basalts and tonalites dredged from Amami Plateau in N West Philippine Basin geochemical characteristics of intra-oceanic island arc rocks. Hornblende 40Ar/39Ar isochron ages of ~115-118 Ma. W Philippine Basin opened within complex of Jurassic- Paleocene island arc terranes, now scattered in northern West Philippine Basin, the Philippine Islands and Halmahera)

Hickey-Vargas, R., M. Bizimis & A. Deschamps (2008)- Onset of the Indian Ocean isotopic signature in the Philippine Sea Plate: Hf and Pb isotope evidence from Early Cretaceous terranes. Earth Planetary Sci. Letters 268, 3, p. 255-267.
(Basalts from Paleocene-Recent Philippine Sea Plate back arc basins have Pb/ Hf-Nd isotopic characteristics of Indian Ocean mid-ocean ridge basalts. Isotopic composition of E Cretaceous terranes in Philippine Sea Plate (Huatung Basin) have Indian MORB Hf-Nd isotopic signature, but Pb isotope ratios intermediate between Indian and Pacific MORB. W Philippine Basin basalts stronger Indian Pb isotope signature than Huatung Basin rocks. Indian MORB characteristics of E Cretaceous Huatung Basin support idea that mantle sources with signature existed prior to opening of present day Indian Ocean and that Tethyan oceanic basalts, now found throughout S Eurasia, shared them)

Hickey-Vargas, R., J.M. Hergt & P.Spadea (1995)- The Indian Ocean-type isotopic signature in western Pacific marginal basins; origin and significance. In: B. Taylor & N. James (eds.) Active margins and marginal basins of the western Pacific, American Geophys. Union (AGU), Geophys. Monograph 88, p. 175-197.
(W Pacific marginal basins floored by basalts with Indian Ocean Sr-Nd-Pb isotopic characteristics, suggesting their spreading ridges tap into Indian Ocean upper mantle domain, which must extend to E side of Philippine Sea and Indo-Australian plates and extends below W Philippine and Celebes Sea basins at time of opening. Basalts from Celebes Sea (ODP sites 767, 770) N-MORB character, with Sr, Nd and Pb isotope ratios close to Indian Ocean MORB)

Hilde, T.W.C. (1983)- Sediment subduction versus accretion around the Pacific. Tectonophysics 99, p. 381-397.
(Sediment subduction common around Circum-Pacific. Bending-induced graben structures of subducting plates major factor for sediment subduction and tectonic erosion)

Hilde, T.W.C. & C.S. Lee (1984)- Origin and evolution of the West Philippine Basin: a new interpretation. Tectonophysics 102, p. 85-104.
(W Philippine Basin two distinct spreading phases. From 60-45 Ma spreading NE-SW, relative to present orientation. At ~45 Ma spreading direction changed to more N-S direction with reconfiguration of C Basin Spreading Center into short E-W segments offset by closely spaced N-S transform faults. Spreading slowed and ceased at 35 Ma B.P. Thus, W Philippine Basin originated at 45 Ma by trapping of normal ocean crust W of initial subduction along Palau-Kyushu trend. 45-35 Ma period represents dying phase of spreading on C Basin Spreading Center following isolation of W Philippine Basin from plate driving forces of Pacific)

Hilde, T.W.C. & S. Uyeda (1983)- Trench depth: variation and significance. In: T.W.C. Hilde & S. Uyeda (eds.) Geodynamics of the Western Pacific-Indonesian region, American Geophys. Union (AGU) and Geol. Soc. America (GSA) Geodyn. Ser. 11, p. 75-89.
(Circum-Pacific trench depths ~5-11km and increase with age. Subduction rates also greater with greater trench depth, suggesting negative buoyancy is significant driving force for plate motion. Backarc region trenches deeper than Pacific basin perimeter trenches, partly due to increased depth of backarc basins, which results from compensation of non-equilibrated portions of subducted lithosphere in asthenosphere under backarc regions. Indonesian trenches unusually shallow for age of subducting oceanic crust)

Hilde, T.W.C., S. Uyeda & L. Kroenke (1976)- Tectonic history of the Western Pacific. In: C.L. Drake (ed.) Geodynamics: progress and prospects, American Geophys. Union (AGU), Spec. Publ. 5, p. 1-15.
(Plate reconstructions of W Pacific region since Jurassic. Showing Borneo as part of Indochina margin in Jurassic-Cretaceous, until Late Cretacous rifting-opening of South China Sea)

Hilde, T.W.C., S. Uyeda & L. Kroenke (1977)- Evolution of the Western Pacific and its margins. Tectonophysics 38, p. 145-165.
(Evolution of W Pacific since M Mesozoic. Subduction along Asian plate margin throughout this time has resulted in general N-ward movement of plates surrounding Asia. An E-W spreading ridge system extended from Pacific into Tethys Sea and migrated N as oceanic plates subducted along Asia. As plates S of these ridge segments started to subduct at Asian margin, new spreading ridges formed far to S, rifting India from Antarctica at ~100 Ma and Australia from Antarctica at ~52 Ma. Subduction of Pacific ridge system in N and SW Pacific resulted in change of direction in Pacific plate motion from NNW to WNW at ~45 Ma. Etc.)

Hodell, D.A. & A.Vayavananda (1993)- Middle Miocene paleoceanography of the western Equatorial Pacific (DSDP Site 289) and the evolution of *Globorotalia (Fohsella)*. Marine Micropaleontology 22, 4, p. 279-310.
(Evolution of planktonic foram lineage Globorotalia (Fohsella) Miocene between 23.7-11.8 Ma, which forms basis for subdivision of early M Miocene zones N10-N12. Most rapid changes in morphology of Fohsella between 13- 12.7 Ma, coinciding with increase in d18O ratios. O values suggest change in depth stratification associated with expansion of thermocline in W Equatorial Pacific. After adapting to deeper water habitat at 13.0 Ma, Fohsella lineage became extinct at 11.8 Ma during period of shoaling of thermocline)

Hoernle, K., F. Hauff, P. van den Bogaard, R. Werner, N. Mortimer, J. Geldmacher, D. Garbe-Schonberg & B. Davy (2010)- Age and geochemistry of volcanic rocks from the Hikurangi and Manihiki oceanic plateaus. Geochimica Cosmochimica Acta 74, 24, p. 7196-7219.
(Ar/Ar age and geochemical data show Hikurangi Plateau basement lavas (118-96 Ma) similar to Ontong Java Plateau (~120 and 90 Ma; primarily Kwaimbaita-type composition). Manihiki Plateau Site 317 lavas (117 Ma) similar to Singgalo lavas on Ontong Java Plateau. Alkalic seamount lavas (99-87 Ma and 67 Ma) on Hikurangi Plateau and adjacent Kiore Seamount derived from different mantle source (see also Timm et al. 2011)

Hoffmeister, J.E. (1932)- Geology of Eua, Tonga. Bernice P. Bishop Museum Bull. 96, p. 1-93.
(online at: http://hbs.bishopmuseum.org/pubs-online/pdf/bull96.pdf)
(Report of 1926 and 1928 surveys of Eua at S end of Tongan archipelago. Nucleus of volcanics, with coating of limestone, of Late Eocene and Late Tertiary ages. Six terraces, up to 760' altitude. Includes chapter by G.L. Whipple (p. 79-86) on Late Eocene larger forams from Eua, incl. Nummulites, Asterocyclina, Pellatispira rutteni and new species Pellatispira fulgeria (=Biplanispira) (see also Cole 1970))

Honza, E. (1991)- The Tertiary Arc Chain in the Western Pacific. Tectonophysics 187, p. 285-303.
(Reconstruction of Tertiary Arc Chain of W and SW Pacific rim since initiation in Eocene-Oligocene. From W Pacific to E margin of Australia: Bonin, Mariana, Yap, Palau, Halmahera, N New Guinea- W Melanesia, Solomon, Vanuatu, and Tonga-Kermadec Arcs. Associated with formation and consumption of backarc basins. Four stages in evolution: (1) arc chain from M Eocene- earliest Oligocene; (2) Oligocene formation of backarc basins; (3) occurrence of double arcs on inner side of arc chain in E-M Miocene and (4) reversal of arc polarities due to collisions since late Miocene. Backarc basins open 15 My after initiation of volcanic arc.

Several to 10 Myrs after opening, backarc spreading terminates. In case of arc collision, reversal of arc polarity occurs if there is oceanic crust on backarc side)

Horibe, Y., K.R. Kim & H. Craig (1987)- Hydrothermal methane plumes in the Mariana back-arc spreading center. Nature 324, p. 131-133.
(Large plumes of methane-enriched water in Mariana Trough back-arc basin and also in summit crater of Loihi Seamount (present site of Hawaiian hotspot). Mariana vents enriched in methane without corresponding enrichment in 3He)

Hottinger, L. (1975)- Late Oligocene larger foraminifera from Koko Guyot, Site 309. Initial Reports Deep Sea Drilling Project (DSDP) 32, p. 825-826.
(online at: www.deepseadrilling.org/32/volume/dsdp32_32.pdf)
(Occ. Late Oligocene Spiroclypeus tidoenganensis and Heterostegina assilinoides on top of Koko Guyot seamount between Japan and Hawai)

Howell, D.G. (1980)- Mesozoic accretion of exotic terranes along the New Zealand segment of Gondwanaland. Geology 8, 10, p. 487-491.
(Permian- M Cretaceous strata in New Zealand grouped in 4 tectonostratigraphic terranes. Present distribution of terranes inferred to represent accretionary processes along Gondwanaland margin. Accretion intermittent until M Cretaceous time, followed by rifting that broke New Zealand away from Australia)

Howell, D.G., E.R. Schermer, D.L. Jones, Z. Ben-Avraham & E. Scheibner (1985)- Preliminary tectonostratigraphic terrane map of the Circum-Pacific. Region. Circum-Pacific Council for Energy and Mineral Resources, American Assoc. Petrol. Geol. (AAPG), Tulsa.
(Map at 1:17M scale and explanatory notes by US Geological Survey personnel)

Huang, C.Y., Y. Yen, P.M. Liew, D.J. He, W.R. Chi & M.S. Wu (2013)- Significance of indigenous Eocene larger foraminifera *Discocyclina dispansa* in Western Foothills, Central Taiwan: a Paleogene marine rift basin in Chinese continental margin. J. Asian Earth Sci. 62, p. 425-437.
(Early M Eocene larger foram Discocyclina dispansa in inner shelf sediments of C Taiwan. Calcareous nannoplankton of zones NP14-15 in overlying clastics. Part of M Eocene syn-rift sequence, unconformably covered by latest Oligocene-Miocene post-rift sequence)

Hughes, G.W. (1989)- The micropaleontology of sedimentary units from the Solomon Islands. In: J.G. Vedder & T.R. Bruns (ed.) Geology and offshore resources of Pacific Island arcs; Solomon Islands and Bougainville, Papua New Guinea regions, Circum-Pacific Council Energy and Mineral Resources, Earth Sci. Ser. 12, p. 227-237.
(Brief review of Solomon Island Island micropaeontological work. Mainly Plio-Pleistocene with planktonic foraminifera, also Late Oligocene and E Miocene limestone with Lepidocyclina)

Hughes, G.W. (2004)- Accretion of the Ontong Java plateau to the Solomon arc: a historical perspective. Tectonophysics 389, p. 127-136.

Hutchison C.S. (1987)- Displaced terranes of the Southwest Pacific. In: Z. Ben Avraham (ed.) The evolution of the Pacific Ocean margins, Oxford Monographs Geol. Geophysics 8, p. 161-175.

Iaffaldano, G. (2012)- The strength of large-scale plate boundaries: constraints from the dynamics of the Philippine Sea plate since ~5Ma. Earth Planetary Sci. Letters 357-358, p. 21-30.
(On convergence of fast-moving Philippine Sea plate towards Eurasia since subduction initiation at ~5 Ma. Because Philippine slab reaches depths shallower than 410km transition zone in upper mantle, its weight unlikely to provide sufficient driving force to shear trailing plate over viscous mantle at observed rates)

Iba, Y. & S. Sano (2007)- Mid-Cretaceous step-wise demise of the carbonate platform biota in the Northwest Pacific and establishment of the North Pacific biotic province. Palaeogeogr. Palaeoclim. Palaeoecology 245, p. 262-282.
(Cretaceous carbonate platform biota flourished from Berriasian- E Albian interval in Japan, Sakhalin, indicating Tethyan biotic realm. Step-wise disappearance in latest Aptian- M Albian of rudists, dasycladacean and red algae, hermatypic corals, stromatoporoids, nerineacean gastropods, orbitolinid foraminifera, etc.)

Ishikawa, A., T. Kuritani, A. Makishima & E. Nakamura (2007)- Ancient recycled crust beneath the Ontong Java Plateau: isotopic evidence from the garnet clinopyroxenite xenoliths, Malaita, Solomon Islands. Earth Planetary Sci. Letters 259, p. 134-148.
(Sr, Nd, Hf and Pb isotope investigation of garnet clinopyroxenite xenoliths from Malaita, Solomon Islands, indicate pollution of S Pacific mantle by the subduction or delamination of Neoproterozoic granulitic lower crust (0.5-1 Ga).Crustal recycling possibly around suture of Rodinia supercontinent, part of which resurfaced during mantle upwelling responsible for creating Cretaceous Ontong Java Plateau)

Ishikawa, A., E. Nakamura & J.J. Mahoney (2005)- Jurassic oceanic lithosphere beneath the southern Ontong Java Plateau: evidence from xenoliths in alnoite, Malaita, Solomon Islands. Geology 33, 5, p. 393-396.
(Xenoliths of spinel lherzolite and gabbro from alnoite intrusion in S Ontong Java Plateau on Malaita yield Sm-Nd age of ~160 Ma and initial εNd value of ∼+8. Plateau basement is ~120 Ma with initial εNd of +3.7- +6.5. Xenoliths appear to represent normal Pacific oceanic lithosphere, formed ∼40 My before plateau, indicating S part of plateau was emplaced off axis on mature seafloor. Closest 160 Ma seafloor to Malaita is >1800 km to N)

Ishikawa, A., D.G. Pearson & C.W. Dale (2011)- Ancient Os isotope signatures from the Ontong Java Plateau lithosphere: tracing lithospheric accretion history. Earth Planetary Sci. Letters 301, p. 159-170.
(Re-Os isotopes in peridotite xenoliths from Malaita, Solomon Islands suggest xenoliths represent virtually entire thickness of S part of subplateau lithospheric mantle (<120 km). Shallowest plateau lithosphere (< 85 km) dominated by fertile lherzolites from ~160 Ma Pacific lithosphere. Basal section of subplateau lithospheric mantle (~95-120 km) enriched in refractory harzburgites with Proterozoic model ages of 0.9-1.7 Ga)

Ishizuka, O., R.N. Taylor, M. Yuasa & Y. Ohara (2011)- Making and breaking an island arc: a new perspective from the Oligocene Kyushu-Palau arc, Philippine Sea. Geochem. Geophys. Geosystems 12, 5, p. 1-40.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2010GC003440)
(Kyushu-Palau Ridge is 2600km long remnant island arc, separated from active Izu-Bonin-Mariana arc by Shikoku and Parece Vela spreading-rift basins at ~25 Ma. KPR active between 25-48 Ma, but majority of exposed volcanism between 25-28 Ma)

Itaya, T., R. Brothers & P. Black (1985)- Sulfides, oxides and sphene in high-pressure schists from New Caledonia. Contrib. Mineralogy Petrology 91, 2, p. 151-162.
(In New Caledonia high-pressure schists pyrite, pyrrhotite, chalcopyrite, rutile and sphene are common)

Ito, G. & P.D. Clift (1998)- Subsidence and growth of Pacific Cretaceous plateaus. Earth Planetary Sci. Letters 161, p. 85-100.
(On creation and subsidence of mid-Cretacoeus Ontong Java, Manihiki, and Shatsky oceanic plateaus)

Johnson, H. (1991)- Petroleum geology of Fiji. Marine Geology 98, p. 313-352.
(Most petroleum exploration in Fiji in shallow-water basins around Viti Levu, Bligh Water and Bau Waters Basins. Five deep wells drilled offshore and on Viti Levu in 1980-1982, all dry, with minor shows of gas and oil fluorescence. Wells with >2500m of mainly Miocene and younger sediments, but some Oligocene or older volcanogenic rocks also intersected. mainly volcaniclastics. E-M Miocene shallow-water limestone targets not encountered. No source rocks identified in wells or outcrops, but anomalous amounts of pentane in seabed sediments off N Viti Levu suggest that thermogenic hydrocarbons generated)

Lagabrielle, Y. & A. Chauvet (2008)- The role of extensional tectonics in shaping Cenozoic New-Caledonia. Bull. Soc. Geologique France 179, 3, p. 315-329.
(New-Caledonia island with ultramafic nappe thrusted over continental and arc-derived basement as result of the closure of back-arc basin in Late Eocene. W and E edges of island are delineated by N140 trending normal faults. Onland main boundary of ultramafic nappe, also trend N140, all reflecting faults that accommodated extension and tectonic thinning peridotite nappe and its basement)

Lagabrielle, Y., A. Chauvet, M. Ulrich & S. Guillot (2013)- Passive obduction and gravity-driven emplacement of large ophiolitic sheets: The New Caledonia ophiolite (SW Pacific) as a case study? Bull. Soc. Geologique France 184, p. 545-556.
(300km long New Caledonia ophiolite: (1) lacks sheeted dykes and pillow basalts; (2) peridotite nappe thrusted over basaltic formations of Poya terrane formerly thought to be from different oceanic environment; (3) flat basal contact of ultramafic sheet and peridotite nappe not thickened during obduction but experienced extension. This suggests peridotites not emplaced by tectonic force applied to rear. Poya terrane basalts may originate from same oceanic basin as peridotites and may represent original cover of Peridotite nappe. Continuous passive uplift of subducted units beneath oceanic lithosphere drove uplift of ophiolite and led to erosion and to initiation of sliding of basaltic layer. In Priabonian (end Eocene), products of erosion of basaltic layer deposited together with sediments from Norfolk passive oceanic margin, now in accretionary wedge. Obduction process ended with gravity sliding of oceanic mantle sheet, contemporaneous with exhumation of HP-LT units of Pouebo and Diahot. Gravity sliding by occurrence of continuous serpentine sole)

Lagabrielle, Y., P. Maurizot, Y. Lafoy, G. Cabioch, B. Pelletier, M. Regnier, I. Wabete & S. Calman (2005)- Post-Eocene extensional tectonics in Southern New Caledonia (SW Pacific): insights from onshore fault analysis and offshore seismic data. Tectonophysics 403, p. 1-28.
(Extensional events affected New Caledonia after Late Eocene obduction of peridotite nappe, in sedimentary pile and ophiolites. Extensional faulting in S New Caledonia started probably in Oligocene and still active after M Miocene)

Laird, M.G. & J.D. Bradshaw (2004)- The break-up of a long-term relationship: the Cretaceous separation of New Zealand from Gondwana. Gondwana Research 7, 1, p. 273ï 286.
(New Zealand part of Late Paleozoic- Mesozoic Gondwana convergent margin, with terrane accretion, uplift and erosion. Rapid change to extensional tectonics in mid-Cretaceous (Albian), marked by angular unconformity separating deformed 'basement' from less-deformed 'cover' strata. Coniacian uplift and erosion

just prior to sea-floor spreading, resulted in 'break-up' unconformity. In Late Santonian (~85 Ma) diachronous, widespread low-relief erosion surface, overlain by fine-grained deposits coincided with onset of sea-floor spreading, passive margin subsidence, and final separation of New Zealand from Gondwana)

Lallemand, S. (2016)- Philippine Sea Plate inception, evolution, and consumption with special emphasis on the early stages of Izu-Bonin-Mariana subduction. Progress in Earth and Planetary Science 3, 15, p. 1-26.
(online at: http://progearthplanetsci.springeropen.com/articles/10.1186/s40645-016-0085-6)
(Izanagi slab detachment beneath E Asia margin at ~60-55 Ma likely triggered splitting of proto-PSP under plume influence at ∼54-48 Ma, leading to formation of long-lived W Philippine Basin and short-lived oceanic basins. Shortening across paleo-transform boundary evolved into thrusting within Pacific Plate at ∼52-50 Ma, allowing it to subduct beneath newly formed PSP, which was composed thick Mesozoic terranes and thin oceanic lithosphere. First magmas from subducting Pacific crust beneath young oceanic crust near upper plate spreading centers at ∼49 Ma were boninites. As Pacific crust reached greater depths at ∼45 Ma composition of lavas evolved into high-Mg andesites, then arc tholeiites and andesites. Serpentinite mud volcanoes in Mariana fore-arc may have formed above remnants of paleo-transform boundary between proto-PSP and Pacific Plate)

Langmuir, C.H., A. Bezos, S. Escrig & S.W.Parman (2006)- Chemical systematics and hydrous melting of the mantle in back-arc basins. In: Back-Arc Spreading Systems: Geological, Biological, Chemical, and Physical Interactions, American Geophys. Union (AGU), Geophys. Monograph 166, p. 87-146.
(Chemical systematics of Scotia, Mariana, Lau, and Manus back-arc basins. In back-arcs basins, on the arc side of spreading center, where water is added, shallow hydrous melting is important. On back side, dry melting under relatively anhydrous conditions occurs, similar to open ocean ridges. Mixing between melts from dry and wet sides leads to characteristic spectra of parental BABB compositions)

Larson, R.L. & C.G. Chase (1972)- Late Mesozoic evolution of the western Pacific Ocean. Geol. Soc. America (GSA), Bull. 83, p. 3627-3644.
(Three sets of Late Mesozoic magnetic anomalies in Pacific Ocean suggests five spreading centers, joined at two triple points. Oldest part of Pacific Ocean just E of Mariana Trench and E Jurassic in age)

Larson, R.L. (1991)- Latest pulse of Earth: evidence for a mid-Cretaceous superplume. Geology 19, p. 547-550.
(Between 120-80 Ma 50-75% increase in Earth's oceanic crust formation, with spreading rate increases (especially in Pacific Ocean). Pulse decreased from 100-80 Ma, dropped significantly at 80 Ma, and continued decrease from 80-30 Ma. Mid-Cretaceous pulse interpreted as response to superplume that originated at ~125 Ma and erupted beneath mid-Cretaceous Pacific basin)

Larson, R.L. (1997)- Superplumes and ridge interactions between Ontong Java and Manihiki Plateaus and the Nova-Canton Trough. Geology 25, 9, p. 779-782.
(Initial pulse of volcanism on Ontong Java and Manihiki Plateaus before 123-124 Ma and largely ceased by ~122 Ma, while intervening Pacific-Phoenix spreading ridge probably disrupted between 120-115 Ma by formation of Nova-Canton Trough rift system)

Lee, C.S. (1983)- Origin and evolution of the West Philippine Basin (tectonics, magnetics). Ph.D. Thesis Texas A&M University, College Station, p. 1-120.
(West Philippine Basin formed by seafloor spreading from Central Basin Spreading Center in two different spreading phases: NE-SW symmetric spreading at 60-45 Ma and N-S oriented spreading from 45-35 Ma)

Leitch, E.C. (1984)- Marginal basins of the SW Pacific and the preservation and recognition of their ancient analogues: a review. In: B.P. Kokelaar & M.F. Howells (eds.) Marginal basin geology, Geol. Soc., London, Spec. Publ. 16, p. 97-108.
(SW Pacific marginal basins floored by oceanic lithosphere formed by (1) sea-floor spreading behind active magmatic arcs (back-arc basins) and (2) rifting of continental crust without obvious connection to arc (small

ocean basins). Basins opened rapidly. Thick sediment piles adjacent to emergent continental margins or active arcs, with thin pelagic sediments, ash, and fine grained turbidites on basin floors. Ancient back-arc basins identifiable on basis of temporal relations to magmatic arcs and volcanic influence in sedimentary sequence, but distinguishing between small and major ocean basins often difficult. Most basins close by subduction)

Matsuoka, A. (1991)- Middle Jurassic radiolarians from the Western Pacific. In: Proc. Shallow Tethys 3, Sendai 1990, Saito Ho-on Kai Spec. Publ. 3, p. 697-707.
(First record of Jurassic sediments in W Pacific at ODP Site 801, C Pigafetta basin. Oldest faunas of Tricolocapsa conexa Zone, Bathonian-Callovian age. Faunas compare well with Tethyan and Japanese faunas)

Matsuoka, A. (1992)- Jurassic and Early Cretaceous radiolarians from Leg 129, Sites 800 and 801, Western Pacific Ocean. In: R.L. Larson et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 129, p. 203-220.
(online at: www-odp.tamu.edu/publications/129_SR/VOLUME/CHAPTERS/sr129_10.pdf)
(Seven M Jurassic - Lower Cretaceous radiolarian zones from Sites 800 and 801, ODP Leg 129 in W Pacific: Dibolachras tytthopora (Hauterivian), Cecrops septemporatus, (U. Valanginian), Pseudodictyomitra carpatica (Berriasian- E Valanginian), P. primitiva, (Kimmeridgean-Tithonian), Cinguloturris carpatica Oxfordian), Stylocapsa spiralis (~U Callovian) and Tricolocapsa conexa (Bathonian- E Callovian). (Most Tan Sin Hok (1927) species of Archaeodictyomitra (A. brouweri= Eucyrtidium brouweri, A. excellens= Lithomitra excellence, A. pseudoscalaris= Stichomitra pseudoscalaris), Eucyrtis (E. hanni= Lithocampe hanni) and Pseudodictyomitra (P. lilyae= Dictyomitra lilyae) range up into D. tytthopora/Hauterivian and down through P. carpatica/ Berriasian; P. lilyae only in U Valanginian-Hauterivian; JTvG)

Matsuoka, A. (1995)- Late Jurassic tropical Radiolaria: *Vallupus* and its related forms. Palaeogeogr. Palaeoclim. Palaeoecology 119, p. 359-369.
(Vallupus Territory is tropical radiolarian realm of Panthalassa and Tethys in Latest Jurassic- early Cretaceous. Vallupinae radiolarian subfamily restricted to Late Jurassic in low- and middle-latitudes of W Pacific, E Asia, Mediterranean regions, etc.. Probably accumulated within 25° of Jurassic paleoequator)

Matthews, K.J., M. Seton, N. Flament & R.D. Muller (2012)- Late Cretaceous to present-day opening of the Southwest Pacific constrained by numerical models and seismic tomography. In: Eastern Australasian Basins Symposium IV, Brisbane 2012, p. 1-15.

Matthews, K.J., S.E. Williams, J.M. Whittaker, D. Muller, M. Seton & G.L. Clarke (2015)- Geologic and kinematic constraints on Late Cretaceous to mid Eocene plate boundaries in the Southwest Pacific. Earth-Science Reviews 140, p. 72-107.
(New plate tectonic reconstruction for Late Cretaceous- M Eocene (~85-45 Ma) of SW Pacific. Subduction has been active E of Lord Howe Rise and N of New Zealand since at least 85 Ma. From >85 Ma, and possibly 100 Ma, until 55 Ma S Loyalty Basin opened to E of New Caledonia associated with W-directed slab roll-back. At ~55 Ma NE dipping subduction initiated in S Loyalty Basin and consumed basin between ~55-45 Ma)

Maurizot, P. (2011)- First sedimentary record of the pre-obduction convergence in New Caledonia: formation of an Early Eocene accretionary complex in the north of Grande Terre and emplacement of the óMontagnes Blanchesô nappe. Bull. Soc. Geologique France 182, 6p. 479-491.
(New Caledonia lies at N tip of Norfolk ridge continental fragment, which separated from E Gondwana margin in Late Cretaceous. Late Cretaceous- Paleogene sedimentary succession of N New Caledonia mainly pelagics with minimal terrigenous input, deformed in M Eocene SW-verging accretionary complex. Change to active-margin regime flysch-type deposits as refected in change from with pelagic micrites to pink marls at end of E Eocene (Late Ypresian, zone E7; ~50 Ma). System prograded S-wards until Late Eocene collisional stage, when continental Norfolk Ridge entered convergence zone and blocked it)

Maurizot, P. & M. Vende-Leclerc (2009)- New Caledonia Geological map, 1:500,000. Direction de l'Industrie et des Mines, New Caledonia.

(Metamorphosed rocks and gabbros of Parece Vela Basin origin predominate on Yap Islands and for upper part of forearc remnant arc volcanics of ~25 Ma age exist. Also arc volcanics of 11-7 Ma age in forearc. Depleted arc-type mantle peridotites exposed along faults in lower part of forearc landward slope. Yap arc- N Yap Escarpment system may form as incipient arc at propagating tip of Parece Vela Rift at ~25 Ma)

Ohara, Y., S. Kasuga & T. Ishii (1996)- Peridotites from the Parece Vela Rift in the Philippine Sea: upper mantle material exposed in an extinct backarc basin. Proc. Japan. Academy, Ser. B, 72, p. 118-123.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/72/6/72_6_118/_pdf)
(First? report of serpentinized peridotites and gabbros dredged from axial zone of Parece Vela Basin in 1995. Central zone of the Parece Vela Basin characterized by N-S trending chain of depressions forming right-step en-echelon alignment. Peridotites residues of partial melting of primitive mantle peridotites)

Ohara, Y., K. Okino & J.E. Snow (2011)- Tectonics of unusual crustal accretion in the Parece Vela Basin. In: Y. Ogawa et al. (eds.) Accretionary prisms and convergent margin tectonics in the Northwest Pacific Basin, Modern Approaches in Solid Earth Sciences 8, Springer, p. 149-168.

Ohara, Y., T. Yoshida, Y. Kato & S. Kasuga (2001)- Giant megamullion in the Parece Vela backarc basin. Marine Geophysical Res. 22, 1, p. 47-61.
(High-resolution bathymetric studies of extinct intermediate-spreading Parece Vela Basin identified large mullion structure, here termed a giant megamullion, order of magnitude larger than similar structures in slow-spreading Mid-Atlantic Ridge. Giant megamullion slightly elevated mantle Bouguer anomaly, and yields serpentinized peridotites and gabbros, suggesting exposed oceanic crust and upper mantle. Also off-axis rugged 'chaotic terrain' of isolated and elevated blocks capped by corrugated lineations)

Ohde, S. & H. Elderfield (1992)- Strontium isotope stratigraphy of Kita-daito-jima Atoll, North Philippine Sea: implications for Neogene sea-level change and tectonic history. Earth Planetary Sci. Letters 113, 4, p. 473-486.
(Chronology of 432 m Late Oligocene- Recent core from Kita-daito-jima atoll on Philippine Sea plate. Atoll growth continuous between 18.8-24.3 Ma. Hiatuses and ages of dolomitization indicate sea-level falls of ~80m at ~17-16 Ma, ~30m at ~16-15 Ma, ~125m at ~11 Ma, and ~90m at ~5 Ma and at ~2 Ma)

Okino, K. & K. Fujioka (2003)- The Central Basin spreading center in the Philippine Sea: structure of an extinct spreading center and implications for marginal basin formation. J. Geophysical Research 108, B1, 2040, p. 1-18.

(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2001JB001095)
(Central Basin Spreading Center is extinct spreading axis of West Philippine Basin (WPB), with along-axis variations of spreading style: in E slow-spreading (deep rift valleys and nodal basins, rough abyssal hills on ridge flanks, and mantle Bouguer anomaly lows beneath segment centers); in W fast-spreading (overlapping spreading centers, volcanic axial ridges, and smooth abyssal hill fabric, with higher melt supply)

Okino, K., Y. Ohara, T. Fujiwara, S.M. Lee, K. Koizumi, Y. Nakamura & S. Wu (2009)- Tectonics of the southern tip of the Parece Vela Basin, Philippine Sea Plate. Tectonophysics 466, p. 213-228.
(Parece Vela Basin formed as backarc basin behind proto Mariana arc from late Oligocene- M Miocene)

Okino, K., Y. Ohara, S. Kasuga & Y. Kato (1999)- The Philippine Sea: new survey results reveal the structure and the history of the marginal basins. Geophysical Research Letters 26, 15, p. 2287-2290.
(New bathymetric and magnetic maps of Philippine Sea seafloor suggest more complicated history than proposed before)

Onoue, T., J. Chablais & R. Martini (2009)- Upper Triassic reefal limestone from the Sambosan accretionary complex in Japan and its geological implication. J. Geol. Soc. Japan, 115, 6, p. 292-295.
(online at: https://archive-ouverte.unige.ch/unige:3944)
(U Triassic massive reefal limestone in latest Jurassic- earliest Cretaceous Sambosan Sambosan accretionary complex in Japan accumulated on mid-oceanic seamount in Panthalassa Ocean. Smaller foraminifera include Alpinophagmium perforatum, Agathammina austroalpina, Aulatortus sinuosus, etc. Corals dominated by Retiophyllia)

Onoue, T. & H. Sano (2007)- Triassic mid-oceanic sedimentation in Panthalassa Ocean: Sambosan accretionary complex, Japan. Island Arc 16, 1, p. 173-190.
(Sambosan accretionary complex of SW Japan formed in latest Jurassic earliest Cretaceous time. Four stratigraphic successions: (1) M-U Triassic (Carnian) basalts (oceanic island basalt); (2) U Triassic shallow-water limestone and (3) limestone breccia (seamount-top and upper seamount-flank); and (4) middle M Triassic- lower U Jurassic siliceous rocks and pelagic carbonates (ocean floor))

Onoue, T. & G.D. Stanley (2008)- Sedimentary facies from Upper Triassic reefal limestone in the Sambosan accretionary complex in Japan. Facies 54, p. 529-547.
(Microfacies of E- M Norian reefal limestone of Sambosan Accretionary Complex, SW Japan. Seven major facies types, recording patch reef development on mid-oceanic seamount in Panthalassa Ocean. Strong Tethyan affinities of corals (dominated by Retiophyllia, also Distichophyllia norica = 'Montlivaltia norica Frech' also known from Timor, Austria) and foraminifera (incl. Agathammina austroalpina))

Onoue, T., T. Nikaido, L.R. Zamoras & A. Matsuoka (2011)- Preservation of larval bivalve shells in a radiolarian chert in the Late Triassic (Early Norian) interval of the Malampaya Sound Group, Calamian Island, western Philippines. Marine Micropaleontology 79, 1, p. 58-65.
(Thin larval bivalve shells occur in E Norian radiolarian chert in Liminangcong Fm, part of Late Jurassic to Early Cretaceous subduction-related accretionary complex in N Palawan Block. 'Bivalve chert' accumulated in open-ocean realm of Panthalassa Ocean. Possibly halobiid bivalves with planktonic larval mode of life)

Otsuki, K. (1990)- Westward migration of the Izu-Bonin Trench, northward motion of the Philippine Sea Plate, and their relationships to the Cenozoic tectonics of Japanese island arcs. Tectonophysics 180, p. 351-367.
(Izu-Bonin Trench wandered ~400 km E froms present position during Paleogene and migrated W thereafter)

Ozawa, T. & K. Kanmera (1984)- Tectonic terranes of Late Paleozoic rocks and their accretionary history in the Circum-Pacific region viewed from fusulinacean paleobiogeography. In: Proc. Circum-Pacific Terrane Conference1983, Stanford University Publ., Geol. Sciences 28, p. 158-160. *(Abstract only?)*

Paris, J.P. & R. Lille (1977)- New Caledonia: evolution from Permian to Miocene. Mapping data and hypothesis about geotectonics. In: Int. Symp. Geodynamics in the Southwest Pacific, Noumea, New Caledonia. Editions Technip, Paris, p. 195-208.

Park, C.H., K. Tamaki & K. Kobayashi (1990)- Age-depth correlation of the Philippine Sea back-arc basins and other marginal basins in the world. Tectonophysics 181, p. 351-371.
(Basement depths of Philippine Sea range from 3200-6000m, with ages from 0-60 Ma. Depth of Philippine Sea ~800m deeper than that of major ocean floors of same age. Young back-arc basins (<10 Ma) both shallower and deeper than major oceans, depending on dip angles of corresponding subducting slabs: shallower back-arc basins above gently dipping slabs, deeper basins over steeply dipping slabs. Back-arc basins older than 15 Ma, always deeper than major oceans and follow age-depth curve of Philippine Sea back-arc basins)

Parrot, J.F. & F. Dugas (1980)- The disrupted ophiolitic belt of the southwest Pacific: evidence of an Eocene subduction zone. Tectonophysics 66, 4, p. 349-372.
(PNG, Solomon, New Hebrides and New Caledonia ophiolitic massifs formed in intra-oceanic subduction zone in Eocene in SW Pacific, as suggested by age of ophiolite-related metamorphic soles. When subduction involves continental crust, amphibolites-blueschists form (PNG, New Caledonia). When subduction in intra-oceanic environment (Solomon islands, New Hebrides) only amphibolites and greenschists formed. Ophiolitic belt created by Eocene subduction disrupted by later transcurrent faults, more recent spreading phenomena and two other subductions (Oligocene-Miocene and Recent))

Pearce, J.A., P.D. Kempton & J.B. Gill (2007)- Hf-Nd evidence for the origin and distribution of mantle domains in the SW Pacific. Earth Planetary Sci. Letters 260, p. 98-114.
(Pb and Hf-Nd isotopes can be used to distinguish lavas of SW Pacific as derived from two mantle domains: (1) Pacific-like character and (2) Indian-like character (present today under Lau Basin, Fiji and N Fiji Basin))

Pearson, P.N. (1995)- Planktonic foraminifer biostratigraphy and the development of pelagic caps on guyots in the Marshall Islands Group. In: J. Haggerty et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 144, p. 21-59.
(online at: www-odp.tamu.edu/publications/144_sr/VOLUME/CHAPTERS/sr144_02.pdf)
(Five Marshall Islands group seamounts drilled on ODP Leg 144, three with thick caps of unconsolidated latest Oligocene- Holocene pelagic sediment (Limalok/ Site 871, Lo-En/ Site 872, Wodejebato/ Site 873). Significant hiatus between drowning of M Eocene carbonate platform/ Cretaceous volcanics and onset of pelagic sediment accumulation)

Pelletier, B. (2007)- Geology of the New Caledonia region and its implications for the study of the New Caledonian biodiversity. In: C. Payri & B. Richer de Forges (eds.) Compendium of marine species in New Caledonia, Forum BIOdiversite des Ecosystemes coralliens, Documents Scient. Techn. IRD, 117, p. 19-32.
(online at: http://nouvelle-caledonie.ird.fr/science-en-partage/editions/....)
(Concise review of New Caledonia geology. Loyalty Ridge considered to be Eocene island Arc in most reconstructions; possibly liks to Eocene D'Entrecasteaux zone subduction zone)

Pelletier, B., M. Meschede, T. Chabemaud, P. Roperch & X. Zhao (1994)- Tectonics of the Central New Hebrides Arc, North Aoba Basin. In: H.G. Greene et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 134, p. 431-444.
(online at: www-odp.tamu.edu/publications/134_sr/volume/chapters/sr134_24.pdf)
(Late Miocene- Pleistocene tectonic history recorded in N Aoba Basin and relation to onshore geology of New Hebrides Island Arc-d'Entrecasteaux Zone collision)

Petterson, M.G. (2004)- The geology of north and central Malaita, Solomon Islands; the thickest and most accessible part of the world's largest (Ontong Java) ocean plateau. In: J.G. Fitton et al. (eds.) Origin and evolution of the Ontong Java Plateau, Geol. Soc., London, Spec. Publ. 229, p. 63-81.
(Geology of Malaita reflects position as obducted part of Ontong Java Plateau. Cretaceous deep water basalt basement sequence up to 3-4 km thick, overlain by 1-2 km-thick Cretaceous-Pliocene pelagic sediments. Pelagic section starts with Aptian-Albian bedded radiolarian chert and is punctuated by alkaline basalt volcanism in Eocene (44 Ma) and intrusion of alnoites in Oligocene. All deformed by intense M Pliocene event)

Petterson, M.G., T. Babbs, C.R. Neal, J.J. Mahoney et al. (1999)- Geological-tectonic framework of Solomon Islands, SW Pacific: crustal accretion and growth within an intra-oceanic setting. Tectonophysics 301, p. 35-60.
(Solomon Islands complex collage of crustal units or terrains (here called 'Solomon block'), formed and accreted within an intra-oceanic environment since Cretaceous)

Petterson, M.G., C.R. Neal, J.J. Mahoney, L.W.Kroenke, A.D. Saunders, T.L. Babbs et al. (1997)- Structure and deformation of north and central Malaita, Solomon Islands: tectonic implications for the Ontong Java Plateau-Solomon arc collision, and for the fate of oceanic plateaus. Tectonophysics 283, p. 1-33.
(Island of Malaita represents obducted S margin of Ontong Java Plateau. Basement of Malaita formed during first plateau-building magmatic event at ~122 Ma (~Aptian), then drifted N, amassing a 1-2 km of Cretaceous-Pliocene pelagic sediment (Aptian radiolarian chert and U Aptian-Eocene planktonic foram limestones), punctuated by alkaline basalt volcanism in Eocene at ~44 Ma and ultramafic (alnoite) intrusive activity in Oligocene at ~34 Ma. Short compressive to transpressive deformation event in M Pliocene)

Phinney, E., P. Mann, M.F. Coffin & T.H. Shipley (1999)- Sequence stratigraphy, structure, and tectonic history of the southwestern Ontong Java Plateau adjacent to the North Solomon Trench and Solomon Island Arc. J. Geophysical Research 104, B9, p. 20449-20446.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/1999JB900169/pdf)
(Ontong Java Plateau is largest and thickest oceanic plateau on Earth and actively converging on Solomon island arc. Seismic data from SW Ontong Java Plateau/ N Solomon Trench show 3 megasequences:OJ1 E Cretaceous upper igneous crust of OJ Plateau and correlates with basalt dated at 122-125 Ma on Malaita island; OJ2 late Cretaceousmarine mudstone (122 -92 Ma); OJ3 late Cretaceous- Quaternary pelagic cover. At 92 Ma second mantle plume caused widespread volcanism on plateau. At ~15 Ma S Ontong Java Plateau

deformed by normal faults during approach toN Solomon Trench. From 4 to 0 Ma, Malaita Accretionary Prism formed during collision)

Phinney, E., P. Mann, M.F. Coffin & T.H. Shipley (1999)- Sequence stratigraphy, structural style, and age of deformation of the Malaita accretionary prism (Solomon arc-Ontong Java Plateau convergent zone). Tectonophysics 389, p. 221-246.
(Malaita accretionary prism formed during late Neogene (5-0 Ma) convergence between ~33km thick crust of Ontong Java oceanic plateau and 15km thick Solomon island arc)

Pickard, A.L., C.J. Adams & M.E. Barley (2000)- Australian provenance for Upper Permian to Cretaceous rocks forming accretionary complexes on the New Zealand sector of the Gondwanaland margin. Australian J. Earth Sci. 47, 6, p. 987-1007.
(Detrital zircon ages for Permian-Cretaceous turbiditic quartzo-feldspathic sandstones from Torlesse and Waipapa terranes of New Zealand. Major Permian-Triassic (especially ~240-250 Ma) and minor E Paleozoic-Mesoproterozoic age peaks indicate sediment from New England Orogen, NE Australia. Late Permian- M Triassic Torlesse/ Waipapa turbidite fans linked to uplift of orogen during 265-230 Ma (Late Permian- M Triassic) Hunter-Bowen event. Post-Triassic depocentres received sediment from relict orogen and from Jurassic and Cretaceous volcanic provinces now offshore from S Queensland and N NSW. Meso- and Neoproterozoic age components cannot be matched with source terranes in Australian-Antarctic Precambrian craton, and possibly originated in Proterozoic cores of Cathaysia and Yangtze Blocks of SE China)

Pillet R., D. Rouland, G. Roult & D.A. Wiens (1999)- Crust and upper mantle heterogeneities in the Southwest Pacific from surface wave phase velocity analysis. Physics Earth Planetary Interiors 110, p. 211-234.
(New tomographic imaging shows large velocities contrasts along Solomon, New Hebrides and Fiji-Tonga trenches. Lowest anomalies under N and S Fiji basins and Lau Basin, highest values beneath Pacific plate and E part of Indian plate downgoing under N Fiji Basin. Continental regions (E Australia, New Guinea, Fiji Islands, New Zealand) low velocities, due to thick continental crust, whereas Tasmanian, D'Entrecasteaux and N and Fiji basins suggestive of thinner oceanic crust)

Pirard, C., J. Hermann & H. St.C. OόNeill (2015)- Petrology and geochemistry of the crust-mantle boundary in a nascent arc, Massif du Sud Ophiolite, New Caledonia, SW Pacific. J. Petrology, 54, 9, p. 1759-1792.
(online at: http://petrology.oxfordjournals.org/content/early/2013/05/30/petrology.egt030.full.pdf)
(Massif du Sud ophiolite, New Caledonia, one of largest exposed ultramafic bodies on Earth. Ophiolite consists of mantle section of ultra-depleted harzburgite, overlain by large dunite zone and with gabbros at top of massif. Massif du Sud represents crust- mantle section in nascent arc)

Pirard, C. & C. Spandler (2017)- The zircon record of high-pressure metasedimentary rocks of New Caledonia: implications for regional tectonics of the south-west Pacific. Gondwana Research 46, p. 79-94.
(Zircon ages from clastic metasediments across high-P metamorphic belt of N New Caledonia. Bulk of low-metamorphic Koumac and blueschist-facies Diahot sequences erosional products of Norfolk Ridge, transported E-wards and accumulated into E New Caledonia Basin. Paleozoic and Precambrian zircons were originally sourced from Paleozoic orogenic belts of E margin of Australia, and possibly from now-submerged continental ridges. Mesozoic zircons (140-80 Ma) derived from volcanic arc activity on E margin of Gondwana)

Rawling, T.J. (1998)- Oscillating orogenesis and exhumation of high-pressure rocks in New Caledonia, SW Pacific. Ph.D. Thesis, Monash University, Melbourne, p. *(Unpublished)*

Rawling, T.J. & G.S. Lister (1999)- Oscillating modes of orogeny in the Southwest Pacific and the tectonic evolution of New Caledonia. In: U. Ring et al. (eds.) Exhumation processes: normal faulting, ductile flow and erosion, Geol. Soc., London, Spec. Publ. 154, p. 109-127.
(High-pressure schist of New Caledonia reflects two switches from large-scale crustal shortening to extensional tectonism: (1) high P metamorphism associated with ophiolite obduction from NE, followed by exhumation in late Middle- Late Eocene (~40-36 Ma); (2) mega- folding, followed by M-L Miocene?basin and range style normal faulting)

Rawling, T.J. & G.S. Lister (2002)- Large-scale structure of the eclogite-blueschist belt of New Caledonia. J. Structural Geol. 24, 8, p. 1239-1258.
(Eclogite-blueschist belt of New Caledonia. Early shear zones and high-P metamorphism associated with M Eocene (~38-45 Ma) overthrusting of ultramafic sheet. Extensional tectonism plays major role in exhumation and final exposure of high-P metamorphic rocks. Middle-stage shear zones related to large-scale continental extension, during which high-P rocks were exhumed. Extended crust subsequently folded during renewed compression, producing orogen-scale antiform throughout high-P belt. Late stage shear zones formed during younger extension. Young normal faults caused late block-faulting. Earlier interpretations of Oligocene metamorphic core complex model rejected: allochthonous slices of high-P rocks are draped over younger, lower-grade rocks in core of antiform)

Regnier, M (1988)- Lateral variation of upper mantle structure beneath New Caledonia determined from P-wave receiver function: evidence for a fossil subduction zone. Geophysical J. Int. 95, p. 561-577.
(P wave velocities from earthquakes suggest N-dipping low velocity zone below New Caledonia, possibly remnant of Eocene subduction zone below New Caledonia continental block (which separated from Gondwana in Late Cretaceous))

(W Pacific produced >75% of marginal basins on Earth. Discussion of models of formation of numerous Eocene-Recent back arc marginal basins (in Indonesia: Sulu Sea, Celebes Sea, Banda Sea, Moluccas Sea, Makassar Straits, Andaman Sea))

Tani, K., D.J. Dunkley & Y. Ohara (2011)- Termination of backarc spreading; zircon dating of a giant oceanic core complex. Geology 39, 1, p. 47-50.
(Godzilla megamullion largest known oceanic core complex, adjacent to extinct backarc spreading center of Parece Vela Basin in Philippine Sea. Zircon U-Pb dating of gabbroic and leucocratic rocks suggest fault-induced spreading over ~125 km lasted for ~4 Myrs, with continuous magmatic accretion at spreading axis. Latest magmatism constrains cessation of spreading to ~7.9 Ma or later)

Tapster, S.R. (2013)- A record of plateau- arc collision: the crustal and tectonic evolution of Guadalcanal, Solomon Islands. Ph.D. Thesis University of Leicester , p. 1-271.
(online at: https://www.bgs.ac.uk/research/bufi/downloads/S176SimonTapster2014Thesis.pdf)
(Convergence between Ontong Java Plateau (world's largest and thickest oceanic plateau) and intra-oceanic Solomon Island Arc, represents youngest arc- plateau collision, and prime example of subduction zone polarity reversal. Collision implicated as cause of several Cenozoic plate motion changes. Guadalcanal Island magmas emplaced at ~23.7 Ma contain Eocene-Archean-aged zircons first evidence of continent-derived material in Solomon Island Arc. Microcontinental plateau- arc collision likely caused transfer of zircons to Guadalcanal's crust and triggered Eocene-aged ophiolite obduction in arc. Changes to magma geochemistry at ~23 Ma coeval with resumption of typical plate motions, following slowing and deflection of Australian Plate at ~26–23 Ma and slab detachment at ~23 Ma, after Ontong Java Plateau collision. Arc magmatism rejuvenated before ~7.7 Ma. Slab detachment crucial for causing M Miocene reversal of subduction zone polarity)

Tapster, S., N.M.W. Roberts, M.G. Petterson, A.D. Saunders & J. Naden (2014)- From continent to intra-oceanic arc: zircon xenocrysts record the crustal evolution of the Solomon island arc. Geology 42, 12, p. 1087-1090.

(Latest Oligocene (26-24 Ma) Umasani pluton on Guadalcanal in intra-oceanic Solomon island arc (SW Pacific Ocean) with Eocene- Archean-age zircon xenocrysts. Older zircon populations of ~39-33 Ma, 71-63 Ma correlate with previous magmatism in arc. ~96 Ma zircon population may be derived from Cretaceous ophiolite basement crust or region-wide continental rift-related magmatism. E Cretaceous- Archean zircon xenocryst ages imply continental origins and cryptic source within arc crust. Caution with use of zircons to determine provenance and setting of ancient arc terranes)

Tarduno, J.A., W.V. Sliter, L. Kroenke, M. Leckie, H. Mayer, J.J. Mahoney et al. (1991)- Rapid formation of Ontong Java Plateau by Aptian mantle plume volcanism. Science 254, 5030, p. 399-403.
(Timing of flood basalt volcanism of Ontong Java Plateau estimated from paleomagnetic and paleontologic data. Much of plateau formed rapidly in <3 Myrs in E Aptian. Origin tied to impingement at base of oceanic lithosphere by head of large mantle plume. Formation of OJP may have led to rise in sea level that induced global oceanic anoxia. Carbon dioxide emissions likely contributed to mid-Cretaceous greenhouse climate, but did not provoke major biologic extinctions)

Taylor, B. (2006)- The single largest oceanic plateau: Ontong Java-Manihiki-Hikurangi. Earth Planetary Sci. Letters 241, p. 372-380.
(Ontong Java Plateau is largest oceanic mafic igneous province. Emplaced at ~120 Ma, with smaller magmatic pulse of ~90 Ma. Manihiki and Hikurangi Plateaus now separated from OJP by ocean basins, but originally formed as one plateau with Ontong Java)

Taylor, B. & A.M. Goodliffe (2004)- The West Philippine Basin and the initiation of subduction, revisited. Geophysical Research Letters 31, 12, L12602, p. 1-4.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2004GL020136/epdf)
(New bathymetry and existing geophysical data suggest direction of W Philippine Basin seafloor spreading rotated 100° CCW between 49 and 33 Ma. Mindanao Fracture Zone separates WPB from Palau Basin to S. WPB opening was contemporaneous with early Izu-Bonin-Mariana subduction, whose arc volcanism began by 50 Ma, producing >1000 km of arc-parallel spreading in Mariana segment of Eocene IBM arc/forearc. Initial IBM subduction cut across pre-existing structures (remnant arcs, fracture zones and spreading fabric))

Taylor, B. & F. Martinez (2003)- Back-arc basin basalt systematics. Earth Planetary Sci. Letters 210, p. 481-497.
((see also corrigendum, vol. 214, p. 679) Mariana, E Scotia, Lau and Manus back-arc basins spreading rates from slow (<50 mm/yr) to fast (>100 mm/yr) and extension axes located from 10-400 km behind their island arcs. Composition of lavas from active backarc basin spreading centers include arc-like components and MORB-like end-members. Axial lava compositions from these basins indicate melting of mid-ocean ridge basalt-like sources, but with added previously depleted, water-rich arc-like components)

Tejada, M.L.G., J.J. Mahoney, R.A. Duncan & M.P. Hawkins (1996)- Age and geochemistry of basement and alkalic rocks of Malaita and Santa Isabel, Solomon Islands, southern margin of Ontong Java Plateau. J. Petrology 37, 2, p. 361-394.
(online at: http://petrology.oxfordjournals.org/content/37/2/361.full.pdf)
(Basaltic basement of Malaita and Santa Isabel islands part of Ontong Java plateau magmatism, 1600km away. Ar-Ar ages of Malaita Older Series and Sigana Basalt lavas 121.3 ± 0.9 Ma and 92.0 ± 1.6 Ma, suggesting two short-lived, voluminous plateau-building episodes. Younger Series in S Malaita Ar- Ar age of 44 Ma. Juxtaposed against OJP crust in Santa Isabel is ~62-46 Ma 'ophiolitic' assemblage of Pacific MORB-like basalts, probably formed in arc-backarc setting before Late Tertiary collision of OJP and old N Solomon Trench)

Tejada, M.L.G., J.J. Mahoney, C.R. Neal, R.A. Duncan & M.G. Petterson (2002)- Basement geochemistry and geochronology of Central Malaita, Solomon Islands, with implications for the origin and evolution of the Ontong Java Plateau. J. Petrology 43, 3, p. 449-484.
(online at: http://petrology.oxfordjournals.org/content/43/3/449.full.pdf+htm)
(Sections of basalt basement in C Malaita 0·5–3.5 km thick and resemble expanded version of Ontong Java Plateau at ODP Site 807. Ar-Ar ages of 121-125 Ma identical to Site 807, S Malaita, Ramos, Santa Isabel and

DSDP Site 289. The ~90 Ma eruptive episode seen in Santa Isabel, San Cristobal, and Sites 803 and 288 not present. C Malaitan basalts two distinct ocean-island-like mantle sources, not from normal ocean-ridge-type mantle. Plume-head may account for geochemical characteristics, but observed stratigraphic succession requires special conditions for latter model. Other features of Ontong Java Plateau that do not fit plume-head model: at least two important, geochemically similar eruptive episodes ~30 My apart, lack of obvious plume-tail trace, and lack of evidence for emergence/uplift)

Wandres, A.M., J.D. Bradshaw, S. Weaver, R. Maas, T. Ireland & N. Eby (2004)- Provenance of the sedimentary Rakaia sub-terrane, Torlesse Terrane, South Island, New Zealand: the use of igneous clast compositions to define the source. Sedimentary Geology 168, p. 193-226.
(Permian to Late Triassic Rakaia sub-terrane is accretionary complex with large volume of quartzo-feldspathic sandstones. Zircon ages of igneous clasts define 3-4 periods of magmatism: minor Early Permian (292-277 Ma) and major Late Permian- M Triassic (258-243 Ma), Carboniferous (356-325 Ma) and Cambrian. Broad correlation with Amundsen and Ross provinces of Marie Byrd Land, Antarctica)

Weissel, J.K. (1981)- Magnetic lineations in marginal basins of the Western Pacific. Philosophical Trans. Royal Soc. London, A, 300, 1454, p. 223-247.
(Small basins of W Pacific Ocean classified into (1) probable marginal basins formed through back-arc extension (Bismarck, Fiji, Lau, Japan Sea, etc.), (2) possible back-arc basins (Andaman, Sulu, Celebes, W Philippine, Banda, Caroline, S Fiji, New Hebrides) and (3) not back-arc (Woodlark, S China Sea, Coral Sea, Solomon, Tasman). Magnetic lineations in back-arc basins, resembling mid-oceanic spreading systems)

Weissel, J.K. & R.N. Anderson (1978)- Is there a Caroline plate? Earth Planetary Sci. Letters 41, p. 143-159.
(Marine geophysical data from Caroline Sea region suggest separate Caroline plate currently exists. Interaction with Philippine Plate along S Yap Trench, Palau Trench and rift system in Ayu Trough)

Wells, R.E. (1989)- The oceanic basalt basement of the Solomon Islands arc and its relationship to the Ontong Java Plateau-insights from Cenozoic plate motion models. In: J.G. Vedder & T.R. Bruns (ed.) Geology and offshore resources of Pacific Island arcs; Solomon Islands and Bougainville, Papua New Guinea regions, Circum-Pacific Council Energy and Mineral Resources, Earth Sci. Ser. 12, p. 7-22.

Wessel, P. & L.W. Kroenke (1998)- The geometric relationship between hot spots and seamounts: implications for Pacific hot spots. Earth Planetary Sci. Letters 158, 1-2, p. 1-18.
(Hot spots and seamounts produced by them provide geometric and temporal evidence for changes in absolute plate motion. Main limitation in using hot-spot-produced seamounts in plate tectonic reconstructions arises from sources of error and ambiguity of radiometric age estimates. Hotspot-produced seamounts have seafloor crustal flow lines that intersect at hot spot location. Hawaii, Louisville, Caroline, Cobb and Bowie hot spots have clear representations in Cumulative Volcano Amplitude images)

Wessel, P. & L.W. Kroenke (2000)- Ontong Java Plateau and late Neogene changes in Pacific plate motion. J. Geophysical Research, Solid Earth, 105, B12, p. 28255-28277.
(Late Neogene collision between Ontong Java Plateau and N margin of Australia plate, starting at 6 Ma, intensifying at 4-2 Ma, still continuing causing CCW rotation of Pacific plate, as inferred from hotspot volcanism, inducing right-lateral shear stress along Pacific plate divergent boundary (San Andreas, Alpine faults). Also triggered circum-Pacific tectonism, with trench migration and back arc rifting. Slab pull dominant plate tectonic driving force)

Wessel, P. & L.W. Kroenke (2007)- Reconciling late Neogene Pacific absolute and relative plate motion changes. Geochem. Geophys. Geosystems 8, 8, p. Q08001, p. 1-12.
(New models of Pacific absolute plate motion relative to hot spots, etc., suggest significant change in late Neogene (5.9 Ma; Chron 3A), reflecting more northerly absolute motion than previously determined)

Wessel, P. & S. Lyons (1997)- Distribution of large Pacific seamounts from Geosat/ERS-1: implications for the history of intraplate volcanism, J. Geophysical Research 102, B10, p. 22459-22476.
(8882 individual seamounts identified on Pacific Ocean Plate. Seamount density greatest in C Pacific. Majority of large seamounts in W region of Pacific Plate, on older crust. Seamount density, peaks at 100-130 Ma crust, suggesting highest magmatism in Cretaceous. Seamount heights tend to increase with increasing age of lithosphere at time of seamount formation. Seamount intraplate volcanism at maximum level in M-Late Cretaceous (~70-120 Ma))

(online at: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5116616/pdf/srep37561.pdf)
(Ontong Java-Manihiki-Hikurangi plateau originated from Cretaceous mantle plume, and rifted apart by two spreading ridges. Manihiki-Hikurangi plateaus rifted apart by Osbourn Trough, with basaltic crust of 103.7 ± 2.3 Ma. Osbourn Trough is abandoned segment of early Pacific spreading ridge)

Zhang, Y., S.Z. Li, Y.H.Suo, L.L. Guo, S. Yu, S. J. Zhao, I D.Somerville, R.H. Guo, Y.B. Zang, Q.L. Zheng & D.L. Mu (2016)- Origin of transform faults in back-arc basins: examples from Western Pacific marginal seas. Geological J. 51, Suppl. 1, p. 490-512.
(Study of transform faults in 4 marginal basins in W Pacific, i.e. S China Sea, Okinawa Trough, W Philippine Basin and Shikoku-Parece Vela Basin. Transform faults in all basins generally NNE-trending)

Zhong, S., M. Ritzwoller, N. Shapiro, W. Landuyt, J. Huang & P. Wessel (2007)- Bathymetry of the Pacific plate and its implications for thermal evolution of lithosphere and mantle dynamics. J. Geophysical Research, Solid Earth, 112, B6, B06412, 18p.
(After removing effects of sediments, seamounts, and large igneous provinces, ocean depths increase uniformly with age from ~2700-3100m at mid-ocean ridges to >5000m after ~70 Ma. Increasings more slowly after that)

Zonenshayn, L.P. & V.V. Khain (1990)- Eocene-Miocene plate tectonic history of Melanesia. Int. Geology Review 32, 6, p.565-577.
(Late Cretaceous-Eocene Melanesian island arc with subduction zone dipping NE beneath Pacific Ocean been reconstructed from distribution of island-arc complexes in N New Guinea, New Caledonia and North Island of New Zealand. Marked change in movement of Pacific plate with respect to Australia and Eurasia at 43 Ma. E Miocene collision between Melanesian arc and passive margin of Australia. At same time, spreading axis was at rear of Melanesian arc, from which Caroline basin was formed)

IX.11. Papua New Guinea (East New Guinea main island)

Abbott, L.D. (1995)- Neogene tectonic reconstruction of the Adelbert-Finisterre-New Britain collision, northern Papua New Guinea. J. Southeast Asian Earth Sci. 11, p. 33-51.
(Finisterre terrane colliding with Australian continent in N PNG today. Exposed in Adelbert and Finisterre blocks. Provenance shifts date collision at 3.0-3.7 Ma. Late Pliocene deep water basin between Adelbert block and continent. Deep marine sediments overthrust by older lithologies of Adelbert block. Collision of E part Adelbert block in M-Late Pliocene. W Adelbert block probably collided in latest Miocene. Collision of Adelbert block and most of Finisterre block above single, N-dipping subduction zone. Double subduction in Solomon Sea never extended >20 km W of present location)

Abbott, L.D. & E.A. Silver (1991)- Geology of the southern Finisterre Range: a case history of modern arc-continent collision. In: R. Rogerson (ed.) Proc. PNG Geology Exploration and Mining Conf., Rabaul 1991. Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 1-7.
(Finisterre Range on N coast of PNG is uplifted forearc region of modern arc-continent collision. Range core composed of Finisterre Volcanics (Oligocene arc terrane), S flank is uplifted accretionary wedge and collision complex, with most thrusts dipping steeply N. Melange fabric near major thrusts. Abrupt change in S Finisterre sandstone provenance from external, orogenic source to Finisterre arc itself in Late Pliocene indicates collision of Finisterre Range younger than previously asusmed)

Abbott, L.D., E.A. Silver, R.S. Anderson, R. Smith, J.C. Ingle, S.A. Kling, D. Haig et al. (1997)- Measurement of tectonic surface uplift rate in a young collisional mountain belt. Nature 385, p. 501-507.
(Finisterre Range in NE PNG (=uplifted forearc region of collided W Bismarck Arc) current tectonic uplift rate 0.8- 2.1 mm/yr)

Abbott, L.D., E.A. Silver & J. Galewsky (1994)- Structural evolution of a modern arc-continent collision in Papua New Guinea. Tectonics 13, p. 1007-1034.
(N PNG Finisterre Mts- W Solomon Sea site of young, active, oblique collision of Finisterre arc terrane, progressing from NW to SE through time. Accretionary wedge complex of SW-ward younging imbricate thrust sheets alongW-ward extension of New Britain Trench and outcrops in Finisterre Mts as Erap Structural Complex. Collision doubled crustal thickness to 50-52 km)

Abbott, L.D., E.A. Silver, P.R. Thompson, M.V. Filewicz, C. Schneider & Abdoerrias (1994)- Stratigraphic constraints on the development and timing of the arc-continent collision in northern Papua New Guinea. J. Sedimentary Res. B64, p. 169-183.
(Two sandstone provenance shifts on S flank Finisterre Range. First shift at ~16-18 Ma, from volcanolithic sediments to mixed-provenance rich in quartz and metasedimentary lithics, probably derived from orogenic belt active along Australian continental margin at that time. At 3.0-3.7 Ma volcanic source rejuvenated, reflecting initial collision/ uplift of SE-propagating Finisterre terrane and Australian continental margin. Finisterre terrane composed of Paleogene- Early Miocene volcanic arc rocks, overlain by Miocene- Pleistocene limestones and probably part of larger Outer Melanesian Arc)

Abers, G.A. (1989)- Active tectonics and seismicity of New Guinea. Ph.D. Thesis, Massachusetts Inst. Technology (MIT), p. 1-255.

Abers, G.A. & H. Lyon-Caen (1990)- Regional gravity anomalies, depth of the foreland basin and isostatic compensation of the New Guinea highlands. Tectonics 9, 6, p. 1479-1493.
(New Guinea foreland basin thickens from <200m in E PNG to 1 km in C PNG to >5km in W New Guinea, reflecting thrust loading of increasingly stronger lithosphere to W. PNG also lower elevations and young volcanism)

Abers, G. & R. McCaffrey (1988)- Active deformation in the New Guinea fold-and-thrust belt: seismological evidence for strike-slip faulting and basement-involved thrusting. J. Geophysical Research 93, B11, p. 13332-13354.

(New Guinea fold-and-thrust belt trend oblique to predicted convergence direction. Large component of left-lateral shear expected, but little geological evidence for such motion. Earthquake mechanisms in New Guinea foldbelt since 1964 indicate thrust events, with steeply dipping fault planes, 11-25 km deep, showing thrust faulting penetrates crystalline basement at high angles. Most earthquakes in W half of thrust belt show E-W oriented, left lateral strike-slip faulting. Translation by strike-slip faulting may play greater role than previously recognized)

Abers, G. & R. McCaffrey (1994)- Active arc-continent collision: earthquakes, gravity anomalies and fault kinematics in the Huon-Finisterre collision zone, Papua New Guinea. Tectonics 13, 2, p. 227-245.
(Huon-Finisterre island arc terrane actively colliding with N edge of Australian continent. Thrust faulting along Ramu-Markham thrust fault zone accomodates most of H-F terrane overthrusting. Thrust earthquakes at depth of 35 km below Huon Peninsula. Thrust earthquake movement produces Pleistocene terrace upliftment on N Huon Peninsula. Much of terrane crust, but little of its mantle being added to Australian continent

Abers, G.A. & S.W. Roecker (1991)- Deep structure of an arc-continent collision: earthquake relocation and inversion for upper mantle P and S wave velocities beneath Papua New Guinea. J. Geophysical Research 96, B4, p. 6379-6401.
(E PNG earthquakes and seismic velocities used to define subduction zones. Hypocenters show seismic zone dipping vertically or steeply to N beneath N Finistere-Huon ranges from 125-250 km depth, continuous along strike with New Britain seismic zone to E. No evidence for arc polarity reversal from seismicity)

Adams, C.G. & D.J. Belford (1979)- A new foraminifer from the Middle Eocene of Papua New Guinea. Palaeontology 22, 1, p. 181-187.
(Reticulogyra mirata, a new complex miliolid species from Middle Eocene Lower Chimbu limestone. Associated larger forams include Fasciolites, Nummulites javanus, Dictyoconus chimbuensis)

Ahmed, M., H. Volk, T. Allan & D. Holland (2012)- Origin of oils in the Eastern Papuan Basin, Papua New Guinea. Organic Geochem.53, p. 137-152.
(Geochemical characteristics of 16 oils/condensates/seep oil/oil shows from E Papuan Basin and one seep oil from W Papuan Basin integrated with data from previous studies show two hydrocarbon families. Family A oils, mostly in WPB region generated from marine source rocks with higher plant derived organic matter, deposited in sub-oxic to oxic environment (likely M-U Jurassic). Family B oils mainly in EPB, generated from Cretaceous or younger marine carbonate source rocks deposited under anoxic- suboxic conditions, and containing mainly prokaryotic OM. Exact source rock formation still unidentified. Both families generated at similar thermal maturities of 1.0-1.3% vitrinite reflectance equivalent)

Allan, T., M. Korsch & D. Whitford (2012)- Larger foraminiferal extinctions as indicators of eustatic sea level fall; new strontium isotope age evidence from the middle Miocene of the Papuan Basin, Papua New Guinea. In: Proc. 34th Int. Geological Congress, Abstracts, p. 2961. *(Abstract only)*
(Age range of three index taxa of Miocene larger foraminfera calibrated to geological timescale using Sr isotope stratigraphic studies of Darai Limestone. Extinction of Austrotrillina and Miogypsina coincident with M-L Miocene boundary (11.0-11.5 Ma) and large eustatic 3rd order sea level fall. Disappearance of Miogypsina at approximately same age on N Marion Plateau. Disappearance of Lepidocyclina at ~7.5 Ma in PNG and S Marion Plateau may also reflect eustatic event)

Allan, T.L., J.A. Trotter, D.W. Whitford & M.J.Korsch (2000)- Strontium isotope stratigraphy and the Oligocene-Miocene T-Letter 'Stages' in Papua New Guinea. In: P.G. Buchanan et al. (eds.) Papua New Guineaǿs petroleum industry in the 21st century, Proc. 4th PNG Petroleum Convention, Port Moresby, p. 155-168.
(Strontium isotopes used to calibrate ages of Oligocene- early Late Miocene Darai Limestone. Age of larger foram zonal boundary Tf1/Tf2 (12.2 Ma) younger than generally accepted age of 15.0 Ma. Te/Tf1 boundary older (20.3 Ma) than generally accepted age of 18.5 Ma. Nummulites possibly ranges in Late Oligocene)

Allan, T., D.J. Whitford, G. Morgan, D.J. Holland & D.P. Leech (2006)- Tertiary stratigraphy of the Papuan Basin: insights from Strontium dating. AAPG Perth Int. Conf., p. *(Abstract only)*
(Three regressive cycles in Oligo-Miocene Darai Lst, each ending with shallow water limestones for which cycles are named: Mid Darai (28.5-17.5 Ma), Mala (17.5-14 Ma) and Warre (14.0-7.1 Ma). Warre Cycle marks top of Darai Lst. Early Oligocene widespread in basal Darai Lst, with significant Eocene reworking, and recycling of quartz sand from Cretaceous into Eocene and Oligocene units. Last appearances of index foraminifera marking T-Letter stage boundaries coincide with lower Mid Darai and lower- upper Warre Cycle boundaries. In Papuan Foreland, cycle boundaries are correlated with 3rd order seismic sequences, including major off-platform Miocene erosional events. Eustatic sea level falls possible factor in faunal 'turnovers')

Anfiloff, V. & A.J. Flavelle (1982)- Formal gravity interpretation over the 800-m Darai Escarpment in New Guinea. Geophysics 47, 7, p. 1091-1099.
(Gravity traverse over 800m Darai escarpment shows fault near base of escarpment. No vertical continuation bump directly over fault. Upthrown basement at depth of roughly 2500m. Fault position near base of escarpment suggests history of repetitive crustal movements)

APC- Australasian Petroleum Company (1961)- Geological results of petroleum exploration in western Papua 1937-1961 (compilers C.A.E. O'Brian, K.W. Gray & I. Gillipie). J. Geol. Soc. Australia 8, 1, p. 1-133.
(Compilation of previously unpublished PNG oil exploration and well data generated by APC. Principal reference for Papuan Basin stratigraphy.)

APC- Australasian Petroleum Company (1961)- Puri No. 1 well, Papua. Bureau Mineral Res. Geol. Geophysics, p. 1-59.
(Final well report of APC Puri 1 well, drilled in 1958 on thrust-faulted anticline with repeated stratigraphy at E end of Kereri Range, PNG Highlands. TD 10,100' in Cretaceous. In hanging wall ~1600' of Eocene- Miocene limestone with Discocyclina, Eorupertia and Distichoplax biserialis near base (= Late Paleocene or E Eocene; JTvG), overlain by Late Oligocene with Heterostegina borneensis (Late Eocene-E Oligocene not documented; JTvG). Tested wet gas below 7425' in sub-thrust Oligo-Miocene limestone)

APOC- Anglo-Persian Oil Company (1930)- Oil exploration work in Papua and New Guinea, conducted by the Anglo-Persian Oil Company on behalf of the government of the Commonwealth of Australia, 1920-1929, vol. 1, Harrison and Sons Ltd., London, p.
(First of 4 volumes and 2 Atlases describing oil exploration work by Anglo-Persian (predecessor company of BP) between 1920-1929. Volume 1 contains Part. 1. Historical outline; Part 2. Reports of the first geological expedition, 1920-1923; Part 3. Drilling operations at Popo, 1922-1929)

(Campanian Pale sandstone in E Papuan foldbelt 160m thick shallow marine delta front-shoreface facies, porosity 5-16%, with biodegraded oil in outcrop)

Barndollar, P. (1993)- Hydrocarbon prospectivity of the Papuan Foreland. In: G.J. & Z. Carman (eds.) Petroleum exploration and development in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby 1993, p. 517-525.
(Recent Papuan foldbelt discoveries with proven reserves of 14.5 TCF gas, 284 MMB Condensate and 395 MMB Oil)

Barrett, R.A. (1996)- A petroleum systems analysis of the Sepik and Ramu basins of Papua New Guinea. In: P.G. Buchanan (ed.) Petroleum exploration development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 495-509.
(Basins on N margin PNG, formed by complex series of Tertiary tectonic events. Up to 10 km of Mio-Pliocene sediments. Formation of several deep Late Oligocene- E Miocene basins overprinted by Late Miocene and younger compression. Potential plays Miocene carbonate buildups and Mio-Pliocene sandstones)

Barrett, R.A. (1997)- Petroleum systems analysis of the Sepik and Ramu basins of Papua New Guinea: implications for Irian Jaya. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum Systems of SE Asia and Australia Conf., Jakarta 1997, Indon. Petroleum Assoc. (IPA), p. 247-260.
(Possible hydrocarbon systems in largely untested Tertiary basins of N New Guinea. Main targets Miocene carbonate buildups. Ramu Basin hundreds of biogenic gas seeps. Meervlakte Basin may be similar to Salawati and PNG Sepik basins and have well developed Miocene buildups. N Coast basin similar to PNG Ramu Basin and may have gas play in structured Plio-Pleistocene turbidites)

Barrett, R.A. (1999)- Play concepts of the northern basins of New Guinea Island. AAPG Ann. Mtg. Abstract, American Assoc. Petrol. Geol. (AAPG) Bull. 83, p. *(Abstract only)*

Barrett, R.A. (1999)- Plio-Pleistocene sedimentation and biogenic gas generation Waropen and Ramu Basins, NeuGuinea (Irian) Island. In: H. Darman & F.H. Sidi (eds.) Tectonics and sedimentation of Indonesia, FOSI-IAGI-ITB Regional Seminar to commemorate 50th anniversary of Van Bemmelen's Geology of Indonesia, Bandung 1999, p. 87. *(Abstract only)*.
(Waropen and Ramu basins along N margin of New Guinea formed in Neogene. Characterized by extremely high Plio-Pleistocene sedimentation rates, of mainly marine turbiditic deposits: up to 12km in Waropen basin, up to 7km of Pleistocene in Ramu Basin. Common organic (plant) material. Waropen basin with biogenic methane flows in wells and seeps)

Barrows, T.T., G.S. Hope, M.L. Prentice, L.K. Ffield & S.G. Tims (2011)- Late Pleistocene glaciation of the Mt. Giluwe volcano, Papua New Guinea. Quaternary Science Reviews 30, 19, p. 2676-2689.
(Mt Giluwe shield volcano largest area glaciated in PNG in Pleistocene. During Last Glacial Maximum glaciers reached down to 3200m. Ice caps formed on flanks of mountain at 4 occasions: 293-306 ka (Gogon Glaciation), 136-158 ka (Mengane Glaciation), ~62 ka (Komia Glaciation; >20.3-11.5 ka (Tongo Glaciation))

Baylis, S.A., S.J. Cawley, C.J. Clayton & M.A. Savell (1997)- The origin of unusual gas seeps from onshore Papua New Guinea. Marine Geology 137, p. 109-120.
(Gas seeps with associated oils and waters from onshore Aure Thrust Belt. Oils biodegraded and from dominantly marine source, some with evidence of higher land plant input. Thermal maturity low to moderately high. Some gases biogenic, some thermogenic and some mixed. Two biogenic groups, one with high CO_2 - light δD (acetate fermentation in low salinity), one with lower CO_2- heavier δD (biogenic CO_2 reduction associated with higher salinity, marine environments). Thermogenic gases associated with intermediate salinity and have exceptionally heavy d13C in CO_2).

(New Guinea orogen formed by succession of collisions of Australian craton with microcontinents and volcanic island arcs, from Late Cretaceous- today. Five main collision events: (1) Irian ophiolite event (end-Cretaceous collision of Australian craton and volcanic island arc, wih K-Ar ages of metamorphic sole 61-68 Ma); (2) Late Paleocene- E-M Eocene Kami event (closing of Kami small ocean basin and suturing of (para-autochthonous?) Bena Bena, Jimi and Kubor terranes with Australian craton); (3) Late Eocene- Oligocene Sepik collision of Australian continent and major volcanic arc(s), accomodating foreland loading and deposition of Darai Limestone; (4) Late Oligocene collision of East Papua Composite Terrane and (5) E Miocene collision of Oligocene- E Miocene Finisterre volcanic arc, with downwarping of continental margin creating Ramu-Markham basin. Often delay in time between collision and uplift)

Doust, H. (1990)- Geology of the Sepik Basin, Papua New Guinea. In: G.J. & Z. Carman (eds.) Petroleum Exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby, p. 461-477.
(Sepik Basin in N part of New Guinea orogen is Neogene successor basin underlain and surrounded by terranes that were accreted in Oligocene-Miocene. Torricelli- Prince Alexander Mts in N are island arc/ oceanic terranes with some E-M Miocene limestones, mountains to S mainly metamorphics. Shell 1986 Nopan well 1, drilled of fault block, penetrated mainly M-L Miocene marine sediments before reaching weathered chlorite-epidote schist at 2312m, without oil shows or anticipated carbonate reservoirs)

Dow, D.B. (1961)- The relationship between the Kaindi metamorphics and Cretaceous rocks at Snake River, Territory of Papua and New Guinea. Bureau Mineral Res. Geol. Geophysics, Record 1961/160, p. 1-10.
(online at: https://www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=10885)
(Snake River area at NW end of Owen-Stanley folded zone (SW of Lae and W of Morobe granodiorite) has thick Cretaceous greywackes previously regarded as part of Kaindi Metamorphics, but are less metamorphosed and less complexely folded. Cretaceous molluscs fauna previously described by Glaessner (1949) include Trigonia. Kaindi Metamorphics are greenschist facies metasediments withe marble lenses and possibly correlative of Permian Omung metamorphics of Kubor Block)

Dow, D.B. (1962)- A geological reconnaissance of the Jimi and Simbai Rivers, Territory Papua and New Guinea. Bureau Mineral Res. Geol. Geophysics, Record 1962/110, p. 1-31.
(online at: www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=10999)

(Area of Jimi Anticline at N side of Jimi River (SW of Upper Ramu River and NW of Mt Herbert/Mt Wilhelm of Bismarck Range. Stratigraphy from old to young: (1) indurated ?Permian greywackes, (2) thick-bedded Jimi Fm greywackes with minor basic volcanics (with U Triassic bivalves Gervillea, Costatoria bivalves); (3) U Jurassic Maril shale with Inoceramus and Buchia malayomaorica (4) Lower Cretaceous basaltic Kondaku Tuff; (5) M Cretacous Genjinji/ Chim Gp marine shales with belemnites (6) thick U Cretaceous submarine basaltic Kumbruff volcanics ('spilites'); (7) thick Eocene Asai Beds (siltstone, shale, limestone with locally common Nummulites/ Discocyclina; metamorphosed to North. Triassic- Jurassic section appears to thicken from W to E (NE? Some of the main faults appear to have transcurrent component)

Dow, D.B. (1977)- A geological synthesis of Papua New Guinea. Bureau Mineral Res. Geol. Geophysics, Bull. 201, p. 1-41.
(online at: www.ga.gov.au/corporate_data/90/Bull_201.pdf)
(Main island of PNG formed by interaction between Australian Plate in SW and Pacific Plate in NE. Between platform and oceanic crust and island arcs, is deformed mobile belt ~150 km wide. Platform stable continental crust of Paleozoic crystalline rocks, overlain by Mesozoic and Tertiary sedimentary rocks, mostly undeformed. Mobile belt deformed since at least Late Mesozoic, with variety of geosynclinal sediments and also site of widespread igneous activity. Oceanic crust and island arcs form NE margin of mobile belt. Oldest rocks in oceanic crust and island arcs are Late Cretaceous ophiolites and island-arc volcanics. Major orogeny in Oligocene, forming belt of metamorphics along length of mobile belt (metamorphics overlain by Upper Te/ E Miocene forams at several localities). E Miocene widespread shelf sediments (mainly limestone). Etc.)

Dow, D.B. & H.L. Davies (1964)- The geology of the Bowutu Mountains, New Guinea. Bureau Mineral Res. Geol. Geophysics, Report 75, p. 1-31.
(online at: www.ga.gov.au/products-services/legacy-publications/reports.html)
(Geologic map of Bowutu Mountains, at NW end of Papuan Ultrabasic belt in SE PNG, between Owen Stanley Range and Morobe Coast. Bowutu Mts consist of igneous rocks of Papuan Basic Belt (emplaced in U Cretaceous or Early Tertiary) and Mageri Volcanics (M Miocene); Owen Stanley Range is made up of metasediments of Owen Stanley Metamorphics)

Dow, D.B. & F.E. Dekker (1964)- The geology of the Bismarck Mountains, New Guinea, Bureau Mineral Res. Geol. Geophysics, Report 76, p. 1-45.
(online at: www.ga.gov.au/products-services/legacy-publications/reports.html)
(W Bismarck Mts W of Mt Wilhelm are NE of main Central Range of PNG and SW of Ramu Valley. Oldest rocks Upper Triassic Jimi Greywacke and Kana Fm volcanoclastics, unconformably overlain by E Jurassic Balimbu Greywacke, M Jurassic Mongum Volcanics and Late Jurassic Maril Shale. Bismarck granodiorite probably U Triassic- lowermost Jurassic)

Dow, D.B. & M.D. Plane (1965)- The geology of the Kainantu goldfields. Bureau Mineral Res., Geol. Geophysics, Canberra, Report 79, p. 1-28.
(online at: www.ga.gov.au/corporate_data/14993/Rep_079.pdf)
(Area of NE PNG Kainantu goldfields with Paleozoic? Bena Bena Fm metamorphics, intruded by U Triassic or younger Bismarck and Mt Victor granodiorites, overlain by Lower Miocene (Te) Nasananka conglomerate and Omaura greywacke (w. Spiroclypeus, Eulepidina, etc.). Unconformably overlain Lower Tf Lamari Conglomerate (w. Miogypsina, Miogypsinoides dehaartii, Lepidocyclina (N)) and ?Pliocene andesitic Aifunka Volcanics with gold lodes)

Dow, D.B., J.A.J. Smit, J.H.G. Bain & R.J. Ryburn (1972)- Geology of the South Sepik region, New Guinea. Australia Bureau Mineral Res. Geol. Geophysics, Bull. 133, p. 1-88.
(online at: https://d28rz98at9flks.cloudfront.net/128/Bull_133.pdf)
(Geology of N part of Central Range mountains to Sepik River in North. Oldest rocks M Triassic Yuat Fm black shale and U Triassic dacitic Kana Volcanics. Triassic unconformably overlain by M Jurassic- Cretaceous (incl. Maril Shale with M. malayomaorica). Ambunti Metamorphics are post-Eocene and pre-Middle Miocene in age. p. 26: Salumei Fm of S Sepik region Upper Cretaceous- Eocene thick turbiditic greywacke series with volcanic

beds, Cretaceous planktonics and Eocene limestone lenses with Biplanispira, Pellatispira. Time- equivalent of bulk of Lagaip beds, but no volcanics in Lagaip Fm. Widespread M Miocene (Tf1-2) arc volcanics)

PNG Geology, exploration and Mining Conf., Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 17-25.

Francis, G. & G.E.G. Westermann (1993)- The Kimmeridgean problem in Papua-New Guinea and other parts of the Indo-Southwest Pacific. In: G.J. & Z. Carman (eds.) Proc. 2nd PNG Petroleum Convention, Port Moresby, p. 75-93.
(Ammonites rel. rare in PNG Late Jurassic; belemnites and bivalves more common. Diagnostic Kimmeridgean ammonites almost unknown in Indo-SW Pacific from Himalaya-PNG- New Zealand, making biozone-stage calibrations difficult in this region. Also provincialism of PNG belemnites makes direct correlations to Tethyan of Europe impossible. In(Sula Islands more complete Jurassic ammonite sequenc, with 3 Oxfordian zones. (from base: Wanaea spectabilis, upper W. spectabilis and Wanaea clathrata dinozones). Ammonite-rich zone overlain by ammonite-poor zone, then latest Tithonian- earliest Berriasian assemblage with P. iehiense dinos)

Franklin, S.P. & J.E. Livingston (1996)- Development of an infill well program to maximise economic return from the Iagafu- Hedinia Field: Part I. Integrated strauctural, stratigraphic and reservoir attribute modelling as input to reservoir simulation and well targeting. In: P.G. Buchanan (ed.) Petroleum exploration development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 573-589.
(Iagafu- Hedinia oil-gas field in Papuan Fold Belt with 31 MMBO recoverable reserves. Large thrust fault duplex structure, with detachment surfaces in Cretaceous Ieru Shale, causing discordance between structure at surface and basal Cretaceous Toro Sst reservoir level. Toro Sst main reservoir 100m thick, composed of four stacked parasequences of wave-dominated delta complex, separated by marine flooding surfaces)

Gagel, C. (1913)- Beitrage zur Geologie von Kaiser Wilhelms-Land. In: Beitrage zur geologischen Forschung der deutschen Schutzgebiete, 4, Kon. Geolog. Landesanstalt, Berlin, p. 1-55.

Galewsky, J. (1998)- The dynamics of foreland basin carbonate platforms: tectonic and eustatic controls. Basin Research 10, p. 409-416.
(Numerical modeling of coral growth and flexural subsidence in foreland basin setting matches drowning and backstepping of Quaternary carbonate platforms in Huon Gulf, PNG)

Galewsky, J., E.A. Silver, C.D. Gallup, R.L. Edwards & D.C. Potts (1996)- Foredeep tectonics and carbonate platform dynamics in the Huon Gulf, Papua New Guinea. Geology 24, p. 819-822.
(Side-scan sonar and seismic data reveal history of carbonate platform growth, drowning, and back stepping in the Huon Gulf, documenting subsidence of Huon Gulf in response to encroaching Finisterre Mts at ~5.7 mm/yr for past 348 ky (highest subsidence in any any foredeep). Reefs may have formed during sea-level lowstands and drowned during rapid rates of sea-level rise)

Gardner, J.V. (1970)- Submarine geology of the western Coral Sea. Geol. America, Bull. 70, p. 1399-1424.
(Coral Sea Basin probably formed by Late Eocene- E Oligocene rotational spreading, with subsidence of basin margins. Erosional unconformity, previously identified on seismic across marginal Queensland Plateau, dated as E Miocene and represents initial marine transgression onto basin margin. Subsidence continued, accompanied by faulting which subdivided margin into four plateaus. Thick terrigenous turbidites derived from New Guinea deposited during last glacial stage, but predominately calcareous pelagic sediments since then)

George, S.C., F.W. Krieger, P.J. Eadington, R.A. Quezada, P.F. Greenwood et al. (1997)- Geochemical comparison of oil-bearing fluid inclusions and produced oil from the Toro sandstone, Papua New Guinea. Organic Geochem. 26, p. 155-173.
(Oil in Lower Cretaceous Toro Sst in Iagifu-7X different from fluid inclusion oil. DST oils sourced from oxic mixed marine/ terrestrial source, probably M- L Jurassic mudstones. Fluid inclusion oils from less terrestrially-influenced marine source rock deposited under less oxic conditions. Fluid inclusion oils early oil charge from probably Cretaceous source, which started migrating into Toro sst in Miocene. At Iagifu early oil diluted by larger volume of Jurassic oil generated at end-Miocene)

George, S.C., Volk, H., Ahmed, M., Middleton, H., T. Allan & D. Holland (2004)- Novel petroleum systems in Papua New Guinea indicated by terpane and methylhopane distributions. In: P.J. Boult et al. (eds.) Eastern Australasian Basins Symposium II, Adelaide, Petroleum Expl. Soc. Australia (PESA), Spec. Publ., p. 575-588.
(Most PNG oil production from W Papuan fold belt, with oils from Jurassic marine source with terrestrial organic matter. Puri-1 oil and Subu wells (Aure Scarp) bitumens indicate Jurassic source also in E Papuan Basin. Calcareous source rock may be regionally significant in E Papuan Basin. W Papuan Basin oils from Iagifu and P'nyang wells (W Fold belt) and Bujon 1 from foreland indicate Late Cretaceous or younger marine source with minor terrestrial organic matter. Oil from Koko 1 in foreland indicate lacustrine source. Oil stains in Bujon-1 also likely from this source, age unconstrained, but expelled later than Late Cretaceous or younger marine source rock which generated FI oil in Bujon 1. Future PNG petroleum plays not restricted to Jurassic source/- M Cretaceous reservoir paradigm)

George, S.C., H. Volk, M. Ahmed, W. Pickel & T. Allan (2007)- Biomarker evidence for two sources for solid bitumens in the Subu wells: implications for the petroleum prospectivity of the East Papuan Basin. Organic Geochem. 38, p. 609-642.
(Late Cretaceous sst from Subu 1,2 (Aure Scarp) with solid bitumens, reflect biodegradation of two oil families: (A) marine source with significant terrestrial organic matter, believed to be Jurassic; (B) more reducing; so far unidentified. Condensate charge relatively recent. Solid bitumen from Miocene volcanolithic sst from Ouha anticline from early mature Paleogene or late Cretaceous source with predominantly terrestrial organic matter in oxic environment. This sample proves existence of different oil source rocks in E Papuan Basin)

Giddings, J., C.T. Klootwijk, W. Sunata, C. Loxton, C. Pigram & H. Davies (1985)- Palaeomagnetism of Australia's active northern margin in New Guinea. In: E.C. Leitch & E. Scheibner (conv.) Third Circum-Pacific terrane conference, Extended abstracts, Geol. Soc. Australia 14, p. 83-86.

Glaessner, M.F. (1958)- New Cretaceous fossils from New Guinea, Guinea, with a contribution on a new ammonite genus by R. Casey. Records South Australian Mus. 13, 2, p. 199-126.
(Cenomanian- Albian molluscs and ammonites from Central Highlands. Includes new Cenomanian ammonite species from Chim Fm near Chimu airstrip, Chimbuites sinuosocostatus)

Glaessner, M.F. (1960)- Upper Cretaceous larger foraminifera from New Guinea. Science Repts. Tohoku University, 2nd. Ser. (Geol.), Spec. Vol. 4 (Hanzawa Memorial Vol.), p. 37-44.
(Abundant larger forams Pseudorbitoides israelskii and Orbitoides tissoti described from Campanian of Port Moresby area, PNG. First report of this distinctive assemblage outside Caribbean-Gulf of Mexico area)

Glaessner, M.F., K.M. Llewellyn & G.A.V. Stanley (1950)- Fossiliferous rocks of Permian age from the Territory of New Guinea. Australian J. Sci. 13, p. 24-25.
(Short report on first discovery of 200' of 'Permian' limestone at Gum/Kum Creek 4 miles SSE of Hagen airstrip, overlying Mt Kubor granite. Subsequently re-interpreted as Late Triassic in age. Limestone not contact-metamorphic. Coarser parts have grains of quartz, feldspar, mica flakes. Associated with quartzite)

Glen, R.A., E. Belousova & W.L. Griffin (2016)- Different styles of modern and ancient non-collisional orogens and implications for crustal growth: a Gondwanaland perspective. Canadian J. Earth Sci. 53, 11, p. 1372-1415.
(online at: http://www.nrcresearchpress.com/doi/pdf/10.1139/cjes-2015-0229)
(Review of 'accretionary orogens' of N and E Gondwana (convergent margin orogens without continental block collisions), including chapter on Papua New Guinea Orogen)

Goldberg, A. & D. Holland (2008)- Inversion tectonics and the structural development of the Elk/ Antelope gas field, Papua New Guinea. In: J.E. Blevin et al. (eds.) Third Eastern Australasian Basins Symposium, Sydney 2008, Petroleum Expl. Soc. Australia (PESA), Spec. Publ., p. 247-258.
(Elk/Antelope gas field in a complex zone of deformation at front of E-most Papuan Foldbelt, where orientation of foldbelt changes from WNW/ESE strike in W, to NW/SE strike in E. Basement-involved inversion played key role. Elk structure formed from thrust detatchment within Ieru Fm above large inverted fault block. Same level of detatchment interpreted for Puri structure)

Goldberg, A., M. Wilson & S. Sioni (2010)- Quantitative seismic interpretation for characterizing carbonate diagenesis; an Elk/Antelope Gas field study. In: N. Harrison (ed.) 21st Geoph. Conf. Australian Soc. Exploration Geophysicists (ASEG), Sydney 2010, p. 1-4. *(Extended Abstract)*
(Elk/Antelope gas field in PNG is hosted in Miocene reefal and deepwater carbonates. Carbonates exhibit multiple diagenetic overprints and complex internal seismic reflector heterogeneity. Dominant control on seismic reflection events within reservoir are porosity variations)

Gow, P.A., P. Upton, C. Zhao & K.C. Hill (2002)- Copper-gold mineralisation in New Guinea: numerical modelling of collision, fluid flow and intrusion-related hydrothermal systems. Australian J. Earth Sci. 49, 4, p. 753-771.
(Porphyry Cu-Au mineralisation in New Guinea foldbelt tied to local dilation, facilitating magma emplacement by reactivation of arc-normal transfer faults, where they cut weakened fold belt. Rapid uplift and erosion greatest in W of W Papua, where stronger Australian crust acts as buttress. In Papuan Fold Belt uplift greatest near margins, where weaker fold belt abuts stronger crust and/or major faults have been reactivated)

Gow, P.A & J.L. Walshe (2005)- The role of preexisting geologic architecture in the formation of giant porphyry-related Cu ± Au deposits: examples from New Guinea and Chile. Economic Geology 100, 5, p. 819-833.
(Development of porphyry copper-gold deposits in New Guinea during Tertiary magmatic event that overprinted extensional Mesozoic passive margin. During collision deeply detached listric faults were inverted and focused uplift/exhumation. Steep transverse faults formed wrench systems with pathways for magma or fluids. Competent units of flat-lying stratigraphic packages like Darai/Mendi Limestone impeded magma ascent and formed cap on magma and/or fluid system)

Grainge, A. (1993)- Recent developments in prospect mapping in the Hides/Karius area of the Papuan fold belt. In: G.J. & Z. Carman (eds.) Petroleum exploration and development in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby 1993, p. 527-537.
(Of the 26 structures drilled in Papuan Foldbelt Toro fairway half have been discoveries, all in readily identifiable thrust-related anticlines. Better surface geologic maps being made using Remote sensing, Strontium isotope stratigraphy, magnetotelluric methods, etc.)

Grainge, A.M., A.J.D. Hine & P.J. Brawley (1990)- Discovery and development of the Hides gas field in Licence PPL 27, Papua New Guinea. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby, p. 539-550.
(Hides gas field 1987 BP discovery in S Highlands Province. Structure large NW-SE trending anticline. Reservoir Early Cretaceous (Berriasian) Toro Fm quartz sandstone. Reserves estimate 1-3 Tcf gas)

Grainger, D.J. & R.L. Grainger (1974)- Explanatory notes of the 1:2,500,000 Mineral deposits map of Papua New Guinea. Bureau Mineral Res., Canberra, Bull. 148, p. 1-171.
(online at: https://d28rz98at9flks.cloudfront.net/114/Bull_148.pdf)
(Gold widely distributed through PNG, associated with Tertiary acid and intermediate rocks. Major porphyry copper province (Panguna, Ok Tedi deposits). Bauxite on Manus Island. Chromite and nickel mineralization disseminated in ultramafic rocks in SE Papua. Molybdenum in several minor occurrences. Small deposits of manganese, phosphate, asbestos, diatomite, graphite, mercury, pumice and sulphur, but not or marginally economic. Many occurrences of lignite, but mostly low-grade and in remote localities. Many oil and gas seepages (listed and shown on map))

Grant, J.N. & R.L. Nielsen (1975)- Geology and geochronology of the Yandera porphyry copper deposit, Papua New Guinea. Economic Geology 70, 7, p. 1157-1174.
(Porphyry copper- molybdenum- gold mineralization at Yandera, 100 km SW of Madang, in N part of PNG highlands. Associated with M Miocene (12-14 Ma) Bismarck synorogenic batholith complex, emplaced during collision of Australian plate and island-arc zone. Intruded into strongly folded-faulted Goroka Fm metamorphics. Mineralization genetically related to aplitic quartz monzonite porphyry, emplaced at ~6.5 Ma. (see also Titley et al. 1978, Watmuff 1978))

Grant-Mackie, J., G. Francis, G.E. Westermann & A.B. Challinor (2006)- Jurassic molluscan palaeontology of the Telefomin area, Papua New Guinea. Geol. Survey PNG Mem. 19, p. 1-101.

Green, D.H. (1961)- Ultramafic breccias from the Musa Valley, Eastern Papua. Geol. Magazine 98, 1, p. 1-17.
(Musa Valley area rocks of Papuan Ultramafic Belt outcrop over 25x 45 miles, part of folded layered sequence of magnesian dunite and peridotite. Agglomerate-like breccias of fragments of ultramafic rock in variable matrix occur as irregular vent-like bodies in peridotite and as horizontal sheets in Pleistocene-Recent sediments. Breccias interpreted as vent and extrusive breccias resulting from penetration, brecciation and local entrainment (fluidization) of peridotitic country rock by volcanic gases)

Green, R. & R.B. Pitt (1967)- Suggested rotation of New Guinea. J. Geomagn. Geoelectr. 19, p. 317-321.
(online at: www.jstage.jst.go.jp/article/jgg1949/19/4/19_4_317/_pdf)
(Palaeomagnetic sampling at 8 Cretaceous- Recent sites in New Guinea (no locality map; mainly N of Central Range?) suggest increase in westerly declination with age, stretching back as far as Cretaceous (U Cretaceous sample= Chimbu River volcanics). Australia and New Guinea moved N during Tertiary, with New Guinea rotating anticlockwise)

Gregory, J.W. & J.B. Trench (1916)- Eocene corals from the Fly River, Central New Guinea. Geol. Magazine, N.S., 3, 11, p. 481-488.
(Descriptions of fossil corals in river float collected by MacGregor in 1890 in Fly River area S of Macrossan Island. Probably M Eocene age. Descriptions of Feddenia, Circophyllia and new species Stylophora papuensis, Stylina macgregori, Leptoria carnei, Dachiardia macgregori, Plesiastrae horizontalis, Kobya hemicribriformis)

Gregory, J.W. & J.B. Trench (1916)- Eocene corals from the Fly River, Central New Guinea (2). Geol. Magazine, N.S., 3, 12, p. 529-536.

(online at: http://onlinelibrary.wiley.com/doi/10.1029/1999TC900009/pdf)
(PNG folbelt at least 2 major orogenic loading events: (1) start of Miocene and marking initial docking of an exotic terrane with Australian craton; associated with widespread carbonate deposition and (2) earliest Pliocene main phase of fold-thrust belt uplift, representing ongoing history of collision at NE margin of Australian continent)

Haig, D.W. (1979)- Early Jurassic foraminiferids from the western Highlands of Papua New Guinea. Neues Jahrbuch Geol. Palaont., Monatshefte 4, p. 208-215.
(Sinemurian-Pliensbachian shelfal foraminifera from gently folded Balimbu greywacke in upper Jimi River area near Mongum, S foothills of Bismarck Range in western (should be eastern?) PNG Highlands. Assemblage dominated by nodosarians and includes Lingulina, Frondicularia, Involutina liassica. No agglutinants)

Haig, D.W. (1981)- Mid-Cretaceous foraminiferids from the Wahgi Valley, Central Highlands of Papua New Guinea. Micropaleontology 27, p. 337-351.
(Albian-Cenomanian open marine forams from Kondaku Tuff and Chim Fm at N flank Kubor Anticline. Cretaceous overlies Jurassic Maril shale with minor unconformity. Planktonic forams include Favusella washitensis, Hedbergella delrioensis, Hedbergella implicissima, Planomalina buxtorfi, Praeglobotruncana, Rotalipora appenninica, R. greenhornensis, etc. Diverse benthic assemblage, dominated by agglutinants)

Haig, D.W. (1982)- Deep-sea foraminifera from Paleocene sediments, Port Moresby, Papua New Guinea. J. Foraminiferal Research 12, 4, p. 287-279.
(online at: http://jfr.geoscienceworld.org/content/12/4/287.full.pdf)
(Tropical Paleocene (P1-P7) planktonic foram assemblages from lower bathyal calcareous mudstones in highly folded 'Port Moresby Beds'. No stratigraphic sections, limited geologic context)

Haig, D.W. (1985)- *Lepidocyclina* associated with Early Miocene planktic foraminiferids from the Fairfax Formation, Papua New Guinea. In: J.M. Lindsay (ed.) Stratigraphy, palaeontology, malacology; papers in honour of Dr. Neil Ludbrook, South Australia Dept. Mines and Energy Spec. Publ. 5, p. 117-131.
(Friable bathyal marine mudstone in upper Fairfax Fm 25 km NW of Port Moresby with Early Miocene/ Burdigalian zone N7 planktonic foraminifera and displaced shallow marine Lepidocyclina (Nephrolepidina) sumatrensis, L. (N.) ferreroi, L. (N) martini and Miogypsina, characteristic of Lower Tf Letter Stage. Average degree of curvature of Lepidocyclina embryon of 43% agrees with age-equivalent assemblages from Indonesia)

Haig, D.W. (1994)- Zone N18 in foreland basin and oceanic platform sequences, Lower Pliocene, Papua New Guinea. In: Forams '94 International Symposium on Foraminifera, Berkeley, Paleobios 16, 2, Suppl., p. 33.
(Planktonic and benthonic foraminifera from zone N18 in the siliciclastic Orubadi Beds of Papuan Foreland Basin. Type section >2000m thick and includes two mid bathyal- inner neritic shallowing upward sequences, Orubadi Beds and underlying Puri Lst (pelagic middle bathyal base of sequence) belong to N17B and N18. No reworking in foraminiferal assemblages, although reworked nannofossils and dinoflagellates flood mud-fraction of sediment, suggesting extensive sediment plumes clouded surface waters of foreland basin)

Haig, D.W. (1996)- Late Neogene bathyal depocentres in mainland Papua New Guinea. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 313-327.
(Late Miocene- Pliocene bathyal deposits in Papuan foreland basin, Aure Trough, SW border of Papuan Peninsula and N New Guinea basin. Significant crustal loading in central orogenic belt in PNG at ~8.5 Ma produced bathyal troughs in Purari depocenter (Orubadi Fm) and along SW margin of Papuan Peninsula. Sepik Basin rapid uplift at ~7 Ma and subsidence between 6.5- 2 Ma. Onset of unroofing of Finisterre terrane between 4.1-3.1 Ma. Spine of mainland PNG was barrier to oceanic circulation: Papuan assemblages 'Trans-Equatorial', with Gr. menardii/ Gr. limbata/ Globigerinoides; N New Guinea assemblages dominated by Gr. tumida group)

Haig, D.W., G.S. Humphreys, R. Rogerson & G. Francis (1986)- Field guide to the Kubor Anticline, Central Highlands. 12th Int. Sedimentological Congress, Canberra 1986, Field trip 34B, Geol. Survey of Papua New Guinea, Port Moresby, p.

Haig, D.W. & D.A. Lynch (1993)- A late early Albian marine transgressive pulse over northeastern Australia, precursor to epeiric basin anoxia: foraminiferal evidence. Marine Micropaleontology 22, 4, p. 311-362.
(Major transgressive pulse in late E Albian in W Papuan Basin, changing character of foraminiferal faunas from impoverished agglutinated-dominated Ammobaculites assemblages to diverse calcareous Marssonella/ Hedbergella assemblages. Similar change in coeval deposits of other basins on NE margin of Australian continent (incl. black shales of Toolebuc Fm). Rapid marine regression in W Papuan Basin immediately after latest Albian)

Haig, D.W. & S. Malagun (1980)- Uppermost Cretaceous and lowermost Tertiary sediments around Bogoro Inlet near Port Moresby, Papua New Guinea. Science in New Guinea 7, 1, p. 12-21.
(Maastrichtian-Paleocene deep marine limestones with planktonic foraminifera, unconformably overlain by Eocene calcarenite with larger forams, incl. Pellatispira)

Haig, D.W. & D. Medd (1996)- Latest Miocene to early Pliocene bathymetric cycles related to tectonism, Puri Anticline, Papuan Basin, Papua New Guinea. Australian J. Earth Sci. 43, 3, p. 451-465.
(Four bathyal-to-neritic progradational clastics cycles in 2000m thick Orubadi Fm (Late Miocene- E Pliocene N17B-N18; ~6.2-4.7 Ma) in Puri Anticline, Papuan foreland basin near frontal foldbelt, overlying Late

Miocene pelagic Puri Limestone. Cycles reflect pulses of folding. Development of foredeep either in lower N17 or N16; ~11.5- 7 Ma?)

Hebberger, J.J. (1992)- A synthesis of regional elements of the Papuan fold and thrust belt of Papua New Guinea. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015. *(Abstract only)*
(Evolution of PNG fold- thrust belt: (1) development of passive margin during Late Triassic-Early Jurassic rifting, with escape of Kubor Anticline continental fragment to NE, causing development of restricted marine basin with Late Triassic and Jurassic source rocks. Basin affected depositional extent of Cretaceous-Tertiary rocks (e.g. Cretaceous Toro Sst, Miocene Darai Lst). Cretaceous deposition caused maturation of Jurassic source and migration into passive margin traps around basin margins. Pliocene-Pleistocene collision along N margin of New Guinea caused development of Papuan fold-thrust belt, uplift and movement of Kubor Anticline back to SW, partially over basinal area, and remigration of oil into thrust belt structures)

Hebberger, J.J., S.P. Franklin, W.H. Uberawa & A.M. Pytte (2000)- Development of the Iagifu-Hedinia Field, PNG fold belt; a multi-disciplinary reservoir management success story. Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 40, 1, p. 546-561.
(Iagifu-Hedinia oil field discovered by Chevron in 1986 in PNG Highlands. Discovered without seismic data due to intense karst development in area. First oil produced in 1992)

Hebberger, J.J. & J.C. Phelps (1992)- Change in structural style from thin-skinned to thick-skinned along the strike of the Papuan fold and thrust Belt, Papua New Guinea. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015. *(Abstract only)*
(In Papuan fold-thrust belt gradual (150 km) change along strike from thin-skinned thrust folds with 1-8 km spacing in area of Iagifu/Hedinia oil discoveries to 20-40 km wide basement-involved folds near Irian Jaya border. No dramatic difference in thickness or composition of U Jurassic- Tertiary sediments evident. Gravity data suggest increase in depth to granitic basement along strike, but not in same area as change thin- to thick-skinned thrusting. Change in style may be related to different levels of detachment. In both areas two major detachment levels: one 15-20 km below top of basement, one near base of sedimentary section)

Hegner, E. & I.E. Smith (1992)- Isotopic compositions of Late Cenozoic volcanics from southeast Papua New Guinea; evidence for multi-component sources in arc and rift environments. Chemical Geology 97, p. 233-249.
(Transition from collisional to extensional tectonics in SE Papuan Peninsula reflected in cessation of arc-type volcanism and eruption of rifting-related transitional basalts. Trachytes inherited isotopic signatures either from lower crust recycled into upper mantle, possibly during Mesozoic rifting of Australian craton, or from unknown ancient continental block in Late Cretaceous basement of E PNG)

Hill, K.C. (1987)- New tectonic framework for PNG and the Caroline Plate: implications for cessation of spreading in back-arc basins. In: E. Brennan (ed.) Proc. Pacific Rim Congress 1987, Gold Coast, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 179-182.

Hill, K.C. (1989)- The Muller anticline, Papua New Guinea: basement-cored, inverted extensional fault structures with opposite vergence. Tectonophysics 158, p. 227-245.
(Papuan Foldbelt two dominant structural styles: (1) in NE 1 km thick, thin-skinned thrust-imbricate slices of Miocene limestone, (2) in SW much larger asymmetrical folds, with thicker stratigraphic sections, resulting from Mio-Pliocene inversion of Mesozoic- Paleogene extensional faults. Outcrop of basement in centre of Muller Range 8 km above regional. E Muller anticline basement thrust to SW, W Muller anticline thrust to NE. Faults under Muller anticline active as extensional faults in Mesozoic, soling at mid-crustal detachment. Extensional faults beneath EMA and WMA opposite vergence and separated by transfer zone)

Hill, K.C. (1990)- Structural styles and hydrocarbons in the Papuan Fold Belt, a review. In: G.J. & Z. Carman (eds.) Petroleum Exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby, p. 301-310.
(Early version of numerous Hill PNG structure papers)

Hill, K.C. (1991)- Structure of the Papuan Fold Belt, Papua New Guinea. American Assoc. Petrol. Geol. (AAPG) Bull. 75, 5, p. 857-872.
(Papuan lithosphere rel. weak, dissected by Mesozoic faults that partly reactivated during Neogene compression, forming basement-involved anticlines)

Hill, K.C. (1991)- Timing of deformation and thermal history in Papua New Guinea: a review. Petroleum Expl. Soc. Australia (PESA) Journal 19, p. 62-67.
(Apatite fission track analysis of Fly Platform and S Papuan Fold Belt suggests widespread M Cretaceous volcanism and Late Cretaceous thermal maximum, probably related to rift-drift in Coral Sea. Most N and W samples reached thermal maximum during Pliocene deformation of Papuan foldbelt. Rapid uplift of basement-cored Muller Anticline in W Papuan Foldbelt and Kubor Anticline in E Papuan Fold Belt at 4.0 ± 0.5 Ma (Kubor thrusting continuing to present day. Cretaceous and Miocene granites NE of Kubor Anticline uplifted at 10- 5 Ma, part of ongoing shortening in C PNG over last 10 Ma, propagating to SW)

Hill, K.C., K. Bradey, J. Iwanec, N. Wilson & K. Lucas (2008)- Structural exploration in the Papua New Guinea fold belt. In: J.E. Blevin et al. (eds.) Third Eastern Australasian Basins Symposium, Sydney 2008, Petroleum Expl. Soc. Australia (PESA) Spec. Publ., p. 225-238.
(In PNG foldbelt large N-S-striking Triassic folds within basement, that influenced subsequent faulting, facies changes and reservoir compartments. Early inversion faults pre-requisite to substantial offset on thin-skinned detachments. Early structures probably trapped migrating hydrocarbons; subsequent thin-skinned deformation decapitated inversion crests, retaining hydrocarbons in newly folded and thrusted hanging wall structures)

Hill, K.C., J. Forwood, C. Rodda, C. Smyth & G. Whitmore (1993)- Structural styles and hydrocarbon prospectivity around the northern Muller anticline, PNG. In: G.J. & Z. Carman (eds.) Petroleum exploration and development in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby, p. 325-324.
(Discussion of surface anticlines N of large Muller Anticline in W PNG foldbelt, with Triassic (222 Ma) granodiorite basement and Mesozoic sandstones exposed in core)

Hill, K.C. & A.J.W. Gleadow (1989)- Uplift and thermal history of the Papuan Fold Belt, Papua New Guinea: apatite fission track analysis. American Assoc. Petrol. Geol. (AAPG) Bull. 75, p. 857-872.

Hill, K.C. & A.J.W. Gleadow (1989)- Uplift and thermal history of the Papuan foldbelt, Papua New Guinea: apatite fission track analysis. Australian J. Earth Sci. 36, p. 515-539.
(Papuan fold belt uplifted and eroded from earliest Pliocene (5 Ma) to present, suggesting Late Miocene collision of New Guinea with island arc to N. Mountain front anticlines like Iehi underwent heating in Late Cretaceous, prior to Paleocene uplift and associated with opening of Coral Sea. Thermal modelling of Iehi 1 indicates ~800m of Late Cretaceous eroded in Paleocene)

Hill, K.C. & A.J.W. Gleadow (1990)- Apatite Fission Track analysis of the Papuan Basin. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby, p. 119-136.
(Widespread Albian volcanogenic detritus in Papuan Basin and E Australia probably sourced from N PNG. AFTA of Ieru Fm in S Papuan basin suggest no heating above 60°C, so underlying Jurassic at best marginally mature for hydrocarbons. S Papuan basin probably at max. T in Late Cretaceous, before Paleogene uplift)

Hill, K.C., G. Grey, D. Foster & R. Barrett (1993)- An alternative model for the Oligo-Miocene evolution of the northern PNG and the Sepik-Ramu basins. In: G.J. & Z. Carman (eds.) Petroleum exploration and development in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby, p. p. 241-259.
(N New Guinea underwent extension in Late Oligocene- E Miocene, probably related to initiation of oblique southern subduction under New Guinea margin (not compression as suggested in other models; there is no obvious body colliding at that time). Mid-crustal rocks with E Miocene cooling ages are local metamorphic core complexes. M Miocene volcanic detritus fill of Sepik- Ramu basins from Maramuni Arc. Late Miocene

collision of Adelbert-Finisterra Arc resulted in compressional deformation through much of New Guinea and transpressional regime in Sepik area)

Hill, K.C. & K.A. Hegarty (1987)- New tectonic framework for PNG and the Caroline Plate: implications for cessation of spreading in back-arc basins. In: Pacific Rim Congress 87, Gold Coast 1987, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 179-182.
(New plate tectonic scenario for N PNG. In N New Guinea Late Oligocene- E Miocene obduction of Mesozoic oceanic crust, followed by S-dipping subduction beneath New Guinea causing extensive M Miocene volcanism. E Pliocene uplift/ folding of main Papuan Foldbelt at ~4 Ma tied to collision of extinct Eocene- Oligocene island arc system with New Guinea margin)

Hill, K., J. Iwanec & D. Lund (2012)- Near-field, subthrust and deep reservoir tests of the Kutubu oil and gas fields, Papua New Guinea. AAPG Int. Conf. Exhib., Singapore 2012, Search and Discovery Art. 20183, p. 1-34. *(Presentation)*
(online at: www.searchanddiscovery.com/documents/2012/20183hill/ndx_hill.pdf)
(Kutubu oil field (= Iagafu- Hedinia) is thrust-faulted anticline in Papuan Fold-Belt, en echelon to smaller Agogo oil field. Structures first drilled in mid-80's and produced over 300 MBO from basal Cretaceous Toro and Digimu sst reservoirs. Reservoirs overlain by ~1 km of Cretaceous shale and ~1 km of Miocene limestone. Kutubu subthrust structure drilled in 2011. Toro-Digimu reservoirs overturned in footwall, with oil-bearing Toro. Koi-Iange test further back on Kutubu field encountered interbedded sands-shales of Koi-Iange Fm)

Hill, K.C., K. Lucas & K. Bradey (2010)- Structural styles in the Papuan Fold Belt, Papua New Guinea: constraints from analogue modelling. In: G.P. Goffey et al. (eds.) Hydrocarbons in contractional belts, Geol. Soc., London, Spec. Publ. 348, p. 33-56.
(Structural styles in oil-producing areas of Papuan Fold Belt include inverted basement faults, detachment faults in Jurassic 1-2 km beneath Neocomian Toro Sst reservoir, and tight, overturned folds in reservoir sequence. Highly variable thicknesses in Cretaceous Ieru Fm, including detachments that isolate Miocene Darai Limestone. Large-offset thrust faults only produced in models with pre-cut faults, generating early inversion then large ramp anticlines, similar to Kutubu oil field. Kutubu oilfield trend probably underlain by large normal fault and oil-rich source rocks may be confined to hanging wall (N side) of this fault)

Hill, K.C. & L. Mahoney (2018)- Compressional evolution of the PNG margin from an orogenic transect from Juha to the Sepik. In: Proc. Australian Exploration Geoscience Conf. (AEGC 2018), Sydney, ASEG Extended Abstracts 2018, 1, p. 1-3. *(Extended Abstract)*
(online at: www.publish.csiro.au/ex/pdf/ASEG2018abT5_3A)
(Regional restored cross-section across PNG orogenic belt shows Oligocene- Recent compressional deformation of margin. N end of section with Landslip Metamorphics, an accreted continental terrane, separated from main foldbelt by Jurassic April Ultramafics/ Om Metamorphics/ Eocene volcanics, together constituting accretionary prism. Suture overlain by Miocene sediments indicating Oligocene docking prior to E Miocene subsidence, consistent with E Miocene extension in PNG and emplacement of metamorphic core complexes in Sepik area. Neogene compression started at ~12 Ma with shortening of ~12mm/yr from 12-4 Ma, and 2.5mm/yr from 4-0 Ma, consistent with change in structural style in foldbelt from thrust to more ductile, fold-dominated deformation. Etc.)

Hill, K.C., D. Medd & P. Darvall (1990)- Structure, stratigraphy, geochemistry and hydrocarbons in the Kagua-Kubor area, Papua New Guinea. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby 1990, p. 351-366.
(Structural geology of in Kagua area, 70 km SW of Kubor anticline)

Hill, K.C., M.S. Norvick, J.T. Keetley & A. Adams (2000)- Structural and stratigraphic shelf-edge hydrocarbon plays in the Papuan fold belt. In: P.G. Buchanan et al. (eds.) Papua New Guineaĝs petroleum industry in the 21st Century, Proc. 4th PNG Petroleum Convention, Port Moresby, p. 67-85.
(PNG Mesozoic-Tertiary shelf-basin transition 20-50 km NE of main oil-gas fields and penetrated by only one well. Interpreted to be long-lived fault zone, with thick basinal facies to N. In S shallow marine Miocene

limestone unconformable over Lower Cretaceous shelf clastics; in N more complete Upper Cretaceous-Miocene deep water marls. Numerous oil seeps. Main potential reservoir Lower Cretaceous Toro sst, but possibly distal facies. Re-entrants may have focused Toro fans)

Hill, K.C. & A. Raza (1999)- Arc-continent collision in Papua Guinea: constraints from fission track thermochronology. Tectonics 18, p. 950-966.
(Paleogene arc along S margin of Caroline plate juxtaposed against PNG in E Miocene, coeval with locking of W-dipping Solomon subduction zone by Ontong Java Plateau. These events initiated wrenching along N PNG margin. Mobile Belt underwent extension above downgoing slab with rapid cooling of metamorphic rocks at 17 Ma, immediately before emplacement of Maramuni Arc from 17-12 Ma. Change in plate motion at 12-10 Ma terminated arc and caused PNG-Caroline plate convergence, creating New Guinea orogenic belt from 12 -4 Ma. This resulted in ~4.5 km of uplift and ~3 km of denudation and cooling of entire Mobile Belt in Late Miocene, propagating W along Mobile Belt at 8-5 Ma and S-ward into Fold Belt at 5-4 Ma. Change in plate motion at 4-3 Ma returned margin to transpression with local compression along strike-slip faults and ongoing collision of Finisterre Arc terrane)

Hill, K.C., R.J. Simpson, R.D. Kendrick, P.V. Crowhurstt, P.B. O' Sullivan & I. Saefu (1996)- Hydrocarbons in New Guinea, controlled by basement fabric, Mesozoic extension and Tertiary convergent margin tectonics. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 63-76.
(PNG mobile belt formed by Oligocene compression followed by E Miocene extension. Foldbelt hydrocarbons largely controlled by basement architecture and style of folding-thrusting. Bosavi lineament separates oil province to E from gas province in W)

Holm, R.J. (2013)- Magmatic arcs of Papua New Guinea: insights into the late Cenozoic tectonic evolution of the northern Australian plate boundary. Ph.D. Thesis, James Cook University, p. 1-220.
(online at:http://researchonline.jcu.edu.au/32125/)
(Late Cenozoic Maramuni Arc intrudes New Guinea Orogen. Early arc magmatism in U Oligocene, with initiation of subduction beneath New Guinea. Arc magmatism related to N-dipping subduction punctuated by arrival of Australian continent at ~12 Ma, etc. Inherited zircon populations in Quaternary volcanics help identify northern extension of Tasman Line under younger crust)

Holm, R.J. & B. Poke (2018)- Petrology and crustal inheritance of the Cloudy Bay Volcanics as derived from a fluvial conglomerate, Papuan Peninsula (Papua New Guinea): an example of geological inquiry in the absence of in situ outcrop. Cogent Geoscience 4, 1, p. 1-26.
(online at: https://www.tandfonline.com/doi/full/10.1080/23312041.2018.1450198)
(Clasts from isolated conglomerate outcrop in SE Papuan Peninsula with 9 types of volcanic rocks, from basalts to trachyandesites. Zircon U-Pb dating of volcanic clasts indicates activity of Cloudy Bay Volcanics mainly latest Miocene, between (~7- 5 Ma). Hf-isotopes of primary igneous zircons suggests relatively unradiogenic crustal contribution to magma compositions)

Holm, R.J., S. Richards, C. Spandler & G. Rosenbaum (2013)- Tracking the Tasman Line in New Guinea: insights into the role of major structure at accretionary margins. Asia Oceania Geosc. Soc. (AOGS) 10th Ann. Meeting, Brisbane, SE26-A004. *(Abstract and Poster)*
(Tasman Line of E Australia is continental suture, separating E margin of Precambrian basement from W limit of Phanerozoic Tasmanides. Extension into New Guinea in W Papua New Guinea indicated by Quaternary magmatism (more intense volcanism in E, inherited zircons of Paleoproterozoic age (~1850 Ma) in W; Permian-Triassic (~250, 270 Ma) age peaks in E), morphological changes in axial ranges of New Guinea, dramatic displacement of Papuan ophiolite belt, etc. Important implications for understanding the occurrence of mineral deposits in region)

Holm, R.J., G. Rosenbaum & S.W. Richards (2016)- Post 8 Ma reconstruction of Papua New Guinea and Solomon Islands: Microplate tectonics in a convergent plate boundary setting. Earth-Science Reviews 156, p. 66-81.
(Since ~6 Ma crustal elements that comprise PNG and Solomon Islands began interacting with impending collision between Ontong Java Plateau and Australian continent, leading to regional microplate tectonics and escalation in tectonic complexity. Bismarck Sea initially formed as back-arc basin behind New Britain arc, but later modified during arc-continent collision. Ttc.)

Holm, R.J., C. Spandler & S.W. Richards (2015)- Continental collision, orogenesis and arc magmatism of the Miocene Maramuni arc, Papua New Guinea. Gondwana Research 28, 3, p. 1117-1136.
(Late Miocene (~12- 6 Ma and older?) Maramuni arc in E Papuan Highlands with intrusive rocks in Kainantu region. From ~12-9 Ma subduction-zone magmas, with increasing incompatible trace element contents and decreasing εHf with time, reflecting increase in crustal component of magmas. Porphyry suites emplaced at 7.5-6 Ma with HREE-depletion. Geodynamic model involves arrival of Australian continent at N-dipping slab at Pocklington Trough (=W continuation of Aure Trough) from ~12 Ma. Continent collision led to underthrusting of leading continental margin, contributing crustal material to magma at ~9 Ma. From ~7 Ma slab break-off and lithospheric delamination reflected in second phase of orogenesis that produced HREE-depleted geochemical signatures of magmatic rocks. Small proportion of zircons Late Permian-M Cretaceous ages (previous interpretations show S-dipping slab from N New Guinea Trench?; JTvG))

Holm, R.J., S. Tapster, H.A. Jelsma, G. Rosenbaum & D.F. Mark (2019)- Tectonic evolution and copper-gold metallogenesis of the Papua New Guinea and Solomon Islands region. Ore Geology Reviews 104, p. 208-226.
(Review of PNG and Solomon islands mineral deposits. Convergence at Pacific-Australia plate boundary from 45 Ma accommodated by subduction at Melanesian trench, with related arc magmatism. Arrival of Ontong Java Plateau at trench at ~26 Ma resulted in cessation of subduction, immediately followed by formation of Cu-Au porphyry-epithermal deposits at 24-20 Ma throughout Melanesian arc. Late Oligocene- E Miocene tectonic reorganization led to initiation of subduction at Pocklington trough, and onset of magmatism in Maramuni arc. Arrival of Australian continent at Pocklington trough by 12 Ma resulted in continental collision and ore deposit formation from 12-6 Ma (Cu-Au porphyry deposits in New Guinea Orogen, epithermal Au systems in Papuan Peninsula). From 6 Ma crustal delamination in PNG related to prior Pocklington trough subduction resulted in adiabatic mantle melting with emplacement of diverse Cu and Au porphyry and epithermal deposits within Papuan fold-thrust belt and Papuan Peninsula from 6 Ma- today)

Klootwijk, C., J. Giddings & C. Pigram (1993)- Palaeomagnetic constraints on terrane tectonics: Highlands and Sepik regions, Papua New Guinea. Exploration Geophysics (Bull. Soc. Australian Exploration Geophysicists) 24, 2, p. 291-294.
(New Guinea more than 32 terranes of oceanic, continental or composite affinity. Paleomagnetic control on terrane movement of mainland New Guinea restricted to Birds Head of Indonesian West Papua (Giddings et al., 1993), and North Sepik and Highland regions of Papua New Guinea. Paleocene- E Miocene Bliri Volcanics of Bewani- Torricelli Arc complex in N Sepik region show overprint acquired at latitude of ~150 °S, attributed to latest-Oligocene-E Miocene accretion of arc onto N margin of Australian plate. Declinations from Bliri Volcanics and cover sediments show meridional trend and indicate CCW rotations of Bewani-Torricelli Arc between 30°-110° relative to Australian craton. Also CCW rotations between 30°-100° in Kubor Anticline and Jimi terrane. In Mendi area of S Highlands CW rotations of 30°-50°)

Klootwijk, C., J. Giddings, C. Pigram, C. Loxton, H. Davies, R. Rogerson & D. Falvey (2003)- Papua New Guinea Highlands: palaeomagnetic constraints on terrane tectonics. Tectonophysics 362, p. 239-272.
(Paleomagnetic study of 21 localities in PNG Highlands. Three magnetic components: (1) recent overprint; (2) mainly normal polarity overprint during M-L Miocene intrusive activity in central cordillera; (3) primary component. Interior zone with Triassic- Miocene of Kubor Anticline, Jimi Terrane and Yaveufa Syncline in C and E Highlands 30°- 100°+ CCW rotations. Exterior zone is basement-involved Pliocene foreland fold-and-thrust belt in S Highlands. Exterior zone 30°- 50°+ clockwise rotations in Mendi area. Contrasting rotations across Tahin and Stolle-Lagaip-Kaugel Fault zones indicate decoupling of zones. CCW rotations in Kubor Anticline-Jimi Terrane cratonic spur interpreted as non-rigid rotation of continental terranes as they were transported W across NE Australian craton margin. This margin became reorganised after M Miocene, when N-advancing Australian craton impinged into W-moving Pacific plate/buffer-plate)

Klootwijk, C., J. Giddings, C. Pigram, C. Loxton, H. Davies R. Rogerson & D. Falvey (2003)- North Sepik region of Papua New Guinea: palaeomagnetic constraints on arc accretion and deformation. Tectonophysics 362, p. 273-301.
(Bewani-Torricelli Arc of N Sepik, Paleocene- E Miocene Bliri Volcanics counterclockwise rotations of 30°+-110°+ relative to Australian craton, and clockwise rotations of 100°- 170°+ of detached Tring Block. Latitudinal evolution of Bewani-Torricelli Arc similar to Baining Arc (Finisterre-Huon-New Ireland-New Britain), and indicates N-ward movement from ~30°S in Late Eocene to ~15°S in E-M Miocene, suggesting both arcs may be parts of larger E-W-oriented arc complex, possibly located on Pacific plate prior to accretion)

Klootwijk, C., J. Giddings, W. Sunata, C. Pigram, C. Loxton, H. Davies, R. Rogerson & D. Falvey (1987)- Paleomagnetic constraints on terrane tectonics in New Guinea. In: E. Brennan (ed.) Proc. Pacific Rim Congress 1987, Gold Coast, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 237-239.
(Paleomagnetic work for New Guinea shows common Late Tertiary overprints. Birds Head probably some N-ward movement relative to Australia between M Eocene and M Miocene and some post E-M Miocene counterclockwise rotation. In N Sepik region Torricelli and Border Mountain blocks 100° or more CCW rotations. In Highlands Kubor Block 50-100°CCW rotation)

(Book on landforms and geomorphological processes in Papua New Guinea, linked to geologic history)

Loffler, E. (1978)- Karst features in igneous rocks in Papua New Guinea. In: J.L. Davies & M.A.J. Williams (eds.) Landform evolution in Australasia, Australian Nat. University Press, Canberra, p. 238-249.

Loffler, E., D.E. MacKenzie & A.W. Webb (1980)- Potassium-Argon ages from some of the Papua New Guinea volcanoes and their relevance to Pleistocene geomorphic history. J. Geol. Soc. Australia 25, p. 387-397.
(PNG Highlands volcanics ages suggest start of volcanic activity at 1.6 Ma, major activity ceasing at 0.2 Ma. Glacial activity on Mt Giluwe may date back to 0.7 Ma, and certainly to ~0.3 Ma, indicating altitudes of present magnitudes existed early in Pleistocene, and that most volcanism postdates uplift of central ranges)

Loudon, A.G. (1987)- Gold in Papua New Guinea. In: E. Brennan (ed.) Proc. Pacific Rim Congress 1987, Gold Coast, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 767-772.
(Brief history of gold discovery and production in PNG)

Lowenstein, P.L. (1982)- Economic geology of the Morobe Goldfield, Papua New Guinea. Geol. Survey of Papua New Guinea, Port Moresby, Memoir 9, 2 vols., p. 1-228.
(Review of discovery, exploitation, geology and economic potential of Morobe Goldfield of E PNG (includes Bulolo, Edie Creek, Wau, etc.))

Lowenstein, P.L. & P.E. Pieters (1974)- Gold and platinum in the East and West Sepik Districts. Dept. of Lands, Surveys and Mines, Geol. Survey of Papua New Guinea, Report 74/25, p. 1-32.

Lucas, K. (2004)- Physical analog modelling of primary stratigraphic and structural controls on the evolution of the Papuan fold belt, Papua New Guinea, with implications for hydrocarbon exploration. M.Sc. Thesis Queen's University, Kingston, ON, Canada, 117p. *(Unpublished)*
(Papuan Foldbelt structures range from thin-skinned deformation of cover to reactivation of extensional basement faults. Scaled physical analog models used to predict structural style. Modelling of reactivation of extensional faults in thin-skinned setting indicates reactivation may occur early in deformation sequence, locally absorbing majority of shortening and controlling location of fold versus thrust-dominated structures)

Lus, W.Y., I. McDougall & H.L. Davies (2004)- Age of the metamorphic sole of the Papuan Ultramafic Belt ophiolite, Papua New Guinea. Tectonophysics 392, p. 85-101.
(Papuan Ultramafic belt >400km long, 12 km thick. Probably Maastrichtian age oceanic crust (Ar-Ar ages 67-59.5 Ma). Emplaced during collision of Cape Vogel island arc and rifted fragment of Australia around K-T boundary. Thick metamorphic sole of 300m amphibolite-granulite, grading into lower-grade Emo metamorphics, cooled at ~58 Ma, Paleocene)

Lynch, D.A. & G.J. Milner (1993)- The Maastrichtian- Danian disconformity in the Mendi-Nipa region, Southern Highlands Province, Papua New Guinea. In: G.J. & Z. Carman (eds.) Petroleum Exploration in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby 1993, p. 61-73.
(Stratigraphic gap across K-T boundary of 2 My (66.4-64.5) in Mendi-Nipa Region in PNG Southern Highlands, in more proximal Nipa region 4.5 My (69- 64.5 Ma))

MacKenzie, D.E. (1975)- Plate boundary evolution in the New Guinea region: Volcanic and plate tectonic evolution of central Papua New Guinea. Exploration Geophysics (Bull. Soc. Australian Exploration Geophysicists) 6, 2/3, p. 66-68.
(Volcanic activity in C PNG began in Late Triassic with submarine and terrestrial eruption of andesitic and dacitic lavas on and neaar NE corner of Australian Paleozoic continental crust. Minor basaltic to rhyolitic eruptions in Jurassic in same general area. In Cretaceous, volcanic activity increased in intensity and distribution, spreading to N and W, with mainly andesitic lavas, which may correlate with beginning of spreading in Pacific basin to NE and could be first subduction in area. No evidence to link earlier volcanism with subduction, although it took place near plate boundary).

MacKenzie, D.E. (1976)- Nature and origin of late Cainozoic volcanoes in western Papua New Guinea. In: R.W. Johnson (ed.) Volcanism in Australasia, Elsevier, Amsterdam, p. 221-238.
(Of Late Cenozoic volcanic centers in W PNG 16 rest on 25-30km thick Paleozoic crust and 10km of post-Paleozoic sediments; one on 35km thick pile of eugeosynclinal sediments. Basaltic rocks dominant in 11 centers, others mainly andesite. Magmas originated in upper mantle low velocity layer)

MacKenzie, D.E. (1978)- Plate-tectonic evolution and delayed partial melting in Western Papua New Guinea. Exploration Geophysics 9, p. 89-90.
(See also Johnson et al. 1978. Late Cenozoic volcanoes in PNG Highlands overlie cratonic crust but produce arc-type volcanics. Mantle magma source chemically modified during subduction and passed through rapid and pronounced changes in tectonic setting may later on be source of magmas produced during favourable but non-arc tectonic regime)

MacKenzie, D.E. & B.W. Chappell (1972)- Shoshonitic and calc-alkaline lavas from the Highlands of Papua New Guinea. Contrib. Mineralogy Petrology 35, p. 50-62.

(Pleistocene- Recent stratovolcanoes in PNG Highlands calc-alkaline to shoshonitic lava, tuff, agglomerate, ash, and lahars. Volcanics originated either in base of thick sialic crust which is undergoing stabilization after major orogeny and uplift, or more probably, in eclogite sinking through underlying mantle)

MacKenzie, D.E. & R.W. Johnson (1984)- Pleistocene volcanoes of the western Papua New Guinea highlands: Morphology, geology, petrography, and modal chemical analyses. Bureau Mineral Res., Geol. Geophysics, Canberra, Report 246, p. 1-271.
(online at: https://www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=15157)
(15 Pleistocene composite stratovolcanoes in PNG highlands in S part of C and W Ranges and adjacent Fly-Purari plains, rising 1000-2000m above basement and up to 3800m above sea level. Volcanism began in E Pleistocene or Late Pliocene, largely complete by ~200 000 years B.P. Mainly basaltic (70-80%) and andesitic lavas. Basalts generally overlain by andesites. General decrease in silica-saturation from NNE to SSW)

Macnab, R.P. (1969)- Geology of the Area - Upper Dilava- Auga- Middle Angabunga Rivers Area, Papua. Bureau Mineral Res. Geol. Geophysics, Record No. 1969 /126, p. 1-49.
(Area NNW of Port Moresby. N- trending schists/ metasediments of Owen Stanley Metamorphics are flanked to W by similarly trending, steeply E-dipping marine sediments of Upper Cretaceous (Senonian) and Lower Miocene Auga Beds, underlain by U Cretaceous submarine basaltic Aibala Volcanics (overtrusting from E, probably in M Miocene). Auga River section >25,000' of sediments and volcanics. Lower Miocene limestones have common reworked Eocene forams. M Miocene Talama Volcanics unconformable over metamorphics and Auga Gp))

Madu, S. (1996)- Correlation sections of the Late Jurassic to Early Cretaceous succession in the Papuan fold belt, Papuan Basin. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 259-277.
(Twelve eustatic cycles around Toro and pre-Toro reservoir cross-sections along Agogo- Iagafu- Hedinia-Gobe fields trend. Sediment supply in Late Jurassic- E Cretaceous sandstones from SW)

Mahoney, L., K. Hill, S. McLaren, A. Hanani (2017)- Complex fold and thrust belt structural styles: examples from the Greater Juha area of the Papuan Fold and Thrust Belt, Papua New Guinea. J. Structural Geol. 100, p. 98-119.
(Greater Juha area in Eastern Muller Ranges of Papuan Fold Belt in PNG with evidence of major inversion, detachment and triangle zone faults. Exposed Cenozoic Darai Lst shows ~13-21% shortening, yet structures elevated up to 7 km above regional, suggesting inversion of pre-existing rift architecture. Pervasive arc-normal oriented structures related to weakened Paleozoic basement cross-structures that affected E Mesozoic rifting)

Mahoney, L., S. McLaren, K. Hill, B. Kohn, K. Gallagher & M. Norvick (2019)- Late Cretaceous to Oligocene burial and collision in western Papua New Guinea: indications from low-temperature thermochronology and thermal modelling. Tectonophysics752, p. 81-112.
(Late Cretaceous-Oligocene history in much of PNG unknown due to absence of stratigraphic record. New thermochronology data from Muller Range in Papuan fold-thrust belt suggests two major Cenozoic cooling events. Eocene-Oligocene cooling may relate to removal of 1500-3000 m of Late Cretaceous- Eocene before deposition of Darai Lst; may tie to collision of Sepik Terrane at N PNG margin. Muller Range uplift possibly in part facilitated by inversion of extensional faults. Well documented Neogene uplift tied to collision at N margin)

Maillet P., M. Monzier, M. Selo & D. Storzer (1983)- The D'Entrecasteaux Zone (Southwest Pacific); a petrological and geochronological reappraisal. Marine Geol. 53, 3, 179-197.

Papua New Guineaȏs petroleum industry in the 21st century, Proc. 4th PNG Petroleum Convention, Port Moresby, p. 475-485.
(Cross Catalina 1 well 51m net oil-saturation in E Cretaceous Woniwogi Fm sst, but low porosity due to quartz overgrowths (2-12%). Cross Catalina structure ~200 km2 and potential OIP may be >500 MBO)

Mason, R.A. (1994)- Structural evolution of the western Papuan fold belt, Papua New Guinea. Ph.D. Thesis, Royal School of Mines, Imperial College, University of London, p. 1-331.
(online at: https://spiral.imperial.ac.uk/handle/10044/1/37523)
(Papuan Fold Belt in PNG comprises deformed basement, platformal and basinal Mesozoic and Tertiary sediments. Deformation in fold belt started possibly in M-L Late Miocene and is currently continuing. Structure of W part of foldbelt characterised by thin-skinned thrusting and basement involved structures (inversion of Mesozoic-Tertiary extensional faults. Inversion thought to have post-dated initiation of thin skinned thrusting by ~5 Ma)

Mason, R.A. (1996)- Structure of the Western Papuan Fold Belt. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 161-173.
(Western Papuan foldbelt three structural domains: (1) frontal foldbelt with thick-skinned deformation (inversion folds over Mesozoic half-grabens); (2) central domain of thin-skinned imbricate thrust sheets of Darai Lst; (3) northern zone of intensely folded low-metamorphic rocks ('Om Beds' near Sepik River))

Mason, R.A. (1997)- Structure of the Alice anticline, Papua New Guinea: serial balanced cross-sections and their restoration. J. Structural Geol. 19, 5, p. 719-734.
(Structures of W part of Papuan Fold Belt both thin-skinned thrusting and basement involved structures. Alice anticline is frontal foldbelt basement-involved structure, formed due to inversion of older extensional fault system, with varying amounts of shortening along strike. Rotations about vertical axes attributed to pinning of foreland propagating deformation, coincident with relay zones in early extensional fault geometry)

Matsumoto, T. & S.K. Skwarko (1991)- Ammonites of the Cretaceous Ieru Formation, western Papua New Guinea. BMR J. Australian Geol. Geophysics 12, 3, p. 245-262.
(online at: www.ga.gov.au/corporate_data/49552/Jou1991_v12_n3.pdf)
(Eleven ammonite species from five localities in Ieru Fm (above Toro Sst) in W PNG Ok Tedi sheet. Four are typical Cenomanian species, others more likely Turonian- Santonian)

Matsumoto, T. & S.K. Skwarko (1993)- Cretaceous ammonites from South Central Papua New Guinea. AGSO J. Australian Geol. Geophysics 14, 4, p. 411-433.
(online at: www.ga.gov.au/corporate_data/81375/Jou1993_v14_n4_p411.pdf)
(Eleven ammonite species from 11 localities in Central Higlands and foothills to S, collected by APC 1954-1969. Fauriella boissieri from Maril Shale is part of Berriasian Tethyan fauna. Large Puzosia aff. mayoriana and Pachydesmoceras suggest Cenomanian age. Acanthoceras rhotomagense, Cunningtoniceras cunningtoni, etc. definitive Cenomanian age. Romaniceras deverianum indicates Turonian age.

(Porgera Au-Ag mineralization in two main stages: (1) disseminated auriferous pyrite in phyllic alteration zones and (2) fault-related, quartz-roscoelite-cemented hydrothermal breccias and veins with locally abundant free gold and Au-Ag-tellurides. Associated with Late Miocene (6 Ma) epizonal intrusive complex, emplaced in continental crust immediately prior to E Pliocene continent- island-arc collision)

Richards, J.P., C.J. Bray, D.M. DeR.Channer & E.T.C. Spooner (1997)- Fluid chemistry and processes at the Porgera gold deposit, Papua New Guinea. Mineralium Deposita 32, p. 119-132.
(Porgera gold deposit in PNG example of alkalic-type epithermal gold system (stage II), which overprints precursor stage of magmatic-hydrothermal gold mineralization (stage I))

Richards, J.P., B.W. Chappell & M.T. McCulloch (1990)- Intraplate-type magmatism in a continent-island arc collision zone: Porgera intrusive complex, Papua New Guinea. Geology 18, p. 958-961.
(Porgera intrusive emplaced in Late Miocene, 6 Ma in Jurassic-Cretaceous shelf-facies sediments near edge of Australasian plate, apparently in backarc environment during subduction of oceanic microplate segment on two sides beneath continental margin and an island arc)

Richards, J.P., B.W. Chappell & M.T. McCulloch (1991)- The Porgera gold deposit, Papua New Guinea, 1: Association with alkalic magmatism in a continent-island-arc collision zone. Brazil Gold '91 Conf., p. 307-312.
(online at: www.iaea.org/inis/collection/NCLCollectionStore/_Public/24/058/24058940.pdf)
(Mesothermal- epithermal Porgera gold deposit associated with shallow level (< 2 km emplacement depth) stocks and dykes of Porgera Intrusive Complex, emplaced at 6.0 ± 0 3 Ma near NE edge of Australian craton, during period of Late Tertiary terrane accretion. Magmatism may have been related to deep subduction beneath continental margin. Gold mineralization immediately followed emplacement of PIC at 5-6Ma. Porgera intrusive suite sodic alkali basalts/gabbros, hawaiites, and mugearites)

Richards, J.P. & R. Kerrich (1993)- The Porgera Gold Mine, Papua New Guinea: magmatic hydrothermal to epithermal evolution of an alkali- type precious metal deposit. Economic Geology 88, 5, p. 1017-1052.
(Porgera Au deposit in PNG highlands associated with Late Miocene (6.0 ±0.3 Ma) epizonal intrusive complex, with close relationship between mafic alkalic magmatism and precious metal mineralizations. Mineralization shortly preceded E Pliocene collision between NE Australasian continental margin and island arc)

Richards, J.P. & I. Ledlie (1993)- Alkalic intrusive rocks associated with the Mount Kare gold deposit, Papua New Guinea; comparison with the Porgera intrusive complex. Economic Geology 88, 4, p. 755-781.
(Mount Kare gold deposit discovered in 1986, 18 km SW of giant Porgera mine in PNG highlands. Both deposits associated with Late Miocene alkalic intrusives emplaced in Mesozoic-Tertiary shelf sediments near edge of Australian plate. K-Ar analysis of illite from altered rock records age of 5.5 Ma, in middle of age ranges of Porgera Au deposit (5.1- 6.1 Ma). Similar alkalic epithermal ore-forming processes at both locations)

Richards, J.P., M.T. McCulloch, B.W. Chappell & R. Kerrich (1991)- Sources of metals in the Porgera gold deposit, Papua New Guinea: evidence from alteration, isotope, and noble metal geochemistry. Geochimica Cosmochimica Acta 55, 2, p. 565-580.
(Porgera gold deposit associated with Late Miocene mafic alkalic Porgera Intrusive Complex, emplaced within continental crust near Lagaip Fault Zone, which represents Oligocene suture between Australian craton and Sepik Terrane volcano-sedimentary rocks. Magmatism at Porgera probably occurred in response to Late Miocene elimination of oceanic microplate and subsequent Early Pliocene collision between craton margin and arc system on Bismarck Sea plate. Gold mineralization occurred within 1 Ma of time of magmatism)

Richards, J.P. & I. McDougall (1990)- Geochronology of the Porgera gold deposit, Papua New Guinea; resolving the effects of excess argon on K Ar and 40Ar/ 39Ar age estimates for magmatism and mineralization. Geochimica Cosmochimica Acta 54, 5, p. 1397-1415.
(Mesothermal/epithermal gold mineralization in Porgera Intrusive Complex and sedimentary host rocks. Conventional K-Ar ages of hornblende from different intrusions between 7-14 Ma, but biotite separates concordant at 6.0 ± 0.3 Ma. Older apparent ages from conventional K-Ar and Ar/Ar analyses explained by excess 40Ar contamination. Late Miocene magmatism and mineralization occurred shortly prior to or during initiation of continent/arc collision and pre-dates Pliocene uplift and foreland deformation)

Richarz, P.S.R. (1910)- Der geologische Bau von Kaiser Wilhelms-Land nach dem heutigen Stand unseres Wissens. Neues Jahrbuch Mineral. Geol. Palaontologie, Beilage Band 29, p. 406-536.

Russell, N.J. (1990)- Application of vitrinite reflectivity to paleogeothermometry studies: some examples from Papua New Guinea basins. In: G.J. & Z. Carmen (eds.) Petroleum Exploration in Papua New Guinea, Proc. First PNG Petroleum Convention, Port Moresby, p. 403-420.
(On the use of vitrinite reflectivity for paleogeothermometry in PNG)

Ruxton, B.P. (1966)- Correlation and stratigraphy of dacitic ash-fall layers in northeastern Papua. J. Geol. Soc. Australia 13, 1, p. 41-67.
(Thick weathered dacitic ash for up to 48 km from Mount Lamington strato-volcano and thins with distance from it. Age of Mount Lamington ~90,000 years)

Ryburn, R.J. (1980)- Blueschists and associated rocks in the south Sepik region, Papua New Guinea; field relations, petrology, mineralogy, metamorphism and tectonic setting. Ph.D. Thesis University of Auckland, p. 1-220. *(Unpublished)*
(online at: https://researchspace.auckland.ac.nz/handle/2292/2448)
(Blueschists in S Sepik formed in N-dipping subduction zone, beneath Paleogene arc system accreted along N coast of New Guinea. Blueschists in allochthonous Tau body E-W lens (55 x 8 km) and smaller allochthons E of Tau. Blueschists in late-Mesozoic- Eocene Salumei Fm (mostly pelitic sediments derived from S) and in ophiolite fragments and other volcanogenic rocks, related to arc to N. Salumei Fm near Tau metamorphosed from prehnite-pumpellyite to low-greenschist grade during Oligocene- E Miocene metamorphism. Blueschists mostly mafic schists with blue amphibole. Metamorphic grade increases to N. Isolated mafic tectonic blocks in and N of Tau body include high-grade blueschist, eclogite and amphibolite, all metamorphosed mafic ophiolite. Metamorphic conditions require blueschists and eclogites formed in subduction system. Active and rapid transport is needed to bring these rocks back to shallow levels, and term 'retrojection' is coined)

(First report of Neocomian Iotrigonia (Zaletrigonia?) telefominiana n.sp. from western Central Range, PNG)

Skwarko, S.K. (1981)- *Nototrigonia cinotuta* (Bivalvia, mainly Lower Cretaceous) from northern Queensland and Papua New Guinea. Palaeontological Papers 1981, Bureau Mineral Res. Geol. Geophys., Bull. 209, p. 59-61.
(online at: www.ga.gov.au/corporate_data/59/Bull_209.pdf)

Skwarko, S.K. (1981)- *Spia*, a new Triassic bakevellid bivalve from Papua New Guinea. Palaeontological Papers 1981, Bureau Mineral Res. Geol. Geophys., Bull. 209, p. 63-64.
(online at: www.ga.gov.au/corporate_data/59/Bull_209.pdf)

(Spia janeki new species of bivalve Bakevellia (Spia) from U Triassic Jimi Greywacke, west-C PNG. Only two known species referable to Spia, both from Carnian-Norian of PNG. Spia viewed as subgenus of Bakevellia by Ros-Franch et al. 2014))

Skwarko, S.K. (1983)- *Somareoides hastatus* (Skwarko) a new Late Triassic bivalve from Papua New Guinea. Palaeontological Papers 1983, Bureau Mineral Res., Geol. Geophysics, Bull. 217, p. 67-72.
(On systematic position of new Upper Triassic bivalve from Jimi Greywacke, central PNG, first described by Skwarko 1967. Initially assigned to Permophorus?, this Carnian genus is viewed as endemic of 'Australian fauna' by Damborenea et al. 2002, Southern Tethys by Ros-Franch et al. 2014)

Skwarko, S.K. & B. Kummel (1974)- Marine Triassic molluscs from Australia and Papua New Guinea. Bureau Mineral Res. Geol. Geophysics, Bull. 150, p. 111-127.
(Mainly on Australian material. Skwarko (1973) Jimi River sandstones and shales with Ladinian-Carnian halobiids and Carnian-Norian ammonite Sirenites cf. malayicus. Yuat River gorge in W Highlands with Anisian cephalopods (Beyrichites, Paraponanoceras, Paraceratites, etc.))

Skwarko, S.K., R.S. Nicoll & K.S.W. Campbell (1976)- The Late Triassic molluscs, conodonts and brachiopods of the Kuta Formation, Papua New Guinea. BMR J. Australian Geol. Geophysics 1, p. 219-230.
(online at: www.ga.gov.au/corporate_data/80882/Jou1976_v1_n3_p219.pdf)
(30-250m thick Kuta Limestone with Rhaetian brachiopods (Clavigera, Zugmayerella), cephalopods (Arcestes cf. sundaicus), bivalves and conodonts (Misikella posthernsteini), E of Mt Hagen. Faunas of Tethyan Province aspect. Kuta Fm grades laterally into calcareous breccia with metamorphic rocks. Limestone unconformably overlain by Upper Jurassic or Cretaceous)

Slater, A., H.R. Balkwill & G.U. Fong (1988)- Seismic evidence for structural style in the offshore Kerema area Papua New Guinea: application to petroleum exploration. Proc. Offshore South East Asia Conf. 1988, Singapore, Proc. SE Asia Petroleum Expl. Soc. (SEAPEX) 8, p. 69-78.
(Marine seismic data off Kerema gives rel. good imaging of PNG foldbelt. Shows common S-dipping backthrusts, frontal folds detached in Mesozoic shales, episodic SW-ward progression of foldbelt compression with younger stratigraphic sequences less tightly folded, etc.)

Slater, A. & F. Dekker (1993)- An overview of the petroleum geology of the Eastern Papuan fold belt, based on recent exploration. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, Proc. 2nd PNG Petroleum Convention, Port Moresby, p. 499-516.
(On- and offshore Aure Trough/ E Papuan foldbelt abundance of oil and gas seeps onshore suggest prolific hydrocarbon system. Cretaceous- Paleogene sediments part of Australian passive continental margin sequence. With map of potential Campanian Pale Sst fairway. Oligo-Miocene Puri Lst also good reservoir potential)

Smillie, R.W., P.J. Pollard, D.R. Hastings, A. Yame, M. Tangwari, J. Garu & E. Atase (2015)- Exploration of the Townsville Cu-Au-Ag skarn, Western Province, Papua New Guinea- preliminary observations of paragenesis and zoning. In: Proc. PACRIM 2015 Congress, Hongkong, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, Publ. Ser. 2/2015, p. 593-600. *(Extended Abstract)*
(On Townsville gold prospect 4 km N of Ok Tedi copper-gold mine in W Province, PNG. Townsville gold deposits in breccia in older Darai Lst)

Smith, I.E.M. (1970)- Late Cainozoic uplift and geomorphology in south-eastern Papua. Search 1, p. 222-225.

Smith, I.E.M. (1972)- High-potassium intrusives from southeastern Papua. Contrib. Mineralogy Petrology 34, p. 167-176.
(Miocene high-K 'shoshonitic' rocks intrude Eocene submarine basalts in SE Papua. Two groups: 'near-saturated' gabbro to syenite, and nepheline normative 'undersaturated' group. Intrusion of shoshonitic rocks at start of period of major tectonic activity in SE Papua and may form part of island arc magmatic association)

Smith, I.E.M. (1976)- Volcanic rocks from southeastern Papua: the evolution of volcanism at a plate boundary. Ph.D. Thesis, Australian National University, Canberra, p.1-290.
(online at: https://openresearch-repository.anu.edu.au/bitstream/1885/138569/2/b10169726_Smith_I_E.pdf)
(Cenozoic volcanism in SE Papuan Peninsula. Oldest volcanics in SE Papua are U Cretaceous and Eocene submarine basalts, forming main ranges at E tip of peninsula; probably mid-ocean ridge basalts associated with sea floor spreading in Coral Sea. Major episode of volcanic activity in SE Papua began in Miocene, with S volcanic belt characterised by high-K basalts and N belt with mainly island arc andesites, basalts and rhyolites)

Smith, I.E.M. (1977)- Peralkaline rhyolites from the D'Entrecasteaux islands, Papua New Guinea. In: R.W. Johnson (ed.) Volcanism in Australasia, Elsevier, Amsterdam, p. 275-285.
(Mildly peralkaline rhyolites (comendites) most abundant lavas in Quaternary volcanic province centered around Dawson Strait in D'Entrecasteaux islands, E PNG, associated with minor basaltic rocks. Tied to crustal extension and rifting)

Smith, I.E.M. (1982)- Volcanic evolution in Eastern Papua. Tectonophysics 87, p. 315-333.
(Basement formations of U Cretaceous and Eocene submarine basalt comparable to sea floor spreading centers and thought to be associated with Coral Sea basin spreading. Arc-trench type andesitic volcanism prominent during Late Cenozoic but no clear relationship to subduction event. Tectonic environment of E Papua during Late Cenozoic was one of block faulting and uplift associated with crustal tension. Quaternary peralkaline rhyolites suggests this environment now being replaced by active rifting)

Smith, I.E.M. (2013)- The chemical characterization and tectonic significance of ophiolite terrains in southeastern Papua New Guinea. Tectonics 32, 2, p. 159-170.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1002/tect.20023)
(Papuan Ultramafic Belt marks collision between continental crust and subduction system. However, in SE Milne Terrain extensive problematic sequence of U Cretaceous and Eocene basaltic rocks with MORB affinities. Probably associated with opening of Coral Sea Basin. Milne Terrain rocks represent lower plate in obduction system along which Papuan Ultramafic Belt was emplaced, and thus equivalent of continental crust which was separated from Australian continental block by opening of Coral Sea. Uplift (>4 km) of Milne Terrain may be due presence of underplated material associated with Late Miocene-Pliocene subduction immediately prior to encroachment of Woodlark spreading center into Papuan area)

Smith, I.E.M. (2014)- High-magnesium andesites: the example of the Papuan volcanic arc. In: A. Gomez-Tuena et al. (eds.) Orogenic Andesites and crustal growth, Geol. Soc., London, Spec. Publ. 385, p. 117-135.
(Late Cenozoic volcanic arc in SE PNG developed in environment of complex tectonic processes including obduction, subduction, rifting and sea floor spreading. Volcanic arc extends from Papuan Peninsula SE-ward through D'Entrecasteaux Islands into Louisiade Archipelago. Mainly basaltic andesite and andesite, but also basalt, dacite and rhyolite. Unusual abundance of high-Mg lavas in SE Papua related to extensional tectonics which allowed deep sourced magmas to rise without significant modification)

Smith, I.E.M. & D.S. Clarke (1982)- Intrusive rocks associated with gold mineralisation in southeastern Papua New Guinea. In: R. Rogerson (ed.) Proc. PNG geology, exploration and mining conference, 1991, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 34-39.

Smith, I.E.M. & W. Compston (1982)- Strontium isotopes in Cenozoic volcanic rocks from southeastern Papua New Guinea. Lithos 15, 3, p. 199-206.
(Sr isotope data from 28 samples representing four episodes of Late Cenozoic volcanism in SE PNG)

Smith, I.E. & H.L. Davies (1973)- Abau, Papua New Guinea, Sheet SC/55-12, 1:250,000. Bureau Mineral Res. Geol. Geophys. Australia and Geol. Survey Papua New Guinea, Geol. Serie, Explanatory Notes, p.

Smith, I.E. & H.L. Davies (1973)- Samarai, Papua New Guinea, Sheet SC/56-9, 1:250,000. Bureau Mineral Res. Geol. Geophys. Australia and Geol. Survey Papua New Guinea, Geol. Serie, Explanatory Notes, p.

Smith, I.E. & H.L. Davies (1976)- Geology of the southeast Papuan mainland. Bureau Mineral Res. Geol. Geophys., Canberra, Bull. 165, p. 1-109.
(online at: https://d28rz98at9flks.cloudfront.net/76/Bull_165.pdf)
(Geology of area of Papuan Peninsula/ Owen Stanley Range. E of 148°30'. Mostly U Cretaceous and M Eocene submarine basalts, with minor limestone and chert (incl. Upper Cretaceous and Eocene pelagic rocks with good planktonics and skeletal Eocene carbonates with Discocyclina, Nummulites). Also localized E-M Miocene reefal carbonates on Kutu Volcanics, commonly with reworked Eocene LBF. Some basalt metamorphosed to low greenschist facies. In NW peridotites of Papuan ultramafic belt are faulted against basalt, probably Eocene thrusting. Emergence of SE Papua started in Oligocene. With extensive appendix on foraminifera by Belford)

Smith, I.E.M. & R.W. Johnson (1981)- Contrasting rhyolite suites in the Late Cenozoic of Papua New Guinea. J. Geophysical Research 86, 11, p. 10257-10272.
(Discussion of 4 types rhyolites from New Britain, N Bismarck Sea (alkali rhyolites), Moresby Strait, Dawson Strait (comendites))

Smith, I.E. & J.S. Milsom (1984)- Late Cenozoic volcanism and extension in Eastern Papua. In: B.P. Kokelaar & M.F. Howells (eds.) Marginal basin geology, Geol. Soc., London, Spec. Publ. 16, p. 163-171.
(Sea floor around E PNG deep basins and submarine ridges with islands of metamorphic, volcanic or coralline rock. Extension phases since at least Paleocene, when Coral Sea basin formed. Compressive events include emplacement of Papuan Ultramafic Belt ophiolite in Oligocene. Extension-related volcanic rocks include low-K tholeiites and peralkaline rhyolite. Two Neogene phases of extension (1) M- Late Miocene, with formation of marginal basins related to subduction and (2) M Pliocene- today, response to changes in relative motions of surrounding plates. Active sea-floor spreading in Woodlark Basin today, and post-Miocene calc-alkaline and shoshonitic rocks of Papuan Peninsula and offshore islands reflect reactivation of subduction-modified mantle under this tensional regime, not renewed subduction)

Smith, I.E.M. & C.J. Simpson (1972)- Late Cenozoic uplift in the Milne Bay area, eastern Papua New Guinea. Bureau Mineral Res. Geol. Geophysics, Bull. 125, p. 29-35.
(online at: https://d28rz98at9flks.cloudfront.net/125/Bull_125.pdf)
(Uplifted Late Plio- E Pleistoce erosional surface(s) up to 185m asl on Miocene- Pliocene volcanic rocks along Milne Bay on SE tip of PNG main island. Nearby uplifted coral reefs at >500m above sea level)

(online at: https://d28rz98at9flks.cloudfront.net/14459/Rec1991_075.pdf)
(PNG is product of plate tectonic processes at N margin of Australian Plate. Two major extensional events in Late Triassic- E Jurassic and Late Cretaceous- Paleocene within passive margin setting. Change in movement direction of Pacific Plate in Eocene and rapid N-ward movement of Australian Plate from Paleocene onwards resulted in oblique convergence of two plates, and formation of island arcs above two major N-ward and S-ward dipping subduction zones to N. From Oligocene onward progressive accretion of allochthonous terranes of mixed and oceanic to island arc affinity to Australian margin caused displacement of parts of former passive margin and deposition of thick syntectonic sequence in foreland and in basins between accreting terranes. Formation of small ocean basins in M-L Pliocene, particularly opening of Manus Basin)

Welsh, A. (1990)- Applied Mesozoic biostratigraphy in the Western Papuan Basin. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, First PNG Petroleum Convention, Port Moresby, p. 369-380.
(BP Jurassic-Cretaceous palynology zonation of PNG LateJurassic- mid-Cretaceous section. A modified version of Helby et al. 1987 and Davey 1987 zonations. With PNG chronostratigraphic diagram)

Whalen, J.B., R.M. Britten & I. McDougall (1982)- Geochronology and geochemistry of the Frieda River prospect area, Papua New Guinea. Economic Geology 77, 3, p. 592-616.
(Intrusive and volcanic rocks of Frieda River prospect between Frieda and Lagaip fault zones of New Guinea Mobile Belt in W Sepik District all of andesitic composition and belong to normal K calc-alkaline suite. Frieda Complex is remnant edifice of island stratovolcano interstratified in M Miocene Wogamush Fm. with copper-gold and porphyry copper deposits along central axis of complex. Mianmin area is separate, unmineralized volcanic center. Nena Diorite N of Frieda Complex intrudes Upper Cretaceous- Eocene basement rocks, with igneous activity dated between ~17.3- 11.2 Ma)

Whattam, S.A., J. Malpas, J.R. Ali & I.E.M. Smith (2008)- New SW Pacific tectonic model: cyclical intra-oceanic magmatic arc construction and near-coeval emplacement along the Australia-Pacific margin in the Cenozoic. Geochem. Geophys. Geosystems G3 9, 3, p. 1-34.
(NE dipping subduction established off PNG by at least 65-60 Ma which resulted in emplacement of Papuan Ultramafic Belt (PUB) ophiolite at 59-58 Ma. PUB formed above NE dipping Cenozoic intraoceanic arc system which diachronously propagated (N-S) along E margin of Australian Plate. These 'infant arc' ophiolites represent fragments of supra-subduction zone lithosphere generated in earliest stages of magmatic arc

formation, emplaced shortly after (<20 My) as result of forearc-Australian Plate collision. Subduction inception result of subsidence of older MORB-like lithosphere generated in extensive back arc basin. During emplacement of each ophiolite, a crustal fragment of older lithosphere was scraped off NE dipping slab and subsequently back-thrust beneath each ophiolite during emplacement)

Whitford, D.J, T.L. Allan, A.S. Andrew, S.J. Craven, P.J. Hamilton, M.J. Korsch et al. (1996)- Strontium isotope chronostratigraphy and geochemistry of the Darai Limestone: Juha 1X well, Papua New Guinea. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 369-380.
(Sr ages in 1600m thick Darai Lst of Juha 1X well show age range of 7.7- 28.9 Ma (Oslick et al. 1994 calibration), in good agreement with foram ranges. Top Te1-4 (Top Borelis pygmaeus) = 24 Ma, Top Te5 (Top Spiroclypeus) near 21 Ma, Top Tf1= 14 Ma (but picked horizon above observed tops Austrotrillina, Miogypsina; JTvG), Tf2 = ~11-12 Ma. Consistent Sr-isotope ratio trend, but also number of anomalous values)

Zhang, J., J.P. Davidson, M.C.S. Humphreys, C.G. Macpherson & I. Neill (2015)- Magmatic enclaves and andesitic lavas from Mt. Lamington, Papua New Guinea: implications for recycling of earlier-fractionated minerals through magma recharge. J. Petrology 56, 11, p. 2223-2256.
(online at: http://petrology.oxfordjournals.org/content/56/11/2223.full.pdf+html)
(Mt. Lamington composite volcano in PNG, on Papuan Ultramafic Belt (PUB) ophiolite. 1951 eruption produced andesitic dome lavas with basaltic–andesitic enclaves and few PUB ultramafic xenoliths. Presence of olivines in enclaves represents recycling of earlier-fractionated components through magma recharge)

Zhu, Z. & Z. Yang (2008)- Cenozoic adakites in Papua New Guinea and metallogetic significance. Jilin Daxue Xuebao (J. Jilin University), Earth Science Edition, 38, 4, p. 618-623.
(Adakites of PNG characterized by high Sr content, positive Sr anomaly peaks (average Sr/Y ratio >41.7) and negative Nb and Th anomalies. Y and Yb contents very low. 87Sr/86Sr values generally <0.704 5. Adakites of PNG located in both oceanic island arc and continental margin orogens in arc-continent collision setting. Some contain both world-class porphyry copper-gold deposits)

Zwingmann, H., T. Allan, K. Liu, D. Holland & D. Leech (2008)- Glauconite ages from Late Cretaceous reservoir sandstones of the Papuan Basin. In: J.E. Blevin et al. (eds.) Eastern Australasian Basins Symposium III, Sydney, Petroleum Expl. Soc. Australia (PESA) Spec. Publ., p. 259-262.
(Coniacian- Campanian glauconite ages of sandstones)

IX.12. Papua New Guinea (Bismarck Sea, Solomon Sea, Woodlark Basin)

Abers, G.A. (1991)- Possible seismogenic shallow-dipping normal faults in the Woodlark-DôEntrecasteaux extensional province, PNG. Geology 19, p. 1205-1208.
(Inversions of large earthquakes in Woodlark-D'Entrecasteaux region of active continental extension show events consistent with normal dip slip on shallow-dipping faults. Largest earthquake near mapped Pliocene-Quaternary metamorphic core complex, with shallow-dipping plane between 10°-25°)

Abers, G.A. (2001)- Evidence for seismogenic normal faults at shallow dips in continental rifts. In: R.C.L. Wilson et al. (eds.) Non-volcanic rifting of continental margins: a comparison of evidence from land and sea, Geol. Soc. London, Spec. Publ. 187, p. 305-318.
(Woodlark Rift system extension rates vary along strike, with shallowest-dipping faults in most rapidly rifting segment. Several earthquakes suggest nodal planes dipping 23-35°, subparallel to shear zones bounding nearby metamorphic core complexes. No documented large earthquake exhibits seismic slip on subhorizontal surfaces)

Abers, G.A., A. Ferris, M. Craig, H. Davies, A.L. Lerner-Lam, J.C. Mutter & B. Taylor (2002)- Mantle compensation of active metamorphic core complexes at Woodlark rift in Papua New Guinea. Nature 418, p. 862-865.
(Seismic observations of metamorphic core complexes of western Woodlark rift show thinned crust beneath regions of greatest surface extension. Core complexes actively exhumed at 5-10 km/Myr, and thinning of underlying crust compensated by mantle rocks of anomalously low density)

Abers, G.A., Z. Eilon, J.B. Gaherty, G. Jin, Y.H. Kim, M. Obrebski & C. Dieck (2016)- Southeast Papuan crustal tectonics: imaging extension and buoyancy of an active rift. J. Geophysical Research, Solid Earth, 121, 2, p. 951-971.
(SE PNG hosts world's youngest ultra-high-pressure metamorphic rocks, in D'Entrecasteaux-Woodlark extensional gneiss domes/ metamorphic core complexes. Seismicity shows active deformation on core complex bounding faults, offset by transfer structures, consistent with N-S extension rather than radial deformation. Crustal thinning under core complexes of 30-50% and very low shear velocities at all depths beneath core complexes. Limited role of diapirism as secondary exhumation mechanism)

Abers, G., C.Z. Mutter & J. Fang (1994)- Shallow dips of normal faults during rapid extension; earthquakes in the Woodlark- D'Entrecasteaux rift system, Papua New Guinea. J. Geophysical Research 102, B7, p. 15301-15317.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/97JB00787/pdf)
(In Woodlark-D'Entrecasteaux rift system low-angle normal faults (dipping 15°-35°) only between 150.5°E - 152.5°E, where transition occurs from seafloor spreading to continental rifting)

Arculus, R.J. & R.W. Johnson (1978)- Criticism of generalised models for the magmatic evolution of arc-trench systems. Earth Planetary Sci. Letters 39, p. 118-126.
(Recent geological and petrological results from PNG and other regions of arc-trench-type volcanism, provide exceptions to spatial, volumetric, and temporal relationships claimed for generalised volcanic arc models. Many alkalic and shoshonitic associations not over deepest parts of downgoing slabs. Several exceptions to K20/SiO2/depth-to-Benioff-zone relationship. Temporal sequence of early tholeiitic- middle calcalkalic- late shoshonitic/alkalic not well substantiated)

Arculus, R.J. & C. Yeats (2007)- Volcanism and tectonism of the South Bismarck microplate, Papua New Guinea. R/V Southern Surveyor Voyage Summary SS06/2007, CSIRO, p.

Ashley, P. M. & R.H. Flood (1981)- Low-K tholeiites and high-K igneous rocks from Woodlark Island, Papua New Guinea. J. Geol. Soc. Australia 28, p. 227-240.
(Woodlark Island, largest above-sea portion of Woodlark Rise, with pre-E Miocene basement of low-K tholeiitic basalt and dolerite, and minor sediments, overlain by E Miocene limestone and volcaniclastics and later Miocene high-K volcanics and intrusives. Basement part of ophiolitic slab en echelon with Papuan Ultramafic

Belt, thrust over equivalents of Cretaceous Owen Stanley Metamorphics. Periodicity in magmatism synchronous with major rifting episodes that formed Woodlark Basin)

Auzende, J.M., J. Ishibashi, Y. Beaudoin, J.L. Charlou, J. Delteil, J.P. Donval et al. (2000)- Les extremites orientale et occidentale du bassin de Manus, Papouasie-Nouvelle-Guinee, explorees par submersible: la campagne Manaute. Comptes Rendus Academie Sciences, Paris, Earth Planetary Science, 331, p. 119-126.
('The E and W ends of the Manus Basin, PNG, explored by submersible'. Submersible dives demonstrate that in E part of Manus basin oceanic accretion is reduced to two axes propagating between Djaul and Weitin FZ. In W part of Manus basin oceanic accretion is along two axes propagating rapidly to SW. Effect of subduction of Australian Plate in New Britain Trench evident throughout basin)

Baldwin, J.T, H.D. Swain & G. H. Clark (1978)- Geology and grade distribution of the Panguna porphyry copper deposit, Bougainville, Papua New Guinea. Economic Geology 73, 5, p. 690-702.
(Panguna mine producing since 1972. Pliocene phase of copper iron sulfide mineralization associated with initial intrusion of Kaverong Diorite into Panguna Andesite. Mineralization successively upgraded by remobilization of copper sulfides with intrusion of Biotite Granodiorite)

Baldwin, S.L., B.D. Monteleone, , L.E. Webb, P.G. Fitzgerald, M. Grove & E.J. Hill (2004)- Pliocene eclogite exhumation at plate tectonic rates in eastern Papua New Guinea. Nature 431, p. 263-267.
(online at: http://instruct.uwo.ca/earth-sci/fieldlog/cal_napp/napp/newfoundland/burlington/nature02846.pdf)
(Exposed metamorphic core complex with Pliocene (4.3 Ma) eclogite facies in D'Entrecasteaux Islands. Extremely rapid exhumation from ~75 km in extending region W of Woodlark basin spreading centre. Such rapid exhumation of high-P rocks facilitated by extension within transient plate boundary zones associated with rapid oblique plate convergence)

Baldwin, S.L. & T.R. Ireland (1995)- A tale of two eras: Pliocene-Pleistocene unroofing of Cenozoic and late Archean zircons from active metamorphic core complexes, Solomon Sea, Papua New Guinea. Geology 23, 11, p. 1023-1026.
(Youngest zircons from felsic gneisses and synkinematically emplaced granodiorites in D'Entrecasteaux Islands Late Pliocene (1.65, 1.98 Ma crystallization ages). Zircon ages from felsic gneisses (2.63, 2.72 Ma) growth subsequent to eclogite facies metamorphism. Felsic gneiss also zircons from Cretaceous-Miocene protoliths. Zircons from igneous and metamorphic clasts from Goodenough No. 1 well single population of 2781 Ma, and derived from basement rocks unroofed from D'Entrecasteaux core complexes. First direct evidence for Archean protoliths in basement rocks of SE PNG).

Baldwin, S.L., G.S. Lister, E.J. Hill, D.A. Foster & I. McDougall (1993)- Thermochronologic constraints on the tectonic evolution of active metamorphic core complexes, DôEntrecasteaux Islands, Papua New Guinea. Tectonics 12, 3, p. 611-628.
(Metamorphic core complexes in D'Entrecasteaux Islands formed by active extension at W end of propagating Woodlark Basin spreading center. Gneisses cooled rapidly at 2.7 to 3.0 Ma and 1.6 to 1.7 Ma., Shear zones active from 4.0-3.5 Ma and 1.9-1.4 Ma. Granodiorites associated with D'Entrecasteaux Islands domes represent syn-kinematically emplaced granitoids intruded into area of continental extension)

Baldwin, S.L., L.E. Webb & B.D. Monteleone (2008)- Late Miocene coesite-eclogite exhumed in the Woodlark Rift. Geology 36, 9, p. 735-738.
(Late Miocene-Pliocene eclogites exhumed in Woodlark Rift. Coesite in Late Miocene (~8 Ma), eclogite from D'Entrecasteaux Islands metamorphic core complexes, exhumed from mantle depths (≥90 km) to surface at plate tectonic rates (cm/ yr). Youngest exhumed ultrahigh-pressure rock on Earth)

Baldwin, S.L., L.E. Webb, B. Monteleone, T.A. Little, P.G. Fitzgerald, K. Peters & J.L. Chappell (2006)- Continental crust subduction and exhumation: insights from eastern Papua New Guinea. Geochimica Cosmochimica Acta 70, 18, Suppl. 1 *(Goldschmidt Conf. Abstract)*
E PNG exhumation of previously subducted continental crust in plate boundary zone characterized by rifting-to- seafloor spreading transition. Australian margin subducted N-ward beneath Late Paleocene- E Eocene

island arc. Eclogite and blueschist relicts in lower plates of metamorphic core complexes (MCCs). Rapid diachronous exhumation from 13 to 0.5 Ma, proceeding from E to W, prior to and synchronous with seafloor spreading in Woodlark Basin (6 Ma). Some rocks subducted to >100 km at ~8 Ma. Exhumation to shallow crustal levels by 1.5 Ma. W of active sea floor spreading rift tip mineral growth and cooling from 8 to 3 Ma; SE of active rift tip ages interpreted to record cooling and exhumation from 13-8 Ma)

(Review of geology of Solomon Sea region, E of 'mainland' PNG. Solomon Sea bounded to N by New Britain active arc-trench subduction system. Lithosphere of Solomon Sea Basin probably formed by back-arc spreading in E Tertiary. As result of subduction to NE, NW and SW lithosphere anticlinally folded about E-W and N-S axes. Miocene- Holocene volcanics of SE Papua mostly arc-trench suite and probably related to Miocene-Quaternary subduction at Trobriand Trough. Trobriand Basin up to 5000m of Miocene- younger sediments)

Davies, H.L., P.A. Symonds & I.D. Ripper (1985)- Structure and evolution of the southern Solomon Sea region. Proc. 21st Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bandung 1984, p. 170-199.

(Reprint of Davies et al. (1984) BMR paper. Good overview of onshore and offshore geology of Solomon Sea area, between E Papuan Peninsula and New Britain. Solomon Sea Basin probably formed by back-arc spreading in E Tertiary)

Davies, H.L. & R.G. Warren (1988)- Origin of eclogite-bearing, domed, layered metamorphic complexes (ócore complexesô) in the D'Entrecasteaux Islands, Papua New Guinea. Tectonics 7, 1, p. 1-21.
(Layered metamorphic rocks of D'Entrecasteaux Islands, PNG, folded into domes and antiforms bounded by faults parallel to metamorphic layering and foliation. Metamorphic grade in N islands amphibolite facies with pockets of eclogite and granulite, and greenschist facies in S island. All three islands sequence from felsic metamorphics at base to ultramafics at top. Association of metamorphic and ultramafic rocks developed in N-dipping Paleogene subduction system and exhumed to upper crustal level in Oligocene- E Miocene, possibly by reversal of faults in former subduction system. Uplift and development of domes and antiforms in Pliocene triggered by W-ward propagation of Woodlark Basin spreading ridge and accompanied by rift-related magmatism, rapid erosion and deposition of coarse sediment in adjacent Trobriand Basin)

Davies, H.L. & R.G. Warren (1992)- Eclogites of the D'Entrecasteaux Islands. Contrib. Mineralogy Petrology 112, 4, p. 463-474.
(Three types of eclogitic rocks on D'Entrecasteaux Islands, SE PNG: (1) true eclogites of omphacite-garnet-rutile; (2) retrogressed eclogites with some omphacite altered to albite and less-jadeitic clinopyroxene, and (3) eclogitic rocks in which clinopyroxene is jadeitic diopside. Eclogitic rocks lenticular boudins and small concordant tabular bodies in 2-3 km thick migmatitic gneisses. Gneiss sequence bounded by detachment faults above and younger granodiorite below. Eclogite equilibrated at T of 530-840°C and P of 12-24 kbar. Metamorphic complex developed during Paleocene N-ward subduction and Paleo-Eocene arc-continent collison, and elevated to crustal levels during Late Oligocene- E Miocene (~30-25 Ma) crustal extension. Plio-Quaternary rapid elevation and doming of metamorphics associated with rifting, magmatism and opening of Woodlark Basin No glaucophane and lawsonite found in D'Entrecasteaux Islands)

(Onshore geology and seismic survey N of New Ireland Basin. Up to 2000m of M Eocene- earliest Miocene andesitic arc volcanics, built on oceanic crust. Subduction ceased in E Miocene, causing deposition of Miocene limestones. Followed by Late Miocene-Pliocene volcanics)

Exon, N.F., W.D. Stewart, M.J. Sandy & D.L. Tiffin (1986)- Geology and offshore petroleum prospects of the eastern New Ireland Basin, Northeastern Papua New Guinea. BMR J. Australian Geol. Geophysics 10, 1, p. 39-51.
(online at: www.ga.gov.au/corporate_data/81203/Jou1986_v10_n1_p039.pdf)
(New Ireland Basin NE of PNG and NE of New Hanover and New Ireland islands. Basin formed as fore-arc basin between Eocene- E Miocene volcanic arc in SW and outer-arc high in NE. Basin with up to 5 km of fill, interpreted as E Miocene and possibly Oligocene volcaniclastics, Miocene shelf carbonates, Late Miocene-Pliocene bathyal chalks and volcaniclastics, and Pleistocene-Recent sediments. In E Plio-Pleistocene volcanism has formed islands and greatly disturbed the older strata)

Exon, N.F. & D.L. Tiffin (1984)- Geology and petroleum prospects of offshore New Ireland Basin in northern Papua New Guinea. In: S.T. Watson (ed.) Trans. Third Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1982, p. 623-630.
(NW trending New Ireland Basin 900km long, 160km wide, undrilled. Manus- New Hanover- New Ireland islands part of ?Late Eocene- Oligocene island arc that separated Indo-Australian Plate from Pacific Plate. Overlain by widespread Miocene limestones (see also Exon et al. (1986) paper above))

Falvey, D.A. & T. Pritchard (1984)- Preliminary palaeomagnetic results from Northern Papua New Guinea: evidence for large microplate rotations. In: S.T. Watson (ed.) Trans. Third Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1982, American Assoc. Petrol. Geol. (AAPG), p. 593-599.
(Paleomagnetic data of Huon Peninsula and islands to N and E (New Britain, Manus, New Ireland, etc.). Huon-New Britain/ Manus/New Ireland rotated 60° CW, and may restore to Eocene NE trending arc, probably adjacent to Papuan Ultramafic belt at 45 Ma. Data from New Ireland- Buka indicate this part of N Solomon Islands part of Pacific Plate since ~10 Ma, Late Miocene)

Ferris, A. (2007)- Seismic imaging of active continental breakup in the Woodlark rift system of Papua New Guinea. Ph.D. Thesis Boston University, p. 1-125.

Ferris, A., G.A. Abers, B. Zelt, B. Taylor & S. Roecker (2006)- Crustal structure across the transition from rifting to spreading: the Woodlark rift system of Papua New Guinea. Geophysical J. Int. 166, p. 622-634.
(online at: http://gji.oxfordjournals.org/content/166/2/622.full.pdf+html)
(Woodlark rift system active ocean basin formation. Continental extension rates some of fastest on planet, with extension progressing E-wards to seafloor spreading. Seismic velocities suggest transition from diffuse continental rifting to localized seafloor spreading likely across narrow zone. Magmatism may not play significant role in altering crust until onset of seafloor spreading, except through underplating at base of crust)

Fitz, G.G. (2011)- Offshore mapping and modeling of Miocene-Recent extensional basins adjacent to metamorphic gneiss domes of the D'Entrecasteaux Islands, eastern Papua New Guinea. M.Sc. Thesis University of Texas at Austin, p. 1-183.
(online at: https://repositories.lib.utexas.edu/handle/2152/14789)
(D'Entrecasteaux Island gneiss domes fault-bounded domes with ~2.5 km of relief, exposing UHP and HP metamorphic gneisses and migmatites, exhumed in Oligocene-Miocene arc-continent collision-subduction zone, subject to Late Miocene- Recent continental extension. Subduction slowed at ~8 Ma as margin transitioned to extensional tectonic environment. Lack of upper crustal extension accompanying subsidence in Trobriand and Goodenough basins suggests lithospheric extension from 8-0 Ma accompanied uplift of DEI gneiss domes. Basin extension of 2.3-13.4 km in upper crust, while subsidence values indicate >21-24 km of lower crust extension since ~8 Ma. DEI domes formation involve vertical exhumation of buoyant lower crust, far-field extension from slab rollback, and inverted two-layer crustal density structure)

Fitz, G. & P. Mann (2013)- Evaluating upper versus lower crustal extension through structural reconstructions and subsidence analysis of basins adjacent to the DôEntrecasteaux Islands, eastern Papua New Guinea. Geochem. Geophys. Geosystems 14, 6, p. 1800-1818.
(D'Entrecasteaux Islands fault-bounded gneiss domes with ~2.5 km of relief, exposing high pressure gneisses and migmatites, exhumed in Oligocene-Miocene arc-continent collision and subject to Late Miocene- Recent continental extension. Trobriand basin formed as fore-arc basin during S-ward Miocene subduction at Trobriand trench. Subduction slowed at ~8 Ma as margin changed to extensional environment. Goodenough rift basin developed after extension began (~8 Ma) as hanging wall of N-dipping Owen-Stanley normal fault. Lack of upper crustal extension accompanying subsidence in Trobriand-Goodenough basins suggests depth-dependent lithospheric extension since 8 Ma accompanied uplift of gneiss domes. Crustal thinning preferentially accommodated in lower crust. Uplift of DEI domes involves vertical exhumation of buoyant, postorogenic lower crust, far-field extension from slab rollback, and inverted 2-layer crustal density structure)

Fitz, G. & P. Mann (2013)- Tectonic uplift mechanism of the Goodenough and Fergusson Island gneiss domes, eastern Papua New Guinea: constraints from seismic reflection and well data. Geochem. Geophys. Geosystems 14, 10, p. 3969-3995.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1002/ggge.20208)
(HP and UHP fault-bounded gneiss domes of Goodenough and Fergusson Islands result of Late Miocene-Recent continental extension/ exhumation (diapiric uplift of previously subducted continental fragment). Seismic and well data from surrounding offshore areas suggest Trobriand basin formed as forearc basin at Trobriand trench, then at ∼8 Ma margin transitioned to extensional tectonic environment)

(online at: https://d28rz98at9flks.cloudfront.net/14939/Rep_025.pdf))
('Hinterland Limestone' of Manus Island NE of PNG with Lower Tf (=Burdigalian) larger foraminifera Miogypsina kotoi and Lepidocyclina, overlain by M-U Miocene? rel. deep marine tuffaceous siltstone and volcanics with rich smaller benthic and pelagic forams)

Kidd, R.P. & J.R. Robinson (2004)- A review of the Kapit Orebody, Lihir Island Group, Papua New Guinea. In: Proc. PACRIM 2004 Conf., Adelaide, Australasian Inst. of Mining and Metallurgy, Melbourne, 9p.

Kington, J.D. & A.M. Goodliffe (2008)- Plate motions and continental extension at the rifting to spreading transition in Woodlark Basin, Papua New Guinea: can oceanic plate kinematics be extended into continental rifts? Tectonophysics 458, p. 82-95.
(online at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.725.6203&rep=rep1&type=pdf)
(Woodlark Basin comparison of brittle extension, subsidence and extension predicted from long-term plate motions at rifting to spreading transition of non-volcanic margin. Seismic data near rifting to spreading transition yields 111 km of brittle extension, subsidence predicts about same. Long term plate motions derived from seafloor spreading predict 220km of extension)

Knight, C.L., R.B. Fraser & A. Baumer (1973)- Geology of the Bougainville copper orebody, New Guinea. In: Metallogenic provinces and mineral deposits in the southwestern Pacific, 12th Pacific Science Congress Symposium, Canberra 1971, Bureau Mineral Res. (BMR) Geol. Geophysics Bull. 141, p. 123-133.

(online at: www.ga.gov.au/corporate_data/108/Bull_141.pdf)
(Bougainville island porphyry copper deposit intrusive into Miocene volcanics and associated sediments)

Korchinski, M., T.A. Little, E. Smith & M.A. Millet (2012)- Variation of Ti-in-quartz in gneiss domes exposing the world's youngest ultrahigh-pressure rocks, D'Entrecasteaux Islands, Papua New Guinea. Geochem. Geophys. Geosystems 13, 10, p. 1-27.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2012GC004230/epdf)
(D'Entrecasteaux Island gneiss domes, PNG, expose world's youngest UHP rocks (5-8 Ma). Ti-in-quartz used as tool to infer domains of differing cooling rates across 4 domes.Fastest cooled rocks exhumed near center of domes Data reinforces structurally based arguments that domes were emplaced vertically into crust as diapirs, not laterally exhumed as result of large-magnitude slip on dome-bounding detachment faults)

Kulig, C., R. McCaffrey, G.A. Abers & H. Letz (1993)- Shallow seismicity of arc-continent collision near Lae, Papua New Guinea. Tectonophysics 27, p. 81-93.
(Ramu-Markham Valley separates island arc rocks to N from continental rocks in S and appears to be W, onland extension of New Britain trench. Narrow, near-vertical belt of seismicity between 10-30 km depth. Huon Peninsula is being emplaced onto Australian plate along gently (~25°) N-dipping thrust fault that is 20 km deep beneath Lae. Ramu-Markhan FZ may be steeply dipping thrust fault that connects with this thrust)

Kvenvolden, K.A. (1988)- Hydrocarbon gas in botton sediment from offshore the northern islands of Papua New Guinea. In: M.S. Marlow et al. (eds.) Geology and offshore resources of Pacific island arcs- New Ireland and Manus region, Papua New Guinea, Circum-Pacific Council Energy and Mineral Resources, Houston, Earth Science Ser. 9, p. 157-160.
(Small concentrations of hydrocarbon gases in 11 samples from 6 gravity cores in New Ireland basin. No evidence for petroleum-related hydrocarbons)

Kvenvolden, K. A. & A. Niem (1989)- Hydrocarbon gases in sediments of the Solomon Islands area. In J.G. Vedder & T.R. Bruns (eds.) Geology and Offshore Resources of Pacific Island arcs-Solomon Islands and Bougainville, Papua New Guinea Regions, Texas, Circum-Pacific Council Energy and Mineral Resources, Earth Science Ser. 12, Houston, p. 283-286.
(Small concentrations of microbial-origin hydrocarbon gases in C Solomons Trough)

Lackschewitz, K.S., D.F. Mertz, , C.W. Devey & C.D. Garbe-Schonberg (2003)- Late Cenozoic volcanism in the western Woodlark Basin area, SW Pacific: the sources of marine volcanic ash layers based on their elemental and Sr-Nd isotope compositions. Bull. Volcanology 65, p. 182-200.
(Tephra fallout layers and volcaniclastics from volcanic sources around/ on Papuan Peninsula form substantial part of Plio-Pleistocene Woodlark Basin marine sediment. Mainly rhyolitic compositions, with subordinate basaltic andesites, etc. Volcanogenic layers indicate much calc-alkaline rhyolitic volcanism in E Papua since 3.8 Ma, but at 135 ka peralkaline tephras appear, reflecting change from crustal subduction to spreading)

Lee, S.M. & E. Ruellan (2006)- Tectonic and magmatic evolution of the Bismarck Sea, Papua New Guinea: review and new synthesis. In: D.M. Christie et al. (eds.) Back-arc spreading systems: geological, biological, chemical and physical interactions, AGU Geophys. Monograph 166, p. 263-286.
(Bismarck Sea N of PNG went through back-arc development beginning in M Pliocene. Around 3.5 Ma N tip of New Guinea came into contact with Finisterre-Huon Range, triggering back-arc opening that eventually divided Bismarck seafloor into N and S Bismarck Plates. Docking of Finisterre- Huon Range with New Guinea Highlands allowed S Bismarck Plate to open faster to E in Manus Basin. Seafloor spreading commenced in Manus Spreading Center <0.78 Ma. Anomalously large distance (>400 km) between arc and spreading axis)

Lewis, R.W. & G.I. Wilson (1990)- Misima gold deposit. In: F.E. Hughes (ed.) Geology of mineral deposits of Australia and Papua New Guinea, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 1741-1745.

(Misima Island in Milne Bay, Solomon Sea with Umuna epithermal gold-silver deposit in host rocks of metamorphosed Cretaceous-Paleogene volcano-sedimentary sequence, intruded by Neogene granodioritic bodies)

Lindley, I.D. (1988)- Early Cainozoic stratigraphy and structure of the Gazelle Peninsula, East New Britain; an example of extensional tectonics in the New Britain arc trench complex. Australian J. Earth Sci. 35, 2, p. 231-244.
(Early Cenozoic sedimentation and volcanism in Gazelle Peninsula three distinct volcanic episodes: Late Eocene, Late Oligocene and Mio-Pliocene. Pre-Miocene andesitic volcanism typical of early island arc. At Oligocene-Miocene boundary major orogeny. Sedimentation resumed in E Miocene with development of extensive carbonate platform. Post-E Miocene history dominated by extensional tectonic regime)

Lindley, I.D. (1994)- A physical volcanology of the mid-Miocene Okiduse Volcanics, Woodlark Island, Papua New Guinea. In: R. Rogerson (ed.) Proc. Papua New Guinea geology, exploration and mining Conf., Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 2-15.

(Manus Basin in E Bismarck Sea fast opening backarc basin behind New Britain arc-trench system)

Martinez, F. & B. Taylor (2003)- Controls on back-arc crustal accretion; insights from the Lau, Manus and Mariana Basins. In: R.D. Larter & P.T. Leat (eds.) Intra-oceanic subduction systems: tectonic and magmatic processes, Geol. Soc., London, Spec. Publ. 219, p. 19-54.
(Lau, Manus and Mariana basins broad range of conditions of back-arc basin development. In each basin magmatism enhanced in spreading centres near arc volcanic front, but decreases in axes further from arc. Lau and Manus basin axes far behind arc and typical mid-ocean ridge characteristics. Spreading centres near arc advect hydrated mantle material, enhancing melt production. Spreading centres further from arc advect partly depleted mantle and produce thinner than normal crust. Spreading centres far from arc advect essentially mid-ocean ridge basalt-source mantle)

(online at: www.searchanddiscovery.com/documents/2011/30181septama/ndx_septama.pdf)
(Provenance study of Pleistocene-Holocene deepwater sands in Gulf of Papua shows three major pathways: (1) long-distance NW-SE sediment transport of quartzo-feldspathic sand from the Papuan Mainland; (2) short-distance transport of felsic-mafic volcanic sand from collision margin of Papuan Peninsula; (3) intermediate-distance delivery from Fly-Strickland and Papuan Peninsula along coastal pathways toe Moresby Trough)

Symonds, P.A., P.J. Davies, C.J. Pigram, D.A. Feary & G.C.H. Chaproniere (1991)- Northeast Australia: Torres Shelf- Pandora Trough. Bureau Mineral Res. Geol. Geophysics, Australia, Canberra, Continental margins program Folio 4, p. 1-74.
(With seismic profiles from BMR Survey 50, 1985)

Symonds, P.A., J. Fritsch & H.U. Schluter (1984)- Continental margin around the western Coral Sea Basin: structural elements, seismic sequences and petroleum geological aspects. In: S.T. Watson (ed.) Trans. Third Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1982, American Assoc. Petrol. Geol. (AAPG), p. 243-252.
(German- Australian surveys across W Coral Sea Basin in 1978/1981 suggest opposing margins of Queensland and Papuan Plateaus underlain by parts of complex rift zone which would have been up to 80 km wide prior to continental break up. "Outer" basement highs" with low angle contacts with oceanic crust in oceanward part of rift zone on both sides of Coral Sea Basin. N Queensland Trough and W margin of Eastern Plateau considered to have best petroleum potential: underlain by grabens with up to 5 km of sediments, part of which may be Mesozoic deltaic sequence similar to that intersected in Anchor Cay 1 well)

Taylor, L.W.H. (1975)- Depositional and tectonic patterns in the western Coral Sea. Bull. Australian Soc. Exploration Geophysicists 6, p. 33-35.
(Preliminary results of DSDP Legs 21 and 30 in Coral Sea. Lower Eocene ocean floor age established at Site 287. Uplift of PNG Owen Stanley Range in latest Oligocene- E Miocene reflected in shedding of detritus into Coral Sea, etc. Fly River of PNG not major sediment source for Coral Sea. U Cretaceous- Paleocene rift valley sequence interpreted for edge of Queensland Plateau, less definitive at SE edge of Papuan Plateau and W part of Louisiade Platform)

Taylor, L. & D.A. Falvey (1977)- Queensland Plateau and Coral Sea basin: stratigraphy, structure and tectonics. Australian Petrol. Explor. Assoc. (APEA) J. 17, 1, p. 13-29.
(Seafloor spreading in Coral Sea dated by DSDP as E Eocene (51 Ma). This requires rifting-breakup of extended NE Australian continent, incl. Queensland, Papuan and Louisiade Plateaus and Cretaceous portions of East Papua. After initial sprading widespread Late Eocene- Mid-Oligocene unconformity on all plateaus. Coral reef development started in Late Oligocene- E Miocene. Up to 3km rift sequences beneath Queensland and Townsville troughs, possibly of U Cretaceous- Paleocene age. With tectonic reconstruction and Paleocene-Eocene paleogeographic maps)

Tcherepanov, E.N., A.W. Droxler, P. Lapointe, G.R. Dickens, S.J. Bentley, L. Beaufort et al. (2008)- Neogene evolution of the mixed carbonate-siliciclastic system in the Gulf of Papua, Papua New Guinea. J. Geophysical Research 113, F01S21, doi:10.1029/2006JF000684, 15p.
(Cenozoic mixed system in Gulf of Papua four phases: (1) Late Cretaceous-Paleocene: rift grabens and uplifted structural blocks which served later as pedestals for carbonate edifices (2) Eocene-M Miocene neritic carbonates, controlled mostly by eustatic fluctuations; (3) Late Miocene- E Pliocene: extensive demise of carbonate platforms in central part of study area; (4) Late Pliocene-Holocene: siliciclastics-dominated, resulting in burial of drowned and active carbonate platforms, although some platforms still alive today)

Tcherepanov, E.N., A.W. Droxler, P. Lapointe & K. Mohn (2008)- Carbonate seismic stratigraphy of the Gulf of Papua mixed depositional system: Neogene stratigraphic signature and eustatic control. Basin Research 20, 2, p. 185-209.
(In Gulf of Papua major carbonate system initiated in Eocene. Subsequent to E Oligocene hiatus, carbonate system expanded and aggraded, then backstepped and partly drowned in Late Oligocene- earliest Miocene. During late E Miocene- early M Miocene carbonate system continued vertical growth in most platform areas. In M Miocene (Langhian-Serravallian boundary) carbonate deposition shifted downward during sea-level regression, exposing most of early M Miocene platform tops. After downward shift, active carbonate production only in NE part of study area. At start of LateMiocene platform tops re-flooded. Overall pattern, often referred to as Oligocene-Neogene stratigraphic signature, similar to patterns such as in Maldives, Bahamas, etc.)

Tcherepanov, E.N., A.W. Droxler, P. Lapointe, K. Mohn & O.A. Larsen (2010)- Siliciclastic influx and burial of the Cenozoic carbonate system in the Gulf of Papua. Marine Petroleum Geol. 27, 2, p. 533-554.
(Extensive Late Oligocene- M Miocene carbonate system in Gulf of Papua buried by huge influx of siliciclastics from PNG. Major episodes of siliciclastic influx in carbonate system related to tectonic activity in fold- thrust belt during Oligocene Peninsular Orogeny, Late Miocene Central Range Orogeny and Late Pliocene renewed uplift and exhumation of peninsular region. Beautiful seismic examples)

Wang, Z. & C.A. Stein (1992)- Subsidence of the Gulf of Papua in the Cenozoic. Tectonophysics 205, p. 409-426.
(Two subsidence episodes in W Gulf of Papua (1) E Cenozoic-Oligocene, minor stretching with opening of Coral Sea; (2) E Miocene- Present higher subsidence rate which cannot be explained by Paleocene rifting. Late Oligocene- Late Miocene episode of rapid subsidence in Aure Trough to E affects subsidence of W Gulf of Papua. Computed expected deflection from flexure due to load of Aure Trough strata similar to that observed. Model used had effective elastic thickness of rifted continental margins, implying relatively weak lithosphere. Predicted position of forebulge in western Gulf where Oligocene strata absent, suggesting post-depositional uplift, facilitating growth of E Miocene reefs)

Weissel, J.K. & A.B. Watts (1979)- Tectonic evolution of the Coral Sea Basin. J. Geophysical Research 84, B9, p. 4572-4582.
(Coral Sea basin magnetic lineations strike N70°W, parallel to N margin Queensland Plateau. Opening began at ~62 Ma, spreading ceased before 50 Ma (~56 Ma?), at same time as Tasman Sea, but finite rotations from two basins different. We infer at least one additional active plate boundary in Paleocene, which met Coral Sea and Tasman Sea plate boundaries at triple junction near E end of Coral Sea basin)

(Argo Abyssal plain early emplacement of oceanic crust and volcanic edifices in Late Jurassic and E Cretaceous, followed by cooling and marked subsidence until Miocene)

Grevemeyer, I., E.R. Flueh, C. Reichert, J. Bialas, D. Klaschen & C. Kopp (2001)- Crustal architecture and deep structure of the Nintyeast Ridge hotspot trail from active-source ocean bottom seismology. Geophysical J. Int. 144, p. 414-431.
(550km long seismic reflection and refraction transect across Ninetyeast Ridge, Indian Ocean, which was created between ~90- 38 Ma above Kerguelen mantle plume. Normal oceanic crust W and E of ridge/ edifice, with crustal thickness average 6.5- 7 km. Crust under ridge bent downward by loading, and hotspot volcanism underplated pre-existing crust, leading to crustal thickness up to ~24km. Underplating continued to E under Wharton Basin)

Hall, C.M. & J.W. Farrell (1995)- Laser 40Ar/39Ar ages of tephra from Indian Ocean deep-sea sediments: Tie points for the astronomical and geomagnetic polarity time scales. Earth Planetary Sci. Letters 133, 3/4, p. 327-338.
(Two Neogene ash layers from ODP Site 758 (Ninetyeast Ridge) dated by laser 40Ar 39Ar. Ash-D (= possible 'Old Toba Tuff') age of 800 ± 20 ka, consistent with 780 ka age of overlying Brunhes-Matuyama transition and age for oxygen isotope stage 19.1. Ash-I, near top of Nunivak subchron possible eruption age of 4.43 ± .03 Ma)

Hoernle, K., F. Hauff, R. Werner, P. van den Bogaard, A.D. Gibbons, S. Conrad & R.D. Muller (2011)- Origin of Indian Ocean Seamount Province by shallow recycling of continental lithosphere. Nature Geoscience 4, p. 883-887.
(Seamounts in Christmas Island Seamount Province in NE Indian Ocean not linear trail of volcanoes and unlikely formed above mantle plume or fracture zone. Ages of seamounts 47-136 Ma, decreasing from E to W and 0-25 Myr younger than underlying oceanic crust, consistent with formation near mid-ocean ridge. Enriched geochemical signal indicates recycled continental lithosphere in source. Seamount province formed where W Burma began separating from Australia-India in Late Jurassic, forming new mid-ocean ridge. Seamounts formed through shallow recycling of delaminated continental lithosphere in mantle that was passively upwelling beneath mid-ocean ridge)

Holbourn, A.E.L. & M.A. Kaminski (1995)- Lower Cretaceous benthic foraminifera from DSDP Site 263: micropalaeontological constraints for the early evolution of the Indian Ocean. Marine Micropaleontology 26, p. 425-460 .
(NW Australian margin DSDP Site 263 E Cretaceous with 66 agglutinated and 31 calcareous taxa: Three assemblages: (1) high-diversity Valanginian-Barremian Bulbobaculites-Recurvoides; (2) moderately diverse Aptian-Albian Rhizammina-Ammodiscus-Glomospira; (3) low diversity Albian-younger of sparse agglutinants, nodosariids and rotaliids. Shelf- lower slope assemblages, deepening after initial breakup of E Gondwana margin in Valanginian. Absence of many cosmopolitan forms suggests faunal differentiation in Austral realm)

Jacob, J., J. Dyment & V. Yatheesh (2014)- Revisiting the structure, age, and evolution of the Wharton Basin to better understand subduction under Indonesia. J. Geophysical Research, Solid Earth, 119, 1, p. 169-190.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/10.1002/2013JB010285)
(Large part of Wharton Basin of N Indian Ocean presently missing, subducted under Indonesia. Gravity and magnetic anomalies show basin characterized by fossil spreading ridge (which became inactive in Late Eocene; ~36.5 Ma), offset by N-S fracture zones. Magnetic anomalies 18-34 (38-84 Ma) identified on both flanks)

Krishna, K.S., D.G. Rao, M.V. Ramana, V. Subrahmanyam, K.V.L.N.S. Sarma, A. I. Pilipenko, V.S. Sheherbakov & I.V.R. Murthy (1995)- Tectonic model for the evolution of oceanic crust in the northeastern Indian Ocean from the Late Cretaceous to the Early Tertiary. J. Geophysical Research, Solid Earth, 100, B10, p. 20011-20024.

Kuznetsova, K.I. (1974)- Distribution of benthonic foraminifera in Upper Jurassic and Lower Cretaceous deposits at Site 261, DSDP Leg 27, in the Eastern Indian Ocean. In: J.J. Veevers et al. (eds.) Initial Reports Deep Sea Drilling Project (DSDP) 27, p. 673-681.
(Latest Jurassic(?)- E Cretaceous foraminifera from Argo abyssal plain DSDP site 261 suggest gradual basin deepening with time and increase in agglutinated forms)

Ludden, J.N. & B. Dionne (1992)- The geochemistry of oceanic crust at the onset of rifting in the Indian Ocean. In: F.M. Gradstein et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Res. 123, p. 791-799.
(online at: www-odp.tamu.edu/Publications/123_SR/VOLUME/CHAPTERS/sr123_42.pdf)
(Basalts of ODP Sites 765 and 766 erupted on NW Australian continental margin at onset of rifting of Indian Ocean at 155Ma. Geochemically distinct from those erupting at present Mid-Indian Ocean Ridge. Isotope characteristics of Site 765 basalts similar to present-day Mid-Indian Ocean Ridge basalts. Indian Ocean mantle domain distinct from Pacific Ocean since Jurassic. (Stagg et al. 1999: K-Ar age of basaltic hyaloclastite directly above basaltic basement at SE Argo Abyssal Plain Site 765 gave 155.3± 3.4 Ma age (~Kimmeridgean), older than Valanginian/E Cretaceous age suggested by oldest overlying sediment))

Mahoney, J.J., R. Frei, M.L.G. Tejada, X.X. Mo, P.T. Leat & T.F. Nagler (1998)- Tracing the Indian Ocean mantle domain through time: isotopic results from old West Indian, East Tethyan, and South Pacific seafloor. J. Petrology 39, p. 1285-1306.
(online at: http://petrology.oxfordjournals.org/content/39/7/1285.full.pdf+html)
(Isotopic difference between modern Indian Ocean and Pacific or N Atlantic Ocean ridge mantle (e.g. lower 206Pb/ 204Pb for a given eNd and 208Pb/204Pb) could reflect processes that occurred before initial breakup of Gondwana. Alternatively, Indian Ocean isotopic signature could be more ancient upper mantle feature inherited from asthenosphere of E Tethyan Ocean, which formerly occupied much of present Indian Ocean region)

Matthews, K.J., R.D. Muller & D.T. Sandwell (2016)- Oceanic microplate formation records the onset of India-Eurasia collision. Earth Planetary Sci. Letters 43, p. 204-214.
(Seafloor tectonic fabric in Indian Ocean from satellite gravity gradient data reveals extinct Pacific-style oceanic microplate ('Mammerickx Microplate') W of 90E Ridge. Formed at Indian- Antarctic ridge, during chron 21n(o) (~47.3Ma; around E-M Eocene boundary). With rotated abyssal hill fabric. Probably plate reorganization linked to India-Eurasia collision (initial 'soft' collision))

Mutterlose, J. (1992)- Early Cretaceous belemnites from the East Indian Ocean and their paleobiogeographic implicatons In: F.M. Gradstein et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 123, p. 443-450.
(online at: www-odp.tamu.edu/publications/123_SR/VOLUME/CHAPTERS/sr123_22.pdf)
(ODP Holes 761B-766A (Legs 122-123) off NW Australia Exmouth Plateau yielded Lower Cretaceous (Berriasian-Hauterivian) belemnites, including Belemnopsis cf. jonkeri, Belemnopsis ex gr. moluccana s.l., Hibolithes and Duvalia. Assemblages close affinities to Belemnopsis moluccana group from Indonesia and included in Neocomian Indo-Pacific Subprovince of Tethyan Realm)

Norton, I.O. & J.G. Sclater (1979)- A model for the evolution of the Indian Ocean and the breakup of Gondwanaland. J. Geophysical Research 84, p. 6803-6830.
(Magnetic anomaly and fracture zone information used to develop tectonic history of Indian and S Atlantic oceans and positions of Gondwana continents back to 115 Ma. Incl. Eocene separation between Australia and Antarctica with Australia joining Indian plate)

Olierook, H.K.H., R.E. Merle, F. Jourdan, K. Sircombe, G. Fraser, N.E. Timms, G. Nelson, K.A. Dadd, L. Kellerson & Borissova (2015)- Age and geochemistry of magmatism on the oceanic Wallaby Plateau and implications for the opening of the Indian Ocean. Geology 43, 11, p. 971-974.
(Plagioclase and zircon dating indicate that portion of theWallaby Plateau off W Australia formed at ~124 Ma (E Aptian), i.e. >6 My younger than oldest oceanic crust in adjacent abyssal plains. Eruption made possible at 124 Ma via opening of Indian Ocean during breakup of Greater India and Australia along Wallaby-Zenith FZ)

Pattan, J.N., N.J.G. Pearce, G. Parthiban, V.C. Smith, A.V. Mudholkar & N.R. Rao (2013)- The origin of ferro-manganese oxide coated pumice from the Central Indian Ocean Basin. Quaternary Int. 313-314, p. 230-239.
(Pumice clasts coated with ferro-manganese oxide from pumice field on C Indian Ocean floor with ~95% glassy matrix, rhyolitic. Glass and mineral (orthopyroxene) chemistry differs from tuffs of Toba Caldera Complex. Fe-Mn oxide coating suggests pumice probably predates activity from Toba caldera. Similarities to rhyolitic eruptives from Sumatra and possibly of Late Miocene- Late Pleistocene age)

Pattan, J.N., M.S. Prasad & E.V.S.S.K. Babu (2010)- Correlation of the oldest Toba Tuff to sediments in the central Indian Ocean Basin. J. Earth System Science 119, 4, p. 531-539.
(online at: www.ias.ac.in/article/fulltext/jess/119/04/0531-0539)
(Ash layer in association with Australasian microtektites of ~0.77 Ma old in two sediment cores ~450 km apart in C Indian Ocean, ~3100 km SW of Toba caldera. Chemically identical to Ash layer-D in ODP site 758 from Ninetyeast Ridge and ash in S China Sea, previously correlated to oldest(?) Toba Tuff eruptions of Toba caldera, Sumatra)

(64 species of planktonic and benthic foraminifera mainly from Site 258, Naturaliste Plateau. Mostly Albian, with some species of Late Cretaceous (Cenomanian-Campanian) ages. Almost all species also known from other parts of Austral biogeoprovince)

Singh, S.C., H. Carton, A.S. Chauhan, S. Androvandi, A. Davaille, J. Dyment, M. Cannat & N.D. Hananto (2011)- Extremely thin crust in the Indian Ocean possibly resulting from plume-ridge interaction. Geophysical J. Int. 184, 1, 2942, p. 29-42.
(online at: https://academic.oup.com/gji/article/184/1/29/606196)
(Thickness of crust created at ocean spreading centres depends on spreading rate and melt production in mantle. It is ~5-8 km for crust formed at slow and fast spreading centres and 2-4 km at ultra-slow spreading centres away from hotspots and mantle anomalies. Crust is generally thin at fracture zones and thick beneath hotspots and large igneous provinces. Crust generated at fast Wharton spreading centre at 55-58 Ma only 3.5-4.5 km thick over 200km segment of Wharton Basin as suggested by interpreted Moho on seismic reflection and refraction data. This is thinnest crust ever observed in fast spreading environment, and likely formed by interaction between Kerguelen mantle plume and Wharton spreading centre at ~55 Ma)

Stein, C.A., S. Cloetingh & R. Wortel (1989)- Seasat-derived gravity constraints on stress and deformation in the northeastern Indian Ocean. Geophysical Research Letters 16, p. 823-826.

Suo, Y., S. Liab, X. Caoa, H. Dong. X. Li, & X. Wang (2020)- Two-stage eastward diachronous model of India-Eurasia collision: Constraints from the intraplate tectonic records in Northeast Indian Ocean. Gondwana Research *(in press)*
(Magma production rates in two aseismic ridges in NE Indian Ocean (Laccadives-Maldives-Chagos (LMCR) and Ninetyeast Ridge) likely indicators of onset of India-Eurasia collision Increasing magma production along LMCR and SW jump of Central Indian Ridge constrain "soft" (India- island arc; 50–52 Ma) and "hard" (India-Eurasia; ~41 Ma) collisions between W India and Eurasia. Soft collision between E India and Eurasia 47-49 Ma, Extinction of Wharton Ridge constrained hard collision between E India and Eurasia to 38 Ma (M-L Eocene).

Taneja, R. & C. OöNeill (2014)- Constraining the age and origin of the seamount province in the Northeast Indian Ocean using geophysical techniques. Marine Geophysical Res. 35, 4, p. 395-417.
(Christmas Island Seamount Province S of Java-Sunda Trench with numerous submerged volcanic seamounts, and Cocos (Keeling) and Christmas Islands. Regional gravity model of crustal structure under Cocos (Keeling) Island constrain thickness of limestone to 900-2100m. Pliocene episode of volcanism at Christmas Island from flexure-induced cracks in subduction fore-bulge, Eocene phase associated with low velocity seismic zone rising from lower mantle. Modelling also supports existence of older, undated volcanic core to Christmas Island)

Taneja, R., C. OöNeill, M. Lackie, T. Rushmer, P. Schmidt & F. Jourdan (2015)- 40Ar/39Ar geochronology and the paleoposition of Christmas Island (Australia), Northeast Indian Ocean. Gondwana Research 28, 1, p. 391-406.
(Christmas Island episodes of volcanism: (1) Eocene (43-37 Ma), (2) Pliocene (4.3 Ma), (3) possible unexposed Late Cretaceous event. Late Eocene (38-39 Ma) paleomagnetic data suggest paleolatitude of 43.5°± 10° S, further S (~30° S) than existing plate reconstruction models. Pliocene (~4 Ma) paleolatitude of ~13° S. Late Eocene ages at Christmas Island correlate with cessation of spreading of Wharton Ridge (~43 Ma))

Trueman, N.A. (1965)- The phosphate, volcanic and carbonate rocks of Christmas Island (Indian Ocean). J. Geol. Soc. Australia 12, 2, p. 261-283.
(Christmas Island consists of interbedded volcanic and carbonate rocks, mainly of Eocene and Miocene age. Volcanic rocks successively more basic, varying from andesite to limburgite. Phosphate deposits three main mineral groups: apatite, barrandite and crandallite-millisite)

Verwer et al. (eds.) Deposits, architecture, and controls of carbonate margin, slope, and basinal settings, Soc. Sedimentary Geol. (SEPM) Spec. Publ. 105, p. 157-177.
(On Quaternary mixed carbonate- siliciclastic sedimentation on 630km-wide Bonaparte Basin shelf, NW Australia)

Bourget, J., R. Nanson, R. Ainsworth, S. Courgeon, S. Jorry & H. Al-Anzi (2013)- Seismic stratigraphy of a Plio-Quaternary intra-shelf basin (Bonaparte Shelf, NW Australia). In: M. Keep & S.J. Moss (eds.) West Australian Basins Symposium, Perth, p. 1-18.
(Bonaparte Basin unusually wide (~630km) continental shelf where carbonate and siliciclastic sediments accumulated during Late Pliocene- Quaternary (~3.5 Ma BP onwards). Early Australia-Banda Arc collision flexure-induced Neogene deformation shaped very low gradient (< 0.07°) basin in middle of shelf. Two main seismic sequences: (1) aggradation of carbonate platforms in late Pliocene- E Quaternary, followed by (2) phase of reduced carbonate production infill of intrashelf basin with clastic and mixed sediments. Change attributed to onset of 100 kyr-long, large amplitude glacio-eustatic cycles at E-L Quaternary transition)

Bourne, J.D. & P.A. Faehrmann (1991)- The Talbot oilfield, Vulcan sub-basin, Timor Sea: a Triassic oil discovery. Australian Petrol. Explor. Assoc. (APEA) J. 31, 1, p. 42-54.

Bown, P.R. (1992)- New calcareous nannofossil taxa from the Jurassic/ Cretaceous boundary interval of sites 765 and 261, Argo abyssal plain. In: F.M. Gradstein, J.N. Ludden et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 123, p. 369-379.
(Late Jurassic- Early Cretaceous nannofossils from Argo Abyssal Plain, NW Australia, transitional between Tethyan and Austral nannofloral realms. Cooler water suggested by absence of thermophile Tethys forms (Nannoconus) and presence of taxa that display bipolar distribution like Crucibiscutum salebrosum)

Boyd, R., P. Williamson & B.U. Haq (1992)- Seismic stratigraphy and passive-margin evolution of the southern Exmouth Plateau. In: U. Von Rad et al. (eds.), Proc. Ocean Drilling Program (ODP), Scient. Results, 122, p. 39-59.
(online at: www-odp.tamu.edu/publications/122_sr/volume/chapters/sr122_03.pdf)
(Permian/Carboniferous- Neocomian rifting along NE Gondwanaland transformed intracratonic basin along E Tethyan continental margin to new passive margin along NW Australia, fronting new Indian Ocean. Subsequent sedimentation thin (starved passive margin). Eight seismic stratigraphic packages of three clastic depositional wedges and carbonate blanket deposit. Evolution: (1) intracratonic sedimentation (Norian-Rhaetian), (2) rift onset and initial breakup (Hettangian-Callovian), (3) second rift to final breakup (Callovian-Hauterivian), (4) postbreakup and rift to drift transition (Hauterivian-Cenomanian), and (5) mature ocean phase to incipient collision (Turonian-Holocene). Hauterivian age of breakup on S Exmouth Plateau corresponds with uplift of Tithonian-Valanginian sediments and progradation of Hauterivian sediment wedge N from Cape Range Fracture Zone. At Cenomanian-Turonian boundary sediment supply on S Exmouth Plateau shifted from N-prograding clastic source to carbonate-dominated blanket. Folding related to collision farther N increased slopes on S Exmouth Plateau starting in Eocene, producing submarine erosion and resedimentation in Cenozoic oozes)

Boyd, R., P. Williamson & B.U. Haq (1993)- Seismic stratigraphy and passive-margin evolution of the southern Exmouth Plateau. In: H.W. Posamentier et al. (eds.) Sequence stratigraphy and facies associations, Int. Assoc. Sedimentologists (IAS), Spec. Publ. 18, p. 581-603.

Crostella, A. & C.J. Boreham (2000)- Origin, distribution and migration patterns of gas in the Northern Carnarvon Basin. Petroleum Expl. Soc. Australia (PESA) Journal 28, p. 7-20.
(Widespread gas in Cretaceous in Onslow Terrace, Peedamullah Shelf and inner Exmouth subbasin dry and considered to have biogenic input. Indications of biodegraded residual oil in y area (Roller, Skate oilfields in innermost Barrow subbasin) probably biodegraded by same bacterial processes that produced dry gas. Age of hydrocarbon charge Late Tertiary.)

Crostella, A., R.P. Iasky, K.A. Blundell, A.R. Yasin & K.A.R. Ghori (2000)- Petroleum geology of the Peedamullah Shelf and Onslow Terrace, Northern Carnarvon Basin, Western Australia. Western Australia Geological Survey, Report 73, p. 1-119.
(online at: www.dmp.wa.gov.au/documents/REPORT_73_CDWEB(4).pdf)
(Peedamullah Shelf and Onslow Terrace formed during Carboniferous- Jurassic rifting episodes. Shelf remained elevated area during Jurassic, whereas thick Jurassic succession was deposited in deep-water rift to NW. Oil was sourced from pre-Jurassic section. E Permian Lyons Group marine sedimentation including glacial erratics, until Sakmarian when carbonate and mud (Callytharra Formation) were deposited)

Crowell, J.C. & L.A. Frakes (1971)- Late Paleozoic glaciation, IV. Australia. Geol. Soc. America (GSA) Bull. 82, p. 2515-2540.

Crowell, J.C. & L.A. Frakes (1971)- Late Palaeozoic glaciation of Australia. J. Geol. Soc. Australia 17, p. 115-155.
(Carboniferous- E Permian glaciation covered large part of Australia continent. In W Australia E Permian ice centres located on Yilgarn Block, Pilbara Block (SW of Canning Basin) and on Kimberley Block. Evidence for glaciation mainly ice-rafted debris and fluvial-glacial and glacial-marine strata that reached as far N as Bonaparte Gulf Basin. Rapid growth of continental glaciers near end of Carboniferous corresponds with rapid shift of paleolatitude when Gondwanaland moved to near-polar position and Paleo-Pacific lay nearby to provide source of moisture)

Curry, J.S., J.M. Lorenzo & G.W. O Brien (2000)- Polarity of continent-island arc collision since late Miocene: Timor Sea, N.W. Shelf, Australia. AAPG 2000 Annual Mtg Abstracts, p. 35.
(Late Miocene-to-Recent collision of NW Australian shelf with Outer Banda Island Arc results in downward flexing of Australian lithosphere toward arc. Normal faulting on Australian Shelf occurs as flexural stresses exceed plate strength. Collision began in Late Miocene W of Timor, progressed eastward during the Pliocene, and continues E. Normal faults W of 124.5°E terminate vertically in the Miocene section. Normal faults from 124.5°E to 125.5°E terminate at the Miocene-Pliocene boundary. From 125.5- ~128°E, faults terminate in E Pliocene section. Normal faults from ~128- 131°E terminate at or near sea floor E of 131° E, motion of Australian lithosphere is subparallel to plate boundary and no faulting is evident)

Daim, F.L. & P.G. Lennox (1998)- A new tectonic model for the evolution of the Northern Carnarvon Basin, Western Australia. In: P.G. & R.R. Purcell (eds.) The sedimentary basins of Western Australia 2, Proc. Petroleum Expl. Soc. Australia (PESA) Symposium, Perth, p. 435-445.
(Creation of N Carnarvon Basin was by multi-stage ductile movement of lower crust, in general northerly direction, from Exmouth Plateau, towards assumed decompression zones S bounding fault of Canning Basin)

Dawson, G.C., B. Krapez, I.R. Fletcher et al. (2002)- Did Late Palaeoproterozoic assembly of proto-Australia involve collision between the Pilbara, Yilgarn and Gawler Cratons? Geochronological evidence from the Mount Barren Group in the Albany-Fraser Orogen of Western Australia. Precambrian Research 118, p. 195-220.

De Boer, R.A. (2003)- The Puffin sandstone, Timor Sea, Australia: anatomy of a submarine fan. In: G.K. Ellis et al. (eds.) Timor Sea Symposium Darwin 2003, Northern Territory Geol. Survey, p. 373-390.

Dolby, J.H. & B.E. Balme (1976)- Triassic palynology of the Carnarvon Basin, Western Australia. Review Palaeobotany Palynology 22, p. 105-168.
(Five Triassic palynological assemblage zones in wells from Carnarvon Basin: I. Kraeuselisporites saeptatus (Griesbachian-Smithian, II. Tigrisporites playfordii (Smithian-Anisian), III. Staurosaccites quadrifidus (Anisian-Carnian), IV. Samaropollenites speciosus (Carnian) and V. Minutosaccus crenulatus (Carnian-?Norian). Provincialism in M-L Triassic floras:(1) Onslow microflora on NW Shelf, with mixed Gondwanan-European elements. (2) Ipswich microflora: less diverse Falcisporites-dominated assemblages in E and S Australia; European elements not present)

Dore, A.G. & I.C. Stewart (2002)- Similarities and differences in the tectonics of two passive margins: the Northeast Atlantic Margin and the Australian North West Shelf. In: M. Keep & S. Moss (eds.) The sedimentary basins of Western Australia 3, Proc. West Australian Basin Symposium, Petroleum Expl. Soc. Australia (PESA), Perth, p. 89-117.
(Regional review and plate reconstructions of Australian NW shelf)

Driscoll, N.W. & G.D. Karner (1998)- Lower crustal extension across the Northern Carnarvon Basin, Australia: evidence for an eastward dipping detachment. J. Geophysical Research, Solid Earth 103, B3, p. 4975-4991.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/97JB03295)
(N Carnarvon basin 4 extension events:(1) broadly distributed late Permian event, (2) localized Rhaetian event responsible for inception of Barrow and Dampier subbasins, (3) localized Callovian fault reactivation in Barrow-Dampier subbasins and (4) Tithonian-Valanginian event that generated large post-Valanginian regional subsidence across N Carnarvon basin with only minor brittle deformation and erosional truncation. (4) requires significant lower crustal and mantle extension across N Carnarvon, implying existence of E-dipping, intracrustal detachment with ramp-flat-ramp geometry, effectively thinning lower crust and lithospheric mantle. Detachment breached surface close to continent-ocean boundary W of Exmouth Plateau. Flat component of detachment at mid-crustal depths(~15 km) across plateau and ramped beneath Australian continent. Lower crustal ductile extension viable mechanism to generate large regional subsidence with little upper crustal brittle deformation)

Duddy, I.R., P.F. Green, H.J. Gibson & K.A. Hegarty (2004)- Regional palaeo-thermal episodes in northern Australia. In: G.K. Ellis et al. (eds.) Timor Sea Symposium Darwin 2003, Northern Territory Geol. Survey, p. 125-142.
(Kilometer-scale uplift and erosion in Late Triassic-E Jurassic is major feature of E onshore Canning Basin, corresponding to structuring associated with Fitzroy Movement (White Hills 1 well geohistory curve suggests 2500 m of uplift and erosion between 230 and 180 Ma)

Dumont, T. (1992)- Upper Triassic (Rhaetian) sequences of the Australian Northwest Shelf recovered on Leg 122: sea-level changes, Tethyan rifting, and overprint of Indo-Australian breakup. In: U. Von Rad, B.U. Haq et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 122, p. 197-211.
(U Triassic shallow-marine sediments recovered in N part of Exmouth Plateau (Wombat Plateau), a few km from continent/ocean boundary. Capped by erosional post-rift unconformity with 80 My hiatus. Youngest sediments below post-rift unconformity Rhaetian platform limestones. Rhaetian series two shallowing-upward sequences. Many similarities beteween Wombat U Triassic and European Tethyan Mesozoic)

Zumberge (2013)- Stable carbon and hydrogen isotopic compositions of Paleozoic marine crude oils from the Canning Basin; comparison with other west Australian crude oils. In: M. Keep & S.J. Moss (eds.) The sedimentary basins of Western Australia IV, Proc. Petroleum Expl. Soc. Australia (PESA) Symposium, Perth, p.
(Oils at Cudalgarra 1, Dodonea 1 and Pictor 2 generated by several G. prisca-rich Ordovician source rocks. Oils at Blina and Janpam N 1 derived from Devonian source rock in Fitzroy Trough. Majority of produced oils from Lennard Shelf from E Carboniferous source rocks in Fitzroy Trough)

Edwards, D.S., J.M. Kennard, J.C. Preston, R.E. Summons et al. (2000)- Bonaparte Basin; geochemical characteristics of hydrocarbon families and petroleum systems. AGSO Research Newsl. 33, p. 14-19.
(Bonaparte Basin explored for >20 years, with oil production from several fields (Jabiru, Challis-Cassini, Laminaria-Corallina, Elang and the depleted Skua field) and proposed production from giant gas/condensate fields (Bayu-Undan, Sunrise-Loxton Shoals-Troubadour, Petrel-Tern). Two Paleozoic and seven Mesozoic oil families can be identified)

Edwards, D.S., J.M. Kennard, J.C. Preston, C. Boreham et al. (2001)- Geochemical evidence for numerous Mesozoic petroleum systems in the Bonaparte and Browse basins, northwestern Australia. AAPG 2001 Ann. Mtg., p. 55-56. *(Abstract)*
(Nine distinct oil families. Two Paleozoic in Petrel Sub-basin. U Jurassic in Swan Graben sourced majority of oils produced from Vulcan Sub-basin. In ZOCA three oil families: (1) mixed marine- terrestrial in Jurassic-Cretaceous Plover, Elang, Frigate Fms and Flamingo Group, (2) condensate from Sunrise-1 with marine carbonate biomarker signature, (3) oils in fractured Darwin Fm marine signature; from Cretaceous Echuca Shoals Fm and related to Browse Basin Cornea and Gwydion oils. Three families of oils with dominant terrestrial organic matter over Browse and Bonaparte Basins and in transition zone. One can be mapped to E-M Jurassic Plover Fm. This system is least understood but wide geographic distribution.)

Edwards, D.S., J.C. Preston, J.M. Kennard et al. (2003)- Geochemical characteristics of hydrocarbons from the Vulcan Sub-basin, western Bonaparte Basin, Australia. In: G.K. Ellis et al. (eds.) Timor Sea Symposium Darwin 2003, Northern Territory Geol. Survey, p. 169-200.
(online at: www.ret.gov.au/resources/...)
(Two end-members of oils in Jurassic Vulcan basin, Australia NW Shelf: (1) marine source, tied to Oxfordian Lower Vulcan; (2) terrigenous, tied to fluvio-deltaic shales/ coals, probably E-M Jurassic Middle Plover Fm)

Edwards, D.S., R.E. Summons, J.M. Kennard et al. (1997)- Geochemical characteristics of Palaeozoic petroleum systems in northwestern Australia. Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 37, p. 351-379.

Ellis, G. (1993)- Late Aptian-Early Albian radiolarian biostratigraphy and palaeoceanography of the Windalia radiolarite (type section), Camarvon Basin, Western Australia. Eclogae Geol. Helvetiae 86, p. 943-995.
(online at: http://dx.doi.org/10.5169/seals-167268)
(Late Aptian (-E Albian?) widespread marine transgression inundated Australia, with extensive radiolarian-rich facies like Windalia Radiolarite in Carnarvon Basin. Type section ~35m thick, with ammonites and belemnites, and with 59 radiolarian taxa, many recorded previously from Tethyan regions. Assemblages dominated by few non-Tethyan forms (Arachnosphaera exilis, etc.), considered to be endemic elements of 'Austral' faunal realm. (Incl. Tan Sin Hok- Roti species Artocapsa ultima, Hemicryptocapsa capita, Ellipsoxiphus? rugosa, etc.))

Ellis, G.J., A. Pitchford & R.H. Bruce (1999)- Barrow island oil field. The Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 39, 1, p. 158-175.

Erskine, R. D. & P.R. Vail (1988)- Seismic stratigraphy of the Exmouth Plateau. In: A.W. Bally (ed.) Atlas of seismic stratigraphy, American Assoc. Petrol. Geol. (AAPG), Studies in Geology 2, p. 163-173.
(Exmouth Plateau with >2000m thick nonmarine- marginally marine Triassic section, overlain by thin, marine latest Triassic (Rhaetian)- Jurassic section. Thin Jurassic section overlain by a >1500m thick Berriasian-Valanginian-age clastic wedge that progrades from SE to NW, overlain by thin Hauterivian-Aptian glauconitic sands on shelf. Overlying Aptian-Tertiary section consists of fine-grained deep marine marls)

Etheridge, M.A. & G.W. O'Brien (1994)- Structural and tectonic evolution of the Western Australian margin basin system. Petroleum Expl. Soc. Australia (PESA) Journal 22, p. 45-63.
(Major NW-SE extension in Late Carboniferous- E Permian under much of W Australian margin, thinning crust from ~40 km to 5-20 km (i.e. 100-500% extension) below much of subsequent Mesozoic basins and present shelf. Inversions of Goulburn Graben in Arafura Sea (major angular unconformity between E Permian (Asselian) and Jurassic, and 4-4.5 km of uplift and erosion), most likely during latest Triassic- E Jurassic 'Fitzroy Movement', driven by major Gondwanan plate readjustment. Sense of Fitzroy Movement consistent with N to NNW-directed compression, perhaps with total shortening of 2-5%)

Exon, N.F. & J.B. Colwell (1994)- Geological history of the outer North West Shelf of Australia: a synthesis. AGSO J. Australian Geol. Geophysics 15, p. 177-190.
(online at: www.ga.gov.au/corporate_data/49408/Jou1994_v15_n1.pdf)

(Outer continental margin of NW Australia (N Exmouth Plateau- Rowley Terrace) was stretched in Late Paleozoic, and subsided to form part of Westralian Superbasin on S margin of Tethys. Basin filled with thick Triassic and variable thicknesses of Jurassic sediments, before progressive breakup in Callovian-Valanginian. Late Triassic mainly fluvio-deltaic with outer shelf, carbonates including reefal buildups on what is now N Exmouth Plateau and Rowley Terrace. Rift volcanics in areas of future breakup, in latest Triassic and earliest Jurassic. Late Middle Jurassic thermal uplift and erosion prior to breakup of Gondwana in N, and major period of faulting and rift volcanism. Callovian breakup led to genesis of Argo Abyssal Plain)

(online at: www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=14309)
(ODP Site 764 demontrated Rhaetian (Latest Triassic) reefs in N of Exmouth Plateau area, and indicates suitable conditions for reefal development on NW Shelf)

Exon, N.F., U. Ruhl, J.B. Colwell & B.B. West (1992)- Mesozoic reef complexes in the Carnarvon and Canning Basins, Australia. AAPG Int. Conf., Sydney 1992, Search and Discovery Art. 91015 *(Abstract only)*
(ODP Leg 122 cored 200m of Late Triassic reefal carbonates in Site 764 on N Exmouth Plateau Later dredging by BMR showed common reef buildups and shelf carbonates in Late Triassic of N Carnarvon and W Canning basins. Seismic from N Carnarvon indicate reefs first became established in Rhaetian, when paleolatitude was 25-30° S, and may have persisted until Callovian when area had moved to 35-40° S. Large number of buildups identified in N Carnarvon S of ODP sites, presumed to be Jurassic buildups, sitting on horst blocks of Triassic fluvio-deltaic sediments, commonly several 100m thick, 2 km wide, >10 km long)

Exon, N.F. & U. Von Rad (1994)- The Mesozoic and Cainozoic sequences of the Northwest Australian margin, as revealed by ODP core drilling and related studies. In: P.G. & R.R. Purcell (eds.) The sedimentary basins of Western Australia, Proc. Petroleum Expl. Soc. Australia (PESA) Symposium, Perth 1994, p. 181-200.
(Results of ODP legs 122 and 123, coring six sites on Exmouth and Wombat plateaus, and two sites on abyssal plains nearby. U Triassic sequence cored on Wombat Plateau consists ~600m of marine Nd-prograding Carnian-Norian fluvio-deltaic sediments (Mungaroo Fm), and 300m of Rhaetian reefal and lagoonal carbonates. Major thermal uplift, faulting and erosion (and volcanism in outer Canning Basin) preceded Callovian-Oxfordian breakup that led to Argo Abyssal Plain formation (155 Ma by K/ Ar age of oldest oceanic crust at Site 765. Etc.)

Exon, N.F., U. Von Rad & U. Von Stackelberg (1982)- The geological development of the passive margins of the Exmouth Plateau off Northwest Australia. Marine Geology 47, p. 131-152.
(Exmouth Plateau large sunken continental block off NW Shelf, formed during Mesozoic breakup of Australia and Greater India. N margin formed in Callovian (155 Ma), when continental fragment moved off to NW. Early rift Late Triassic-E Jurassic volcanics (213-192 Ma) over thick Triassic paralic sequence. N of E-W hinge line several 1000m of E-M Jurassic pre-breakup carbonates and coals. Breakup along series of rifted and sheared segments, with NE-trending Callovian horsts and grabens. Horsts planed off in Late Jurassic- E Cretaceous. Margin was covered by few 100m of Late Cretaceous- Cenozoic pelagic carbonate as it sank to present depth of 2000-2500m. NE-trending West margin formed by Neocomian (120-125 Ma) rifting, as India moved off to NW. Triassic paralic sequence unconformably overlain by thin Late Jurassic and younger marine beds, indicating area was high in E-M Jurassic. NW South margin formed by shearing in Neocomian. Thick Triassic paralics unconformably overlain by thick Late Jurassic-Neocomian delta, suggesting area was high in E-M Jurassic, but depocentre before and after)

Gaina, C., R.D. Muller, B.J. Brown & T. Ishihara (2003)- Microcontinent formation around Australia. Geol. Soc. Australia Spec. Publ. 22, p. 399-410. *(also in Geol. Soc. America, Spec. Paper 372, p. 405-416)*
Microcontinents of Australian origin in Tasman Sea and Indian Ocean include E Tasman Rise, Gilbert Seamount, Seychelles, Elan Bank (Kerguelen Plateau), possibly fragments of Lord Howe Rise and Norfolk Ridge, Wallaby Plateau. Tasman Sea continental fragments formed by ridge jumps onto adjacent continental margins after sea-floor spreading in S Tasman Sea commenced. E Tasman Plateau separated from Lord Howe Rise at ~83 Ma. Most microcontinents formed by re-rifting of young continental margin in vicinity of mantle plume stem. Weak inner flank of rifted margin weakens further when passing over mantle plume, causing nearby spreading ridge to jump onto this zone of weakness, isolating passive margin segment and leaving narrow passive margin behind)

Gardner, R.L., N.R. Daczko, J.A. Halpin & J.M.Whittaker (2015)- Discovery of a microcontinent (Gulden Draak Knoll) offshore Western Australia: implications for East Gondwana reconstructions. Gondwana Research 28, 3, p. 1019-1031.
(Dredged samples from Gulden Draak Knoll show it is rifted continental fragment at boundary between W Perth Abyssal Plain and Wharton Basin, Indian Ocean. Comprises granulite facies basement with Cambrian granite)

(online at: www.ga.gov.au/corporate_data/80974/Jou1978_v3_n4_p319.pdf)
(Results of 1977 RV Valdivia marine geological survey. Scott Plateau between Argo Abyssal Plain in W and Roti Basin in N is foundered continental block at depth of 2000-3000m. Dominant fault direction is NW to WNW, an ancient strike direction on Australian continent. W margin probably formed as NE-trending rifts and NW-trending transforms during Late Jurassic breakup. Argo Abyssal Plain 5000-5730m deep, overlain by ~400m of Late Jurassic-Cretaceous sediments, unconformably overlain by 200m of Tertiary sediment. Callovian breakup was preceded by period of basic volcanism and shallow marine sedimentation, followed by restricted shallow marine conditions in the Late Jurassic, and bathyal carbonate sedimentation by Late Cretaceous. Manganese crusts up to 1 cm thick at all dredge stations on Scott Plateau)

Kaiko, A.R. & A.M. Tait (2001)- Post-rift tectonic subsidence and palaeo-water depths in the northern Carnarvon Basin, western Australia. Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 2001, p. 367-379.
(Subsidence history of N Carnarvon Basin dominated by thermal sag following E-M Jurassic rifting. Miocene wrench-related uplift (several 100m) caused local basin inversion)

Kaiko, A.R. & P.R. Tingate (1996)- Suppressed vitrinite reflectance and its effect on thermal history modelling in the Barrow and Dampier sub-basins. Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 1996, p. 428-443.
(Jurassic-Cretaceous formations of predominantly marine origin yield vitrinite reflectance values that are often lower than expected. Two possible explanations: (1) recent increase in thermal gradients occurred; or (2) vitrinite reflectance is suppressed, related to the marine environment of deposition)

Kaoru, M., Y. Kurata, D.J. Christiansen & J. Scott (2004)- The Crux gas-condensate discovery, northern Browse Basin, Australia. In: G.K. Ellis et al. (eds.) Timor Sea Symposium Darwin 2003, Northern Territory Geol. Survey, p. 67-79.

Karner, G.D. & N.W. Driscoll (1999)- Style, timing and distribution of tectonic deformation across the Exmouth Plateau, northwest Australia, determined from stratal architecture and quantitative basin modeling. In: C. Mac Niocaill & P.D. Ryan (eds.) Continental Tectonics, Geol. Soc., London, Spec. Publ. 164, p. 271-311.
(Tectonic events responsible for formation of Exmouth Plateau varied in space and time. Deformation broadly distributed in Late Permian event (widespread 'intra-cratonic' Locker Shales and Mungaroo Fm). Late Triassic-E Jurassic extension more localized and formed Exmouth, Barrow and Dampier sub-basins. Callovian and Kimmeridgean extension resulted in seafloor spreading. Regional extension in Tithonian- Valanginian generated widespread regional subsidence. After initiation of seafloor spreading, inversion phase with minor reactivation of fault systems. Post-Valanginian subsidence requires significant lower crustal and mantle extension across Exmouth Plateau in Tithonian-Valanginian, which should be accompanied by large injection of heat)

Keall, J.M. & P.J. Smith (2000)- The impact of late tilting on hydrocarbon migration, eastern Browse Basin, Western Australia. AAPG Int. Conf. Exhibition, Bali 2000, American Assoc. Petrol. Geol. (AAPG) Bull. 84; 9, p. 1445-1446 *(Abstract only)*
(Discoveries of oil in Gwydion-1 (1995) and Cornea-1 (1996) on E margin of Browse Basin confirmed presence of oil source in E Cretaceous- Late Jurassic source rocks, with migration of >50 km from kitchen areas to W. Wells drilled along E side of basin have residual oil columns, suggesting traps had greater structural closure at time of charge. Uplift and erosion in Miocene resulted in tilting of traps, causing reduction in amount of closure and spilling of oil updip)

Moss (eds.) The sedimentary basins of Western Australia 3, Proc. West Australian Basin Symposium, Petroleum Expl. Soc. Australia (PESA), Perth, p. 409-437.
(Thermal history analysis of E Carboniferous- Permian petroleum systems in Petrel. Modelled oil- gas expulsion from postulated oil-prone source in Lower Carboniferous Milligans Fm in two offshore depocentres N and S of Turtle-Barnett High. Expulsion commenced in Late Carboniferous, peaked in E Permian, prior to onset of Late Triassic 'Fitzroy Movement' uplift. Expulsion from Lower Permian Keyling Fm restricted to central and outer portions of Petrel Deep. Expulsion from outer Petrel Deep in Late Permian-E Triassic. C Petrel Deep peaked in E Triassic, with minor expulsion in Late Triassic-Cretaceous. Gas expulsion from U Permian Hyland Bay Fm limited to outboard limits of Petrel Sub-basin. Timing is Jurassic-Cretaceous, with peak in mid-late Cretaceous)

Longley, I.M., C. Buessenschuett, L. Clydsdale, C.J. Cubitt, R.C. Davis, M.K. Johnson, N.M. Marshall et al. (2002)- The North West Shelf of Australia- a Woodside perspective. In: M. Keep & S.J. Moss (eds.) The sedimentary basins of Western Australia 3. Proc. West Australian Basins Symp. Perth, p. 27-86.
(also online at: www.searchanddiscovery.com/documents/longley/images/longley_full_big.pdf)
(NW Shelf of Australia major gas province with minor oily sweet spots. Pre-rift Permo-Triassic intracratonic sediments, overlain by Jurassic- Cainozoic syn-post-rift successions, deposited in response to rifting and seafloor spreading of at least three continental blocks in Oxfordian-Valanginian. Rifting initiated in C Argo area in Oxfordian, jumped N of Timor in Tithonian, to S Cuvier area in Valanginian. 754 exploration wells between 1953-2001 discovered 2.6 GBO, 2.6 GBC, 152 Tcf gas in 233 fields. Most traps sands in horsts and tilt blocks, or overlying drape structures. 97% reservoired below Cretaceous regional seal. Dominance of gas (84%) due to

quality and maturity of source. Effective oil source in mainly Jurassic pre- and syn-rift deltaic, or partially restricted syn-rift marine settings. Open marine deposits typically lean and gas-prone. 119 Tcf of gas reserves remain undeveloped, together with ~1400 MB condensate)

Lorenzo, J.M. (2004)- Foreland basins: lithospheric flexure, plate strength and regional stratigraphy. Ph.D. Thesis Louisiana State University, p. 1-168. *(Unpublished)*
(Including chapters on flexural loading control of accommodation in Timor Sea- Australian NW shelf. Model represents geometry of Timor Trough as ~300 km wide, ~2000m deep depression with 300m high forebulge. Inelastic deformation in SW part of Timor Sea reveals tectonic loading since Late Miocene; NE region loading more substantial since Late Pliocene)

Moss, G.D., D.L. Cathro & J.A. Austin (2004)- Sequence biostratigraphy of prograding clinoforms, Northern Carnarvon Basin, Western Australia: a proxy for variations in Oligocene to Pliocene global sea level? Palaios 19, 3, p. 206-226.
(Sequence biostratigraphic analyses from 5 wells in N Carnarvon Basin. Late Oligocene- M Miocene with deeper-water benthic assemblages. Regional flooding event at start of M Miocene (climatic optimum, 16-14.5 Ma), followed by karstification on shelf and incision on clinoform front. Transition to shallow-water, warm facies on shelf in M and Late Miocene, with benthic fauna dominated by larger foraminifera, probably result of progradation. Late M Miocene (12 Ma) intensification of development of gullies and submarine canyons)

Muller, R.D., S. Dyksterhuis & P. Rey (2012)- Australian paleo-stress fields and tectonic reactivation over the past 100 Ma. Australian J. Earth Sci. 59, 1, p. 13-28.
(Changes in stress regime of Australian continent through time can be modelled by changing geometry and forces acting along boundaries of Indo-Australia and Paleo-Australian plate since E Cretaceous. Intraplate structural events may be caused by interaction of far field stress field with heterogeneous geology of Australia. Some intraplate suture zones of Australian continent particularly weak, i.e. faulted portions of NW Shelf and Flinders Ranges, which reactivated when favourable stress regimes existed)

Muller, R.D., N. Flament, K.J. Matthews, S.E. Williams & M. Gurnis (2016)- Formation of Australian continental margin highlands driven by plate-mantle interaction. Earth Planetary Sci. Letters 441, p. 60-70.
(E Australian highlands well-documented episodic uplift history spanning 120 Myrs. Initial dynamic uplift of 400-600 m from 120-80 Ma driven by E-ward motion of EAustralia margin away from sinking E Gondwana slab, At ~60 Ma in S (Snowy Mountains) renewed uplift of ~700, propelled by the gradual motion of margin over edge of large Pacific mantle upwelling. N highlands experienced continuous history of dynamic uplift, first due to the end of subduction E of Australia, then due to moving over large passive mantle upwelling. Etc.)

Muller, R.D., C. Gaina & S. Clark (2000)- Seafloor spreading around Australia. In: J. Veevers (ed.) Billion-year history of Australia and neighbors in Gondwanaland, GEMOC Press, Sydney, p. 18-28.
(Review of Late Jurassic- Recent seafloor spreading around Australia. In NW Late Jurassic breakup of Argoland at ~156 Ma, followed by start of seafloor spreading at Gascoyne and Cuvier abyssal plains in E Cretaceous (~132 Ma), starting separation of Australia and Greater India. Onset of Australia- Antarctica slow separation at ~100 Ma. In E seafloor spreading of Tasman Sea propagated from S, with early rifting at ~70 Ma, continuous spreading at 64 Ma and onset of opening in Coral Sea area at ~58 Ma. At ~52 Ma (Early Eocene) end of seafloor spreading along entire E and NE Australia margin)

Muller, R.D., C. Gaina, A.A. Tikku, D. Mihut, S. Cane & J.M. Stock (2000)- Mesozoic/Cenozoic tectonic events around Australia. In: M.A. Richards et al. (eds.) The history and dynamics of global plate motion, Geol. Soc. America (GSA), Geophys. Monograph 121, p. 161-188.

Muller, R.D., A. Goncharov & A. Kritski (2005)- Geophysical evaluation of the enigmatic Bedout basement high, offshore northwestern Australia. Earth Planetary Sci. Letters 237, p. 264-284.
(Bedout High in Roebuck (offshore Canning) Basin unusual structure, controversially interpreted as end-Permian impact structure. Associated with major crustal thinning and interpreted magmatic underplating. Moho uplift of 7-8 km. Thermal modelling from well La Grange-1 and basalts drilled on top of Bedout High consistent with rifting above anomalously hot mantle. Preferred interpretation is basement high formed by two consecutive Paleozoic and Mesozoic rifting episodes, orthogonal to each other, with basin formation to E and W)

Muller, R.D., D. Mihut & S. Baldwin (1998)- A new kinematic model for the formation and evolution of the West and Northwest Australian margin. In: P.G. & R.R. Purcell (eds.) The sedimentary basins of Western Australia 2, Proc. Petroleum Expl. Soc. Australia (PESA) Symposium, Perth 1998, p. 55-72.
(Revised model of Mesozoic continental breakup and sea-floor spreading in Perth, Cuvier, Gascoyne and Argo abyssal plains. Sea-floor spreading in Gascoyne and Cuvier abyssal plains starts in E Valanginian. At Albian-Cenomanian boundary (99 Ma) spreading direction between India- Australia changed from NW-SE to N-S. Event at ~61 Ma in E Paleocene in Tasman Sea and SE Indian- Pacific oceans with change in spreading direction. 99 Ma event resulted in renewed local extension, 61 Ma event may reflect elastic buckling of lithosphere. Both events may have originated from stepwise subduction of Neo-Tethyan Ridge, first N of India at 99 Ma, then N of Australia at 61 Ma. NW Shelf accelerated subsidence, starting at ~20 Ma. Cannot be explained by foreland basin loading, but likely result of complex evolution of compressive intraplate stresses following breakup of Indo-Australian Plate into Indian, Australian and Capricorn plates)

Muller, R.D., D. Mihut, C. Heine, C. OóNeill & I. Russell (2002)- Tectonic and volcanic history of the Carnarvon Terrace: constraints from seismic interpretation and geodynamic modeling. In: M. Keep & S. Moss (eds.) The sedimentary basins of Western Australia 3, Proc. West Australian Basin Symposium, Petroleum Expl. Soc. Australia (PESA), Perth, p. 719-740.
(Carnarvon Terrace multi-phase history of faulting and sedimentation, with major bounding faults active during Late Triassic and E Jurassic. Major phase of uplift and erosion shortly before breakup between Greater India and Australia prior to 130 Ma. Widespread lower Cretaceous intrusions in Exmouth sub-basin and offshore Wallaby and Zenith plateaus, provide evidence for syn- and post-rift volcanism)

OõBrien, G.W. (1992)- Some ideas on the rifting history of the Timor Sea from the integration of deep crustal seismic and other data. Petroleum Expl. Soc. Australia (PESA) Journal 21, p. 95-113.
(Principal tectonic event shaping architecture of Timor Sea is Late Carboniferous- E Permian crustal extension to 35-40% of former thickness. Vulcan Sub-basin/ Ashmore Platform/Sahul Platform part of single upper plate rift margin, with extension via 'pulling' of lower crust from beneath upper crust. Flexural stress on inboard of upper plate rift margin initiated Vulcan Sub-basin and Malita Graben. Subsequent thermal subsidence created thick sediments until Late Triassic. Jurassic extension associated with rifting and ultimate break-up of Gondwana was minor compared to Permo-Carboniferous event, possibly because crust so heated/ stretched during Permo-Carboniferous that limited Jurassic extension led to crust failure and start of seafloor spreading)

(online at: www.publish.csiro.au/ex/pdf/ASEG2018abM2_3B)
(Lower Barrow Group in N Carnarvon basin is latest Tithonian- E Valanginian prograding shelf-margin system with ~100-500m high clinoforms. 3D seismic shows high-order clinothems with cyclicity of ~40,000 yrs. Falling to flat shelf-edge trajectories associated with sediment bypass; rising shelf-edge trajectories linked with increasing sediment storage on shelf. Fluvial-dominated coastlines steep slope clinoforms; wave-dominated coastlines low-angle slope clinoforms. Turbidite systems mostly short-lived, fed by multiple small rivers forming linear ramp systems. Due to shallow configuration of margin (<500m), short slopes and high sand ratio, turbidite systems smaller scale (<50 km) and shorter lived than most modern turbidite systems (100-1000 km))

Robinson, P.H., H.S. Stead, J.B. OôReilly & N.K. Guppy (1994)- Meanders to fans: a sequence stratigraphic approach to Upper Jurassic- Lower Cretaceous sedimentation in the Sahul Syncline, North Bonaparte Basin. In: P.G. & R.R. Purcell (eds.) The sedimentary basins of Western Australia, Proc. Petroleum Expl. Soc. Australia (PESA), Perth 1994, p. 223-242.
(In Sahul Syncline up to 2000m of Late Jurassic- E Cretaceous with 11 depositional sequences. Include Callovian fluvial to shoreface sands and Oxfordian- Berriasian offshore shales, Valanginian massive progradation and aggradation that filled the trough with highstand shales and minor sands. From M Valanginian-earliest Aptian veneer of marine, glauconitic shale marked end of Sahul Syncline as structural entity)

Rohead-OôBrien, H. & C. Elders (2018)- Controls on Mesozoic rift-related uplift and syn-extensional sedimentation in the Exmouth Plateau. In: Proc. Australian Exploration Geoscience Conf. (AEGC 2018), Sydney, ASEG Extended Abstracts, 1, p. 1-8. *(Extended Abstract)*
(online at: http://www.publish.csiro.au/EX/ASEG2018abM2_2B)
(Exmouth Plateau of N Carnarvon Basin, NW Australia, multi-phase extensional history. Initially formed as basin during Permo-Carboniferous rifting event that thinned crust and led to large volumes of Triassic sediment accumulatation. Fault activity of second rift phase began in latest Triassic, mainly on NNE-SSW and NE-SW trending faults. Rotation of Triassic fault blocks continued in Jurassic, with erosion of pre-rift sediments. Latest Jurassic infilled of half-grabens and deposition onto highs limited in W as area was starved of sediment. E Cretaceous progradation of Barrow Delta resulted in infilling of previously starved half-grabens)

Rohl, U., T. Dumont, U. Von Rad, R. Martini & L. Zaninetti (1991)- Upper Triassic Tethyan carbonates off Northwest Australia (Wombat Plateau, ODP Leg 122). Facies 25, p. 211-252.
(Wombat Plateau U. Carnian and Norian deltaics, overlain by Rhaetian reefal carbonates. Foraminiferal assemblages closest affinity to Seram, also similarities with other regions like Europe)

Rohl, U., U. Von Rad & G.Wirsing (1992)- Microfacies, paleoenvironment, and facies-dependent carbonate diagenesis in Upper Triassic platform carbonates off Northwest Australia. In: U. Von Rad, B.U. Haq et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 122, p. 129-159.
(online at: www-odp.tamu.edu/publications/122_sr/VOLUME/CHAPTERS/sr122_07.pdf)
(ODP 122 identified 900m U Triassic (Carnian- Rhaetian) early rift sediments on Wombat (N Exmouth) Plateau. Carnian-Norian dominated by fluviodeltaic sediments with many carbonate intercalations. Sequence boundary at base of 'Rhaetian transgression' (215 Ma), overlain by shallowing-upward cycles from bioturbated wackestones to dolomitic algal bindstones, with reef development at platform margin. Open shelf limestone-marl alternations grade into bioclastic and oolitic grainstones, into calcisponge patch reefs and coral reefs. Reef growth ended with sequence boundary, followed by latest Rhaetian sea-level rise. Diagenetic successions of Rhaetian carbonates suggest Wombat Plateau horst was locally subaerially eroded, probably in Callovian-Oxfordian)

Rohrman, M. (2013)- Intrusive large igneous provinces below sedimentary basins: an example from the Exmouth Plateau (NW Australia. J. Geophysical Research, Solid Earth, 118, 8, p. 4477-4487.

(Exmouth Plateau with breakup-related 150 × 400 km sill complex, intruding mainly Triassic sedimentary rocks between Late Jurassic and E Cretaceous. Sill complex likely sourced by mafic or ultramafic magma chamber at base of crust, seismically imaged as high-velocity body and covering ~16x 104 km2)

Rohrman, M. (2015)- Delineating the Exmouth mantle plume (NW Australia) from denudation and magmatic addition estimates. Lithosphere 7, 5, p. 589-600.
(Late Jurassic Exmouth mantle plume upwelling at highly extended and subsided continental fragment bounded by present-day subsea Sonne and Sonja Ridges and includes Cuvier margin and Cape Range fracture zone. Region characterized by ~2.6 km of denudation and ~500m of tectonic uplift, with erosion products acting as source material for E Cretaceous Lower Barrow delta. ~40% of the seismically detected magmatic underplate melt related, with effective underplate ~4 km thick near locus of uplift. Plume-induced domal uplift preceded magmatism and breakup. Plume activity followed by W- propagating hotspot track, possibly terminating in Greater India (Tibet))

Rollet, N., S.T. Abbott, M.E. Lech, D. Caust, R. Romeyn, K. Romine, J. Blevin, K. Khider et al. (2016)- Cretaceous stratigraphic play fairways and risk assessment in the Browse Basin: implications for CO2 Storage. AAPG/SEG Int. Conf. Exhib., Melbourne 2015, Search and Discovery Art. 80513, 29p.
(online at: www.searchanddiscovery.com/documents/2016/80513rollet/ndx_rollet.pdf)
(Browse basin with large undeveloped gas resources (36 Tcf gas, 1148 MMB condensate). Gas rel. high in CO2 (~ 8%). Study of Cretaceous deltaic and submarine fan sandstone reservoirs for CO2 sequestration)

(online at: www.ga.gov.au/corporate_data/62/Bull_213.pdf)
(Scott Plateau of NW Shelf is subsided W margin to Browse Basin, and was probably paleohigh in Permian-Jurassic, shedding sediments into Browse Basin to E and Rowley Sub-basin to S. Since break-up of continental margin in Callovian, plateau gradually subsided to present depth of 1000-3500m, and now covered by ~1 km U Cretaceous-Cainozoic sediments, mainly carbonates. Basement of possible Kimberley Block equivalents probably no more than 2-4 km below seabed)

Stagg, H.M.J., J.B. Willcox, P.A. Symonds, G.W. OÕBrien, J.B. Colwell, P.J. Hill, C.S. Lee, A.M.G. Moore & H.I.M. Struckmeyer (1999)- Architecture and evolution of the Australian continental margin. AGSO J. Australian Geol. Geophysics 17, 5/6, p. 17-33.
(online at: www.ga.gov.au/corporate_data/81551/Jou2000_v17_n5-6_p017.pdf)
(Review of continental margins of Australia. Normally rifted NW and oblique-slip W margins have polyphase rift/drift history with progressive separation of continental blocks from Permo-Carboniferous- E Cretaceous. Multiple tectonic episodes produced geologically complex margin with strong imprint of volcanism. Continental shelf and marginal plateaux generally underlain by thick Phanerozoic sediments of Westralian Superbasin; areas of shallow crystalline basement are rare. Phanerozoic generally thick and flat-lying. Extension of upper crust

observed only adjacent to inboard confined deep rifts and on outermost margin. Upper crustal extension rarely >20%; basins formed largely as result of lower crustal extension. Goulburn Graben inversion may be related to Late Triassic 'Fitzroy Movement')

Stanley, G.D. (1994)- Upper Triassic spongiomorph and coral association dredged off the northwestern Australian shelf. AGSO J. Australian Geol. Geophysics 15, 1, p. 127-133.
(online at: https://d28rz98at9flks.cloudfront.net/81385/Jou1994_v15_n1_p127.pdf)
(U Triassic corals and spongiomorphs dredged during BMR Cruise 95 from Rowley Terrace, off Canning Basin, NW Australia. Branching spongiomorph (Spongiomorpha sp.) and two corals (Pamiroseris rectilamellosa, Retiophyllia tellae) indicate Late Triassic (Norian-Rhaetian) age. Although different in composition, Rowley Terrace occurrences may be E-ward extension of Wombat Plateau reefs, along rifted margin of Gondwana)

(online at: www-odp.tamu.edu/publications/122_SR/VOLUME/CHAPTERS/sr122_39.pdf)
(Diverse, warm-water Late Oligocene-Recent planktonic foram faunas on Wombat and Exmouth plateaus, despite N-ward drift of Australia across 10°-15° latitude since E Miocene. Invasions of cool-water species during periods of global cooling in late M Miocene (replacement of warm water Paragloborotalia mayeri by Globorotalia partimlabiata), Late Miocene (common cool-water Globorotalia conoidea just after coiling change in Neogloboquadrina humerosa) and Pleistocene (common cool-water Globorotalia inflata))

Zaninetti, L., R. Martini & T. Dumont (1992)- Triassic foraminifers from sites 761 and 764, Wombat Plateau, Northwest Australia. In: U. von Rad, B.U. Haq et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 122, p. 427-436.
(online at: www-odp.tamu.edu/publications/122_SR/VOLUME/CHAPTERS/sr122_24.pdf)
(Late Norian (Triasina oberhauseri) and Rhaetian (Triasina hantkeni) forams from ~250m thick Late Triassic reefal-platform carbonate section in ODP cores from Wombat Plateau at edge of Argo Abussal Plain, NW Australia. Reefal carbonate platform with inner shelf (intertidal to lagoon), patch reef, and outer shelf facies. Close affinity to microfauna of Seram. First record of Galeanella? laticarinata outside Seram)

Zhan, Y. & A.J. Mory (2013)- Structural interpretation of the Northern Canning Basin, Western Australia. West Australian Basins Symposium, Perth 2013, Session 9, p. 1-17.
(Seismic profiles in N Canning Basin reveal major WNW-oriented strike-slip fault zone in Fitzroy Trough, generated during Late Triassic-E Jurassic 'Fitzroy Transpression'. With NW-oriented fault splays indicative of right-lateral slip. Deformation at this time also produced N-S compression and E-W extension)

Zhen, Y.Y. & R.S. Nicoll (2009)- Biogeographic and biostratigraphic implications of the *Serratognathus bilobatus* Fauna (Conodonta) from the Emanuel Formation (Early Ordovician) of the Canning Basin, Western Australia. Records Australian Museum, Sydney 61, p. 1-30.
(Discovery of Serratognathus bilobatus in E Ordovician Emanuel Fm of Canning Basin indicates biogeographic link between Australia and E Gondwanan plates in E Ordovician and formation of 'Australasian Province'. S. bilobatus fauna from Canning Basin is more diverse than coeval Chinese Lower Ordovician successions and probably represents assemblage inhabiting relatively deeper water (mid-outer shelf) facies. Also present in Setul Lst, Malaysia. E Ordovician paleobiogeographic reconstruction shows E Gondwana shows Australia- New Guinea in equatorial position)

IX.16. NE Australia margin ('Tasmanides')

Adams, C. & R. Korsch (2010)- Crossing the Tasman: tracking Torlesse Terrane rocks from New Zealand into the New England Orogen. 20th Australian Geological Convention, Canberra 2010, Geol. Soc. Australia, Abstracts 98, p. 71-72. *(Abstract only)*
(New Zealand Torlesse Supergroup extensive Permian-Cretaceous accretionary wedge of quartzose greywacke turbidites. Provenances continent-derived, plutonic rock, best match with Carboniferous, Permian and Triassic sources in New England Orogen, with some Cambrian and Ordovician. Jurassic-Cretaceous ages dominant in North Island, Late Permian-Triassic in South Island. Oldest horizons close to S-most edge of terrane, with slivers with Late Carboniferous limestone, probably oceanic seamount and pelagic seafloor assemblages upon which Torlesse was later deposited. Oldest Torlesse records M Permian initiation (~270 Ma) of major Late Permian-Triassic accretionary phase, supplied by erosion of contemporaneous magmatic arcs in E Australia)

Aitchison, J. (1990)- Significance of Devonian-Carboniferous radiolarians from accretionary terranes of the New England orogen, eastern Australia. Marine Micropaleontology 15, p. 365-378.
(Radiolarians provide age constraints for terranes in New England tectonic collage along E margin of Australia. Djungati terrane two siliceous sediment lithofacies: M Silurian- Late Devonian ocean-floor red, ribbon-bedded cherts and latest Devonian green tuffaceous cherts. Anaiwan terrane with latest Devonian and E Carboniferous radiolarians in cherts and tuffaceous siltstones. Yarrimie Fm of Gamilaroi terrane with Late Devonian (Frasnian) radiolarians and allochthonous blocks of limestone with Givetian conodonts and corals)

Aitchison, J., M.C. Blake, P.G. Flood & A.S. Jayko (1994)- Paleozoic ophiolite assemblages within the southern New England Orogen of eastern Australia: implications for the growth of the Gondwana margin. Tectonics, 13, 1135-1149.
(Narrow belt of E Cambrian ophiolite crops out near Peel- Manning Fault System, juxtaposed against younger arc and subduction complex terranes. May represent portions of Lachlan Fold Belt basement. M-L Devonian ophiolitic rocks in Yarras Complex comprise basement to Birpai subterrane and represent crustal cross section through rifted island arc. Periodic accretion of island arc systems to E margin of Gondwana suggests multiple phases of subduction with possibility of polarity reversals throughout the history of accretion)

Aitchison, J. C. & S. Buckman (2012)- Accordion vs. quantum tectonics: insights into continental growth processes from the Paleozoic of eastern Gondwanan. Gondwana Research 22, p. 674-680.
(E Paleozoic Lachlan Fold Belt of E Australia widely regarded as convergent plate margin beneath which Paleo-Pacific (Panthalassic) oceanic lithosphere was continuously subducted, in retreating accretionary orogeny. However, sandstone compositions, chert accumulation and stratigraphic architecture not consistent with this model. Alternative explanation for growth of continental margin includes subduction of oceanic lithosphere outboard of passive Gondwana continental margin under extensive intra-oceanic island arc that now crops out as allochthonous Macquarie arc in foldbelt. Once intervening oceanic lithosphere was eliminated, the arc was emplaced oh Gondwana margin. Four such events recognized in Phanerozoic)

Aitchison, J.C., A.M. Davis, J.M.C. Stratford & F.C.P. Spiller (1999)- Lower and Middle Devonian radiolarian biozonation of the Gamilaroi Terrane New England Orogen, Eastern Australia. Micropaleontology 45, 2, p. 138-162.
(Seven uppermost Lower to M Devonian radiolarian assemblages in Gamilaroi terrane of E Australia. Gamilaroi terrane sedimentation occurred during Early (Pragian) to Late (Frasnian) Devonian in volcanic island arc environment with abundant radiolarians. Assemblages are dominated by spumellarians)

Aitchison, J.C. & P.G. Flood (1992)- Early Permian transform margin development of the southern New England Orogen, eastern Australia (eastern Gondwana). Tectonics 11, 6, p. 1385-1391.
(S New England orogen evolved from zone of high-angle plate convergence during Carboniferous, into either transform margin or highly oblique-convergent margin by E Permian)

Aitchison, J.C. & P.G. Flood (1992)- Implications of radiolarian research for analysis of subduction complex terranes in the New England Orogen, NSW, Australia. Palaeogeogr. Palaeoclim. Palaeoecology 96, p. 89-102.

Aitchison, J.C. & P.G. Flood (1994)- Gamilaroi Terrane: a Devonian rifted intra-oceanic island-arc assemblage, NSW, Australia. In: J.L. Smellie (ed.) Volcanism associated with extension at consuming plate margins, Geol. Soc., London, Spec. Publ. 81, p. 155-168.
(Devonian Gamilaroi terrane of New England orogen is intra-oceanic island arc, with local rifting. Oceanic crust between Gamilaroi terrane and Gondwana subducted E-wards under W margin of Gamilaroi terrane arc. Gamilaroi terrane obducted onto Gondwana margin in latest Devonian, resulting in subduction flip and subsequent development of E-facing continental margin arc system on top of Gamilaroi terrane)

Aitchison, J.C., P.G. Flood & F.C.P. Spiller (1992)- Tectonic setting and paleoenvironment of terranes in the southern New England orogen, eastern Australia as constrained by radiolarian biostratigraphy. Palaeogeogr. Palaeoclim. Palaeoecology 94, p. 31-54.
(Radiolarians abundant in Gamilaroi, Djungati and Anaiwan terranes of New England orogen in E Australia. Oldest rocks of Gamilaroi terrane probably Devonian, part of intra-oceanic island arc succession which accreted to E margin of Australia at end of Devonian. Overlain by Carboniferous, continental arc sequence of successor basin. Djungati terrane was part of oceanic basin in M Silurian- Late Devonian, influenced by volcanic island arc activity and tectonically disrupted in latest Devonian- E Carboniferous)

(online at: https://d28rz98at9flks.cloudfront.net/81317/Jou1992_v13_n3_p191.pdf)
(New zircon U-Pb ages define two major short-lived episodes of Paleozoic magmatism in Coen Inlier, N Queensland: (1) E Permian (284 Ma; Weymouth Granite, Twin Humps Adamellite); (2) most granites Late Silurian- E Devonian (~402-408 Ma). Similarities in ages of granites in Coen and Georgetown Inliers)

Blake, P.R. (2010)- Devonian corals of the Yarrol Province, eastern-central Queensland. Mem. Assoc. Australasian Palaeontologists (AAP) 38, p. 1-191.
(Yarrol Province in E-C Queensland contains latest Silurian to Permian rocks. Devonian corals locally abundant. Fairly diverse Late Devonian coral fauna present, with 45 genera and 77 species (incl. Heliolites, etc.). Six coral faunas, three in E Devonian, two in M Devonian, and one in Late Devonian)

Blewett, R.S. & L.P. Black (1998)- Structural and temporal framework of the Coen Region, north Queensland: implications for major tectonothermal events in east and north Australia. Australian J. Earth Sci. 45, p. 597-609.
(Coen Region Proterozoic (Yambo, Savannah) and Paleozoic (Pama, Kennedy) Provinces. N Queensland two major crust-forming periods: Proterozoic (1800-1550 Ma) and Paleozoic (430-280 Ma), with intervening 1000 million years of quiescence interrupted by minor Grenville-age modification (1300-1000 Ma). Coen Region intraplate, with plate-margin processes further E)

Boger, S.D. & D. Hansen (2004)- Metamorphic evolution of the Georgetown Inlier, northeast Queensland, Australia; evidence for an accreted Palaeoproterozoic terrane? J. Metamorphic Geol. 22, p. 511-527.

(Georgetown Inlier, NE Australia, two separate metamorphic events: (1) contemporaneously with Paleo- to Mesoproterozoic orogenesis; (2) thermal overprint with emplacement of Forsayth Batholith (~1550 Ma))

Brakel, A.T., J.M. Totterdell, A.T. Wells & M.G. Nicoll (2009)- Sequence stratigraphy and fill history of the Bowen Basin, Queensland. Australian J. Earth Sci. 56, 3, p. 401-432.
(Regional seismic synthesis of 10 km-thick continental-shallow marine succession of Bowen Basin revealed 3 basin-fill episodes and 9 depositional supersequences: (A) E Permian volcanics and half-graben development in separate troughs with fluvio-lacustrine sediments including coal. In subsequent thermal subsidence phase, four marine supersequences (B-E) were generated. Foreland loading in Late Permian-Triassic, with pulses of thrust loading and 4 supersequences (F-I). Later part of F mainly non-marine coal measures. Foreland-loading phase greatest rate of subsidence since initial rift, but little evidence of widespread marine flooding)

Briggs, D.J.C. (1998)- Permian Productidina and Strophalosiidina from the Sydney-Bowen Basin and New England Orogen: systematics and biostratigraphic significance. Mem. Assoc. Australasian Palaeontologists (AAP) 19, p. 1-258.

Bruce, M.C. & Y.L. Niu (2000)- Early Permian supra-subduction assemblage of the South Island terrane, Percy Isles, New England Fold Belt, Queensland. Australian J. Earth Sci. 47, p. 1077-1086.
(South Island of Percy Isles off Queensland dominated by serpentinised ultramafic rocks. E Permian age (~277 Ma) of calc-alkaline, intermediate volcanics and granitoids from South Island terrane similar to that of Gympie terrane (270-280 Ma) and Berserker terrane of C-E Queensland and may represent different sections of same oceanic arc)

Bruce, M.C, Y. Niu, T.A. Harbort & R.J. Holcombe (2000)- Petrological, geochemical and geochronological evidence for a Neoproterozoic ocean basin recorded in the Marlborough terrane of the northern New England Fold Belt. Australian J. Earth Sci. 47, p. 1053-1064.
(Marlborough Terrane largest (~700km2) ultramafic-mafic complex in E Australia. Terrane is near-horizontal, out-of-sequence thin-skinned nappe sheet and has sea-floor spreading centre origin. Crystallisation age of ~562 Ma suggests Late Neoproterozoic ocean basin. New England Fold Belt may have developed on oceanic crust, following oceanward migration of subduction zone at ~540 Ma)

Bruhl, D. & S. Pohler (1999)- Tabulate corals from the Moore Creek Limestone (Middle Devonian: Late Eifelian- Early Givetian) in the Tamworth Belt (New South Wales, Australia). In: R. Feist et al. (eds.) North Gondwana: Mid-Paleozoic terranes, stratigraphy and biota. Abhand. Geol. Bundesanstalt, Vienna, 54, p. 275-293.
(M Devonian (Eifelian-early Givetian) Moore Creek Limestone of Tamworth foldbelt in NSW, E Australia, thought to be deposited in intra-oceanic island arc setting. With tabulate corals, incl. Heliolites porosus. Assemblage and depositional setting may be comparable to NE Kalimantan, described by Rutten 1940, 1943)

Cawood, P.A. (1984)- The development of the SW Pacific margin of Gondwana: correlations between the Rangitata and New England orogens. Tectonics 3, 5, p. 539-553.
(Before formation of Tasman Sea, Late Paleozoic-Mesozoic Rangitata Orogen of New Zealand and New Caledonia abutted New England Orogen of E Australia. Similar Permian-Cretaceous igneous and deformational events in two orogens: (1) end of arc volcanism and widespread sedimentation in New England, together with onset of regional deformation and crustal anatexis synchronous with start of volcanism and sedimentation in Rangitata Orogen; (2) E Permian andesitic volcanism in E New England is along-strike extension of Brook Street terrane of New Zealand; (3) Late Permian regional deformation in New England coincides with break in subduction- related igneous activity in New England and Rangitata Orogens and shift in locus of activity; (4) Late Permian-Triassic calc-alkaline igneous activity in New England correlates with pyroclastic material in forearc basin of Rangitata Orogen; (5) cessation of plutonism in New England corresponds with start of Esk Head Melange in New Zealand; (6) Late Cretaceous plutons in New England Orogen similar to final Rangitata orogenesis, both marking initial rifting associated with formation of Tasman Sea)

Cawood, P.A. (2005)- Terra Australis orogen: Rodinia breakup and development of the Pacific and Iapetus margins of Gondwana during the Neoproterozoic and Paleozoic. Earth-Science Reviews 69, p. 249-279.
(Pacific Ocean formed through Neoproterozoic rifting of Rodinia and never subsequently closed. Record of ocean opening and inception of ocean convergence/subduction preserved in Neoproterozoic- late Paleozoic Terra Australis Orogen. Orogen pre-dispersal length along E Gondwana margin ~18000 km long, up to 1600 km wide. Subduction of Pacific Ocean established at Gondwana margin by ~570 Ma. Termination of Terra Australis Orogen at ~300-230 Ma associated with assembly of Pangea (Pan-Pacific Gondwanide Orogeny)

Cawood, P.A. & G. Buchan (2007)- Linking accretionary orogenesis with supercontinent assembly. Earth-Science Reviews 82, p. 217-256.

(Assembly of Gondwana and Pangea indicate timing of collisional orogenesis between amalgamating continental bodies synchronous with subduction initiation and contractional orogenesis in accretionary orogens along margins of supercontinents. Final assembly of Gondwana between ~570-510 Ma, amalgamating East and West Gondwana, coeval with switch from passive margin sedimentation to convergent margin activity along Pacific margin of supercontinent. Subduction initiation along Pacific margin 580-550 Ma. Final stages of assembly of Pangean supercontinent between ~320-250 Ma, with major plate boundary reorganization and regional orogenesis alonge Pacific margin. E Gondwana margin segment transpressional and transtensional activity from ~305-270 Ma, after which convergence along margin was re-established. In E Australia this involved E-ward migration of arc magmatism into old subduction complex)

Cawood, P.A. & R.J. Korsch (2008)- Assembling Australia: Proterozoic building of a continent. Precambrian Research 166, p. 1-35.

Cawood, P.A. & E.C. Leitch (1984)- Accretion and dispersal tectonics of the southern New England foldbelt, Eastern Australia. In: D.G. Howell (ed.) Tectonostratigraphic terranes of the Circum-Pacific region, Circum-Pacific Council Energy and Mineral Resources, Earth Sci. Ser. 1, p. 481-492.

Cawood, P.A., E.C. Leitch, R.E. Merle & A.A. Nemchin (2010)- Earliest Permian non-collisional orogeny and basin formation in the southern New England fold belt sector of the Terra Australis Orogen. 20th Australian Geological Convention, Canberra 2010, Geol. Soc. Australia, Abstracts 98, p. 70 *(Abstract only)*
(Tablelands Orogeny major tectonothermal event around Carboniferous-Permian boundary, between 305-295 Ma, with HT/LP metamorphism, ending long-lived subduction-related magmatic arc activity in W New England. Followed by development of new E Permian arc (S-type granites) and contemporaneous extensional basins on accretionary complex of older arc system. Major stratigraphic break in Tamworth Belt in latest Carboniferous, with removal of several 1000m of M Devonian- Carboniferous strata before E Permian)

Cawood, P.A., E.C. Leitch, R.E. Merle & A.A. Nemchin (2011)- Orogenesis without collision: stabilizing the Terra Australis accretionary orogen, eastern Australia. Geol. Soc. America (GSA) Bull. 123, 11-12, p. 2240-2255.
(Convergent margin magmatism along W margin of New England foldbelt ended latest Carboniferous (~305 Ma), followed by short pulse of compressional deformation/ metamorphism. Followed by onset of clastic sedimentation and local calc-alkaline volcanism, dated at 293 Ma in extensional Barnard Basin. Emplacement of S-type granites with high-T metamorphism at 296-288 Ma. Hunter-Bowen orogenic phase regional deformation/ metamorphism at ~265-260 Ma, associated with I-type plutonism and volcanic activity in New England orogen that ceased around 230 Ma, marking end of Gondwanide orogenesis. No evidence that deformation was related to collision with major lithospheric mass. Widespread development of extensional basins in E third of Australia in E Permian indicates controls acting on continental scale, probably changing plate kinematics)

Cawood, P.A., S.A. Pisarevsky & E.C. Leitch (2011)- Unraveling the New England orocline, east Gondwana accretionary margin. Tectonics 30, TC5002, p. 1-15.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2011TC002864)
(New England orocline developed during Late Carboniferous- E Triassic Gondwanide Orogeny (310-230 Ma), which deformed pre-Permian arc assemblage (W magmatic arc, adjoining forearc basin and E subduction complex). Buckling of arc system about vertical axis during N-ward translation of S segment of arc system against N segment, which is pinned relative to cratonic Gondwana. Final stage of orocline formation (~270-265 Ma; ~M Permian) overlaps with major gap in magmatic activity)

Anchor Cay 1 well with Late Eocene Pellatispira. Early Oligocene unconformity in most S Papuan/ Capricorn wells)

Cohen, B.E. (2012)- The scenic rim of southeastern Queensland, Australia: a history of mid Cenozoic intraplate volcanism. Episodes 35, 1, p. 103-109.
(online at: www.episodes.co.in/contents/2012/march/p103-109.pdf)
(SE Queensland intraplate plume-derived mafic volcanism provide record of N-ward Australian plate movement over mantle plume. Major slowdown between 26 -23 Ma is correlated with initial collision of Ontong Java plateau with N subduction margin of Australian plate, which also caused brief changes in direction of Tasmantid and Lord Howe seamount chains and also changed motion of Pacific plate. Little contamination of upper mantle-drived magmas by 36 km thick continental crust, except rhyolites formed during last 1 Myr of slow plate velocity)

Collins, W.J. (1991)- A reassessment of the 'Hunter-Bowen orogeny': tectonic implications for the southern New England fold belt. Australian J. Earth Sci. 38, p. 409-423.
(All Late Permian deformation in S New England Fold Belt ascribed to single compressive tectonic event: Hunter-Bowen Orogeny (265-250 Ma). E Permian rifting of Carboniferous arc and fore-arc of Tamworth Belt and region W of it produced Sydney Basin and subsidiary meridional troughs in backarc environment. Initial E-W compression in Late Permian produced meridional folds and above W-propagating decollement. Final deformation reactivated ancestral Peel Fault, rotated fault blocks in Tamworth Belt and caused sinistral displacement of tectonostratigraphic units in Tablelands Complex, culminating in Permian dispersal event. Orogenic cycle recorded as massive flooding of Sydney Basin with continental detritus from S New England Fold Belt, in response to uplift of belt, and change from backarc to foreland basin in Late Permian)

Collins, W.J. & S.W. Richards (2008)- Geodynamic significance of ópost-collisionalô S-type granites in circum-Pacific orogens. Geology 36, p. 559-562.
(Delamerian, Lachlan and New England orogens characterized by 'tripartite associations' of (1) belts of S-type granite and associated high T-low P metamorphic complexes, (2) outboard oceanic arc sequences, remnants of which are preserved as greenstones, and (3) intervening, slightly younger back-arc basins into which I-type plutons are emplaced. Four tripartite associations: M Cambrian, Cambrian-Ordovician, Silurian and Carboniferous, each representing distinct phase of arc retreat, magmatism, and back-arc rifting that followed major compressive event associated with closure of precursor back-arc basin)

Coney, P.J. (1992)- The Lachlan belt of eastern Australia and Circum-Pacific tectonic evolution. Tectonophysics 214, p. 1-25.
(Pacific Ocean basin remarkable permanency through Phanerozoic, with accretionary continental margin orogens showing little evidence of continental collisions (unlike Circum-Atlantic and Tethyan realms). Through Paleozoic- E Mesozoic South America, Antarctica, and Australia were joined along SE, S and SW margins of Pacific Ocean, with Pacific margin orogenic system extending for 20,000 km from NW South America to NE

Australia. Lachlan Fold Belt E Paleozoic deep-marine turbiditic facies common along margin, often directly juxtaposed against cratonic interior. Prolonged histories of Late Precambrian- Late Cambrian, then E Silurian-E Mesozoic convergent to transpressive and accretionary tectonics, often accompanied by magmatism)

Coney, P.J., A. Edwards, R. Hine, F. Morrison & D. Windrum (1990)- The regional tectonics of the Tasman orogenic system, Eastern Australia. J. Structural Geol. 12, p. 519-543.
(Tectonic evolution of Tasman orogen four main phases: (1) late Proterozoic- E Paleozoic, generally deep-marine turbiditic sedimentation submarine volcanism, and shifting deformation, metamorphism and plutonism; (2) major mid-Paleozoic deformation, volcanism and plutonism; (3) major accretionary phase in outer New England belt of terranes that culminated in Late Paleozoic and continuing into E Mesozoic; (4) extensional break-up of Gondwanaland in Cretaceous, continuing to present)

Craven, S.J., N.R. Daczko & J.A. Halpin (2012)- Thermal gradient and timing of high-T-low-P metamorphism in the Wongwibinda Metamorphic Complex, southern New England Orogen, Australia. J. Metamorphic Geol. 30, p. 3-20.
(online at: http://onlinelibrary.wiley.com/doi/10.1111/j.1525-1314.2011.00949.x/pdf)
(Wongwibinda high T- low P Metamorphic Complex in S New England Orogen (variably metamorphosed Devonian-Carboniferous turbidites, intruded by granodiorite/granitoids). Overall increase in metamorphic grade from W to E. Age peak metamorphism ~297 Ma. Zircon U-Pb crystallization age in granodiorite 290.5 Ma, suggesting confirming pluton emplacement post-dates peak HTLP metamorphism (both earliest Permian))

Crawford, A.J., S. Meffre & P.A. Symonds (2003)- 120 to 0 Ma tectonic evolution of the southwest Pacific and analogous geological evolution of the 600 to 220 Ma Tasman Fold Belt System. Geol. Soc. Australia Spec. Publ. 22, p. 377-397. (or Geol. Soc. America (GSA), Spec. Paper 372, p. 383-403).
(Elongate microcontinental ribbons (Lord Howe Rise, Norfolk-New Caledonia Ridge) calved off E Australia during ~120-52 Ma extension, with oceanic crust formation from 85-52 Ma, producing Tasman Sea and S Loyalty Basin. Change in Pacific plate motion at ~55 Ma initiated E-directed subduction along recently extinct spreading centre in S Loyalty Basin. Subduction of S Loyalty Basin crust led to arrival at ~38 Ma of 70-60 My old Norfolk Ridge volcanic passive margin at trench, and W-directed emplacement of New Caledonia ophiolite. After locking of subduction zone at 38-34 Ma, subduction jumped E to form new W-dipping subduction zone and Vitiaz arc. Arc splitting episodes fragmented Vitiaz arc to form S Fiji (31-25 Ma) and N Fiji Basins (10 Ma- present). Collision of Ontong Java Plateau with Solomons section of Vitiaz arc resulted in reversal of subduction polarity, and growth of Vanuatu arc. Continued rollback of trench fronting Tonga arc since 6 Ma split this arc to form Lau Basin-Havre Trough. SW Pacific style of crustal growth above rolling-back slab applied to Tasman Fold Belt)

Gallagher, K., T.A. Dumitru & A.J.W. Gleadow (1994)- Constraints on the vertical motion of eastern Australia during the Mesozoic. Basin Research 6, 2/3, p. 77-94.
(Backstripping and AFT analysis of Eromanga, Surat and Clarence-Moreton basins show linear subsidence in Jurassic, with increasing subsidence towards E. Cretaceous preserved only in Eromanga Basin. Cretaceous probably deposited, then eroded over Surat and Clarence-Moreton Basins. Exhumation started in E in Late Cretaceous-Early Tertiary. Removed section greater in E (~2.5 km) than in W (<1 km). Results suggest platform tilting, related to Jurassic- E Cretaceous subduction along E Australia. Cessation of subduction, and subsequent opening of Tasman Sea in Late Cretaceous accompanied by uplift on E margin and termination of widespread deposition on platform)

Gibson, P.J. (1989)- Petrology of two Tertiary oil shale deposits from Queensland, Australia. J. Geol. Soc., London, 146, 2, p. 319-331.
(In E Central Queensland series of small E Paleogene rift basins with M-L Eocene lacustrine oil shale deposits. Petrography of oil shales in Lowmead and Duaringa Basins)

Glen, R.A. (1992)- Thrust, extensional and strike-slip tectonics in an evolving Palaeozoic orogen- a structural synthesis of the Lachlan Orogen of southeastern Australia. Tectonophysics 214, p. 341-380.

Glen, R.A. (2005)- The Tasmanides of Eastern Australia. In: A.P.M. Vaughan et al. (eds.) Terrane processes at the margins of Gondwana. Geol. Soc., London, Spec. Publ. 246, p. 23-96.
(Major review of Tasmanines foldbelt of E Australia. Five Neoproterozoic- Triassic orogenic belts along E margin of Gondwana, with internal Permian-Triassic rift- foreland basin system. Complex deformation ended with E Triassic accretion of intra-oceanic arc)

Glen, R.A. (2013)- Refining accretionary orogen models for the Tasmanides of eastern Australia. Australian J. Earth Sci. 60, 3, p. 315-370.
(SW to NE younging of stratigraphy in S Tasmanides of E Australia has been used to infer continually E-wards-rolling paleo-Pacific plate, but not simple, continuous rollback. E-wards rollback of paleo-Pacific plate from 520-502 Ma (Cambrian) opened vast backarc basin that never closed. Ordovician- Carboniferous, almost vertical stacking of continental margin arcs in New England Orogen indicates constant W-dipping plate boundary. Rollback in E Permian never completely reversed, so Late Permian-Triassic to Cretaceous arcs lie farther E, with rifted fragments in Lord Howe Rise and in New Zealand. N Tasmanides missed out M Cambrian plate boundary. Tasmanides characterised by general absence of material accreted from paleo-Pacific plate and dominance of craton-derived, recycled sedimentary rocks)

Glen, R.A., E. Belousova & W.L. Griffin (2016)- Different styles of modern and ancient non-collisional orogens and implications for crustal growth: a Gondwanaland perspective. Canadian J. Earth Sci. 53, 11, p. 1372-1415.
(online at: http://www.nrcresearchpress.com/doi/pdf/10.1139/cjes-2015-0229)
(Review of non-collisional, convergent margin orogens, commonly called accretionary orogens. Along margin of Australian Plate, New Guinea accretionary orogen, SW Pacific Orogen, Tasmanides (Lachlan Orogen, outboard New England Orogen), etc. All non-collisional orogens involve continental growth, but only New England Orogen and to lesser extent New Guinea Orogen involve significant crustal growth)

Glen, R.A. & S. Meffre (2009)- Styles of Cenozoic collisions in the western and southwestern Pacific and their applications to Palaeozoic collisions in the Tasmanides of eastern Australia. Tectonophysics 479, p. 130-149.
(Several styles of collisions in W and SW Pacific, mainly oblique and strike-slip collisions between island arcs and rifted continental fragments and collisions between forearc lithosphere and continental fragments. The 58 Ma collision along N Australian plate margin in New Guinea, 44-34 Ma collision in New Caledonia and 26-25 Ma collision in N Island New Zealand may be parts of single, S-migrating plate boundary collision. Collision between forearc crust and continental fragment produces subduction flip or rollback, thus avoiding classic arc-continent collision. Pacific style collisions applied to interpretation of Delamerian Orogen and Lachlan Orogen in S Tasmanides with varying degrees of success)

Goscombe, P.W. & B.A. Coxhead (1995)- Clarence-Moreton, Surat, Eromanga, Nambour, and Mulgildie Basins. In: C.R. Ward et al. (eds.) Geology of Australian coal basins, Geol. Soc. Australia, Coal Geol. Grp., Spec. Publ. 1, p. 489-511.

Gray, D.R., D.A. Foster & F.P. Bierlein (2002)- Geodynamics and metallogeny of the Lachlan Orogen. Australian J. Earth Sci. 49, p. 1041-1056.
(Paleozoic Lachlan Orogen of E Australia is accretionary orogen made up of structurally thickened oceanic successions, including turbidites from deep-sea fans, andesitic volcanics from remnant island arcs, forearc sediments and slices of oceanic crust. Accretion by collapse of marginal basin during double divergent subduction. Stepwise deformation and metamorphism from Late Ordovician- E Carboniferous times formed three subprovinces. In W Subprovince, Ordovician turbidites host major lode Au deposits (C Victoria). In E Subprovince, porphyry Cu-Au deposits formed in Ordovician oceanic island arc)

Gray, D.R., D.A. Foster & M. Bucher (1997)- Recognition and definition of orogenic events in the Lachlan Fold Belt. Australian J. Earth Sci. 44, 4, p. 489-501.
(Unconformities used to establish orogenic framework for Lachlan Fold Belt. Four orogenic pulses between 440-340 Ma (Latest Ordovician- Late Devonian; Lachlan Orogeny) not regional events. M Devonian 'Tabberabberan' event (~380-370 Ma) represents limited deformation during amalgamation of W and C/E subprovinces. Orogeny over much of Lachlan Fold Belt progressive, ongoing and subduction-controlled in complex oceanic, SW Pacific-style setting, analogous to migrating deformation and sedimentation in accretionary wedges above subduction zones)

Gray, D.R., D.A.Foster, R.J.Korsch & C.V. Spaggiari (2006)- Structural style and crustal architecture of the Tasmanides of eastern Australia, example of a composite accretionary orogen. In: S. Mazzoli et al. (eds.) Styles of continental contraction, Geol. Soc. America (GSA), Spec. Paper 414, p. 119-132.
(E Australian Tasmanides both thin-skinned thrusting and thick-skinned faulting. Composite orogenic system made up of three orogenic belts: (1) former rifted passive margin to make Delamerian Orogen, (2) turbidite fan system(s) in back-arc setting to make Lachlan Orogen, (3) arc-subduction complex with older accreted components to make New England Orogen. New England Orogen constructed from craton-vergent, fore-arc and magmatic arc sequences, subduction complexes, and ophiolite fragments)

(Lower-Middle Permian limestones from NE Australia New England Foldbelt and Bowen basin typical cold water limestones without corals, fusulinids, etc.)

Jansson, I.M., S. McLoughlin, V. Vajda & M. Pole (2008)- An Early Jurassic flora from the Clarence-Moreton Basin, Australia. Review Palaeobotany Palynology 150, p. 5-21
(Low-diversity E Jurassic flora in floodbasin siltstones of Clarence-Moreton Basin. Basin has Late Triassic-Late Jurassic sedimentary section over moderately deformed M-L Paleozoic accretionary prism and intrusive igneous rocks. Palynoflora dominated by Classopollis pollen and attributable to Late Pliensbachian- E Toarcian age (180-185 Ma) upper Corollina (=Classopollis) torosa Zone. Relatively humid paleoclimate)

Jeon, H., I.S. Williams, B.W. Chappell & V.C. Bennett (2010)- Implications of contrasting patterns of inherited zircon in the Late Palaeozoic granites of the Lachlan and New England fold belts. 20th Australian Geological Convention, Canberra 2010, Geol. Soc. Australia, Abstracts 98, p. 249. *(Abstract only)*
(Lachlan Foldbelt granites mostly Silurian-Devonian, some in NE Carboniferous age. Inherited zircons same as detrital zircons in intruded Ordovician sediments. Two inheritance age patterns in Carboniferous (~340-325 Ma) I-type granites. New England fold belt granites Permian-Triassic in age, mainly E Permian (~290 Ma) S-type and Late Permian (~250 Ma) I-types. S-type inherited zircon, mostly Carboniferous age (peaks at 310 and 330 Ma; same age as Carboniferous granites in LFB)

John, C.M., G.D. Karner, E. Browning, R.M. Leckie, Z. Mateo, B. Carson & C. Lowery (2011)- Timing and magnitude of Miocene eustasy derived from the mixed siliciclastic-carbonate stratigraphic record of the northeastern Australian margin. Earth Planetary Sci. Letters 304, p. 455-467.
(online at: https://www.geo.umass.edu/faculty/leckie/John%202011%20EPSL%20Marion%20SL.pdf)
(Marion Plateau carbonate platform 8 sequences (18.0, 17.2, 16.5, 15.4, 14.7, 13.9, 13.0, 11.9 Ma), controlled by glacio-eustasy as demonstrated by increases in δ18O (= deep-sea Miocene isotope events Mi1b, Mbi-3, Mi2, Mi2a, Mi3a, Mi3, Mi4, and Mi5), reflecting increased ice volumes primarily on Antarctica. Backstripping estimates combined with δ18O estimates yields sea-level fall amplitudes of 27m at 16.5 and at 15.4 Ma, 33m at 14.7 Ma, 59± 6 m at 13.9 Ma. Sea-level fell by 53-69 m between 16.5-13.9 Ma. Implies >90% of E Antarctic Ice sheet formed during M Miocene)

Jones, A.T. & C.R. Fielding (2004)- Sedimentological record of the late Paleozoic glaciation in Queensland, Australia. Geology, 32, p. 153-156.
(Glaciation in Queensland, NE Australia, restricted to discrete periods, in Namurian (315 Ma), Westphalian (311 Ma) and Sakmarian (289-293 Ma). Glaciations confined to local (valley or mountain) glaciers)

Keep, M. (2003)- Physical modelling of deformation in the Tasman Orogenic Zone. Tectonophysics 375, p. 37-47.

Kemp, A.I.S., C.J. Hawkesworth, W.J. Collins, C.M. Gray, P.L. Blevin & EIMF (2009)- Isotopic evidence for rapid continental growth in an extensional accretionary orogen: The Tasmanides, eastern Australia. Earth Planetary Sci. Letters 284, p. 455-466.
(Nd and zircon Hf–O isotope data used to study continental crust formation in Tasmanides (515-230 Ma), which formed by repeated opening and closure of sediment-filled back-arc basins behind long-lived subduction zone. Juvenile magmatic input enhanced during extensional, back-arc rifting episodes that followed crustal thickening, suggesting relationship between slab rollback and continental growth. Juvenile component in Tasmanide igneous rocks increased from Cambrian to Triassic, as subduction zone migrated outboard. Subduction zone retreat formed large tracts of new crust in E Australia at comparable rates to crust generation at modern island arcs)

Kidane, T.B., M. Fuller & Y.I. Otofuji (2010)- Shipboard paleomagnetic age estimates for an acoustic basement emplacement in Marion Plateau, off northeast Australia. Australian J. Earth Sci. 57, 2, p. 231-241.
(Shipboard paleomagnetic work on olivine basalt cores from bottom of ODP Leg 194 holes 1193C and 1198B give paleolatitude of Marion Plateau at 33.3°S, indicating possible emplacement time for basalt of either 130-110 Ma or 190-165 Ma. Latter result better fit with 40Ar/39Ar age of 162 ±1 Ma for basalt)

Klootwijk C. (2009)- Sedimentary basins of eastern Australia: paleomagnetic constraints on geodynamic evolution in a global context. Australian J. Earth Sci. 56, 3, p. 273-308.
(L2 loop indicates Late Devonian- M Carboniferous N-ward excursion of NE Gondwanaland. Succeeding early-Late Carboniferous S-ward movement of NE Gondwanaland was extremely fast and created extensional environment, initiating Westralian Superbasin. L3 loop reflects change in rotation of Gondwanaland from CCW (Late Carboniferous) to CW (E Permian), leading to Stephanian initiation of Bowen-Gunnedah-Sydney basins)

Korsch, R.J. (1984)- Sandstone compositions from the New England Orogen, Eastern Australia- implications for tectonic setting. J. Sedimentary Petrology 54, 1, p. 192-211.
(Late Paleozoic sandstones from New England Orogen mainly quartz-poor, lithic to feldspathic types derived from volcanic arc terrane, evolving from mafic to more felsic in composition through time. Volcanic source existed for >100 Million years. Possibly deposited in backarc basin)

Korsch, R.J. (2004)- A Permian-Triassic retro-foreland thrust system- The New England Orogen, and adjacent sedimentary basins, Eastern Australia. In: K.R. McClay (ed.) Thrust tectonics and hydrocarbon systems, American Assoc. Petrol. Geol. (AAPG), Mem. 82, p. 515-537.
(From Late Devonian to Triassic, E Australia was active, convergent plate margin with W-dipping subduction system. Permian-Triassic development, of major W-directed retroforeland thrust belt in N New England, with formation of thick foreland-basin phase in adjacent Bowen Basin to W)

Korsch, R.J., C.J. Adams, L.P. Black, D.A. Foster, G.L. Fraser, C.G. Murray, C. Foudoulis & W.L. Griffin (2009)- Geochronology and provenance of the Late Paleozoic accretionary wedge and Gympie Terrane, New England Orogen, eastern Australia. Australian J. Earth Sci. 56, 5, p. 655-685.
(New England Orogen result of Late Devonian- Triassic W-dipping subduction system at boundary of E Gondwanaland and Panthalassan Ocean. Late Paleozoic accretionary wedge contains deep-marine trench fill turbidites with in-faulted slices of oceanic crust. Turbidites first-cycle, immature, quartz-poor, volcanic-derived. Dating of detrital zircons and hornblendes show maximum depositional ages of 355-316 Ma for sediments in accretionary wedge, indicating accretionary wedge evolved over 40 Ma, with principal sources from active

continental margin volcanic arc. Quartz-rich sandstones from E part of accretionary wedge with Late Paleozoic-Archean zircon ages, indicating quartz-rich detritus from continental interior dominated depocentres)

Korsch, R.J., C.J. Boreham, J.M. Totterdell, R.D. Shaw & M.G. Nicoll (1998)- Development and petroleum resource evaluation of the Bowen, Gunnedah and Surat Basins, Eastern Australia. Australian Petrol. Prod. Explor. Assoc. (APPEA) J. 38, p. 199-237.

Korsch, R.J. & H.J. Harrington (1981)- Stratigraphic and structural synthesis of the New England Orogen. Australian J. Earth Sci. 28, p. 205-226.
(Four principal sets of regional deformations: D1- pre-Late Carboniferous (could extend back into Devonian); D2-Late Carboniferous- E Permian (~295 Ma); D3-E Permian (~ 273 Ma); D4-Late Permian (~250 Ma).

Korsch, R.J. & H.J. Harrington (1987)- Oroclinal bending, fragmentation and deformation of terranes in the New England Orogen, Eastern Australia. In: E.C. Leith & E. Scheibner (eds.) Terrane accretion and orogenic belts, American Geophys. Union (AGU), Geodyn. Ser. 19, p. 119-127.
(New England Orogen two pre-Permian terranes which form forearc basin-accretionary wedge couple. Orogen disrupted by major oroclinal bending in late E Permian)

Korsch, R.J., P.E. O'Brien, M.J. Sexton, K.D. Wake-Dyster & A.T. Wells (1989)- Development of Mesozoic transtensional basins in easternmost Australia. Australian J. Earth Sci. 36, p. 13-28.
(E Australia basins Esk Trough, Ipswich Basin and Clarence-Moreton Basin initiated by transtensional events in Late Permian or Early Triassic)

Korsch, R.J. & J.M. Totterdell (2009)- Subsidence history and basin phases of the Bowen, Gunnedah and Surat Basins, eastern Australia. Australian J. Earth Sci. 56, 3, p. 335-353.
(E Permian- M Triassic Bowen and Gunnedah Basins and E Jurassic- E Cretaceous Surat Basin complex subsidence history over 200 My: (1) E Permian, rapid subsidence in half-grabens along W margin of Bowen-Gunnedah Basins; extension ceased at ~280 Ma, followed by thermal subsidence with widespread, uniform sedimentation; (2) Late Permian foreland basin phase, driven by thrust loading to E in New England Orogen. very high rates of tectonic subsidence (3) peneplanation in Late Triassic; (4) sedimentation at start of Jurassic, forming Surat Basin, with tectonic subsidence driven by dynamically induced platform tilting; (5) subduction ceased at ~95 Ma, resulting in rapid uplift, due to rebound of lithosphere)

Korsch, R.J., J.M. Totterdell, D.L. Cathro & M.G. Nicoll (2009)- Early Permian East Australian rift system. Australian J. Earth Sci. 56, 3, p. 381-400.
(E Permian- M Triassic Bowen and Gunnedah back-arc basins developed in response to tectonic events to E (W-dipping subduction system at E Gondwana margin). Initial extension part of major E Permian N-S trending E Australian Rift System from N Queensland to S New South Wales. Denison Trough with producing gasfields. E part of rift system commenced at ~305 Ma and volcanic-dominated. Half-grabens in and W of Bowen Basin non-volcanic, with mechanical extension from~285-280 Ma (~Artinskian), followed by thermal subsidence)

Korsch, R.J., J.M. Totterdell, T. Fomin & M.G. Nicoll (2009)- Contractional structures and deformational events in the Bowen, Gunnedah and Surat Basins, eastern Australia. Australian J. Earth Sci. 56, 3, p. 477-499.
(Permian- Triassic Bowen and Gunnedah Basins formed in backarc setting, initially extensional, but switched to contractional in mid-Permian, with major W-directed thrust belt in New England Orogen and foreland basin phase to W in Bowen-Gunnedah. Inversion of E Permian extensional faults as thrusts. During Late Permian-Late Triassic period of rapid subsidence driven by thrust loading several short periods of non-deposition and contraction. Final contractional event in early Late Cretaceous corresponds with cessation of sedimentation in Surat Basin, uplift and reactivation of earlier structures)

Korsch, R.J., K.D. Wake-Dyster & D.W. Johnstone (1991)- Structure of the Permian-Mesozoic eastern Australian Basins complex, with emphasis on the BMR Bowen Basin deep seismic profiles. Exploration Geophysics 22, 1, p. 223-226.

(Permian Taroom Trough (S extension of Bowen Basin) interpreted as transtensional basin. Small flower structures in overlying Jurassic sediments are transpressional features due to reactivation of faults. Bowen Basin Late Permian- E Triassic sedimentary wedge thickening to E, initiated during period of extension oriented ENE-WSW in latest Carboniferous or earliest Permian)

Korth, J. (1987)- Analytical studies on Australian oil shales. Ph.D. Thesis, University of Wollongong, p. 1-328.
(online at: http://ro.uow.edu.au/theses/1110)
(Analyses of M-L Eocene lacustrine oil shales of upper and lower seams of Duaringa deposit, Queensland. Telalginite (torbanite) with common green algae Botryococcus, Tasmanites and Gloeocapsomorpha; lamalginite (lamosite) mainly with planktonic Pediastrum)

Kositcin, N., D.C. Champion & D.L. Huston (2009)- Geodynamic synthesis of the North Queensland region and implications for metallogeny. Geoscience Australia Record 2009/30, p. 1-196.
(online at: www.ga.gov.au/corporate_data/69159/Rec2009_030.pdf)
(Useful overview of N Queensland geology and geodynamic history)

Leitch, E.C. (1975)- Plate tectonic interpretation of the Palaeozoic history of the New England Fold Belt. Geol. Soc. America (GSA) Bull. 86, p. 141-144.
(M-U Paleozoic paleogeographic elements in New England Fold Belt comprise W volcanic chain, a fore-chain basin, and E non-volcanic arc-platform-trench complex, developed above W-dipping subduction zone. Temporary halts in subduction led to minor deformational episodes. Subduction ceased in E Permian, followed by major orogenesis. Late stage right-lateral movement on Demon Fault displaced paleogeographic elements)

Leitch, E.C., C.L. Fergusson & R.A. Henderson (2003)- Arc to craton provenance switching in a Late Palaeozoic subduction complex, Wandilla and Shoalwater terranes, New England Fold Belt, eastern Australia. Australian J. Earth Sci. 50, p. 919-929.
(Wandilla and Shoalwater terranes of N New England Fold Belt are Carboniferous accretionary subduction complexes formed at convergent plate boundary along E edge of Gondwana. Sandstones from Wandilla terrane quartz-poor and derived from magmatic arc; Shoalwater terrane quartz-rich and from cratonic region)

Leitch, E.C., J.V. Morand, C.L. Fergusson, R.A. Henderson & P.F. Carr (2007)- Accretion and post-accretion metamorphism in subduction complex terranes of the New England Fold Belt, eastern Australia. J. Metamorphic Geol. 11, 3, p. 309-318.
(Two regional metamorphic episodes in Late Paleozoic subduction complexes of Queensland: (1) Synaccretion prehnite-pumpellyite and greenschist facies, (2) upper greenschist- upper amphibolite facies episode at ~250 Ma in arc or back-arc setting. Similar pattern for 1000 km along New England Fold Belt)

Leitch, E.C. & E. Scheibner (1987)- Stratotectonic terranes of the Eastern Australian Tasmanides. In: E.C. Leitch & E. Scheibner (eds.) Terrane accretion and orogenic belts, Amer. Geophys. Union (AGU), Geodyn. Ser. 19, p. 1-19.
(Some 36 tectonostratigraphic terranes accreted along E Australia Tasmanides convergent margin of E cratonic edge of Gondwanaland. Major episodes of amalgamation coincided with widespread deformational episodes. Despite >200 Myr of subduction in Paleozoic- Mesozoic no evidence for major continental collision or large exotic terranes, but mainly magmatic arcs and microcontinental blocks)

Li, P.F., G. Rosenbaum & D. Rubatto (2012)- Triassic asymmetric subduction rollback in the southern New England Orogen (eastern Australia): the end of the Hunter-Bowen Orogeny. Australian J. Earth Sci. 59, 6, p. 965-981.
(New England Orogen youngest subduction in Australian continent, with history of W-dipping Devonian-Triassic subduction. From M-L Permian- U Triassic (~265-235 Ma) subjected to contractional deformation (Hunter-Bowen Orogeny) and widespread I-type calc-alkaline magmatism. Zircon ages from granites 255-215 Ma. Magmatism during Hunter-Bowen Orogeny along NNE–SSW belt; younger magmatism (235-215 Ma) aligned along N-S belt farther E, suggesting E-ward arc migration, possibly in response to slab rollback.

Proposed model involves asymmetric slab rollback, possibly in response to pinning of N part of subduction zone by Gympie Terrane accretion, marking earliest phase of Mesozoic rifting of E Australia)

Lindner, A.W. (1983)- Geology and geochemistry of some Queensland Tertiary oil shales. In: Symposium on Geochemistry and chemistry of oil shale, Seattle, p. 10-19.
(online at: https://web.anl.gov/PCS/acsfuel/preprint%20archive/Files/28_3_SEATTLE_03-83_0010.pdf)
(Duaringa Tertiary basin in NE Queensland E Tertiary rift basin, related to Tasman Sea- Coral Sea rifting. With algal-rich lacustrine oil shales (lamosites). Highest grade in Rundle deposits; 25-161m thick (see also Dixon 1987)

Lipski, P. (2001)- Geology and hydrocarbon potential of the Jurassic- Cretaceous Maryborough Basin. In: K.C. Hill & T. Bernecker (eds.) Eastern Australasian Basins Symposium, a refocused energy perspective for the future, Petroleum Expl. Soc. Australia (PESA), Spec. Publ., p. 263-268.
(Maryborough Basin Late Triassic- E Tertiary basin that straddles coastline of SE Queensland, with up to >6000m of Jurassic- Cretaceous sediments. Late Cretaceous transpressional deformation formed NW-trending anticlines. Source rocks marine and lacustrine shales of Early Cretaceous Maryborough Fm and also coals and shales of E-M Jurassic Tiaro and E Cretaceous Burrum Coal Measures)

Little, T.A., R.J. Holcombe, G.M. Gibson, R. Offler, P.B. Gans & M.O. McWilliams (1992)- Exhumation of Late Paleozoic blueschists in Queensland, Australia, by extensional faulting. Geology 20, p. 231-234.
(Blueschists in SE Queensland record Carboniferous history of subduction and metamorphism and later thermal overprint from intrusion of Late Carboniferous S-type granitoids at ~306 Ma. By E Permian most of New England orogeny uplifted and eroded and now site of back-arc extensional basins)

Little, T.A., R.J. Holcombe & R. Sliwa (1993)- Structural evidence for extensional exhumation of blueschist-bearing serpentinite matrix melange, New England Orogen, southeast Queensland, Australia. Tectonics 12, p. 536-549.
(N D'Aguilar block with blueschist blocks in serpentinite matrix melange. Mid-Carboniferous epidote-blueschist metamorphism, intruded by ~306 Ma (latest Carboniferous) granitoids)

Little, T.A., M.O. McWilliams & R.J. Holcombe (1995)- 40Ar/39Ar thermochronology of epidote blueschists from the North D'Aguilar block, Queensland Australia: timing and kinematics of subduction complex unroofing. Geol. Soc. America (GSA) Bull. 107, p. 520-535.
(Epidote blueschists as coherent schists and blocks in serpentinite matrix melange. Formed below 18 km depth in lower plate of metamorphic core complex. Slate from upper plate dated as 315 Ma (Late Carboniferous), interpreted as minimum age for subduction. Exhumation of lower plate schists coeval with overprinting by greenschist facies fabric by ductile stretching and normal faulting. Phengites from lower plate schists 40Ar/39Ar plateau ages of ~299-296 Ma (earliest Permian; = time of cooling below ~350°C). Similar cooling ages for different blueschist blocks support view that Australian melange uplifted by extensional tectonic processes unrelated to serpentinite diapirism)

(Extensive overview of ages of igneous rocks and episodes of metamorphism in Proterozoic across Australia. Very useful for provenance analysis of detrital zircons)

Norvick, M.S. & M.A. Smith (2001)- Mapping the plate tectonic reconstruction of southern and southeastern Australia and Implications for petroleum systems. Australian Petrol. Prod. Explor. Assoc. (APPEA) J., p. 15-35.

Norvick, M.S., M.A. Smith & M.R. Power (2001)- The plate tectonic evolution of Eastern Australia guided by the stratigraphy of the Gippsland Basin. Petroleum Expl. Soc. Australia (PESA) Eastern Australian Basins Symposium, Melbourne, p. 15-23.
(Common themes in E Australasia include Triassic-Jurassic subduction, from Papuan Fold Belt to New Zealand, and Late Barremian-Albian volcanogenic sedimentation (back-arc volcanism). Local developments include Lower Cretaceous rift basins in Bass Strait area (N-S extension between Australia- Antarctica), Turonian-Santonian rift basins (E-W Tasman Sea opening). Tasman Sea seafloor spreading started in S in M Santonian (~85 Ma)and stopped in Ey Eocene (~54 Ma). Later spreading event opened Coral Sea, starting in Paleocene (~62 Ma). Subduction prisms began approaching NE Australasia in E Eocene. Etc.)

Nott, J. & S. Horton (2000)- 180 Ma continental drainage divide in northeastern Australia: role of passive margin tectonics. Geology 28, 8, p. 763-766.
(Stratigraphy and sedimentology of Jurassic-Tertiary sediments in Laura and Carpentaria basins in NE Australia show continental drainage divide here remained stationary since M Jurassic. Maximum of only 50m of denudation could have occurred on continental drainage divide here since Cretaceous)

Nutman, A.P., S. Buckman, H. Hidaka, T. Kamiichi, E. Belousova & J. Aitchison (2013)- Middle Carboniferous- Early Triassic eclogite-blueschist blocks within a serpentinite melange at Port Macquarie, eastern Australia: implications for the evolution of Gondwana's eastern margin. Gondwana Research 24, p. 1038-1050.
(New England Orogen with suites of Paleozoic- earliest Mesozoic rocks, formed in supra-subduction zone settings at Gondwana E margin. In Port Macquarie serpentinite with blocks of low-T, high-P metamorphic rocks with glaucophane blueschists and lawsonite-bearing eclogites. High-P metasediments contain Archean to 251±6 Ma (Permo-Triassic) detrital zircons, with most grains of M Devonian- Carboniferous age (380-340 Ma). In Lorne Basin to S ≥220 Ma Triassic sedimentary and volcanic rocks unconformably overlie serpentinite melange and provide minimum age of high-P metamorphism. Emplacement of melange with high-P rocks may have been due to docking of Permian oceanic island arc (Gympie terrane in S Queensland?) and Andean-style arc at E Australian margin (New England Orogen 260-230 Ma N-S oriented magmatic belts)

O'Brien, P.E., R.J. Korsch, A.T. Wells, M.J. Sexton & K. Wake-Dyster (1994)- Structure and tectonics of the Clarence-Moreton Basin. In: A.T. Wells & P.E. O'Brien (eds.) Geology and petroleum potential of the Clarence-Moreton Basin, New South Wales and Queensland, AGSO, Bull. 241, p. 195-216.

Offler, R. & D.A. Foster (2008)- Timing and development of oroclines in the southern New England Orogen, New South Wales. Australian J. Earth Sci. 55, p. 331-340.

Offler, R. & C. Murray (2011)- Devonian volcanics in the New England Orogen: tectonic setting and polarity. Gondwana Research 19, 3, p. 706-715.
(Devonian volcanics in New England Orogen formed in intra-oceanic island arc and back arc basin settings. Many samples that formed in BAB have mixed MORB and arc characteristics, believed to be due to subduction component in basaltic magma. Samples with MORB-like compositions originated at spreading centres. Late Devonian basalts more arc-like to W, suggesting W-facing polarity. Two subduction zones in Late Devonian: (1) dipping W beneath Lachlan Orogen, (2) dipping E beneath rifted intra oceanic arc. Obduction of this intra oceanic arc over continental margin of Lachlan Orogen in latest Devonian at ~375 Ma led to development of new W dipping subduction zone oceanward and start of continental, arc magmatism)

O'Sullivan, P.B., D.A. Foster, B.P. Kohn & A.J.W. Gleadow (1996)- Multiple postorogenic denudation events: an example from the eastern Lachlan fold belt, Australia. Geology 24, 6, p. 563-566.
(Fission-track results from E part of Lachlan fold belt suggest two distinct episodes of rapid km-scale denudation since M Carboniferous when deformation in fold belt ceased: (1) E Triassic, possibly response to Hunter-Bowen orogeny, affected New England fold belt, Sydney-Bowen basin, and now Lachlan fold belt (2) M

Cretaceous, possibly in response to onset of continental extension in Tasman Sea at ~96 Ma, resulting in km-scale denudation over much of SE highlands of Australia)

Partridge, A.D. (2006)- Australian Mesozoic and Cenozoic palynology zonations (Charts 1-4). In: E. Monteil (coord.) Australian Mesozoic palynology zonations- updated to the 2004 Geologic Time Scale, Geoscience Australia Record 2006/23.
(online: /www.ga.gov.au/image_cache/GA14151.pdf, www.ga.gov.au/image_cache/GA14153.pdf)
(Spore-pollen and dinocyst zonations charts: Jurassic- Early Cretaceous for Australia, Late Cretaceous-Cenozoic Gippsland Basin)

Petrizzo, M.R. (2000)- Upper Turonian-lower Campanian planktonic foraminifera from southern mid-high latitudes (Exmouth Plateau, NW Australia): biostratigraphy and taxonomic notes. Cretaceous Research 21, 4, p. 479-505.
(Planktonic foraminifera from ODP Holes 762C and 763B Some low latitude (Globotruncana ventricosa, Hedbergella flandrini, Marginotruncana marianosi) and high latitude (Globigerinelloides impensus, Hedbergella sliteri) markers different vertical distribution at mid-high latitudes from low latitudes)

Passmore, V.L. (1980)- Laura Basin. In: Stratigraphic correlation between sedimentary basins of the ESCAP region, VII, ESCAP Atlas of stratigraphy II, Australia, Japan, Mineral Res. Dev. Ser. 46, p. 23-27.
(Well cross-section of N-S trending Laura Basin shows ~500-700m sandy Middle- Late Jurassic section (Dalrymple Sst, Gilbert River Fm), unconformably over Hodgkinson Basin Permian. Basin trends offshore under Great Barrier Reef)

Peters, S.G. (1993)- Polygenetic melange in the Hodgkinson goldfield, Northern Tasman Orogenic Zone. Australian J. Earth Sci. 40, 2, p. 115-129.
(Melange intercalated with multiply deformed Siluro-Devonian shale, greywacke, clast-in-matrix rock, spilite and chert in Hodgkinson goldfield of NE Australia)

Phillips, G. & R. Offler (2011)- Contrasting modes of eclogite and blueschist exhumation in a retreating subduction system: The Tasmanides, Australia. Gondwana Research 19, 3, p. 800-811.
(Three groups of HP metamorphic blueschists and eclogites in Tasmanides: (1) eclogite-blueschists in thick sedimentary sequences (exhumation by buoyancy of continental slabs); (2) moderate-pressure (< 9 kbar) blueschist of arc to MORB-type composition in sedimentary or serpentinite melange zones (accretionary HP rocks; exhumation by corner flow and/or extensional collapse in accretionary wedge) and (3) eclogites of MORB-type composition within serpentinite (exotic HP rocks; exhumation by slab rollback and trench retreat)
(Three groups pf blueschists and eclogites in Tasmanides of E Australia: (1) eclogite-blueschists with calc-alkaline/ tholeiitic affinities in thick sedimentary sequences (continental HP rocks; exhumation by buoyancy of continental slabs); (2) moderate-P blueschist of arc to MORB-type composition in sedimentary or serpentinite melange zones (accretionary HP rocks; exhumation by corner flow /or extensional collapse in accretionary wedge) and (3) eclogites of MORB-type composition within serpentinite (exotic HP rocks; discontinuous exhumation triggered by slab rollback and trench retreat) Dominant W-dipping, E-ward migrating subduction zone can explain HP metamorphic rocks in Tasmanides.)

Pohler, S. (1998)- Devonian carbonate buildup facies in an intra-oceanic island arc (Tamworth Belt, New South-Wales, Australia). Facies 39, p. 1-34.
(E- M Devonian biohermal buildups in Tamworth Belt, possibly comparable to NE Kalimantan Devonian coral)

Powell, C.M., Z.X. Li & G.A. Thrupp (1990)- Australian Palaeozoic palaeomagnetism and tectonics- I. Tectonostratigraphic terrane constraints from the Tasman Fold Belt. J. Structural Geol. 12, p. 553-565.
(Tasman Fold Belt three N-S orogenic realms: Kanmantoo, Lachlan-Thomson and New England. Kanmantoo Orogen accreted to Australia by Late Cambrian. Lachlan Fold Belt two major amalgamated terranes by M Silurian, progressively covered, from W in Late Silurian-Late Devonian by quartzose overlap assemblage. New England Orogen fragmentary E Paleozoic history, but from Devonian onwards related to series of volcanic island and continental margin magmatic arcs. Docking not demonstrated until mid-Carboniferous)

Power, P.E. & S.B. Devine (1970)- Surat Basin, Australia- subsurface stratigraphy, history and petroleum. American Assoc. Petrol. Geol. (AAPG) Bull. 54, 12, p. 2410-2437.
(Jurassic- Lower Cretaceous Surat basin is segment of Great Artesian basin. Deposition of fluvial quartzose sands began in Late Triassic E of Surat basin and transgressed W-ward to C and N parts of basin, covering folded and block-faulted Triassic and older rocks. Mainly non-marine deposits, up to 7500' thick. Uplift-erosion event in M Jurassic time. Cretaceous sediments becoming marine. Basin contracted in M Cretaceous due to deformation N and E of basin. Small Jurassic oil-gas fields. Source probably in nonmarine Jurassic rocks, but marine Permian may have contributed)

Przeslawski, R., A. Williams, S.L. Nichol, M.G. Hughes, T.J. Anderson & F. Althaus (2011)- Biogeography of the Lord Howe Rise region, Tasman Sea. Deep Sea Research II, 58, 7-8, p. 959-969.
(Lord Howe Rise is ribbon fragment of continental crust, separated from E Gondwana as Tasman Sea opened in Late Cretaceous. It attained present position once seafloor spreading ended, at ~52Ma, then subsided to present depth by ~23 Ma. LHR supports mixture of endemic species together with species associated with Australian and NewZealand continental margins)

Quinn, C.D., I.G. Percival, R.A. Glen & W.J. Xiao (2014)- Ordovician marginal basin evolution near the palaeo-Pacific east Gondwana margin, Australia. J. Geol. Soc. 171, 5, p. 723-736.
(Ordovician Macquarie Arc in E Lachlan Orogen of SE Australia long considered to be intra-oceanic arc within an accretionary orogen. More likely extensional tectonics at palaeo-Pacific E Gondwana margin in Ordovician with alkalic and calc-alkalic Cu-Au porphyry deposits away from active arc system)

Raza, A., K.C. Hill & R.J. Korsch (2009)- Mid-Cretaceous uplift and denudation of the Bowen and Surat Basins, eastern Australia: relationship to Tasman Sea rifting from apatite fission-track and vitrinite-reflectance data. Australian J. Earth Sci. 56, p. 501-531.
(Peak paleotemperatures/ depth of burial in Bowen and Gunnedah Basins, E Australia, in Early Cretaceous. Late Cretaceous (100-80 Ma) cooling, with erosion of up to 1.9 km of Jurassic- E Cretaceous rock. Uplift widespread along E margin of Gondwanaland, including all of E Australia, New Zealand, Antarctica. Onset of mid-Cretaceous denudation coincided with continental extension after cessation of volcanism and subduction at ~95 Ma, and prior to initiation of seafloor spreading at ~84 Ma and formation of current passive margin)

Rey, P.F. & R.D. Muller (2008)- Late Cretaceous-Paleocene evolution of the East Gondwana margin, a new dynamic model for the formation of marginal basins. In: J.E. Blevin et al. (eds.) Eastern Australasian Basins Symposium III- Energy security for the 21st century, Sydney, Petroleum Expl. Soc. Australia (PESA), Spec. Publ., p. 267-269.
(At ~100 Ma E Gondwana cordillera started oceanward gravitational collapse, until opening of Tasman Sea from ~90 to 52 Ma. Collapse of cordilleran orogens, marginal basin opening and detachment of micro-continents often considered consequence of slab rollback, but along E Gondwana margin Late Cretaceous change in plate motion probably caused switch from contractional to extensional tectonics)

Rey, P.F. & R.D. Muller (2010)- Fragmentation of active continental plate margins owing to the buoyancy of the mantle wedge. Nature Geoscience 3, p. 257-261.

(Mantle-wedge buoyancy may explain collapse of E Gondwana Cordillera along edge of E Australia/ E Antarctic. At 105-90 Ma, change in absolute plate motion reduced subduction velocity, triggering gravitational collapse of orogen and fragmentation of active margin)

Roberts, J. (1987)- Carboniferous faunas: their role in the recognition of tectonostratigraphic terranes in the Tasman Belt, eastern Australia. In: E.C. Leitch & E. Scheibner (eds.) Terrane accretion and orogenic belts, American Geophys. Union (AGU), Geodyn. Ser. 19, p. 93-102.
(Two marine invertebrate assemblages in Carboniferous shelfal successions of Australia: (1) high diversity, warm water, E Carboniferous Cosmopolitan; (2) low diversity, cold water, M-L Carboniferous Gondwanan. In E Carboniferous Yarrol-New England portion of Tasman Tasman Belt may be separate terrane, in near-equatorial position N of Australia, as indicated by paleomagnetic data, and docked later in Carboniferous)

Roberts, J., J.C. Claoue-Long & C.B. Foster (1996)- SHRIMP zircon dating of the Permian system of eastern Australia. Australian J. Earth Sci. 43, 4, p. 401-421.
(SHRIMP zircon dates from Permian ignimbrites and tuffs associated with fossiliferous strata within the Sydney-Bowen Basin and New England Orogen)

Roberts, J. & B.A. Engel (1980)- Carboniferous palaeogeography of the Yarrol and New England orogens, eastern Australia. J. Geol. Soc. Australia 27, p. 167-186.
(During Carboniferous Yarrol and New England Orogens comprised active depositional margin E of cratonised parts of Australia)

Roberts, J., P.J. Jones & T.B.H. Jenkins (1993)- Revised correlations for Carboniferous marine invertebrate zones of eastern Australia. Alcheringa 17, 4, p. 353-376.
(Update of E Australian faunal zonations and chronostratigraphy of Carboniferous. Gondwanan assemblages succeeding E Carboniferous cosmopolitan faunas cannot be readily correlated with N Hemisphere biozones)

Rosenbaum, G., P. Li & D. Rubatto (2012)- The contorted New England Orogen (eastern Australia): new evidence from U-Pb geochronology of early Permian granitoids. Tectonics 31, TC1006, p. 1-14.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2011TC002960)
(Sharp bends (oroclines) in Paleozoic- E Mesozoic New England Orogen of E Australia, obscured by voluminous magmatism (E Permian granitoids zircon U-Pb ages 296-288 Ma). Phase of younger magmatism (<260 Ma) postdates orocline development. Tectonic model involves early stage of subduction curvature during slab rollback at 300-285 Ma, followed by bending associated with dextral transpression and final tightening possibly by E-W shortening during Late Permian- Triassic (265-230 Ma) Hunter-Bowen orogeny)

Schellart, W.P., B.L.N. Kennett, W. Spakman & M. Amaru (2009)- Plate reconstructions and tomography reveal a fossil lower mantle slab below the Tasman Sea. Earth Planetary Sci. Letters 278, p. 143-151.
(New P-wave and S-wave mantle tomography models from SW Pacific identify flat-lying high-velocity anomaly below Tasman Sea at ~1100 km depth that cannot be linked to Pacific subduction. Strike NW-SE and ~2200 x 600-900 km in lateral extent. Can be interpreted as middle Cenozoic single NE-dipping New Caledonia fossil subduction zone)

Seton, M., N. Flament & R.D. Muller (2012)- Subduction history in the Melanesian Borderlands region, SW Pacific. In: Eastern Australian Basins Symposium IV (EABS IV), Brisbane 2012, p. 1-12.
(online at: www.earthbyte.org/Resources/Pdf/Seton_Melanesian_borderlands_subduction_history_EABS4_2012.pdf
(Plate kinematic model of E Coral Sea area developed from comparison with seismic tomography. Subduction history in E Coral Sea works well for latest Cenozoic but fails to predict seismically fast material (indicative of cold, subducted material) in lower mantle imaged in seismic tomography models)

Seton, M., N. Mortimer, S. Williams, P. Quilty, P. Gans, S. Meffre, S. Micklethwaite, S. Zahirovic, J. Moore & K.J. Matthews (2016)- Melanesian back-arc basin and arc development: constraints from the eastern Coral Sea. Gondwana Research 39, p. 77-95.

(E Coral Sea in NE corner of Australian Plate, where interaction between Pacific and Australian plate boundaries, and accretion of Ontong Java Plateau resulted in complex assemblage of back-arc basins, island arcs, continental plateaus and volcanic products. Start of opening of Santa Cruz Basin and S Rennell Trough at ~48 Ma and termination at 25-28 Ma. Simultaneous opening of Melanesian Basin/ Solomon Sea further N suggests single >2000 km long back-arc basin, with triple junction landward of Melanesian subduction zone from Eocene-Oligocene. Cessation of spreading corresponds with reorganization of plate boundaries and initial soft collision of Ontong Java Plateau)

Shaanan, U. & G. Rosenbaum (2018)- Detrital zircons as palaeodrainage indicators: insights into southeastern Gondwana from Permian basins in eastern Australia. Basin Research 30, Suppl. 1, p. 36-47.
(U-Pb ages from detrital zircon grains from E Permian sediments (~290-297 Ma) in southern New England Orogen. Over 80% of ages Late Carboniferous, from adjacent forearc sediments. Pre-Devonian detritus from SE Gondwanan craton, with peaks of 2000-1500 Ma, 1200-900 Ma (Grenvillian) and 620-480 Ma)

Shaanan, U., G. Rosenbaum, D. Hoy & N. Mortimer (2018)- Late Paleozoic geology of the Queensland Plateau (offshore northeastern Australia. Australian J. Earth Sciences 65, 3, p. 357-366.
(Queensland Plateau (off NE Australia) submerged continental block. Detrital zircons from two drill cores that penetrated Paleozoic metasedimentary strata (ODP Leg 133) provide maximum depositional ages of ~319 and 299 Ma. Queensland Plateau probably formed in backarc basin, NE continuation of New England Orogen and/or E Australian Rift System)

Shaw, S.E. & R.H. Flood (1981)- The New England Batholith, Eastern Australia: geochemical variations in time and space. J. Geophysical Research 86, p. 10530-10544.

Sheps, K. (2004)- Quantitative paleoenvironmental analysis of carbonate platform sediments on the Marion Plateau (NE Australia, ODP Leg 194). M.Sc. Thesis, College of Marine Science, University Southern Florida, p. 1-105.

Stratford, J.M.C. & J. C. Aitchison (1996)- Devonian intra-oceanic arc rift sedimentation- facies development in the Gamilaroi terrane, New England orogen, eastern Australia. Sedimentary Geology 101, p. 173-192.
(Silurian-Devonian rocks in Gamilaroi terrane of New England orogen example of intra-oceanic arc rift, with volcaniclastics deposited by debris flows and turbidity currents. Subordinate facies include limestones, crystal-rich volcaniclastic sandstones, volcanic breccias and olistostromes. Felsic volcanics at base of section represent part of original arc and are overlain by volcaniclastic sandstones and mudstones deposited within an arc basin. Lower Devonian (Emsian) limestones. Thick pillow basalts at top of succession)

Struckmeyer, H.I.M. & P.A. Symonds (1997)- Tectonostratigraphic evolution of the Townsville Basin, Townsville Trough, offshore northeast Australia. Australian J. Earth Sci. 44, p. 799-817.
(Townsville Basin is E-W extensional half-graben, separating Marion and Queensland Plateaus, off NE Australia. No direct control on stratigraphy; timing interpreted from regional context. Up to ~6.5 km sediment in two megasequences: (1) probably Cretaceous synrift in fault-controlled depocentres up to 4 km thick; (2) Tertiary sag-phase up to 3.8 km thick. Half-grabens contain several rotational blocks. Compartmentalised into sub-basins by NNW-NW trending transverse zones, which may represent pre-existing basement structures. Two extensional events. Structuring event during early sag-phase followed by multiple reactivation in ?Late Miocene- E Pliocene. Townsville Basin part of complex rift system of probable Late Jurassic-E Cretaceous age, formed as result of oblique extension that utilised pre-existing Paleozoic structural trends. Comparison with trends of adjacent Queensland Trough suggests formation of both basins independent of (Late Cretaceous-Paleocene) sea-floor spreading in Tasman and Coral Sea Basins)

Symonds, P.A., J. Fritsch & H. Schluter (1984)- Continental margin around the western Coral Sea Basin: structural elements, seismic sequences and petroleum geological aspects. In: S.T. Watson (ed.) Trans. Third Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1982, AAPG, p. 243-252.
(Coral Sea oppposing margins of Queensland and Papuan Plateaus underlain by (Late Cretaceous-Paleocene) rift zone which would have been up to 80 km wide before continental break up. Outer basement highs, with low angle contacts with oceanic crust, in oceanward part of rift zone on both sides of Coral Sea Basin and under lower slope of Eastern Plateau, N Queensland Trough and Osprey Embayment. N Queensland Trough and W margin of Eastern Plateau underlain by grabens with up to 5 km of sediments, part of which may be Mesozoic deltaic sequence similar to that intersected in Anchor Cay 1 well, or deeper water equivalent)

Symonds, P.A., J.B. Colwell, H.I. Struckmeyer, J.B. Willcox & P.J. Hill (1996)- Mesozoic rift basin development off eastern Australia, Geol. Soc. Australia Bull. 43, p. 528-542.

Tulloch, A., J. Ramezani, K. Faure & A. Allibone (2010)- Early Cretaceous magmatism in New Zealand and Queensland: intra-plate or intra-arc origin?. In: S. Buckman & P.L. Blevin (eds.) Proc. Conf. New England Orogen 2010 (NEO 2010), Armidale, p. 332-335.
(Mesozoic magmatism in New Zealand dominated by 800+km-long subduction-related Median Batholith. Main phase of magmatism 170-105 Ma, broadly subdivided into 130-105 Ma inboard belt (adakitic) and 170-130 Ma outboard belt. E Cretaceous magmatism in E Australia dominated by Whitsunday Volcanic Province with high-silica rhyolite and bimodal basalt and coeval isolated granitic plutons (mainly 134-120, some 100 Ma), comparable to that of Median Batholith. Apparent absence of Cretaceous subduction zone suggests formation in extensional intra-plate environment (but too old for 84-55 Ma Tasman Sea spreading?))

Uysal, I.T., M. Glikson, S.D. Golding & F. Audsley (2000)- The thermal history of the Bowen Basin, Queensland, Australia: vitrinite reflectance and clay mineralogy of Late Permian coal measures. Tectonophysics 323, 1, p. 105-129.
(Vitinite Reflectance values from 0.45% Ro in S Bowen Basin to >3.5% Ro in N Bowen Basin. Maximum temperatures of organic maturation of Bowen Basin coals not related to deep burial metamorphism during latest M Triassic- earliest Late Triassic, but to zone of high heat flow in latest Late Triassic)

Vaughan, A.P.M & R.A. Livermore (2005)- Episodicity of Mesozoic terrane accretion along the Pacific margin of Gondwana: implications for superplume-plate interactions. In: A.P.M. Vaughan et al. (eds.) Terrane processes at the margins of Gondwana. Geol. Soc., London, Spec. Publ. 246, p. 143-178.
(Discussion of Late Triassic- E Jurassic (202-197 Ma) and Mid-Cretaceous(~116-110 Ma) periods of coincident continental rifting and marginal collision around Paleo-Pacific. Both are times of elevated mantle heat flow and magmatism, followed by periods of high rates of continental extension (Pangea/Gondwana break-up in Late Triassic-E Jurassic; extensional core-complex formation in M Cretaceous), and times of oceanic plate reorganization and major changes in plate velocity. Possibly related to 'superplume events')

Veevers, J.J., P.J. Conaghan & C.M. Powell (1994)- Eastern Australia. In: J.J. Veevers & C.M. Powell (eds.) Permian-Triassic Pangean basins and foldbelts along the Panthalassan margin of Gondwanaland, Geol. Soc. America (GSA) Mem. 184, p. 11-172.

Vos, I.M.A., F.P. Bierlein & D. Phillips (2007)- The Palaeozoic tectono-metallogenic evolution of the northern Tasman Fold Belt system, Australia: interplay of subduction rollback and accretion. Ore Geology Reviews 30, p. 277-296.

Vos, I.M.A., F.P. Bierlein & J. Webb (2006)- Geochemistry of Early- Middle Palaeozoic basalts in the Hodgkinson Province: a key to tectono-magmatic evolution of the Tasman Fold Belt System in northeastern Queensland, Australia. Int. J. Earth Sciences (Geol. Rundschau) 95, 4, p. 569-585.
(Hodgkinson Province Late Ordovician- Devonian tholeiitic- calc-alkaline basalts interspersed with marine sedimentary rocks and limestones, metamorphosed to lower greenschist facies. Decreasing volcanic arc affinity of Silurian-Devonian MORB-type basalts. Interpreted to reflect deposition in back-arc basin setting. Onset of basin extension in Silurian, accelerated subsidence through Devonian and halted by basin inversion in Late Devonian. Basin evolution controlled by E-ward stepping subduction zone outboard of Australian Craton)

Wartenberg, W. (2005)- The concealed Tamworth Belt (New England Orogen)- stratigraphic and geophysical observations depicting a thrust-related geometry in southern Queensland, Australia. Doct. Diss. Rheinischen Friedrich-Wilhelms University, Bonn, 106p.
(extended abstract online at: http://hss.ulb.uni-bonn.de/2005/0534/0534-1.pdf)
(Tamworth and Yarrol Belts part of Devonian-Carboniferous fore-arc basin, partly concealed in W by Permian-Triassic Bowen and Gumnnedal rift basins. Age equivalent accretionary wedge assemblages in outcrop across E part of orogeny, e.g. Tablelands Complex in NSW and Beenleigh, D'Aguilar, Wandilla and Shoalwater terranes in Queensland. Magmatic arc exposed only in N NEO (Conners and Auburn arcs))

Waschbusch, P., R.J. Korsch & C. Beaumont (2009)- Geodynamic modelling in aspects of the Bowen, Gunnedah, Surat and Eromanga basins from the perspective of convergent margin processes: Australian J. Earth Sci. 56, p. 309-334.
(Geodynamic modelling of Bowen, Gunnedah, Surat and Eromanga Basins. Bowen and Gunnedah Basins subsidence in early Late Permian initial foreland phase platform tilting associated with W-directed subduction. Late Permian-E Triassic platform tilting due to foreland loading, as thrust front in New England Orogen migrated W-ward. Surat and Eromanga subsidence also dynamic platform tilting. Uplift of Eastern Highlands in mid-Cretaceous due to rebound of lithosphere after cessation of W-directed subduction)

Waterhouse, J.B. & W.J. Sivell (1987)- Permian evidence for Trans-Tasman relationships between East Australia, New Caledonia and New Zealand. Tectonophysics 142, p. 227-240.
(E Permian submarine volcanic sequence of Gympie Group, SE Queensland suggestive of immature submarine, tholeiitic stage of arc development on thin (oceanic) crust. M Carboniferous-Permian calc-alkaline Camboon arc to W developed on continental crust. Volcanics and overlying sediments of Gympie Group similar to volcanic arc and adjoining formations of Nelson-Eglinton-Takitimu areas of New Zealand. Dacitic volcanics in New Caledonia may form young part of same volcanic arc. Overlying Permian sediments further similarities between three regions. New Zealand was locus for actively spreading mid-ocean ridge (Dun Mt Ultramafics/ Patuki ophiolite complex), Gympie lay towards end of mid-ocean ridge, New Caledonia close to terminus of volcanic arc and received more terrestrial sediment)

Webb, G.E. (1990)- Lower Carboniferous coral fauna of the Rockhampton Group, east-central Queensland. In: P.A. Jell (ed.) Devonian and Carboniferous coral studies, Assoc. Australasian Pal. Mem. 10, p. 1-167.

Webb, A.W. & I. McDougall (1968)- The geochronology of the igneous rocks of Eastern Queensland. J. Geol. Soc. Australia 15, p. 313-346.
(E Queensland phases of granite emplacement in Devonian (360 Ma), Carboniferous (310, 285Ma), Permian (265, 245, 235 Ma), Triassic (220 Ma.) and Cretaceous (125, 110 Ma). Activity moved generally E-wards with time. Igneous intrusion in Late Permian can be correlated with phases of the Hunter-Bowen Orogeny)

Withnall, I.W., R. Bultitude, S.C. Lang, P.J. Donchak & R.L. Hammond (1987)- Geology and tectonic history of the Palaeozoic Hodgkinson and Broken River provinces, North Queensland. In: E. Brennan (ed.) Proc. Pacific Rim Congress 1987, Gold Coast, Australasian Inst. of Mining and Metallurgy (AusIMM), Parkville, p. 495-498.
(Hodgkinson and Broken River provinces of N part of Tasman Orogen separated by Late Paleozoic igneous rocks, but probably originally continuous. Hodgkinson Province multiply deformed and composed mainly of Silurian-Devonian turbidites, mainly quartz-rich and continent-derived. With probably allochthonous limestone lenses (with E Silurian- E Devonian conodonts))

Withnall, I.W. & R.A. Henderson (2012)- Accretion on the long-lived continental margin of northeastern Australia. Episodes 35, 1, p. 166-176.
(online at: www.episodes.co.in/contents/2012/march/p166-176.pdf)
(S part of Tasman Orogenic Zone broad tract of crust, ~1000 km across, added to cratonic core of Australia. In N Queensland much smaller volume of new crust generated, expressing slow accretion. As a consequence, three large-scale, successive Paleozoic active margin igneous assemblages form largely co-located and overprinting belts with plutonic suites stitching Tasman Line and extending into craton)

Withnall, I.W., D.E. Mackenzie, T.J. Denaro, J.H.C. Bain et al. (1997)- Georgetown Region. In: J.H.C. Bain & J.J. Draper (eds.) North Queensland Geology, Australian Geol. Survey Org. Bull. 240/ Queensland Geology 9, p. 19-116.

Zuchetto, R.G., R.A. Henderson, B.K. Davis & R. Wysoczansky (1999)- Age constraints on deformation of the eastern Hodgkinson Province, North Queensland: new perspectives on the evolution of the northern Tasman Orogenic Zone. Australian J. Earth Sci. 46, p. 105-114.
(Granitic plutons intrude Hodgkinson Fm of E Hodgkinson Province, N Queensland. Fabrics show four deformational events. Plutons two supersuites: (1) latest Devonian- earliest Carboniferous, with emplacement age of ~357 Ma (Mt Formartine Suite); (2) Early Permian Wangetti suite (majority of granites). Devonian-Carboniferous granites emplacement associated with first episode of regional orogenesis and development of penetrative fabrics in Hodgkinson-Broken River Fold Belt)

X. PALEONTOLOGY, BIOSTRATIGRAPHY

(Numerous additional biostratigraphy papers are listed under specific areas, and are not all repeated here)

X.1. Quaternary-Recent faunas-microfloras and distribution

Adisaputra, Mimin K. (1985)- Paleontological analyses of the Savu and Lombok basins and Argo abyssal plain. Proc. 14th Ann. Conv. Indon. Assoc. Geol. (IAGI), p. 205-221.

Adisaputra, Mimin K. (1988)- Late Quaternary calcareous nannoplankton in the surface sediment of Makasar and Flores basin, Indonesia. Bull. Marine Geol. Inst. Indonesia 3, 1, p. 25-36.

Adisaputra, Mimin K. (1989)- Planktonic foraminifera in recent bottom sediments of the Flores, Lombok and Savu Basins, eastern Indonesia. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. Sea Research 24, 4, p. 465-475.
(Planktonic foraminiferal assemblages differ between Flores, Lombok and Savu Basins. In Flores Basin Ng. dutertrei dominant, followed by Gr. menardii, Pulleniatina obliquiloculata, Hastigerina siphonifera and Globigerina bulloides. Lombok and Savu Basins dominated by Gr. menardii, with Pulleniatina obliquiloculata, Gs. ruber and Gr. tumida)

Adisaputra, Mimin K. (1991)- Mikrofauna dan potensi wisata perairan Benoa, Bali. J. Geologi Sumberdaya Mineral 1, 2, p. 2-6.
('Microfauna and recreational potential of the water of Benoa, Bali'. Beach sand at Benoa, S of Denpasar, SE Bali, contains abundant foraminifera of genus Schlumbergerella, also Amphistegina lessoni, Calcarina calcar, Tinoporus spengleri, Baculogypsisna sphaerulata, Operculina, etc.)

Adisaputra, Mimin K. (1992)- Mikrofauna perairan Muria. J. Geologi Sumberdaya Mineral 2, 5, p. 11-16.
('Microfauna in the waters of Muria'. Shallow marine small benthic forams of Java Sea N of Muriah volcano. At less than 20m common Ammonia beccarii, Eponides praecinctus and Asterorotalia trispinosa. In deeper parts more Ammonia annectens, Pseudorotalia schroeteriana and Quinqueloculina. Not much detail)

Adisaputra, Mimin K. (1992)- Late Neogene planktonic foraminifera of the Makasar Basin. Bull. Marine Geol. Inst. 7, 1, p. 15-21.
(Abundant planktonic foraminifera in Makassar Straits bottom samples between 42-2300m, collected during Snellius II expedition. Globigerinoides ruber dominant in North, Neogloboquadrina dutertrei in S part)

Adisaputra, Mimin K. (1996)- Planktonic foraminifera and oxygen isotope records in two cores from the Banda Sea and Indian Ocean. J. Geologi Sumberdaya Mineral 6, 57, p. 10-17.
(Study of Quaternary planktonic foraminifera from two ~7-8m long French- Indonesian cores collected in 1990, one SW of Timor (2313m), one in Banda Sea depth (3163m). Neogloboqudrina dutertrei is indicator of rel. low salinity, Globorotalia menardii for rel. high salinity)

Adisaputra, Mimin K. (1996)- Biostratigrafi kuarter sedimen dasar laut perairan Indonesia bagian Timur dan Samudera Hindia. J. Geologi Sumberdaya Mineral 6, 59, p. 2-6.
('Stratigraphy of Quaternary seafloor sediments in waters of eastern Indonesia and the Indian Ocean'. Study of Quaternary planktonic foraminifera from 46 seven meter long seafloor cores in deep waters of E Indonesia and adjacent Indonesian Ocean. Four subzones in Quaternary Globorotalia truncatulinoides zone (N22-N23), from top: (1) Globorotalia fimbriata-Bolliella adamsi, (2) Globigerina calida, (3) Globorotalia crassaformis hessi and (4) Globigerinoides cyclostomus))

Adisaputra, Mimin K. (1997)- Foraminifera sedimen permukaa perairan Selat Bangka-Belitung. J. Geologi Sumberdaya Mineral 7, 70, p. 2-10.
('Foraminifera from seafloor sediments of Bangka-Belitung Straits'. 38 seafloor samples from straits S of Bangka and Belitung in water depths 10-50m. Dominant foraminifera Operculina ammonoides and other spp., followed by Quinqueloculina, Amphistegina lessonii, Elphidium, Cellanthus, Pseudorotalia schroeteriana, etc.)

Adisaputra, Mimin K. (1998)- *Schlumbergerella floresiana* accumulation in coastal zone of Bali and Nusatenggara, Indonesia: implementation for tourism. Proc. 33rd Sess. Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Shanghai 1996, p. 310-316.
('White sands' along coasts of E Bali, W Lombok, N Sumbawa and S Flores composed mainly of rounded foraminifera Schlumbergerella floresiana (formerly also called Tinoporus, Baculogypsina, Baculogypsinoides; JTvG). Forams derived from adjacent coral reefs)

Adisaputra, Mimin K. (1998)- Foraminifera bentos pantai Senggigi, Lombok Barat dan asosiasinya; faktor penunjang pariwisata. Proc. 27th Ann. Conv. Indon. Assoc. Geol. (IAGI), 2 (Sed. Pal. Strat.), Yogyakarta, p. 53-65.
('Benthic foraminifera of Senggigi Beach, W Lombok, and its associations; factors supporting tourism'. Senggigi beach with abundant foraminifera derived from adjacent reef flat, dominated by Schlumbergerella floresiana. Also Baculogypsina, Baculogysinoides spinosus, Amphistegina lessonii, Calcarina calcar))

Adisaputra, Mimin K. (2000)- Recent foraminifera on the coast and offshore of East Lombok, Eastern Indonesia. Proc. 36th Sess. Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Hanoi 1999, p. 181-200.
(Benthic foraminifera from East Lombok coast and Alas Strait shallow waters down to 90m. In N and central parts Amphistegina lessonii dominant and associated with Calcarina. In S Asterorotalia ('Rotalinoides') gaimardii dominant, still with Amphistegina. Beach samples in N with common Schlumbergerella and Baculogypsinoides, derived from coral reef. Planktonic foraminifera rare)

Adisaputra, Mimin K. (2000)- Late Neogene planktonic foraminiferal biostratigraphy of two cores in Timor waters, Indonesia. Majalah Geologi Indonesia (IAGI) 24, 1, p. 39-50.

Adisaputra, Mimin K. & M. Hendrizan (2011)- Foraminifera perairan Balikpapan, Kalimantan Timur: lingkungan pengendapan dan pengaruhnya. J. Geologi Kelautan 9, 2, p. 119-133.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/205/195)
('Foraminifera from waters off Balikpapan, East Kalimantan: depositional environment and its effects'. 195 benthic and 34 planktonic foraminifera species in Makassar Straits seafloor samples off Balikpapan, between 18-562m depth. Asterorotalia trispinosa dominant around 20m, Heterolepa praecincta most abundant from ~50-300m, Karreriella brady and Uvigerina spp. common only >300m, etc. Cycloclypeus only at 71 and 83m. Abundant planktonic foraminifera Neogloboquadrina dutertrei below 100m, indicating rel. low salinity.)

Adisaputra, Mimin K., M. Hendrizan & A. Kholiq (2010)- Katalog foraminifera perairan Indonesia. Pusat Puslitbang Geologi Kelautan, Bandung, p. 1-198.
('Catalog of Foraminifera collected from Indonesian seas')

Adisaputra, Mimin K. & D. Rostyati (2000)- Recorded Recent foraminifera in the surface sediment of Sunda Strait water. Proc. 29th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 4, p. 117-132.
(Foraminifera from 12 seafloor samples in Sunda Straits and adjacent Indian Ocean between 52- 2180m. Rel. common planktonic foram Neogloboquadrina dutertrei, possibly related to rel. low salinity. Most common benthics Bulimina and Bolivina (mostly 490-1580m). Hyalinea balthica between 489-1078m)

Adisaputra, Mimin K. & D. Rostyati (2003)- Foraminifera sedimen dasar Laut Delta Mahakam, Kalimantan Timur. J. Geol. Kelautan 1, 3, p. 1-10.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/98/88)
('Foraminifera in sediments offshore Mahakam Delta, E Kalimantan'. Foram distribution in samples mainly from 10-100m water depth. 39 species of planktonic, 149 benthic foraminifera. Common benthics Amphistegina lessonii, Heterolepa, Operculina and Pseudorotalia schroeteriana. Max. diversity at depth of 63,5 m)

Amijaya, H., Ngisomuddin & Akmaluddin (2010)- Characterization of July 17, 2006 tsunamiite at South coast of West Java. J. Southeast Asian Applied Geol. (UGM) 2, 1, p. 35-39.

(online at: https://journal.ugm.ac.id/index.php/jag/article/viewFile/7232/5672)
(Deposits of July 26 tsunami at Pangandaran Beach, W Java. Mainly f-m sand, ~10-12cm thick, separated from older beach sediment by erosional surface. Sedimentary structures parallel lamination and current ripples. No vertical fining trends. With transported shallow and deeper marine benthic foraminifera, incl. Ammonia, Elphidium, Amphistegina, Cibicides., Biginerina, Bolivina, Bathysiphon, Nodosaria and Quinqueloculina)

Anderson, J.A.R. (1963)- The flora of the peat swamp forests of Sarawak and Brunei, including a catalogue of all recorded species of flowering plants, ferns and fern allies. Singapore Gardens Bull. 20, p. 131-228.
(All modern coastal and deltaic peat swamps of N Borneo raised bog type. 243 plant/tree species, in 6 communities: 1) Mixed swamp forest, 2) Alan forest, 3) Alan bunga forest, 4) High pole forest, 5) Low pole forest, 6) Padang keruntum)

Aswan, Y. Zaim & Y. Rizal (2006)- Distribution of Quarternary freshwater molluscs fossils in Jawa. In: Y. Zaim et al. (eds.) S. Sartono: dari hominid ke delapsi dengan kontroversi, Penerbit ITB, Bandung, Chapter 9, p. 109-120.

Auliaherliaty, L., K.T. Dewi & Y.A. Priohandono (2004)- Foraminifera di Teluk Sepi- Blongas, Lombok selatan, Nusa Tenggara Barat dan kaitannya dengan faktor lingkungan. J. Geologi Kelautan 2, 3, p. 1-8.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/115/105)
(Seafloor sediment samples of 1-78m in Sepi-Blongas Bay, S Lombok, with 133 foraminiferal species, mainly Ammonia beccarii, Elphidium crispum, Pattelina, Amphistegina lessonii, Calcarina, Pyrgo, Quinqueloculina, etc.. Genus Calcarina with 15 species (?))

Baccaert, J. (1976)- Soritidae of the Lizard Island reef complex: a preliminary report. Annales Soc. Geologique Belgique 99, p. 237-262.
(Eight species of soritids, incl. Marginopora vertebralis)

Estuarine Coastal Shelf Science 65, p. 557-570.

Cleary, D.F.R. & W. Renema (2007)- Relating species traits of foraminifera to environmental variables in the Spermonde Archipelago, Indonesia. Marine Ecology Progress Series 334, p. 73-82.
(Dinoflagellate symbionts and an orbitoidal chamber arrangement in foraminifera linked to exposed reefs and hard substrate, whereas rhodophyte symbionts linked to sheltered reefs and sandy substrate. Etc.)

Cole, A.R., P.T. Harris & J.B. Keene (1995)- Foraminifers as facies indicators in a tropical macrotidal environment; Torres Strait-Fly River delta, Papua New Guinea. In: B.W. Flemming & A. Bartholomae (eds.) Tidal signatures in modern and ancient sediments, Int. Assoc. Sediment (IAS)., Spec. Publ. 24, p. 213-223.

Collen, J.D. & D.W. Garton (2004)- Larger foraminifera and sedimentation around Fongafale Island, Funafuti Atoll, Tuvalu. Coral Reefs 23, 3, p. 445-454.
(Larger foraminifera common around Fongafale Island, Tuvalu. In shallow lagoon mainly larger foraminifera (Amphistegina lessonii, A. lobifera, Baculogypsina sphaerulata, Calcarina spengleri, Marginopora vertebralis, Sorites marginalis). In deeper water Halimeda replaces foraminifera)

Collins, A.C. (1958)- Foraminifera. In: Great Barrier Reef Expedition 1928-29, Scient. Reports, British Museum (Natural History), London, 6, 6, p. 335-437.

Coustillas, F. (1983)- Les facies recents de la plate-forme orientale de Kalimantan (Indonesie) et leur contenu micropaleontologique (foraminiferes benthiques). Doct. Thesis Universite de Bordeaux, p. 1-188.
('Recent facies of the eastern platform of Kalimantan and the micropaleontological content (benthic foraminifera)')

Culver, S. J., E. Leorri, D.R. Corbett, D.J. Mallinson, N.A.M. Shazili et al. (2013)- Infaunal mangrove swamp foraminifera in the Setiu wetland, Terengganu, Malaysia. J. Foraminiferal Research 43, 3, p. 262-279.
(Mangrove swamp samples from Setiu wetlands of NE Peninsular Malaysia with 13 infauna taxa. Six taxa live in all cores: Ammobaculites exiguus, Bruneica clypea, Caronia exilis, Haplophragmoides, Siphotrochammina and Trochammina inflata. Upper mangrove swamp populations with Arenoparella mexicana (=Trochammina inflata mexicana), Haplophragmoides wilberti, Miliammina fusca, Miliammina obliqua, Trochammina inflata and calcareous Helenina anderseni. Low-mangrove-swamp and adjacent mudflat populations dominated by calcareous species such as Ammonia aoteana, Rosalina sp., Elphidium oceanicum, and Triloculina oblonga)

Culver, S.J., D.J. Mallinson, D.R. Corbett, E. Leorri, A.A. Rouf, N.A.M. Shazili, R. Yaacob, J.E. Whittaker, M.A. Buzas & P.R. Parham (2012)- Distribution of foraminifera in the Setiu estuary and lagoon, Terengganu, Malaysia. J. Foraminiferal Research 42, p. 109-133.
(Four benthic foram thanatofacies in Setiu wetlands of NE Peninsular Malaysia, related to variations in salinity and hydrodynamics: (1) low salinity estuarine: low diversity assemblage dominated by Ammotium directum, Trochammina amnicola, Miliammina fusca and Ammobaculites exiguus; (2) medium salinity lagoon: dominated by Ammobaculites exiguus; (3) high salinity estuary and lagoon: high diversity, dominated by A. exiguus and Ammonia aff. A. aoteana; (4) normal marine salinity inlet and adjacent lagoon: high diversity dominated by Amphistegina lessonii, Ammonia aff. A. aoteana)

(Descriptions and environmental conditions of 1000 species of Recent foraminifera found around New Caledonia)

Debenay, J.P. & G. Cabioch (2007)- Recent and Quaternary foraminifera collected around New Caledonia. In: Compendium of marine species of New Caledonia, Doc. Sci. Techn II-7, Inst. Rech. Dev., Noumea, p. 69-94.
(Online: www.ird.nc/biodec/downloads/Compendium/Version%20v%E9rrouill%E9e/Debenay-Cabioch-v.pdf)
(Listing and some illustrations of modern forams around New Caledonia)

Debenay, J.P. & C.E. Payri (2007)- Epiphytic foraminiferal assemblages on macroalgae in reefal environments of New Caledonia. J. Foraminiferal Research 40, 1, p. 36-60.
(online at: http://jfr.geoscienceworld.org/content/40/1/36.full.pdf)
(152 species of epiphytic foraminifera identified from New Caledonia)

De Deckker, P. & F.X. Gingele (2002)- On the occurrence of the giant diatom *Ethmodiscus rex* in an 80-ka record from a deep-sea core, southeast of Sumatra, Indonesia: implications for tropical palaeoceanography. Marine Geology 183, p. 31-43.
(Deep-sea core from water depth 2542 m off SE Sumatra shows 'blooms' of giant diatom Ethmodiscus rex in Indian Ocean during last glacial period, particularly in Last Glacial Maximum. Blooms caused by increases in salinity and nitrate levels near surface. No major upwelling recorded during glacial times. During glacial period Indonesian Archipelago was much drier, preventing low-salinity 'cap' at surface of oceans)

De Neve, G.A. (1949)- Foraminifera from the shore zone of the Islands of Roeang and Siaoe. Chronica Naturae 105, 4, p. 113-115.
(online at: http://colonial.library.leiden.edu/….)

(Recent benthic foraminifera in shoreline sands of islands between Sulawesi and Philippines. Mainly miliolids, Robulus, Elphidium, Heterostegina, Amphistegina, Calcarina spp., Baculogypsina sphaerulata)

De Neve, G.A. (1949)- Opmerkingen over een foraminifenhoudende kalksteen van Baranti op het schiereiland Sanggar (Soembawa) en de strandzanden van Poeloe Ngali (Salehbaai) en Poeloe Madang. Chronica Naturae 105, 4, p. 116-118.
(online at: http://colonial.library.leiden.edu/….)
('Remarks on a foraminifera-bearing limestone of Baranti on the Sanggar Peninsula (Sumbawa) and the beach sands of Pulau Ngali (Saleh Bay) and Pulau Madang'. Late Neogene limestone similar to described by Tobler (1918), with Schlumbergerina, Alveolinella quoyi, Calcarina spp., Baculogypsina sphaerulata, etc. Baculogypsina tetraedra n.sp. described by Tobler (1918) from this area is probably synonym of Tinoporus baculatus and T. floresianus (Schlumberger))

De Neve, G.A. (1949)- Foraminifera from the shore zone of the islands of Morotai and Ternate. Chronica Naturae 105, 7, p. 196-198.
(online at: http://colonial.library.leiden.edu/….)
(Recent foraminifera from beach sand samples of SW Molotai and Ternate: Quinqueloculina, Robulus, Elphidium, Heterostegina, Orbitolites, Rotalia gaimardii, Amphistegina radiata, Calcarina spp., Baculogypsina sphaerulata. With summary of foraminifera from deep water samples off W Halmahera from 'Albatross-Expedition', as reported by Cushman (1921))

De Neve, G.A. (1949)- Foraminifera from the shore zone of Parigi and Poso (Gulf of Tomini). Chronica Naturae 105, 10, p. 252-254.
(online at: http://colonial.library.leiden.edu/….)
(Recent foraminifera from beach sand samples near Parigi and Poso, C Sulawesi. Up to 13 species, incl. miliolids, Elphidium, Operculina, Verbeekia, Orbitolites, Siderolites tetraeda and Calcarina. With summary of Gulf of Tomini deep water samples (1240-1966m) from 'Albatross-Expedition', as reported by Cushman (1921))

De Neve, G.A. (1949)- Een notitie over de foraminiferen van de oudste diepzee-lodingen in Indonesia. Chronica Naturae 105, 11, p. 291-292.
(online at: http://colonial.library.leiden.edu/….)
('Note on the foraminifera from the oldest deep sea soundings in Indonesia'. Brief note on earliest descriptions of deep sea foraminifera from Indonesia by Ehrenberg (1854) and Harting (1861, 1864))

De Silva, L.P. & P.J. Militante-Matias (1998)- Foraminiferal assemblages of Pagbilao Bay, Philippines. J. Geol. Soc. Philippines 53, 1-2, p.
(134 foram species identified, representing 7 foraminiferal assemblages: river mouth, intertidal zone- Patayan Island, intertidal zone- Bocboc point, beach, reef/carbonate platform, inner bay, and inner bay channel. Nature of substrate strongly influences distribution of shallow water benthic foraminifera)

Dewi, K.T. (1993)- Ostracoda from the Java Sea, West of Bawean Island, Indonesia. Masters Thesis, University of Wollongong, Australia, p. 1-165.
(online at: http://ro.uow.edu.au/cgi/viewcontent.cgi?article=3832&context=theses)
(Seafloor samples from Sunda Shelf W of Bawean island contain 113 species of ostracodes, including 7 new)

Dewi, K.T. (1997)- Ostracoda from the Java Sea, West of Bawean Island, Indonesia. Marine Geol. Inst., Bandung, Spec. Publ. 4, p. 1-86.
(same as Dewi (1993) above; Masters Thesis, University of Wollongong, Australia)

Dewi, K.T. (2000)- Distribution of ostracoda from South of Tanjung Selatan, South Kalimantan. Bull. Marine Geol. 15, 1, p. 1-14.

Dewi, K.T. (2014)- Ostracoda from subsurface sediments of Karimata Strait as indicator of environmental changes. Bull. Marine Geol. 29, 1, p. 1-10.

(online at: ejournal.mgi.esdm.go.id/index.php/bomg/article/download/60/61)
(43 species of ostracods from 3 short seafloor cores of Sunda Shelf, in water depth 11-27m. Highest abundance/ diversity in upper 70cm of cores. Main genera Actinocythereis, Hemicytheridea, Loxoconcha, Neocytheretta, Stigmatocythere, Neomonoceratina, Phlyctenophora, Argillloecia, etc. (see also Mostafawi 1992))

Dewi, K.T., I. Adhirana, Y.A. Priohandono & L. Gustiantini (2016)- Ostracoda sebagai indikator perubahan lingkungan perairan sekitar PLTU Tarahan, Teluk Lampung, Sumatera. J. Geologi Kelautan 14, 1, p. 1-12.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/335/263)
('Ostracoda as indicators of marine environmental changes off the Tarahan power plant, Lampung Bay, Sumatera'. Ostracods from surface sediments in Lampung Bay quite diverse and abundant, with 27 genera, dominated by Keijella, Hemicytheridea and Cytherella. Also locally abundant Bairdopillata)

Dewi, K.T., L. Arifin, A. Yuningsih & Y. Permanawati (2012)- Meiofauna (Foraminifera) dalam sedimen dan keterkaitannya dengan pantai pasir putih Senggigi serta kondisi perairan Lombok Barat. Jurnal Ilmu Tekn. Kelautan Tropis 4, 1, p. 47-54.
(online at: www.itk.fpik.ipb.ac.id/ej_itkt41/jurnal/…)
('Meiofauna (Foraminifera) in sediments and its association with the white sand beaches and water conditions of Senggigi, West Lombok'. Schlumbergerella floresiana abundant in white sands of Senggigi beach, but not common in offshore samples)

Dewi, K.T., N.C.D. Aryanto & Y. Noviadi (2007)- Land-sea interactions in coastal waters off NE Kalimantan: evidence from microfaunal communities. Bull. Marine Geol. 22, 1, p. 1-15.
(online at: ejournal.mgi.esdm.go.id/index.php/bomg/article/download/1/1)
(Microfauna in seafloor samples in 14-43m deep water off Nunukan and Sebatik islands in NE Kalimantan with typical microfauna of shallow marine ostracoda (Hemicytheridea spp., Keijella spp., Cytherella) and foraminifera (Asterorotalia trispinosa, Operculina))

Dewi, K.T., P. Frenzel & A. Muller (2008)- Mikrofauna (ostracoda) di sekitar paparan Sahul dan Laut Banda dalam kaitannya dengan batimetri. Proc. 37th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 127-138.
(Study of recent ostracods distribution in Snellius II samples along transects from Timor, Tanimbar, Seram into Banda Sea down to 3070m. Highest number of ostracods between 100-210m water depth, with Bairdopillata, Neonesidea, Paranesidea, Paracytheridea, Hemiparacytheridea, Foveoleberis, Polycope and Loxoconcha)

Dewi, K.T., P. Frenzel, A. Muller & D. van Harten (2004)- Recent ostracoda (microcrustacea) from a Banda-to-Timor Sea traverse: implications for paleobathymetric studies. Proc. 33rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 42-51.
(146 species of ostracods in surface sediments between 100-3070m along Banda Sea- Leti Strait-Timor Sea transect, E of Timor island. Richest assemblages in <100m water; abundance and diversity decreases with depth. Bathyal zone characterized by Cytheropteron, Saida, Bradleya, Paleocythere, Henryhowella, Krithe and Parakrithe; lower bathyal by Acantocythereis, Agrenocythereis and Krithe- Parakrithe spp.; abyssal by Argilloecia, Xestoleberis, Cytheropteron)

Dewi, K.T. & M. Hanafi (2013)- Karakteristik komunitas foraminifera laut dalam di Teluk Tomini, Sulawesi. J. Ilmu dan Teknologi Kelautan Tropis (Bogor), 5, 1, p. 17-25.
(online at: http://journal.ipb.ac.id/index.php/jurnalikt/article/view/7742)
('The characteristics of the deep sea foraminiferal community in Tomini Bay, Sulawesi'. Foraminifera from 14 seafloor sediment samples from 600-1400m in Tomini Bay. Samples dominated by planktonic foraminifera (>90%). Benthic foraminifera represented by Cibicidoides wuellerstorfi, Ceratobulimina pacifica, Pyrgo sp., Bolivinita quadrilatera, Uvigerina peregrina, Planulina, etc., also very rare Laticarinina below 1000m)

Dewi, K.T. & D. Illahude (2005)- Ostracoda from off Derawan island, East Kalimantan (LP-1815) in relation to bathymetric zonation. Bull. Marine Geol. 20, 1, p. 1-14.
(Depth distribution of Recent ostracoda from 25 seafloor samples at depths 7-628m off Berau/ Tarakan Rivers, NE Kalimantan. 142 species identified. Common ostracods in area around reef complex, with Bairdopillata

paracratericola, B. paraalcyanicola and Macrocypris decora. Also high diversity at water depths >200m, with displaced shallow water ostracods and deep water fauna. Bradleya common deepwater ostracod, found from <50m to >500m)

Dewi, K.T., A. Muller, P. Frenzel, L. Auliaherliaty & L. Gustiantini (2003)- Do Quaternary ostracods reflect sea level changes in the Timor Sea? Proc. 32nd Ann. Conv. Indon. Assoc. Geologists (IAGI) and 28th Ann. Conv. HAGI, Jakarta, 11p.
(Samples from E of Timor in water depth 1768m show several small ostracod diversity peaks. Peaks of deep-sea taxa like Krithe, Bradleya, Cytheropteron, Acantocythereis and Ambocythere related to changes in paleoproductivity. Other peak with mixed shallow-water (Paracytheridea, Quadracythere, Loxocorniculum, Neonesidea) and deep-sea taxa suggest downslope transport of sediments, possibly regressive events)

Dewi, K.T., N. Nurdin, Y.A. Priohandono & A. Sinaga (2015)- Benthic foraminifera in marine sediment related to environmental changes off Bangka Island, Indonesia. Berita Sedimentologi 33, p. 47-57.
(online at: www.iagi.or.id/fosi/files/2015/09/BS33-Marine-Geology-of-Indonesia-II-R1.pdf)
(60 species of foraminifera in samples from 6-24m water depth offshore E Bangka island. Dominated by Amphistegina, Elphidium, Quinqueloculina, Operculina)

Dewi, K.T., Y.A. Prihandono & H.H. Prabowo (2000)- Ostracoda perairan Utara P. Kangean: kaitannya dengan transpor sedimen. Proc. 29th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 4, p. 109-116.
('Ostracodes from waters North of Kangean Island; relations to sediment transport'. 30 sediment samples with 30 species, dominated by Bairdopillata, Cytherella, Foveoleberis. Not much detail)

Dewi, K.T. & E. Saputro (2013)- Sebaran spasial foraminifera dalam kaitannya dengan kedalaman laut dan jenis sedimen di Teluk Bone, Sulawesi Selatan. J. Geologi Kelautan 11, 3, p. 165-173.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/240/230)
('Spatial distribution of foraminifera in relation to water depth and sediment types in Bone Bay, S Sulawesi'. Foraminifera from 23-85m water depth in N Bone Bay mainly Operculina spp., Heterolepa, Pseudorotalia. Absence of 'Sunda species' Asterorotalia trispinosa)

(online at: http://jurnal.unpad.ac.id/bsc/article/view/8292/3839)
('Vertical distribution of ostracods and relationship with environmental changes in Jakarta Bay waters'. Similar to Fauzielly et al. (2012), below)

Fauzielly, L., T. Irizuki & Y. Sampei (2012)- Vertical changes of Recent ostrocode asemblages and environment in the inner part of Jakarta Bay, Indonesia. J. Coastal Development 16, p. 11-24.
(Ostracodes from sediment core from the inner part of Jakarta Bay. 53 species, dominated by Keijella carriei and Loxoconcha wrighti, which are common in areas with high organic carbon and nitrogen contents)

Fauzielly, L., T. Irizuki & Y. Sampei (2013)- Spatial distribution of Recent ostracode assemblages and depositional environments in Jakarta Bay, Indonesia, with relation to environmental factors. Paleont. Research 16, 4, p. 267-281.
(Recent ostracodes of Jakarta Bay 94 species, dominated by Keijella carriei, Hemicytheridea reticulata, Loxoconcha wrighti and Hemicytheridea ornata. Cytherella, Cytherelloidea, Neomonoceratina, and Pistocythereis also abundant. Three biofacies: (I) muddy bottom inner-middle bay with K. carriei, L. wrighti, and H. reticulata. Biofacies; (II) muddy bottom outer bay with H. reticulata, H. ornata and Cytherella spp. (III) sandy mud bottom outer bay high-diversity assemblages with Atjehella kingmai, Foveoleberis cypraeoides, Neomonoceratina bataviana and Pistocythereis cribriformis)

Fauzielly, L., L. Jurnaliah & A.H. Hamdani (2014)- Distribusi foraminifera bentonik sedimen paleo-tsunami letusan Gunung Krakatau berdasarkan data inti bor U-6 Di daerah Ujungkulon, Banten. Bull. Scientific Contr. (UNPAD) 12, 2, p. 84-91.
(online at: http://repository.unpad.ac.id/21772/1/Distribusi-foraminifera-bentonik-sedimen...)
('The distribution of benthic foraminifera in sedimentary paleo-tsunami eruption of Krakatoa based on data from core U-6 in the Ujungkulon area, Banten'. Marine microfossils in onland sediments may indicate paleo-tsunami deposits. Sand with coral debris at 90-120cm in core from Ujung Kulon recognized as tsunami deposit. With 55 species of benthic foraminifera, dominated by Streblus beccarii, Planulina wuellerstorfi, Hyalinea balthica, Bulimina marginata, Bolivina spathulata, Elphidium, Uvigerina peregrina Cushman. Origin of tsunami sediments is (outer) shelf-bathyal and inner shelf lagoon)

Fernando, A.G.S., A.M. Peleo-Alampay & M.G. Wiesner (2007)- Calcareous nannofossils in surface sediments of the eastern and western South China Sea. Marine Micropaleontology 66, p. 1-26.
(Calcareous nannofossils in surface sediments of S China Sea in water depths of 35–4345 m. In shallow/ nearshore waters dominant taxa are Emiliania huxleyi and Gephyrocapsa oceanica. In deeper portion of SCS, Florisphaera profunda dominates. Three assemblages recognized:(a) upwelling, (b) oceanic and (c) deep basin assemblages. F. profunda is relatively resistant to dissolution)

Flenley, J.R. (1979)- The Equatorial rain forest: a geological history. Butterworths London, p. 1-162.
(Includes review of SE Asia Cretaceous- Neogene evolution of pollen assemblages and chapter on Quaternary palynology and vegetation changes of SE Asia. In PNG vegetation zones moved downward ~1600m during Pleistocene glacial episodes, suggesting 10°C decline in temperatures (later book with similar title by R.J. Morley (2000) Origin and evolution of tropical rain forests))

Flenley, J.R. (1998)- Tropical forests under the climates of the last 30,000 years. In: A. Markham (ed.) Potential impacts of climate change on tropical forest ecosystems, Climatic Change 39, Kluwer, p. 177-197.
(Incl. review of pollen diagrams from lowlands of SE Asia. Depression of altitudinal vegetation zones during Late Pleistocene Last Glacial Maximum suggests temperatures 5-10°C cooler than now)

Flenley, J.R. (1999)- Problems of the Quaternary on mountains of the Sunda-Sahul region. Quaternary Science Reviews 15, p. 549-555.
(In montane areas in Sunda-Sahul region Upper Montane rainforest appears to be absent in Late Pleistocene. Estimates of temperature lowering in Late Pleistocene strikingly greater in mountains than in lowlands)

Forderer, M. & M.R. Langer (2016)- Five new species and one new genus of recent miliolid foraminifera from Raja Ampat (West Papua, Indonesia). PeerJ 4:e2157; DOI 10.7717/peerj.2157, 20p.
(online at: www.ncbi.nlm.nih.gov/pmc/articles/PMC4924127/pdf/peerj-04-2157.pdf)
(Shallow waters W of Waigeo Island with highly diverse assemblages of 455 species of benthic foraminifera (249 miliolid species). With new genus (Dentoplanispirinella) and 5 new species of miliolids (D. occulta, Miliolinella moia, M. undina, Triloculina kawea, Siphonaperta hallocki). New species relatively rare)

Frerichs, W.E. (1967)- Distribution and ecology of benthonic foraminifera in the sediments of the Andaman Sea. Ph.D. Thesis University Southern California, Los Angeles, p. 1-269.
(Recent foraminifera from seafloor samples across Andaman Sea, between 13-3778m depth. Number of forams increases with depth to 1800m; below this affected by dissolution of calcareous foraminifera. Planktonic number increases with depth and distance from shore. Planktonic assemblages from shelf sediments have globose chambers (Globigerina, Globigerinoides, Globigerinita); in bathyal deposits also common Globorotalia and Sphaeroidinella. Radiolarian number increases with depth; not significant above middle bathyal depths. Benthic foraminifera five faunal provinces. Etc.)

Frerichs, W.E. (1970)- Distribution and ecology of benthonic foraminifera in the sediments of the Andaman Sea. Contr. Cushman Foundation Foraminiferal Research 21, 4, p. 123-147.
(online at: https://cushmanfoundation.allenpress.com/portals/_default/files/pubarchive/CCFFR/21ccffr4.pdf)
(In Andaman Sea shelf faunas characterized by species of Ammonia, Asterorotalia and Pseudorotalia. Upper bathyal faunas characterized by first appearance of Bolivina robusta. Change in ornamentation of Uvigerina at upper-middle bathyal boundary: costate species in outer shelf-upper bathyal; hispid species (U. auberiana) below 600m. Lower bathyal microfaunas calcareous forams dissolved, characterized by arenaceous Glomospira charoides and Karreriella apicularis. Etc.)

Frerichs, W.E. (1971)- Planktonic foraminifera in the sediments of the Andaman Sea. J. Foraminiferal Research 1, p. 1-14.
(Distribution of Recent planktonic foraminifera in sediments of Andaman Sea controlled by surface salinity, water depth, diagenesis and topography. Large volumes of fresh water in N Andaman Sea result in lowering of surface salinity and exclusion of planktonic forams. Depth zonation: Sphaeroidinella and some Globorotalia species indicative of bathyal depths)

Fujita, K. (2006)- Identification of coral reef environments based on foraminiferal death assemblages from Ishigaki Island, Okinawa, Japan. In: Proc. 10th Int. Coral Reef Symposium, Okinawa 2004, p. 528-535.
(Reef-flat foraminiferal assemblages characterized by dominant Calcarinidae, whereas fore-reef foraminiferal assemblages are characterized by various dominant species)

(Modern intertidal foraminifera in mangrove-lined microtidal distributary of Barron River Delta (Queensland): (1) saltmarsh: Trochammina inflata assemblage; (2) regularly inundated tidal flat: dominated by Ammonia beccarii; (3a) high tidal flat: >70% Ammonia beccarii and low diversity, and (3b) low tidal flat: 55-65% Ammonia beccarii and diverse small allochthonous species transported into estuary from shelf)

Hayward, B.W. & S. Kawagata (2005)- Extinct foraminifera figured in Bradyφs Challenger Report. J. Micropalaeontology 24, 2, p. 171-175.
(online at: https://www.j-micropalaeontol.net/24/171/2005/jm-24-171-2005.pdf)
(Brady's (1884) monograph on living foraminifera from Challenger Expedition samples contains 18 species known to become extinct in M Pleistocene between 1.2- 0.6 Ma (mainly elongate, benthic foraminifera like Pleurostomella, Stilostomella, Orthomorphina, etc.). Majority (14 species) from two stations off Kei Islands, Banda Sea (191A, 192). Station 192 (~250m depth) is considerably shallower than established fossil bathymetric ranges of extinct species, suggesting tectonic uplift)

Hayward, B.W., S. Kawagata, H.R. Grenfell, A.T. Sabaa & T. O'Neill (2007)- Last global extinction in the deep sea during the mid-Pleistocene climate transition. Paleoceanography 22, PA3103, p. 1-14.
(20% of cosmopolitan deep-sea benthic foraminifera extinct during late Pliocene-M Pleistocene, with peak of extinctions during M Pleistocene Climate Transition (1.2-0.55 Ma). Family Stilostomellidae (30 species) wiped out, Pleurostomellidae (9 species) decimated. Pulsed declines in abundance, earlier in deepst water sites. Tied to demise of microbial food source due to increased cold and oxygenation of S-sourced deep water masses during major late Pliocene and E Pleistocene glacials)

Hendrizan, M., R.A. Troa, R. Zuraida & E. Triarso (2016)- Calcareous nannoplankton (marine algae) analysis in subsurface sediments of Andaman Sea. Bull. Marine Geol. 31, 2, p. 91-98.
(online at: http://ejournal.mgi.esdm.go.id/index.php/bomg/article/view/313/277)
(4m thick Quaternary clay sediment core BS36 in S Andaman Sea (Mergui-N Sumatra Basin). With 11 genera of calcareous nannofossils, dominated by Gephyrocapsa, Emiliania, and Helicosphaera)
