('Some stratigraphic notes on the islands off the SW coast of Sumatra'. Summary of lecture on Mentawai islands (Nias, etc.), which show remarkably similar Tertiary stratigraphy over ~1200km. Common Miocene basic extrusives. In central islands Miocene isoclinally folded at end-Miocene, i.e. earlier than Sumatra)

Klingelhoefer, F., M.A. Gutscher, S. Ladage, J.X. Dessa, D.F. Graindorge, A. Camille, H. Permana, T. Yudistira & A. Chauhan (2010)- Limits of the seismogenic zone in the epicentral region of the 26 December 2004 great Sumatra-Andaman earthquake: Results from seismic refraction and wide-angle reflection surveys and thermal modeling. J. Geophysical Research 115, B1, B01304, p. 1-23.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2009JB006569/epdf)
(2004 Sumatra earthquake initiated at ~ 30km depth and ruptured 1300km of Indo-Australian- Sunda plate boundary. Seismic velocity model from tomography and forward modeling shows deep structure of earthquake source region. 4-5km of sediments on oceanic crust at trench. Crystalline backstop 120 km from trench axis, below fore-arc basin. Shallow continental Moho (22 km depth), 170 km from trench. Seismogenic zone begins 5-30 km from trench. Deeper part of rupture along contact between mantle wedge and downgoing plate)

Kopp, H. (2001)- Crustal structure along the central Sunda Margin, Indonesia. Dissertation Christian-Albrechts Universitat, Kiel, p. 1-138.
(online at: http://macau.uni-kiel.de/receive/dissertation_diss_00000439)
(Seismic and gravity study of 5600 km long forearc margin of Sumatra- Java. Subduction zone significant variation of trench curvature resulting in areas of normal and of oblique subduction. Frontal part of prism experiencing active accretion between deformation front and active backstop structure, which separates accretionary domain from outer high. Velocities under outer high fairly low, suggesting sedimentary origin. Forearc basin undeformed. Significant change of Moho depth under forearc basin: shallow Moho under Java forearc domain, crust under Sumatra forearc off Sumatra is more continental)

Kopp, H., E.R. Flueh, D. Klaeschen, J. Bialas & C. Reichert (2001)- Crustal structure of the central Sunda margin at the onset of oblique subduction. Geophysical J. Int. 147, 2, p. 449-474.
(online at: http://gji.oxfordjournals.org/content/147/2/449.full.pdf+html)

(Data off S Sumatra and Sunda Strait show lateral increase in dip of subducted plate from 5° to 7° below outer high off Sumatra to Sunda Strait. Downgoing slab traced to >30 km depth. Backstop structure underlying trench slope break defines landward termination of accretionary prism. Velocities of outer high moderate, suggest sediments. Reduced reflectivity beneath rugged top basement supports high degree of deformation and compaction. Several km of sediment in forearc, with distinct basin recognized off S Sumatra but not off Sunda Strait. Bathymetric elevation of Java shelf in S Sunda Strait corresponds to increased basement high velocities and is connected to Sunda Strait transtensional basin. Velocity-depth model indicates continental-type crust under forearc basin off S Sumatra, whereas lower velocities found beneath Sunda Strait forearc)

Kopp, H., R. Weinrebe, S. Ladage, U. Barckhausen, D. Klaeschen, E.R. Flueh, C. Gaedicke, Y. Djajadihardja et al. (2008)- Lower slope morphology of the Sumatra trench system. Basin Research 20, p. 519-529.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2006EO170001/pdf)
(Lower plate fabric extensively modulates upper plate morphology and morphotectonic segmentation of Sumatra trench system is linked to subduction of reactivated fracture zones and aseismic ridges of Wharton Basin. In general, increasing intensity of mass-wasting processes, from S to N, correlates with oversteepening of lower slope, probably in response to alternating phases of frontal accretion and sediment underthrusting)

(online at: www.searchanddiscovery.net/documents/2010/10230lutz/ndx_lutz.pdf)
(Expanded Abstract; short version of paper below)

Lutz, R., C. Gaedicke, K. Berglar, S. Schloemer, D. Franke & Y.S. Djajadihardja (2009)- Petroleum systems of the Simeulue fore-arc basin, offshore Sumatra, Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 95, 9, p. 1589-1616.
(Fore-arc basins generally not considered as important petroleum provinces because of low heat flow. Simeulue fore-arc basin off N Sumatra bright spots on seismic above potential carbonate platform reservoirs, with AVO/AVA analyses indicating presence of gas. Petroleum system modeling of assumed source rocks in Eocene and E-M Miocene reveals hydrocarbon generation is possible in main depocenters of C and S Simeulue Basin and may be more prolific than previously thought)

Malod, J.A., B.M. Kemal, M.O. Beslier, C. Deplus, M. Diament et al. (1993)- Deformations du bassin d'avant-arc au Nord-Ouest de Sumatra: une reponse a la subduction oblique. Comptes Rendus Academie Sciences, Paris 316, p. 791-797.
('Deformation of the fore-arc basin NW of Sumatra; a response to oblique subduction'. NW Sumatra example of oblique convergence, expressed by two major strike-slip fault zones: Sumatra and Mentawai faults. Mentawai fault zone continues N-ward, and fore-arc basin segmented by strike-slip or compressional features)

Malod, J. & B.M. Kemal (1996)- The Sumatra margin: oblique subduction and lateral displacement of the accretionary prism. In: R. Hall & D.J. Blundell (eds.) Tectonic evolution of SE Asia, Geol. Soc., London, Spec. Publ. 106, p. 19-28.
(Oblique convergence in Sumatra forearc partitioned into trench- perpendicular convergence and strike-slip parallel to trench. Strike-slip along two major faults, Sumatra and Mentawai FZ. Mentawai fault attenuated at N end, terminates in accretionary prism. It is relayed and connected to Sumatra fault. Pattern can be explained with two sliver plates, Mentawai and Aceh, on top of which forearc basin developed. Accretionary prism moving NW along Mentawai fault. No extension within Mentawai plate, suggesting uniform motion along Sumatra fault S of 3°N. Strike-slip along Mentawai fault explained by better coupling between subducting slab and upper plate beneath accretionary prism compared to forearc)

Matson, R.G. & G.F. Moore (1992)- Structural influences on Neogene subsidence in the Central Sumatra fore-arc basin. In: J.S. Watkins et al. (eds.) Geology and geophysics of continental margins, American Assoc. Petrol. Geol. (AAPG), Mem. 53, p. 157-181.
(C Sumatra fore-arc Singkel and Pini subbasins with 11 Neogene sequences. In Miocene- E Pliocene both subbasins subsided independently. Initial subsidence of Singkel Basin from lateral translation of structural block between Batee and Singkel faults. Regional basin subsidence from deflection of descending oceanic plate, created when material was added to and/or redistributed in accretionary wedge. Structural influences on fore-arc basin subsidence: (1) location of continental margin; (2) presence of strike-slip faults traversing fore arc; and (3) local and regional deformation within accretionary wedge)

McCaffrey, R. (1991)- Slip-vectors and stretching of the Sumatra fore arc. Geology 19, p. 881-884.
(Thrust earthquakes at Java trench SW of Sumatra suggest Sumatra fore arc translated to NW by oblique plate convergence. NW motion of forearc rel. to SE Asia increases from zero at Sunda Strait to 45-60 mm/yr in NW Sumatra)

McCaffrey, R. (1992)- Oblique plate convergence, slip vectors, and forearc deformation. J. Geophysical Research, Solid Earth, 97, B6, p. 8905-8915.
(On oblique plate convergence, with examples from Sumatra forearc. Thrust earthquakes suggest partial decoupling, where component of arc-parallel motion of leading edge of upper plate results in less oblique thrusting at trench)

Moore, G.F. (1979)- Petrography of subduction zone sandstones from Nias Island, Indonesia. J. Sedimentary Petrology 49, p. 71-84.
(Rocks on Nias two tectonostratigraphic units: (1) deformed late Oligocene-E Miocene trench deposits (tectonic melange) and (2) Miocene-Pliocene trench slope deposits. Sandstone rich in quartz and lithic fragments. Quartzose nature of Nias sediments indicates provenance from Sumatra W coast exposures of E Tertiary quartz-rich sediments and Paleozoic/Mesozoic metamorphic and plutonic rocks. Much lower contents of volcanic lithic grains than most arc-derived sandstones may be due to nonvolcanic source terrane on W coast)

Moore, G.F., H.G. Billman, P.E. Hehanussa & D.E. Karig (1980)- Sedimentology and paleobathymetry of Neogene trench-slope deposits, Nias Island, Indonesia. J. Geology 88, p. 161-180.
(Nias Island Neogene consists of Miocene trench-slope marls, sandstones, and conglomerates of Nias beds that overlie Oyo melange. Lithofacies and sedimentary sequences similar to ancient submarine fan environments. Oldest Nias beds contain very poor fauna or no calcareous microfossils at all, indicating deposition below CCD. Lower Miocene assemblages indicative of depths >2000m. Middle bathyal (500-2000 m) benthic species in U Miocene strata. Nias beds overlain by Pliocene shelf deposits and Pleistocene coral cap. Lower Miocene strata uplifted 4000 m in ~20 Myrs. Basin sediments folded and faulted penecontemporaneous with sedimentation. Dominant source for Nias beds was arc terrane of mainland Sumatra)

Moore, G.F. & J.R. Curray (1980)- Structure of the Sunda Trench lower slope off Sumatra from multichannel seismic reflection data. J. Marine Geophysical Res. 4, p. 319-340.
(Seismic profiles across Sunda Trench slope off C Sumatra reveal details of subduction zone structure. Oceanic crust not involved in deformation at toe of slope, and it can be observed dipping landward ~25 km under toe of accretionary prism. Middle portion of trench slope underlain by deformed accreted strata. Slope basins in 375-1500m water depths. Seaward flank of one large slope basin recently uplifted, indicated by shallow landward-dipping reflectors. Also arlier periods of uplift indicated by numerous angular unconformities in basin strata)

(online at: http://www.tectonics.caltech.edu/sumatra/downloads/papers/Snu.pdf)
('Sunda Megathrust' is name for 1600km long seismogenic subduction zone off Myanmar-Andaman- Sumatra-Java, which runs from deep trench on ocean floor under continental margins. Slippage events in 2004 and 2005 caused major earthquakes and tsunamis)

Simoes, M., J. Avouac, R. Cattin & P. Henry (2004)- The Sumatra subduction zone: a case for a locked fault zone extending into the mantle. J. Geophysical Research 109, B10, B10402, p. 1-16.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2003JB002958/epdf)
Subduction interface locked between large interplate earthquakes (locked fault zone, LFZ), postulated to not extend into mantle because serpentinization of mantle wedge favors aseismic sliding. Uplift rates from coral

growth and GPS indicate LFZ extends ~132 km from trench, to 35-57 km depth. LFZ extends below forearc Moho, estimated at ~30 km depth, 110 km from trench, probably into mantle)

Singh, S.C., H. Carton, P. Tapponnier, N.D. Hananto, A.P.S. Chauhan, D. Hartoyo, M. Bayly, S. Moeljopranoto et al. (2008)- Seismic evidence for broken oceanic crust in the 2004 Sumatra earthquake epicentral region. Nature Geoscience 1, p. 777-781.
(Sumatra 2004 earthquake caused by sudden slip along plate interface between subducting Indo-Australian plate and overriding Sunda plate. Seismic section of focal region reveals subducting crust and oceanic Moho are broken and displaced by landward-dipping thrust ramps, suggesting megathrust now lies in oceanic mantle. Active thrust faults at front of accretionary wedgeconsistent with thrust aftershocks on steeply dipping planes. Brittle failure of mantle rocks accounts for initiation of exceptionally large earthquake)

Singh, S.C., A.P.S. Chauhan, A.J. Calvert, N. Hananto, D. Ghosal, A. Rai & H. Carton (2012)- Seismic evidence of bending and unbending of subducting oceanic crust and the presence of mantle megathrust in the 2004 Great Sumatra earthquake rupture zone. Earth Planetary Sci. Letters 321-322, p. 166-176.
(Deep seismic reflection and refraction data image top of subducting oceanic crust down to 60 km depth in 2004 great Sumatra-Andaman earthquake rupture zone. Top of the downgoing plate does not dip gently into subduction zone but displays staircase geometry with three 5-15 km vertical steps, spaced ~50 km apart)

Singh, S.C., N.D. Hananto & A.P.S. Chauhan (2011)- Enhanced reflectivity of backthrusts in the recent great Sumatran earthquake rupture zones. Geophysical Research Letters 38, L04302, p. 1-5.
(Seismic images of backthrusts in the 2004 and 2007 great earthquake ruptured zones in the Sumatra forearc are brighter than those in regions where subduction zone is still locked. Enhanced reflectivity may be due to increase of fluid contents along reactivated backthrusts during or soon after great earthquakes)

Singh, S.C., N.D. Hananto, A.P.S. Chauhan, H. Permana, M. Denolle, A. Hendriyana & D. Natawidjaja (2010)- Evidence of active backthrusting at the NE margin of Mentawai Islands, SW Sumatra. Geophysical J. Int. 180, 2, p. 703-714.
(online at: https://academic.oup.com/gji/article/180/2/703/2101866)
(Onshore Great Sumatra Fault takes up significant part of strike-slip motion of oblique subduction of Indo-Australian plate beneath Sunda plate, but offshoreMentawai Fault characterized by active SW dipping backthrusts)

Singh, S.C., N. Hananto, M. Mukti, H. Permana, Y. Djajadihardja & H. Harjono (2011)- Seismic images of the megathrust rupture during the 25th October 2010 Pagai earthquake, SW Sumatra: frontal rupture and large tsunami. Geophysical Research Letters 38, L16313, p. 1-6.

Singh, S.C., N.D. Hananto, M. Mukti, D.P. Robinson, S. Das, A. Chauhan, H. Carton, B. Gratacos, S. Midnet, Y. Djajadihardja & H. Harjono (2011)- Aseismic zone and earthquake segmentation associated with a deep subducted seamount in Sumatra. Nature Geoscience 4, p. 308-311.
(Imaging of subducted seamount 3-4 km high and 40 km wide at 30-40 km below Sumatra forearc mantle. Seamount remained intact despite >160 km of subduction, and no seismic activity above or below seamount. Coupling between seamount and overriding plate appears weak and aseismic. Subduction of such a topographic feature could lead to segmentation of subduction zone)

Situmorang, B., N.A. Harbury & M.G. Audley-Charles (1987)- Tectonic inversions in the Sunda Forearc: evidence from Simeulue. Proc. 16th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 57-63.
(Cenozoic history of Simeulue, NW of Nias, includes Oligo-Miocene erosional unconformity. Repeated tectonic inversions may be related in part to transpression and transtension stresses generated by strike-slip motion interacting with sinuosities in trench and Sumatran fault system)

(Map of Belitung (= Billiton) Island, SE of Bangka. Similar geology with folded, low-metamorphic Permo-Carboniferous clastics: (1) Kelapakampit Fm flysch-type deposits with rare Permian fossils, incl. ammonite Agathiceras sundaicum, Fusulina and Schwagerina and Gigantopteris, interfingering with: (2) Tajam Fm quartz sandstones and (3) Siantu Fm basalts and volcanic breccias. Intruded by Tanjungpandan S-type biotite-hornblende granite in NW, locally rich in primary cassiterite (Late Triassic; 215 Ma Rb-Sr age; Schwartz and Surjono 1990) and I-type Baginda adamellite in S (Jurassic?;160-208 Ma; Priem et al. 1975))

Batchelor, B.C. (1979)- Geological characteristics of certain coastal and offshore placers as essential guides for tin exploration in Sundaland, Southeast Asia. In: C.H. Yeap (ed.) Proc. Int. Symp. Geology of tin deposits, Kuala Lumpur 1978, Bull. Geol. Soc. Malaysia 11, p. 283-313.
(online at: www.gsm.org.my/products/702001-101221-PDF.pdf)
(Over 95% of tin production in Malaysia and Indonesia from 'alluvial' placers. Discontinuously rising late Cenozoic eustatic sea-levels and accompanying climate changes main controls on Sundaland sedimentation. Late Cenozoic subdivided into Sundaland regiolith (Late Miocene- E Pliocene), Older sedimentary cover (Pliocene- E Pleistocene) and Young Alluvium (Late Pleistocene- Holocene))

Batchelor, B.C. (1979)- Discontinuously rising late Cainozoic eustatic sea-levels, with special reference to Sundaland, Southeast Asia. Geologie en Mijnbouw 58, 1, p. 1-20.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0c2VPc282N1Q3YVE/view)
(M Miocene- Recent se level cyclicity. Late Cenozoic global eustatic sea-level rise, of greater magnitude and opposite trend to previous schemes, indicated by studies in Sundaland area. Abrupt sea-level drop in late M Miocene (~N14/N15; ~14-12 Ma?) to ~1000 m below present, correlated with emergent Sundaland continent. Increased land area resulted in more seasonal semi-arid climates. Sea levels have since risen discontinuously since Late Miocene (~11 Ma) at ~10cm/ 1000 yrs, with maximum transgression in late Quaternary. Pleistocene Sundaland coastlines changed little before M. Once since then seas rose above shelf-break causing major coast line shifts, dramatically affecting sedimentation and climates)

Hanebuth, T.J.J. & K. Stattegger (2003)- The stratigraphic evolution of the Sunda Shelf during the past fifty thousand years. In: F.H. Sidi, D. Nummedal et al. (eds.) Deltas of Southeast Asia and vicinity-sedimentology, stratigraphy and petroleum geology, SEPM Spec. Publ. 76, p. 189-200.
(Sunda shelf exposed during last glaciation, with soil formation and sediment bypass. Analysis of 36 cores from transect in main paleo-valley of North Sunda River on middle Sunda Shelf. Large foresets of delta system extended basinward following sea-level lowering before Last Glacial Maximum. Marshy soil formed after exposure, and sediment bypass dominated during lowstand. Subsequent sea-level rise caused stepwise submergence. Before 13.5 ka drowning restricted mainly to N Sunda River valley. After 13.5 ka flooding of Sunda plain (~70 m below modern sea surface) caused loss of upper course of river system combined with interruption of terrigenous supply)

Hanebuth, T.J.J. & K. Stattegger (2004)- Depositional sequences on a late Pleistocene-Holocene tropical siliciclastic shelf (Sunda Shelf, Southeast Asia). J. Asian Earth Sci. 23, p. 113-126.
(Sunda Shelf tropical siliciclastic shelf with low gradient, extreme width, huge paleo-valley systems, high sediment input due to large catchment area. Four systems tracts during last glacial sea-level fall and subsequent deglacial rise: (a) wide, partly detached deltaic clinoforms indicate forced regression; (b) shoreline deposits and soil formation of lowstand systems tract; (c) backstepping coastline deposits form confined transgressive systems tract and mainly restricted to paleo-valley system; (d) thin marine mud cover as condensed section over whole shelf (base of HST))

Hanebuth, T.J.J., K. Stattegger & A. Bojanowski (2009)- Termination of the Last Glacial Maximum sea-level lowstand: the Sunda-Shelf data revisited. Global Planetary Change 66, p. 76-84.
(Sunda Shelf Late Pleistocene paleo-coastal relict forms indicating older lowstand 5m deeper than sea level during Last Glacial Maximum (LGM; 21-19 ka BP). LGM sea level recalculated to 123m below modern water depth. Deglacial sea level rise started with massive pulse of 10m in ~800 years, starting at ~19.6 ka. Followed by slow sea level rise throughout HS1, shifting shorelines steadily to hinterland. Onset of Meltwater Pulse 1a at 14.5 ka led to flooding of large parts of Paternoster Platform and Sunda Shelf and widened connections from SCS into Sulu Sea/Celebes Sea. After Meltwater Pulse 1b at ~9.5 ka Sunda Shelf fully flooded)

Hanebuth, T.J.J., K. Stattegger & P.M. Grootes (2000)- Rapid flooding of the Sunda Shelf- a late-glacial sea-level record. Science 288, p. 1033-1035.

(Sea level rise after last glacial maximum at ~20 ka derived from siliciclastic shoreline facies. Record generally confirms reconstructions from coral reefs (~ -115m at 20 ka). Rise of sea level during meltwater pulse 1A was 16m in 300 years between 14.6 to 14.3 ka)

('Historical sketch of the tin mining on Bangka, chapter II, period 1816-1900. Continuation of Schuurman (1898) Bangka history paper)

Schwartz, M.O. (1992)- Geochemical criteria for distinguishing magmatic and metasomatic albite-enrichment in granitoids- examples from the Ta-Li granite Yichun (China) and the Sn-W deposit Tikus (Indonesia). Mineralium Deposita 27, 2, p. 101-108.
(On two examples of albite-rich granitoids: Late Triassic Tikus granite on Belitung and Ta-Li in China)

Schwartz, M.O., S.S. Rajah, A.K. Askury, P. Putthapiban & S. Djaswadi (1995)- The Southeast Asian tin belt. Earth-Science Reviews 38, p. 95-290.
(SE Asian tin belt, N-S zone, 2800 km long/ 400 km wide, from Myanmar- Thailand to Malay Peninsula and Indonesian Tin Islands Bangka- Belitung. Granitoids grouped geographically into 5 provinces: (1) Main Range Granitoid Province in W Malay Peninsula, S Peninsular Thailand and C Thailand, almost entirely biotite granite (184-230 Ma). Contributed 55% of tin production of SE Asia; (2) N Granitoid Province in N Thailand

(0.1% of tin production), also mainly biotite granite (200-269 Ma); (3) E Granitoid Province of E Peninsular Malaysia- E Thailand (Malaysian part subdivided into E Coast Belt (220-263 Ma), Boundary Range Belt (197-257 Ma) and C Belt (79-219 Ma)). Wide compositional range. Tin deposits only in biotite granite in E Coast Belt (3% of production); (4) W Granitoid Province (22-149 Ma) in N Peninsular and W Thailand and Burma biotite granite (14% of tin production); (5) Granitoids of Indonesian Tin Islands (193-251 Ma) do not permit grouping into above units; most tin deposits associated with Main Range-like plutons)

Schwartz, M.O. & Surjono (1990)- Greisenization and albitization at the Tikus tin-tungsten deposit, Belitung, Indonesia. Economic Geology 85, p. 691-713.
(Tikus primary tin-tungsten deposit on NW Belitung hosted by large Late Triassic Tanjungpandan biotite granite pluton (Rb-Sr age 215±3Ma). Deposition mechanism for cassiterite and wolframite was pH increase and temperature decrease in both greisen and moderately albitized granite)

Schwartz, M.O. & Surjono (1990)- The strata-bound tin deposit Nam Salu, Kelapa Kampit, Indonesia Economic Geology 85, 1, p. 76-98.
(Nam Salu horizon at Kelapa Kampit on Belitung Island is richest strata-bound tin mineralization in SE Asia, in Carboniferous-Permian sediments and volcanics, intruded by Triassic granitoids. Most likely source of Sn-bearing fluids is granitic magmatism)

Schwartz, M.O. & Surjono (1991)- The Pemali tin deposit, Bangka, Indonesia. Mineralium Deposita 26, 1, p. 18-25.
(Pemali Mine in NE Bangka is most important granite-hosted tin deposit in Indonesia. Mineralization in SE part of large Klabat batholith Triassic two-mica granite and consists of disseminated cassiterite and greisen-bordered veins)

(online at: www.dwc.knaw.nl/DL/publications/PU00017686.pdf)
(Petrographic descriptions of rocks collected by Roggeveen: schists, radiolarian chert as pebbles in conglomerate, quartzite, sandstones, greywackes, porphyrite, diotite, etc.)

Verbeek, R.D.M. (1897)- Geologische beschrijving van Bangka en Billiton. Jaarboek Mijnwezen Nederlandsch Oost-Indie 26, Wetenschappelijk Gedeelte, p. 1-272.
(Geological description of Bangka and Billiton (Belitung) Islands, E Sumatra, with focus on occurrences of tin. Incl. descriptions of radiolaria of probable Late Paleozoic age from chert by Hinde (p. 223-227) and 'glass pebbles (tektites))

Verbeek, R.D.M. (1897)- Glaskogels van Billiton. Jaarboek Mijnwezen Nederlandsch Oost-Indie 26, Wetenschappelijk Gedeelte, p. 235-272.
('Glass pebbles from Billiton'. Early description of up to 5cm large tektites, locally common on Belitung island in Pleistocene alluvial deposits. Also known from Java, Kalimantan and Australia. Can not be tied to Indonesian volcanoes, so Verbeek assumes extra-terrestrial origin, possibly from volcanoes on moon (now interpreted as part of large SE Asian- Australia tektite-strewn field, dated at ~0.7-08 Ma (see also Krause (1898), Wing Easton (1915, 1921), Von Koenigswald (1935), Chapman (1964), etc.; JTvG))

Von Koenigswald. G.H.R. (1933)- Soenda-plat en poolverplaatsing. De Mijningenieur. 14, 7, p. 124-130.
('The Sunda Shelf and polar wandering'. Sunda shelf between Sumatra, Java and Borneo is drowned alluvial plain now covered by Java Sea. Usually explained as Pleistocene post-glacial sea level rise of ~70-100m, but drowning may also be due subsidence related to change of geoid with shifting of pole in Pleistocene (?))

Wade-Murphy, J. & J.H.A. van Konijnenburg-van Cittert (2008)- A revision of the Late Triassic Bintan flora from the Riau Archipelago (Indonesia). Scripta Geologica 136, p. 73-105.
(Online at: http://dpc.uba.uva.nl/08/nr136/a04)

(Flora from SW Bintan Island, Riau Archipelago, partly described by Jongmans in 1951. Additional taxa identified. Absence of fern and sphenophytes and dominance of diminutive Pterophyllum and Ptilophyllum leaves. Stronger similarities between Bintan and SW Asia than with SE Asia floras. Differences may point to slightly younger age (E-M Jurassic), but unlikely to be Early Cretaceous as suggested by Kon'no 1972)

Wang, X.M., X.J. Sun, P.X. Wang & K. Stattegger (2007)- A high-resolution history of vegetation and climate history on Sunda Shelf since the last glaciation. Science in China Ser., D- Earth Sci., 50, p. 75-80.
(16,500-year high-resolution pollen and spore records from sediments of core 18287 on continental slope of southern S China Sea. Between 16.5-13.9 ka BP low-mountain rainforest dominated. In 13.9-10.2 ka BP lowland rainforest and ferns expanded, indicating warming at last deglaciation and pollen sedimentation rates reduced, implying rise of sea level/ submergence of shelf. After 10.2 ka BP, decreasing fern indicates early Holocene (10.2- ka BP) cold period, while increasing of fern marks rising temperature (7-3.6 ka BP)).

Wang, X.M., X.J. Sun, P.X. Wang & K. Stattegger (2009)- Vegetation on the Sunda Shelf, South China Sea, during the Last Glacial Maximum. Palaeogeogr. Palaeoclim. Palaeoecology 278, p. 88-97.
(online at: http://ocean.tongji.edu.cn/pub/pinxian/eng/2009-04.pdf)
(Pollen from Sonne 1996 cruise sediment cores along paleo-valley of North Sunda River on Sunda Shelf of southern S China Sea. During Last Glacial Maximum (22-16 ka) high percentages of pollen from lowland rain forests and lower montane rainforests, suggesting exposed shelf covered with humid vegetation. Marshy vegetation in valley along N Sunda River. Climate during LGM inferred from vegetation cooler today, but no significant decrease in humidity recorded)

Warburg, O. (1897)- Zwei neu fossile Phanerogamen-Gattungen von der Insel Bangka. Jaarboek Mijnwezen Nederlandsch Oost-Indie 26, p. 229-234.
('Two new phanerogam species from Bangka island'. Fossil Pliocene (?) plant fruit fossils collected by Verbeek in tin quarry 7 of Lumut River, Blinju District. Described by Dr. Warburg from Berlin as Spondiocarpus verbeekii and Monoderosperum bangkanum)

Westerveld, J. (1936)- On the geology of North Banka (Djeboes). Proc. Kon. Nederl. Akademie Wetenschappen, Amsterdam, 39, 9, p. 1122-1132.
(online at: www.dwc.knaw.nl/DL/publications/PU00016981.pdf)
(Survey of NW Bangka Island. Oldest rocks thick, monotonous series of presumably Triassic-age, intensely folded dark shales and yellowish sandstones, steeply dipping, NW-SE or WNW-ESE trending. Sandstones mainly composed of undulose (metamorphic) quartz. Presence of radiolaria in shales similar to Triassic rocks in Malaya, etc. With Djeboes granite, part of large (~100 km) intrusive biotite granite mass. W of granite area diabase intrusions in folded Mesozoic clastics (should not be confused with Pahang series of Malay Peninsula))

Westerveld, J. (1936)- The granites of the Malayan tin belt compared with tin granites from other regions. Proc. Kon. Nederl. Akademie Wetenschappen, Amsterdam 39, p. 1199-1209.
(Brief overview, without figures, of tin granites of Sumatra (Banka, Billiton, etc.), Malay Peninsula, Cornwall, Saxony, Bolivia and S Africa)

Westerveld, J. (1937)- The tin ores of Banca, Billiton and Singkep, Malay Archipelago- a discussion. Economic Geology 32, p. 1019-1041.
(Discussion of Wing Easton 1937 paper, arguing that (1) there is one granite instead of two; depth of granitic intrusion and mineralization was deep; some contact-metamorphism is present. Tin mineralization not Pliocene but post-Triassic and probably pre-Cenomanian, etc.)

Westerveld, J. (1941)- Mineralisatie op de tineilanden. Jaarboek Mijnbouwkundige Studenten Delft 1938-1941, p. 187-233.
(online at: https://resolver.kb.nl/resolve?urn=MMAD01:000080001:pdf)
('Mineralization on the tin islands'. Comprehensive review of geology and tin mineralization on Bangka, Billiton and Riau-Lingga Archipelago, from presentation to Delft students in 1939. Tin granites believed to be of Jurassic age, intruded into isoclinally folded but not regionally-metamorphosed Triassic clastic sedimentary

series (derived from granitic rocks; with rare Daonella on Lingga and radiolarian chert). Tin Island granites rel. rich in Rare Earth Elements (Y, La, Ce, Nd). Primary cassiterite mineralization veins in sediments surrounding granite and in greisen zones in granite. Most tin mined from residual cassiterite deposits ('kaksa') in Quaternary valley bottoms above and around tin granite outcrops, both onshore and near-offshore. With maps of residual cassiterite deposits of Bangka and Belitung)

Wichmann, A. (1893)- Obsidianbomben der Zinnseifen der Insel Billiton. Zeitschrift Deutschen Geol. Gesellschaft 1893, p. 518-519.
('Obsidian bombs from the tin-bearing beds of Belitung Island'. Brief comment by Wichmann on glass spheres in tin beds of Belitung, but which are not found in Indonesian volcanoes. Described earlier by Van Dijk 1879 (see also Verbeek 1897, Wing Easton 1921, etc.; these are now known to be part of M Pleistocene Australasian tektite strewn field. JTvG))

(Natuna D-Alpha Block with thick Terumbu Fm carbonate buildup of L structure, deposited mainly in Late Miocene time (>5000' of carbonates deposited in ~2 Myrs?). Lower Terumbu Units I-III broad carbonate platform, Upper Terumbu reefal buildup. Carbonate complex with 5250' thick gas column, with $C0_2$ *content from 67% in upper zones to 82% near base. Reef facies higher porosity than off-reef facies)*

Krause, P.G. (1898)- Verzeichniss einer Sammlung von Mineralien und Gesteinen aus Bunguran (Gross Natuna) und Sededap im Natuna-Archipel. Sammlungen Geol. Reichs-Museums Leiden Ser. 1, 5, p. 221-236.
(online at: www.repository.naturalis.nl/document/552437)
(also in Jaarboek Mijnwezen Nederlandsch Oost-Indie 1898, Wetenschappelijk Gedeelte, p. 1-16)
('Description of a collection of minerals and rocks from Bunguran (Natuna Besar) and Sededap in the Natuna Archipelago'. Brief descriptions of granite, quartzite, serpentine, etc. No locality information)

Kurniawan, B.A., A.E. Harahap & I.Y. Syukri (2017)- Fundamental work flow for improving static model using seismic data case study: Upper Gabus zones in Kerisi Field. Proc. 41st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA17-682-G, 24p.

(Seismic- geologic study of Late Oligocene Upper and Lower Gabus Fm channelized sandstone reservoirs in 1990 Kerisi oil field in Block B)

Livsey, A., S. Carmody & M. Raharja (2014)- The use of fluid inclusion information to understand hydrocarbon charge history in the Sokang Trough, East Natuna Basin. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-362, 18p.
(Sokang sub-basin underexplored Neogene depocentre in E Natuna Basin. Sokang-1 well drilled on inversion structure in 1973 tested CO2-rich gas from Late Miocene sandstones. Fluid inclusion study showed multiple populations of liquid petroleum in Late Miocene and deeper sandstones of Sokang 1, proving presence of liquid petroleum system and indicating complex hydrocarbon charge history. Contributions from at least three different source rocks suggested by biomarkers and range of API gravities. Inclusions provide evidence of earlier oil accumulation, displaced by late migration of CO2- rich gas)

Manur, H. & J.M. Jacques (2014)- Deformational characteristics of the West Natuna Basin with regards to its remaining exploration potential. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-193, 13p.
(Structural history of W Natuna Basin, in particular temporal variation and magnitude of inversions and effect on spatial distribution of known hydrocarbons. Structural trap styles: (1) Paleogene basement high (KRA field type), (2) Neogene, minor wrench-related (KG, KH), and (3) major inversion structures (KF-Anoa). Initiation of inversion diachronous (~27-18 Ma), with peak inversion from ~21-15 Ma. This resulted in inversion of many of Eocene- E Oligocene E-W trending half grabens and formation of 'Sunda' propagation folds)

Mattes, E.M. (1979)- Udang Field: a new Indonesian development. Proc. 8th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 177-184.
(Conoco Udang field in Natuna Sea discovered in 1974. Reservoir is GabusFm alluvial fan sands. Production start January 1979)

(Large Miocene gas-bearing carbonate complex, called L-structure, in Natuna D-Alpha block, 200 km NE of Natuna Island. Isolated buildup in front of much larger carbonate shelf)

Maynard, K. & I. Murray (2003)- One million years from the Upper Arang Formation, West Natuna Basin, Implications for reservoir distribution and facies variation in fluvial deltaic deposits. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 270-276.
(M Miocene Upper Arang Fm important reservoir in fluvial deltaic deposits, with gas sourced from interbedded coals. Periodic marine flooding events provide intra-formational seals. Series of horizon slices over 1 million year time interval, at ~4800' illustrate major changes in reservoir distribution and facies. Lateral and vertical complexity of these reservoir not resolved by limited well penetrations)

Maynard, K., W. Prabowo, J. Gunawan, C. Ways & R. Brotherton (2003)- Maximising the value of a mature asset, the Belida Field, West Natuna- can a detailed subsurface re-evaluation really add value late in field life? Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 291-305.
(Belida Field 1989 discovery, EUR ~350 MMBO developed in 1992, with peak oil production of 135,000 bopd in 1994 from two fluvial deltaic sandstone reservoirs, E Miocene Lower Arang Fm and Oligocene Udang Fm)

Maynard, K., P. Siregar & L. Andria (2002)- Seismic stratigraphic interpretation of a major 3D, the Gabus Sub-basin, Blocks B and Tobong, West Natuna Sea, Indonesia: getting the geology back into seismic. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 87-104.
(Conoco 2000 large regional 3D survey in Gabus Sub-Basin, W Natuna. Interpretation focused on stratigraphy. Source rock distribution re-interpreted based on seismic facies)

Meirita, M.F. (2003)- Structural and depositional evolution, KH Field, West Natuna Basin, Offshore Indonesia. M.Sc. Thesis Texas A&M University, College Station, p. 1-56.
(online at: http://txspace.tamu.edu/..)
(3D seismic study of KH field. Structure formed by N-S trending Eo-Oligocene rifting, reactivated by E-M Miocene inversion)

Michael, E. & H. Adrian (1996)- The petroleum systems of West Block ôBô PSC, South Natuna Sea, Indonesia. Proc. 25th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 465-479.
(Two petroleum systems in Conoco West Block 'B': (1) coals and coaly shales of Late Oligocene- E Miocene Arang and Gabus Fms and (2) Oligocene lacustrine synrift Belut/Gabus Fms. Synrift organic facies divided into 'deep lacustrine' and 'shallow lacustrine'. Early synrift sections expel as early as 29-19 Ma, shallower; more gas prone synrift sections expel from 26-12 Ma and 23-0 Ma. Coals and coaly shales in Arang and Gabus expulsion below 7500' (0.7% Ro) suggesting charging from 8 Ma- present. Late formed traps (<20 Ma) likely charged from gas prone synrift facies or syn-inversion coals and coaly shales)

Michael, E. & D. Bond (1997)- Integration of 2D modelling, drainage polygon analysis and geochemistry as petroleum systems analysis tools: West Block B PSC, S Natuna Sea. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum Systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc. (IPA), Jakarta, p. 391-401.
(2D modeling of hydrocarbon generation and migration)

Mochammad, F. (2003)- Quantitative seismic geomorphology of Gabus and Belanak Fields, West Natuna Basin, Indonesia. Masters Thesis University of Texas, Austin, p. 1-74.
(Morphology of fluvial and deltaic depositional systems imaged in 3D seismic from W Natuna Basin, Indonesia. Fluvial systems include straight, low-sinuosity, high-sinuosity, anastomosing and braided rivers. No consistency of channel axis. Shore zone represented by prograding strandplain systems. Shelf systems identified from very flat and uniform amplitude map. Channel width ranges from 45- 2174m, meander belt width 243-8750m, meander wavelength 540- 18,450m, radius of curvature 119 to 4635m and sinuosity 1.0 to 3.4)

Mone, A. & S. Samsidi (1993)- A successful gas injection project in the Kakap KF Field: design, implementation and results. Proc. 22nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 323-340.

Morley, R.J., H.P. Morley & P. Restrepo-Pace (2003)- Unravelling the tectonically controlled stratigraphy of the West Natuna Basin by means of palaeo-derived Mid-Tertiary climate changes. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 561-584.
(15 climate cycles interpreted from Late Eocene- M Miocene. Arang Fm climate cycles reflect mainly very wet climates, but with cool lowstand phases, and warm climate highstands. Barat, Udang and Gabus cycles characterized by cool and dry lowstands and warm and slightly wetter highstands. Belut Group cycles trend from drier to wetter with little temperature change)

Morley, R.J., P. Salvador, M.I. Challis, W.R. Morris & I.R. Adhyaksawan (2007)- Sequence biostratigraphic evaluation of North Belut Field, West Natuna Basin. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-G-120, p. 357-375.
(Stratigraphic model of N Belut field reservoir interval from foraminiferal and palynological analysis of Barat, Udang and Gabus Fms. Fourteen biofacies in lacustrine and coastal plain facies. Shales either allocyclic or autocyclic. 15 cycles, capped by allocyclic shale and interpreted as 4th-order sequences, identified through U Gabus and Udang Fms. Packages can be differentiated into 3 groups, thought to reflect 3rd-order sequences)

Mujito, S. Hadipandoyo & Suprijanto (1995)- Hydrocarbon assesment of the carbonate play, East Natuna basin. In: J. Ringis (ed.) Proc. 31st Sess. Comm. Coord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Kuala Lumpur 1994, 2, p. 10-19.
(E Natuna basin considered to form W part of large Sarawak Basin. N-S trending Oligo-Miocene rift-basin. Middle-Late Miocene carbonates with local buildups in N half of E Natuna basin (Terumbu Fm). Risked total resources in carbonate play may be as high as 1196 MT oil and 3110 Gm3 of gas)

Murbini, S. (2000)- Technology challenge for Natuna gas development. Proc. 27th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 339-351.

Murti, N.A. & Minarwan (2000)- Natuna. In: H. Darman & F.H. Sidi, F. H. (eds.) An outline of the geology of Indonesia, Indonesian Geologists Association (IAGI), Spec. Publ., p.

Nagura, H., H. Honda & S. Katori (2000)- Tertiary inversion tectonics and petroleum systems in West Natuna Sea Basins, Indonesia. J. Japanese Assoc. Petroleum Technologists 65, 1, p. 91-102.
(online at: www.journalarchive.jst.go.jp/...)
(In Japanese, with English summary. W Natuna Sea Basins inverted Tertiary intra-continental rift-basins on Sunda Shelf. Basin deposits include M-U Eocene lacustrine, Oligocene fluvial-deltaic, E Miocene muddy facies, M Miocene sand-dominant deposits, and Late Miocene-Recent mud-sand deposits. No E-M Miocene carbonates. Four petroleum systems identified: 1A (Belida oil field), 1B (Tembang, Buntal and Bintang Laut gas pools), 2B (Forel oil pool, Belanak oil and gas field) and 2A (Udang oil field))

Navilova, H. & B.A. Kurniawan (2013)- Comparing and contrasting a meandering point bar sequence and barrier island system within the Upper Arang Formation, Belanak Field, West Natuna Basin. Proc. 37th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA13-G-114, p. 1-17.
(Two distinct depositional systems interpreted from M Miocene Upper Arang Fm gas bearing reservoirs from Belanak Field, Block B, W Natuna Sea. Arang-7 seismic amplitudes look like point bar system, Arang-8 amplitudes interpreted as barrier island system)

Nugraha, R.S., R. Wijayanti & H. Mohede (2012)- Geological concept to geomodel: lessons learned from the Belanak Field Arang-3 development. Proc. 36th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA12-G-182, p. 1-13.
(Reservoir model of Late to M Miocene Arang-3 secondary gas reservoir in Belanak oil-gas field in Block B, Natuna Sea. Interpreted as NNE-SSW trending lower delta plain distributary channel complex)

Nugraha, R.S., P.S. Wisman & D.A. Ramdani (2014)- Depositional model of Gabus Massive Zone, Kerisi Field, West Natuna Basin, Indonesia. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-075, 15p.
(Late Oligocene- E Miocene Gabus Massive Mb sandstones primary reservoir for several Natuna Sea Block B fields, including 1990 Kerisi oil field. Depositional environment lower delta plain- estuarine distributary system, exposed to autocylic avulsion related floods. Seismic data show SW-NE trending main channel complex ~2 km wide and 40 ms thick with 200-250m wide individual channels inside it. Correlations suggest increased tidal (-marine) influence to SW)

Ozza, T., M. Mazied, F.H. Korah, M. Arisandy, H.I. Darmawan, I W.A. Darma, B.P. Putra & W.N. Farida (2018)- Geochemistry analysis and petroleum system modeling for "X" Block, West Natuna Basin. Proc. 42nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA18-417-G, 18p.
(Geochemistry and hydrocarbon charge/ entrapment model for "X" Block close to NW tip of West Natuna Basin and with several inverted half-grabens (Anoa, Gajah, Kakap, Kambing) that delivered hydrocarbon charge. Inversion structures started at ~21 Ma; M Miocene erosion up to 1000m. Oil biomarkers indicate (Paleogene) lacustrine source facies. In deep grabens hydrocarbon expulsion started at 37, 31 Ma)

Pangarso, B., J. Guttormsen, P. Schmitz, I. Sihombing & H. Eko (2010)- North Belut Field- complex clastic diagenesis in an inverted paleo-structure. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-G-184, 16p.
(W Natuna Basin Belut 1974 discovery undeveloped until 2009. Structure originally paleo-tilted fault block, which flooded, filled, then inverted. Hydrocarbon zones in Udang and Gabus Fm fluvial- deltaic clastics. Crest of structure good porosity- permeability sands; downdip portions of field tight due to ferroan cement)

Panjaitan, J.P., B. Siswanto, R.P. Putra, H. Putranto & R. Achdiat (2015)- Comparing overpressure in the West and East Natuna Basins. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-235, 17p.

(Little indication of overpressure in W Natuna Basin while in E Natuna Basin significant overpressure common. Overpressure in E Natuna due to both disequilibrium compaction caused by rapid sedimentation and unloading tied to thermal cracking of hydrocarbons as evidenced by high CO2 and high geothermal gradients)

Panjaitan, J.P., A.B. Nugroho, T. Hamonangan, I. Yuliandri, I. Rahmawan & M. Firdaus (2016)- Case study: horizontal drilling challenge in the thin Gamma 1B Member of the Arang Formation, Belida Field. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-36-E, 15p.
(On horizontal drilling into late E Miocene gas sand in Arang Fm of Belida Field)

Permana, B.R. & M. Firdaus (2014)- Temperature profile and geothermal gradient in Block B West Natuna Basin; case study: the impact on SW calculation for Lower Arang Zone Belut-1 Well. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-076, 10p.
(Prior studies based on nine wells estimated geothermal gradient for W Natuna Basin between 1.9° F/100' and 2.7°F/100' (Aadland and Phoa, 1981). New temperature profiles from many additional wells suggest deep segment of wells has geothermal gradient of 2.38° F/100', in shallower reservoir sections 3.45° F/100')

Permana, B.R., M. Firdaus, R. Wijayanti & L. Hidayat (2015)- ñCoolò shale in the Udang Formation, South Belut Sub-Basin. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-033, 15p.
(Low-radioactive shale in Late Oligocene- E Miocene Udang Fm in S Belut sub-basin of W Natuna basin, caused by dominance of low radioactivite minerals like kaolinite or chlorite)

Pertamina BPPKA (D. Natanegara et al.) (1996)- Petroleum geology of Indonesian basins: West Natuna basin. Petroleum geology of Indonesian basins, principles, methods and applications, XIV, p. 1-86.

Phillips, S., L. Little, E. Michael & V. Odell (1997)- Sequence stratigraphy of Tertiary petroleum systems in the West Natuna Basin, Indonesia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Petroleum Systems of SE Asia and Australasia Conf., Indon. Petroleum Assoc. (IPA), Jakarta, p. 381-389.
(W Natuna Tertiary 3-4 megasequences (Oligocene syn-rift, Late Oligocene- earliest Miocene post-rift, E-M Miocene syn-inversion, Late Miocene-Recent post inversion), subdivided into third-order sequences. Two major Tertiary petroleum systems: syn-rift and syn-inversion. Two source intervals in syn-rift of larger rift half-grabens: (1) early syn-rift open lacustrine, with algal organic matter, and (2) late syn-rift shallow lacustrine/ shoreline, with mixed algal- terrestrial organic matter. Source rocks of syn-inversion coals and coaly shales)

('Analysis of the structure of the Laut and Sekatung islands, Natuna Besar island group'. Laut and Sekatung Islands ~80km NNE of Natuna Besar. Composed of Jurassic- Cretaceous Bunguran Fm. Intensely deformed, with 5 types of oblique slip fault, of different orientations, but tied to first order WNW-ESE right-lateral fault)

Sutoto, A. (1991)- Reservoir geology of the Belida Field South Natuna Sea, Block B. Proc. 20th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 453-478.
(1989 Conoco Belida oil field with 187 MBO and 130 BCF gas. Trap four-way closure, a structural inversion of half-graben during E Miocene (later?; JTvG) regional compression. Age of sediments over Cretaceous granite Oligocene- Holocene. Oil reservoirs Oligocene Udang and E Miocene Lower Arang Sands, gas in E Miocene Arang Fm. Udang Fm sands stacked fluvial channels, Lower Arang sands distributary mouth bars in progadational lacustrine delta. Good vertical and lateral reservoir continuity. Sands ~30% porosity)

Syukri, I.Y., J. Hughes & M. Medianesterian (2014)- A comparison of depth conversion methods in Buntal Gas Field, Block B, Natuna Sea, Indonesia. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-227, 17p.
(On impact of depth conversion methods on volumetric analysis of Buntal gas field, 1990 discovery 30 km E of Belida field, producing since 2003. WSW-ENE trending structure with three primary reservoirs in fluvial-deltaic M Miocene Arang Fm sandstones)

Thamrin, M., Prayitno, S. Tiwar & Solichin (1983)- Heatflow investigation in the Tertiary basins of Natuna Sea. Proc. 19th Sess. CCOP, Tokyo 1982, 2, Techn. Repts., p. 153-166.
(Heatflow data from 29 wells in Indonesian sector of Natuna Sea. Heatflow in W area of Natuna Arch (av. 2.03 HFU, T gradient av. 3.45 °C/100m) higher than in E (av. 1.59 HFU, T gradient av. 3.36 °C/100m))

Tjia, H.D. (1997)- Regional northwest to west-northwest lineaments in the southern part of the South China Sea Basin. Warta Geologi (Newsl. Geol. Soc. Malaysia) 23, 5, p. 297-302.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1997005.pdf)
(Several well-developed NW-WNW striking regional lineaments known from S part of S China Sea Basin and adjacent land areas. In W Sarawak: Lupar Line, Tatau horst-graben, W Balingian Line, Tinjar Line, Upper Baram Line, W Baram Line. In Sabah: Kinabalu Lineament and Balabac Fault. Also ~10 major NE/NNW trending wrench-fault zones across continental margin in SE S China Sea. May tie to regional NW faults in mainland SE Asia, believed to have facilitated extrusion of continental SE Asia)

Usman, E. (2015)- The geochemical characteristic of major element of granitoid of Natuna, Singkep, Bangka and Sibolga. Bull. Marine Geol. 30, 1, p. 45-54.
(online at: http://ejournal.mgi.esdm.go.id/index.php/bomg/article/view/74/75)
(Mesozoic granites from Natuna, Bangka and Singkep with SiO2 contents of ~71-75% and classified as acid and calk-alkaline magmas. Sibolga granitoid with SiO2 60- 71% classified as intermediate-acid magma and high K, ultrapotassic island arc granite)

Van Mechelen, G., J. Meyer & R. Gir (1998)- Correlation mapping technique, a powerful tool to minimize risk and to guide future development plans. Proc. 26th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 175-196.
(Geophysical study over two gas fields in W Natuna Basin)

Wagimin, N. & E.A. Sentani (2009)- Opportunities (II), East Natuna area. Inameta J. 7, p. 24-27.
(online at: www.patranusa.com)
(Brief overview of E Natuna Basin, in conjunction with tender round offering)

Wirojudo, G.K. (1985)- Geological studies as a risk-reducing factor in exploration ventures with special references to the South China Sea. Energy 10, 3, p. 517-523.

(40 new exploration wells drilled in E and W Natuna basin in 1981-1982. Decisions on exploration ventures involve knowledge of basin geology. Natuna basins area can be used as a model)

Wirojudo, G.K. & A. Wongsosantiko (1985)- Tertiary tectonic evolution and related hydrocarbon potential in the Natuna area. Energy 10, 3/4, p. 433-455.
((In E Oligocene Natuna area included W Natuna and E Natuna Basins, separated by N-S trending Natuna basement Arch. Basin development in W Natuna began in E Oligocene time with rifting and pull-apart forming SW-NE half-grabens filled with nonmarine sediments, possibly driven by extrusion of Malay Peninsula from Asia during early stages of India-Asia collision. In E Natuna Basin no rifting, but Oligocene sediments only thicken regionally E-ward toward basin center. Compressive forces in W Natuna Basin during E Miocene resulting in inversion of normal faults. Simultaneously in E Natuna Basin mainly tensional forces that produced NW-SE right lateral movements coupled with NE-SW trending normal faulting. Hydrocarbon potential of W Natuna Basin enhanced by presence of locally thick Oligocene and Miocene sediments)

Wongkosantiko, A. & P. Prijosoesilo (1995)- Geologic summary of the Natuna Sea. In: Seismic Atlas of Indonesian Oil and Gas Fields, II: Java, Kalimantan, Natuna, Irian Jaya, Indon. Petroleum Assoc. (IPA), Jakarta, 6p.

Wongkosantiko, A. & G.K. Wirojudo (1984)- Tertiary tectonic evolution and related hydrocarbon potential in the Natuna area. Proc. 13th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 161-183.
(W and E Natuna Basins separated by N-S trending Natuna basement Arch. W Natuna Basin started in E Oligocene by rifting/ pull-apart, producing SW-NE half-grabens filled with non-marine sediments. Extension in W Natuna little effect on E Natuna Basin, where Oligocene sediments more uniform thickness. Compressive forces started in W Natuna in E Miocene, resulting in inversions of former half grabens)

Akmaluddin, A. Kano & K. Watanabe (2012)- Paleoceanography of Central Java and closing of Indonesian Seaway reconstruction based on oxygen isotope composition of foraminifera. Proc. 41st Ann. Conv. Indon. Assoc. Geol. (IAGI), Yogyakarta, 2012-SS-10, p. 17. *(Abstract only)*

(Oxygen isotopes study of planktonic and benthic foraminifera from Ngalang River section, S Mountains, C Java, Indonesia. Low planktonic δ18O values indicate sea surface T in this area higher than other tropical areas during E-M Miocene, probably related to development of W Pacific Warm Pool, which moved to present-day location in W Pacific after ~10Ma, due to closure of Indonesian seaway. Low δ18O values (warming of bottom water) of benthic foraminifera at ~18 Ma and ~12 Ma. Gradual δ18O increase (cooling) in Late Miocene (~12 Ma) in all taxa can be correlated to global cooling and/or closing of Indonesian seaway. Decreasing of carbon δ13C in Late Miocene likely correlates to 'carbonate crash', at ~11-10 Ma)

Akmaluddin, A.R. Perdana, A.N. Fadhillah, Z. Nadirah & A. Hafiz (2017)- Studi awal kelimpahan fosil moluska pada Formasi Sentolo bagian atas. Proc. 10th Seminar Nasional Kebumian, Dept. Teknik Geologi, Universitas Gadjah Mada (UGM), Yogyakarta, PSP-10, p. 895-911.
(online at: https://repository.ugm.ac.id/274228/1/PSP-10.pdf)
('Preliminary study of abundance of fossil molluscs in the upper Sentolo Formation'. Molluscs in Late Pliocene (N20-N21) part of Sentolo Fm NW of Kaliagung village, Kulon Progo, C Java: 10 species of gastropods (incl. Corbicula gerthi, Conus spp., Amnicola, Sulcospira, Cypraea) and 5 species of pelecypoda (incl. Anomia boettgeri, Paphia cheribonensis, Meretrix, Pallium, Anadara). Most species shallow marine and transitional)

Akmaluddin & R.N. Saputra (2014)- Umur Formasi Kebo Butak berdasarkan nanofosil gampingan daerah Bayat, Kab. Klaten, Provinsi Jawa Tengah. Proc. 7th Nat. Seminar Nasional Kebumian, Jurusan Teknik Geologi, Universitas Gadjah Mada, Yogyakarta, M4P-07, p. 874-885.
(online at: https://repository.ugm.ac.id/135168/1/874-885%20M4P-0.pdf)
('Age of the Kebo Butak Formation based on calcareous nannofossils in the Bayat area, Klaten District, C Java'. Kebo Butak Fm of S Mountains of E Miocene age. Tegalrejo-Cermo section with Cyclicargolithus floridanus, Sphenolithus ciperoensis and Dictyococcites bisecta (zone NN1, earliest Miocene) and Discoaster druggii (zone NN2). Basal Karangnongko section with Sphenolithus heteromorphs and S. belemnos (NN4))

Akmaluddin, D.L. Setijadji, K. Watanabe & T. Itaya (2005)- New interpretation on magmatic belts evolution during the Neogene- Quaternary periods as revealed from newly-collected K-Ar ages from Central-East Java, Indonesia. Proc. 34th Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, p. 235-238.
(K-Ar dating shows rock samples from Lawu and Wilis volcanic complex very young (Quaternary). Three volcanic centers of Late Miocene age at transition zone between Quaternary belt and Tertiary Southern Mountains (volcanic centers near Borobudur, Selogiri area, SE of Yogya, and hornblende-rich tuff of ~12 Ma)

Akmaluddin, T. Susilo & W. Rahardjo (2006)- Calcareous nannofossils biostratigraphy of Ngalang River section, Southern Mountain area, Gunung Kidul, Yogyakarta. Proc. 35th Ann. Conv. Indon Geol. Assoc. (IAGI), Pekanbaru 2006, 1p. *(Abstract only)*
(Samples from Miocene Sambipitu and Oyo Fms of Ngalang River section, S Mountains, C Java. Sambipitu Fm shows 5 zones (NN2-NN6; E- M Miocene), Oyo Fm 3 zones (NN8-NN10; M- L Miocene). Results suggest gap between Sambipitu and Oyo Fms. Suggesting younger ages than dated previously)

Akmaluddin, K. Watanabe, A. Kano & W. Rahardjo (2010)- Miocene warm tropical climate: evidence based on oxygen isotope in Central Java, Indonesia. World Academy of Science, Engin. Technology, 71, p. 66-70.
(online at: www.waset.org/journals/waset/v71/v71-11.pdf)
(O and C isotopes records of foraminifera and bulk carbonates from Oyo- Sambipitu Fms, S Mountains, C Java, demonstrate warm sea surface T during Miocene. Decrease of O isotope values at ~14 Ma, tied to M Miocene Optimum. Warming of sea surface T related to development of W Pacific Warm Pool and flow of warm water through Indonesian seaway. Cooling at ~12 Ma, tied to Late Miocene global cooling or due to closing of Indonesian Gateway)

Akmaluddin, K. Watanabe & H. Ohira (2012)- Oligocene-Early Miocene foraminifera, 40Ar/39Ar dating & fission track dating in Southern Mountains, Central Java. Proc. 41st Ann. Conv. Indon. Assoc. Geol. (IAGI), Yogyakarta, 2012-SS-09, 1p. *(Abstract only)*
(Fission track dating of 3 samples from lower, middle and upper Semilir Fm at Buyutan section yielded ages of 23.2 Ma; near FO Globoquadrina dehiscens, 19.8±1.5 Ma and 19.4 Ma, near Top Globigerina binaiensis)

Akmaluddin, K. Watanabe & W. Rahardjo (2012)- Miocene calcareous nannofossils and foraminifera biostratigraphy, with calibrating the age using 40Ar/39Ar dating in Southern Mountains, Central Java. Proc. 41st Ann. Conv. Indon. Assoc. Geol. (IAGI), Yogyakarta, 2012-SS-08, 1p. *(Abstract only)*
(Calcareous nannofossil analysis on Miocene Sambipitu and Oyo Fms at Kali Ngalang section. Sambipitu Fm 5 zones (NN2-NN6; E-M Miocene), Oyo Fm 3 zones (NN8-NN10; M-L Miocene). Results indicate gap between Sambipitu and Oyo Fms, with absence of NN7. Foraminifera biostratigraphy of Sambipitu Fm 4 zones (N6-N8a), good agreement with nannofossil biozones, but M Miocene (Oyo Fm) suggest hiatus of N10-N12, inconsistent with nannofossils. 40Ar/39Ar date of 10.0±1.3 Ma of Oyo Fm tuff layers in agreement with biostratigraphic ages (tuff layers 10m above FO Discoaster hamatus (10.7 Ma) and FO Globigerina nepenthes (11.7 Ma), 20m below LO D. hamatus (9.4 Ma))

Ardhana, W. (1993)- A depositional model for the Early Miocene Ngrayong Formation and implications for exploration in the East Java Basin. Proc. 22nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 396-443.
(Ngrayong Fm regressive-transgressive cycle with coarse sands in lower part, fine clastics and limestones towards top. Five facies: tidally-influenced cross-bedded sandstones, sandy turbidites, contourites, hemipelagic mudstones and carbonates. Cross-bedded sandstones, capped by thin bioclastic carbonates, widely distributed in shelf- upper slope area in N of study area. Contemporaneous turbidites, contourites and hemipelagic slope-basinal mudstones to S. Basement architecture controlled Oligocene-Miocene paleogeography and Ngrayong deposition. Sandy turbidite facies most productive and primary exploration target. Cross-bedded sandstones produced gas in NW, but no hydrocarbons elsewhere Main reason is destruction of traps by exposure and erosion. Deep marine carbonate contourites tested hydrocarbons in Tuban Block and form secondary target)

Ardhana, W., P. Lunt & G.E. Burgon (1993)- The deep marine sand facies of the Ngrayong Formation in the Tuban Block, East Java Sea. Indon. Petroleum Assoc. (IPA) Sandstone Core Workshop, Jakarta 1993, p. 117-175.
(Early M Miocene Ngrayong Fm quartz sands most productive reservoir onshore E Java. Fields near Cepu and outcrops to N and W show thickly bedded, m-grained, cross-bedded sandstones. Three wells drilled further S (Tuban JOB; Ngasin 1, Gondang 1, Grigis Barat 1) silt to fine sand, with some m-grained quartz. Paleontology suggests bathyal facies. Sediments thinly bedded and locally good flow rates. Gondang-1 tested 538 BOPD from 25' sandy pelagic carbonate. Deposition mainly from deep sea currents (contourites). Grigis Barat-1 with features indicative of distal turbidite)

Ardhito, Y. (2013)- Biostratigrafi nannofossil gampingan, lintasan Gunung Temas dan Gunung Lanang Kecamatan Bayat, Kabupaten Klaten, Propinsi Jawa Tengah. S1 Thesis, Universitas Gadjah Mada, p. 1-143.
(Unpublished; see also Akmaluddin and Ardito 2014))

Burhannudinnur, M. (2013)- Pengaruh tektonik dan laju sedimentasi dalam pembentukan gunung lumpur (mud volcano) di zona Kendeng dan Rembang Cekungan Java Timur. Ph.D. Thesis (S3), Inst. Teknologi Bandung (ITB), p.
('Tectonics and rate of sedimentation effect in mud volcano generation in the Kendeng and Rembang zones, East Java Basin'. Mud volcanoes are surface expressions of extruing overpressured formations or shale diapirs. E Java mud volcanoes grouped into four models, i.e. Kuwu, Crewek Medang and Lusi. Mud volcanoes caused by contractional tectonic deformation, sedimentation rate (>280m/My), deep burial (>1000m) and dominance of shale (>85%). If mud volcano system is at critical pressure phase, drilling will cause rapid explosion of mud volcano. If mud volcano system is in near critical phase, explosion will start when drill pipe is deepened. Overpressured mud zone has potential for unconventional gas reservoir with high gas storage capacity)

Cahyono, A.B. & C.F. Burgess (2007)- Cepu 3D seismic- variations in Oligo-Miocene carbonate buildup morphology. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-G-116, p. 561-567.
(Carbonate build-up morphologies in Cepu Block vary from steep, narrow pinnacles to broad platform deposits. Buildups developed on isolated platform that began to form in E Oligocene. Through Late Oligocene-E Miocene, carbonate deposition ceased over parts of platform while other areas continued to grow, resulting in isolated carbonate buildups, drowning at different times, with morphologies related to underlying extensional faults and subsidence rates. Buildups up to 2 km thick. Thicker buildups drown in E Miocene and are covered by M Miocene clastics of low seal quality. Other areas of Cepu platform drowned in Oligocene.

These carbonates have different morphology, lower reservoir quality and more clay-rich seals and commonly contain large gas columns)

Carlile, J.C., I.L. Price & S. Prihatmoko (2005)- The Cibaliung gold deposit, Banten: discovery to decision to mine. In: S. Prihatmoko et al. (eds.) Indonesian mineral and coal discoveries, Indon. Assoc. Geol. (IAGI) Spec. Issue, Jakarta, p. 45-57.
(Cibaliung low sulphidation epithermal Au-Ag deposit at SW tip of Java. First discovered in 1992, decision to mine in 2004. Miocene-age mineralization (~10 Ma), formed at shallow depths (250-300m), hosted in Neogene volcanics. Site possibly influenced by NW-SE Sumatra Fault system, creating small pul-apart basin (see also Harijoko et al. 2004, 2007)

(Cretaceous-Late Miocene paleogeographic maps W Java)

Clements, B. & R. Hall (2008)- U-Pb dating of detrital zircons from West Java show complex Sundaland provenance. Proc. 32nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA08-G-115, 19p.
(Ages of zircons from M Eocene volcanoclastic Ciletuh Fm indicate Late Cretaceous- E Paleogene local volcanic arc source. M Eocene- Oligocene quartzose formations sourced from Sundaland, with wide zircon age ranges (Proterozoic- Eocene). M Eocene Ciemas Fm zircons mainly Permo-Triassic ages, and derived from Malay Peninsula and Tin Islands granites, Late Eocene Bayah Fm higher contribution of E-M Cretaceous granites from Borneo Schwaner Mts)

Clements, B., R. Hall, H.R. Smyth & M.A. Cottam (2009)- Thrusting of a volcanic arc: a new structural model for Java. Petroleum Geoscience 15, 2, p. 159-174.

(Java apparently simple structure with E-W physiographic zones broadly corresponding to structural zones. Simplicity complicated by structures inherited from Cretaceous subduction, by extension related to development of volcanic arcs, extension related to development of Makassar Straits, Late Cenozoic contraction, and active cross-arc extensional faults. Major thrusting in S Java displaced Early Cenozoic volcanic arc rocks N-wards by 50km or more. C Java displays deepest structural levels of N-directed thrusts, with Cretaceous basement exposed; overthrust arc largely removed by erosion. In W and E Java overthrust volcanic arc still preserved. W Java arc now thrust onto shelf sequences that formed on Sundaland continental margin. In E Java volcanic arc thrust onto thick volcanic/sedimentary sequence formed N of arc in basin due largely to volcanic arc loading)

Clements, B., I. Sevastjanova, R. Hall, E.A. Belousova, W.L. Griffin & N. Pearson (2012)- Detrital zircon U-Pb age and Hf-isotope perspective on sediment provenance and tectonic models in SE Asia. Hall, R., B. Clements, H.R. Smyth & M.A. Cottam (2007)- A new interpretation of Javaôs structure. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-G-035, 23p.
(Paleogene arc volcanoes acted as load which caused flexural basin to develop between Sunda Shelf and S Mountains Arc. Thrusting in S Java displaced Paleogene volcanic arc rocks N by >50 km and eliminated flexural basin in W Java. Amount of thrusting diminishes from W to E Java. Three distinct structural sectors in Java, W, Central and E. C Java displays deepest structural levels of N-directed thrusts, and Cretaceous basement is exposed; overthrust volcanic arc largely removed by erosion. In W and E Java overthrust arc preserved. In W Java arc thrust onto shelf sequences of Sundaland margin. In E Java volcanic arc thrust onto thick volcanic/sedimentary sequence formed N of arc in flexural basin due largely to arc loading. Traps beneath overthrust arc offer new hydrocarbon exploration possibilities, particularly in W Java)

Hamilton, P.J., H. Smyth, R. Hall & P.D. Kinny (2006)- Zircon age constraints on the basement in East Java, Indonesia. Geochimica Cosmichim. Acta 70, 18, Suppl. 1, p. A225 (Goldschmidt Conference Abstract)
(Inherited zircon U-Pb dates in E Java volcaniclastics mixed populations, reflecting recycling from earlier eruptions. Inherited dates peaks at: (1) Cretaceous- restricted to W and NW of E Java, close to Cretaceous basement exposures (2) Cambrian-Archean (500-750 Ma, 900-1250 Ma and 2500-2700 Ma)- confined to S Mountains Arc. Peaks in distribution of dates similar to E Gondwana basement ages and Permo-Triassic-modern sediments from W Australia, suggesting S Mountains volcanoes sampled deep crust of continental Gondwanan origin beneath E Java, different from Cretaceous accretionary basement of W and N Java)

(Oldest formation outcropping on Rembang Quad is marine E Miocene Tawun Fm. Grades upward ino late E-M Miocene (N8-N12) Ngrayong Fm quartz sst, overlain by Bulu Fm platy limestone (N13) and further Mio-Pliocene marine sediments)

Kadar, D., R.A. Wibowo, H. Wijaya, L. Sebayang & E.Y. Patriani (2014)- Late Eocene- Pleistocene planktonic foraminiferal biostratigraphy of the Kuripan-1 well, North Central Java, Indonesia. Berita Sedimentologi 29, p. 95-115.
(online at: www.iagi.or.id/fosi)
(Planktonic foraminifera from marine Ngimbang, Kujung, Tuban, Selorejo and Lidah Formations in Kuripan-1 well, North C Java range in age from Late Eocene- Pleistocene (upper Zone P17- N22).

Kadarusman, A., H.J. Massonne, H. van Roermund, H. Permana & Munasri (2007)- P-T evolution of eclogites and blueschists from the Luk Ulo Complex of Central Java, Indonesia. Int. Geology Review 49, 4, p. 329-356.
(C Java Lok Ulo Cretaceous accretionary-collision complex with tectonic slabs of dismembered ophiolites, sedimentary rocks, schists and gneisses in black-shale matrix. High-Pressure eclogite and blueschist in thin zone between low-grade schists and serpentinite zone. Eclogites subducted to ~70 km depth at geothermal gradient of ~6 C°/km. Different P-T paths explained by metamorphism in subduction channel. Low geothermal gradient probably due to high rate of subduction of cold oceanic plate)

Kadarusman, A., H. Permana, H.J. Massonne, H. van Roermund, Munasri & B. Priadi (2010)- Contrasting protoliths of Cretaceous metamorphic rocks from the Luk Ulo accretionary wedge complex of Central Java, Indonesia. Proc. 39th Conv. Indon. Assoc. Geol. (IAGI), Lombok, PIT-IAGI-2010-121, 9p.
(Metamorphic rocks in C Java Luk-Ulo Early Cretaceous accretionary complex two types of protoliths, with different P-T evolution: (1) 'oceanic plate protolith' metabasites- metapelites, associated with serpentinite, chert, red limestone, some undergone high P metamorphism (blueschist, eclogite), and (2) 'continental crustal protolith' metapelites, calc-silicate rocks and metagranites (gneiss, quartzite, marble). Metamorphics not simply result of oceanic subduction metamorphism along Indo-Australian oceanic plate (Sundaland craton margin), but early involvement of continental crust during collisional event in Karangsambung area)

(High-resolution bathymetry suggests tectonic erosion of frontal accretionary prism by underthrusting of oceanic basement relief such as seamounts and ridges)

Kopp, H., D. Hindle, D. Klaeschen, O. Oncken, C. Reichert & D. Scholl (2009)- Anatomy of the western Java plate interface from depth-migrated seismic images. Earth Planetary Sci. Letters 288, p. 399-407.
(W Java forearc segmentation into discrete mechanical domains. W Java margins subducting plate interface shows irregular morphological relief of subducted seamounts and thicker than average patches of underthrust sediment)

Kopp, H., D. Klaeschen, E.R. Flueh, J. Bialas & C. Reichert (2002)- Crustal structure of the Java margin from seismic wide-angle and multichannel reflection data. J. Geophysical Research 107, B2, 2034, 24p.
(Seismic data across subduction zone yield used to build cross section of subduction zone, confirmed by supplementary gravity modeling. Sunda accretionary margin has massive accretionary prism, >110 km wide between trench and forearc basin. It is composed of frontal wedge and fossil part behind present backstop structure which constitutes outer high. Moderate seismic velocities indicate sedimentary composition of outer high. Subducting oceanic slab traced down to almost 30 km underneath accretionary prism. Adjacent forearc domain with pronounced basin, possibly underlain by remnant fragments of oceanic crust)

Kopp, H. & N. Kukowski (2003)- Backstop geometry and accretionary mechanics of the Sunda margin. Tectonics 22, 6, doi:10.1029/2002TC001420, p. 1-16.
(Convergent Sunda margin off Indonesia is accretion-dominated subduction zone. New seismic reflection data off SE Sumatra- SW Java allows mapping of backstop regimes. Initially, outer high evolved as material was pushed against static rigid arc framework backstop underlying forearc basin. Increasing lithification of outer high formed dynamic backstop, which controls accretion today. Out-of-sequence thrust marks transition from recent active frontal accretionary prism to outer high. Existence of static and dynamic backstop controls forearc geometry and segmentation of forearc. Mass balance calculations indicate accretionary processes since late Eocene. Accretion is associated with low values of basal friction)

Koswara, M., J. Negre & L. Hendrata (1990)- The integration of geophysical, geological and petrophysical data: a case study in North West Java, Indonesia. In: 8th Offshore South East Asia Conf., Singapore 1990, SE Asia Petroleum Expl. Soc. (SEAPEX) Proc. 9, p. 100-111.
(Evaluation of two onshore NW Java wells ~60km E of Jakarta, drilled in 1988-1989, in >500m thick Late Miocene/Tf3 Parigi Fm carbonate buildups)

Koulakov, I., M. Bohm, G. Asch, B.G. Luehr, A. Manzanares, K.S. Brotopuspito, P. Fauzi et al. (2007)- P- and S-velocity structure of the crust and the upper mantle beneath Central Java from local tomography inversion. J. Geophysical Research B08310, p. 1-19.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2006JB004712)

(Local source tomographic inversion used to obtain 3-D models of crust and mantle wedge beneath C Java. Clearly image of shape of subduction zone. Slab dip increases gradually from near-horizontal to ~70°. Double seismic zone in slab between 80-150 km depth. Low-velocity anomaly in crust, just N of volcanic arc (Merapi-Lawu anomaly; MLA), with 30-36% lower velocities than fore arc at 10 km. This shows probable high content of fluids and partial melts in crust (more likely deep sedimentary basin ?; JTvG). Inclined low-velocity anomaly in upper mantle links cluster of seismicity at 100 km with MLA and may reflect ascending fluids paths)

Koulakov, I., A. Jakovlev & B.G. Luehr (2009)- Anisotropic structure beneath central Java from local earthquake tomography. Geochem. Geophys. Geosystems 10, 2, Q02011, p. 1-31.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2008GC002109)
(New tomographic data from local seismicity. Crust and upper mantle velocity structure beneath C Java strongly anisotropic. Forearc area between S coast and volcanoes heterogeneous, explained by complex block structure of crust. Beneath volcanoes faster velocities in vertical direction, probably channels, dykes. In crust beneath middle part of C Java, N to Merapi and Lawu large slow anomaly with E-W zone of fast velocity, probably caused by regional extension)

(Evaluation report of limestone near Surabaya. Concludes surveyed limestone deposit sufficient to supply cement plant with 250 thousand tons per year, for 60 years)

Lehmann, H. (1936)- Morphologische Studien auf Java. Geographische Abhandl., Stuttgart, Ser. 3, 9, p. 1-114.
('Geomorphologic studies on Java'. Mainly on Southern Mountains SE of Yogya and NE Java Kendeng-Rembang zones around Cepu. Introduction of term 'cone-karst')

Lehner, P., H. Doust, G. Bakker, P. Allenbach & J. Guenau (1983)- Active margins 3, Java Trench. In: A.W. Bally (ed.) Seismic expression of structural styles- a picture and work atlas, American Assoc. Petrol. Geol. (AAPG), Studies in Geology 15, 3, p. 45-80.

(Two profiles across Java Trench P7 and N508 show subduction of Late Jurassic- E Cretaceous descending Indian Ocean crustt, overlain by imbricated accretionary wedge of sediment. Uppermost portion of basement, probably pillow basalts, structurally deformed and partly imbricated. Thrusts steepening away from trench. Individual imbrications may bend over toward trench in uppermost part, probably triggering submarine slides and turbidity flows. Sediment fill of fore-arc basins Late Oligocene/E Miocene- Recent. Offshore wells in fore-arc basin Oligocene volcaniclastics below base Miocene unconformity. Reefs on unconformity indicates fore-arc basin subsided to present depth after Oligocene orogenic pulse. Neogene transgressive-regressive cycle with basal marine sandstones and limestones. Doming and fracturing of entire island arc region during Oligocene was followed by Miocene regional subsidence and tectonic quiescence. Compressional folding and basin inversion began in Late Miocene and appears to have been continuous into Recent time)

Lelgemann, H., M. A. Gutscher, J. Bialas, E.R. Flueh, W. Weinrebe & C. Reichert (2000)- Transtensional basins in the western Sunda Strait. Geophysical Research Letters 27, p. 3545-3548.
(On crustal structure and evolution of Sunda Strait, based on 1999 seismic survey. Transtensional character of the area shown by faulted blocks of arc basement and active normal faults on both sides of large graben at W entrance to Sunda Strait. Over 6 km of graben fill sediment, associated with substantial crustal thinning. S part of region 50 km from trench and Moho of downgoing plate is at depth of 28 km)

Lelono, E.B. (2000)- Palynological study of the Eocene Nanggulan Formation, Central Java, Indonesia. Ph.D. Thesis, Royal Holloway, University of London, p. 1-457. *(Unpublished)*
(Nanggulan Fm age diagnostic M-L Eocene fauna and palynomorph assemblages. Many palynomorphs affinity with Indian forms, suggesting plant migration into SE Asia following plate collision in E Tertiary. Distribution of similar M Eocene palynomorph assemblages suggests Sundaland extended from Java to SW Sulawesi. Podocarpidites pollen in upper unit indicates cooling, probably equivalent to M-L Eocene boundary event recorded elsewhere. Nanggulan Fm is transgressive sequence)

Lelono, E.B. (2001)- Sea level changes during Middle-Late Eocene in the Nanggulan Formation, Central Java. Lemigas Scientific Contr. 1, p. 8-15.

Lelono, E.B. (2007)- Gondwanan palynomorphs from the Paleogene sediments of East Java?; the evidence of earlier arrival. Proc. Joint Conv. 32nd HAGI, 36th IAGI, and 29th IATMI, Bali, JCB2007-010, p. 40-47.
(Appearance of Gondwanan/ Australian pollen, including Dacrydium and Casuarina, in Late Eocene-Oligocene of wells in N Madura- E Java Sea is unusual, as these are generally first recorded only in E Miocene of NW Java Sea, S Sumatra, C Java, S Sulawesi and Natuna, after collision of Australian plate and Sundaland in latest Oligocene. This may indicate earlier arrival of Gondwanan/ Australian fragment in E Java area than in other areas of Indonesia)

Lelono, E.B. (2012)- Oligocene palynology of onshore West Java. Lemigas Scientific Contr. Oil Gas 35, 2, p. 67-82.
(online at: www.lemigas.esdm.go.id/)
(Palynological studies of Oligocene in (unnamed) onshore wells in Ciputat sub-basin, W Java. Generally poor pollen assemblages. Unlike equivalent beds offshore NW Java, lacustrine elements rare, suggesting absence of lake deposit. Oligocene defined by presence of Oligocene marker Meyeripollis naharkotensis. Depositional environment transition non-marine- shallow marine. Common brackish pollen of Zonocostites ramonae and Spinizonocolpites echinatus indicate mangrove/ back-mangrove environment)

Lelono, E.B. (2016)- Cooling event in the boundary of Middle/Late Eocene of Java. Proc. 5th Int. Conf. Earth Science & Climate Change, Bangkok, J Earth Sci. Climate Change 7, 5, (Suppl.), p. 63. *(Abstract only)*
(Eocene palynomorphs in Nanggulan Fm, C Java: M Eocene abundant and diverse lowland/rain forest elements suggesting warm- wet conditions with Palmaepollenites kutchensis, Retitricolporites equatorialis, Campnosperma sp., Marginipollis concinus and Dicolpopollis malesianus. Late Eocene marked by regular grass pollen and reduction of rainforest elements, indicating development of savanna in cool-dry climate condition (also recorded in Toraja Fm of S Sulawesi and Late Eocene of Makassar Strait. First occurrence of hinterland pollen Podocarpidites spp. marks M-L Eocene boundary)

Lelono, E.B. & R.J. Morley (2011)- Oligocene climate changes of Java. Lemigas Scientific Contr. 34, 3, p. 169-176.
(online at: www.lemigas.esdm.go.id/id/pdf/scientific_contribution/..)
(E Oligocene characterized by common rain forest elements, suggesting everwet rain forest climate at that time. Early part of Late Oligocene much reduced rain forest elements, and presence of regular Gramineae pollen, suggesting more seasonal climate, whereas for latest Late Oligocene rain forest (and peat swamp) elements return in abundance, suggesting very wet rain forest climate)

(NE Java. New interpretation of early M Miocene (N11-N12) Ngrayong Fm quartz sandstones: deep marine deposit, not fluvio-deltaic, based mainly on presence of deep-water foram Cyclammina (but these are also common in age-equivalent beds of Mahakam Delta and probably reworked from uplifted Paleogene of E

Kalimantan; JTvG). Erosional unconformity identified at end-Miocene (Tuban Uplift; base of Ledok Fm and age-equivalent Karren Fm limestones)

Lunt, P. (2000)- A draft review of the Lutut Beds in the type area. AAPG Bali 2000 Int. Conv./ IPA fieldtrip-appendix, 13p.
(Lutut sands in thrust belt SW of Semarang are E Miocene (N6-N7, NN4) immature erosional products of metamorphic basement, radiolarian chert and Eo-Oligocene sediments, apparent product of mid-E Miocene orogenic event. Very different from M Miocene Ngrayong Fm mature quartz sands)

Lunt, P. (2013)- The sedimentary geology of Java. Indon. Petroleum Assoc. (IPA), Jakarta, Spec. Publ., p. 1-340.
(Comprehensive book on Java sedimentary geology Major tectonic events affecting sedimentation: (1) Late Mesozoic accretion of Paternoster microplate. Rembang Line is N edge of accreted 'Woyla Terranes'; (2) Mid-Eocene onset of sedimentation, but no clear backarc basins; (3) Early Oligocene half-graben extension; (4) Late Oligocene- E Miocene' Old Andesite' volcanic arc in S Java, simultaneous with widespread carbonates in N Java; 20/21 Ma marks end of 'Old Andesite' volcanism; (5) 20-12 Ma tectonically quiescent; possible effect of 18 Ma S Central Kalimantan uplift; 15 Ma is max. flood over Sundaland; (6) M Miocene/12 Ma fault inversion/ widespread subsidence phase; (7) Late Miocene/ 8 Ma: inversion of 'Woyla terranes'; main phase Rembang-Madura-Kangean zone uplift; (8) mid-Pliocene-Pleistocene thrusting episodes)

Lunt, P. & G. Burgon (2003)- State of the art or state of decay?- the role of classic geological skills in 21st century exploration. Proc. 2003 SE Asia Petrol. Expl. Soc. (SEAPEX) Exploration Conf., Singapore, 11p.
(Examples of application of classic geology in hydrocarbon exploration on Java. Early Miocene sediments show major tectonic event during quiet sag phase of previous workers. Sag phase Oligo-Miocene carbonates show complex distribution, suggesting local tectonic controls more important than assumed eustatic trends)

Milesi, J.P., E. Marcoux, P. Nehlig, Y. Sunarya, A. Sukandar & J. Felenc (1994)- Cirotan, West Java, Indonesia; a 1.7 Ma hybrid epithermal Au-Ag-Sn-W deposit. Economic Geology 89, 2, p. 227-245.
(Cirotan is main gold mine in Cikotok District, Bayah Dome, SW Java. Gold deposit, dated at 1.7 Ma, is mineralized right-lateral strike-slip fault in Late Miocene volcano-sedimentary series (9.5 Ma) intruded by Pliocene microdiorite (4.5 Ma). Lead isotopes suggest common origin for gold deposit and Pliocene andesitic-dacitic magmas to which gold is related. Unusual cassiterite- wolframite (Sn-W-Bi) enrichment in late stage of mineralization indicate remobilization of Precambrian continental basement)

Milesi, J.P., E. Marcoux, T. Sitorius, M. Simandjuntak, J. LeRoy & L. Bailly (1999)- Pongkor (West Java, Indonesia): a Pliocene supergene-enriched epithermal Au-Ag-(Mn) deposit. Mineralium Deposita 34, p. 131-149.
(Pongkor large 1988 gold-silver discovery, 80km SW of Jakarta. Low-sulfidation epithermal deposit, with 2.05 Ma 40Ar/39Ar age of adularia samples. Four main mineralized quartz veins, steeply dipping, close to internal rim of caldera. Lead isotopes suggests source of mineralization and associated volcanics is underlying ancient continental crust that melted and remobilized in Pliocene (as applicable to entire Bayah Dome))

Miller, S.A. & A. Mazzini (2018)- More than ten years of Lusi: a review of facts, coincidences, and past and future studies. Marine Petroleum Geol. 90, p. 1-25.
(Lusi mud eruption in E Java continued unabated for >10 years, continuously erupting mud breccia, gas, steam, and water. Suggested drilling trigger cannot explain subsequent observations; more likely volcanically-linked hydrothermal system)

Napitupulu, H., L. Ellis & R.M. Mitterer (2000)- Post-generative alteration effects on petroleum in the onshore Northwest Java basin, Indonesia. Organic Geochem. 31, p. 295-315.
(NW Java Basin on-and offshore oils mainly derived from Oligocene fluvial-deltaic Talangakar Fm, with API gravities 17°-53°. In shallow reservoirs heavy biodegraded oils (API <22°). Post-generative alteration processes widespread. Pristane to phytane biomarker ratios affected by evaporative fractionation. Isotope and biomarker data identified two oil families: (1) marine influenced delta front-prodelta settings and (2) from higher plant-rich delta plain- delta front environment)

Napitupulu, H., R.M. Mitterer & J.A. Morelos-Garcia (1997)- Differentiation of oils from the NW Java Basin into three oil types based on biomarker composition. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum Systems of SE Asia and Australasia, Jakarta 1997, Indon. Petroleum Assoc. (IPA), p. 667-679.
(Three source rock facies in NW Java Basin based on biomarker composition of oil: (1) deltaic withtypically high concentration of oleanane, etc. (2) probably lacustrine with abundant botryococcane, etc. and (3) two oils with intermediate-high sulfur content suggestive of marine carbonate depositional setting, although high pristane/phytane, etc. conflict with this interpretation; may be mixed with oil from a non-carbonate source)

Naranjo, J.C. (2007)- Tertiary basin initiation and sedimentation; East Java Basin, Indonesia. Masters Thesis, University of Wisconsin, Madison, p. 1-70. *(Unpublished)*
(Majority of proposed E Java Basin formation mechanisms back-arc related, but onshore part of basin appears to be constructed on pre-existing basement structural grain, not tectonic or fault-initiated. Passive basin fill of initial Eocene-Oligocene Ngimbang Fm clastic-dominated sedimentation suggesst pronounced paleo-basement topography. Mounded geometries of shallow-water carbonates, continuing into Kujung time (Oligocene-Miocene), on NE-SW basement highs. Mild initial subsidence during Eocene increases with time)

Naranjo, J.C., J.A. Simo, E. Dragan & A.R. Carroll (2007)- Tertiary basin initiation and sedimentation; East Java Basin, Indonesia. AAPG 2007 Ann. Conv., 1p. *(Abstract only)*
(Seismic isochron mapping shows axis of Eocene-Oligocene E Java basin trended NE-SW. Oligocene-Miocene isochron map shows change to WNW-ESE orientation. Subsidence rates increased at this time, inconsistent with rift origin for earlier basin history. Prolific carbonate accumulations formed in areas with ~500m or less Oligocene-M Miocene subsidence; areas with greater subsidence (up to 900m) became sediment-starved deeps. Major carbonate platform formed in N part of basin. Two SW-trending projections from platform represent buildups formed on paleohighs, corresponding to areas of lesser Eocene-Oligocene subsidence)

('The epithermal god deposit of Cirotan, W Java; microthermometric constraints'. Microthermometric study of fluid inclusions from Cirotan epithermal gold deposit in Citotok Mining District, SW Java, suggest mineralization under rel. high salinities. Mineralized fractures tied to Pliocene quartz-microdiorite (4.5 Ma), intrusive in rhyolitic ignimbrites dated as 9.5 Ma. Absence of phase separation suggests minimal erosion of 410m since mineralization)

Ngkoimani, L.O., S. Bijaksana & C.I. Abdullah (2006)- Paleomagnetic and geochronological constraints on the Cretaceous- Miocene tectonic evolution of Java. Proc. Jakarta 2006 Int. Geosciences Conf. and Exhib., IPA, SOT-11, 4p. *(Extended Abstract)*
(Paleomagnetic study of area of 'Old Andesites' from Kulon Progo and other sites near near Yogyakarta suggests paleolatitudes of C Java moved from 16-21°S in Cretaceous-Eocene (~76-47 Ma) to between 12-13°S in Oligocene (~30-25 Ma), 10-11° S in Miocene (6-11 Ma), to 7°-8° S today, supporting hypothesis that C and E parts of Java formed microcontinent that collided with Sundaland in Late Cretaceous-Eocene (but: collision should be younger if continued to move N after Eocene?; JTvG))

Ngkoimani, L.O., S. Bijaksana, M. Mahrizal & C.I. Abdullah & T.H. Liong (2005)- Magnetic properties of igneous rocks from Banyuwangi, East Java and their reliability for paleomagnetic study. Indonesian J. Physics 16, 2, p. 33-41.
(online at: http://www.ijphysics.com/index.php/ijp/article/download/120/120)
(Paleomagnetic investigation of two igneous intrusions (no absolute age known) in Gunung Nangkajajar at E tip of Java near Banyuwangi. Paleolatitude of these intrusions was~30° S, well S of present position)

Niethammer, G. (1909)- Die Eruptivgesteine von Loh Oelo auf Java. Inaugural Dissertation, Universitat Basel, Tschermak Mineral. Petrogr. Mitteilungen 28, 3, p. 205-273.
('The volcanic rocks from Lok Ulo on Java'. Petrographic descriptions of Cretaceous and Tertiary volcanic and metamorphic rocks, collected during 3-day visit by Tobler in 1902. Includes discussions of Cretaceous Orbitolina limestone folded within serpentinite, first record of quartzose glaucophane schist, etc.)

Nilsen, T.H. (2002)- Summary report on outcrop geology and general setting of the Banyumas Block, South-Central Java, Indonesia. Report for Coparex Banyumas, Jakarta, 31p. *(Unpublished)*
(Lunt 2007, p. 147: M-L Eocene in Banyumas area rel. deep water facies with slope channel sands and slumped Nummulites limestone blocks)

Ningrum, H.N.R. & Abdurrokhim (2016)- Study of paleoenvironmental changes based on lithofacies and foraminifera analysis in Padalarang Area, West Bandung Regency, West Java Province. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 524-532.
(Summary of Oligocene- M Miocene (bio-)stratigraphy of Padalarang area, W of Bandung. Oldest rocks deep marine M Oligocene (N2) Batuasih Fm shale. Overlain by Late Oligocene (N3-N4)Rajamandala Lst, overlain by E Miocene outer neritic- bathyal clastics (N5-N13), etc. (No references to many earlier papers on this area))

Nishimura, S., H. Harjono & S. Suparka (1992)- The Krakatau islands: the geotectonic setting. GeoJournal 28, 2, p. 87-98.
(Sunda Strait transitional zone between Java frontal and Sumatra oblique subduction modes. W Java and Sumatra geologically continuous. Krakatau at intersection of two graben zones and N-S active, shallow seismic belt (fracture zone with fissure extrusion of alkali basaltic rocks commencing at Sukadana and continuing S as far as Panaitan island through Rajabasa, Sebuku and Krakatau). Paleomagnetic studies suggest Sumatra

rotated CW relative to Java from at least 2.0 Ma to present at 5-10h/ Ma, so opening of Sunda Strait may have started before 2 Ma. W Sumatra has been moving N along Semangko fault and S part Sunda Strait pulled apart. Assuming perpendicular component (58 mm/y) of oblique subduction has not changed, subduction started at 7-10 Ma. Sunda Strait under tensional regime as result of clockwise rotation along continental margin and N-ward movement of Sumatra sliver plate along Semangko fault zone)

Nishimura, S., J. Nishida, T. Yokoyama & F. Hehuwat (1986)- Neotectonics of the Strait of Sunda, Indonesia. J. Asian Earth Sci. 1, p. 81-91.
(Sunda Strait rapidly subsiding trough, with thick U Pliocene- Quaternary clastics from Lampung to Krakatau fracture zone. Krakatau complex at intersection of two graben zones and N-S active seismic belt. Gravity anomalies in (1) N of Ujung Kulon, indicating existence of low gravity caldera, from which Malingping and Banten tufts were ejected 0.1 Ma ago, and (2) area of Kotaagung, where graben structure was observed and ignimbrite eruption occurred at 1 Ma. Paleomagnetic studies suggest Sumatra rotated clockwise relative to Java from 2.0 Ma- present at 5-10°/ My. Difference in strike of Java and Sumatra exceeds 20 °, so rotation of Sumatra and opening of Strait Sunda might have started before 2 Ma)

Nishimura, S., K.H. Thio & F. Hehuwat (1980)- Fission-track ages of the tuffs of the Pucangan and Kabuh Formations and the tektite at Sangiran, Central Java. In: S. Nishimura (ed.) Physical geology of Indonesian island arcs, Kyoto University Press, p. 72-80.

Nishimura, S., K.H. Thio & F. Hehuwat (1980)- Fission-track ages of tephras and tuffs from Bayat and Karansambung, Central Jawa. Physical Geology of Indonesian Island Arcs, Kyoto University, Kyoto, p. 81-87.

Noble, R.A., K.H. Pratomo, K. Nugrahanto, A.M.T. Ibrahim, I. Prasetya et al. (1997)- Petroleum systems of Northwest Java, Indonesia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Conf. Petroleum Systems of SE Asia and Australasia. Indon. Petroleum Assoc. (IPA), Jakarta, p. 585-600.
(NW Java at least ten active petroleum systems and 150 oil and gas fields. Expected EUR >4 BBOE from ~14 BBOE in-place. Onshore sub-basins Ciputat, Kepuh, Pasir Bungur, Cipunegara/E15 and Jatibarang. Oil and gas originating here migrated through structural high in N direction towards offshore. Offshore petroleum systems S Ardjuna, C Ardjuna, Sunda, Yani/N Seribu Trough and Asri systems. Ten systems characterized in terms of source rock type, migration/ carrier bed system, major reservoir and seal, and style of entrapment)

Noble, R.A., C.H. Wu & C.D. Atkinson (1991)- Petroleum generation and migration from Talang Akar coals and shales offshore N.W. Java, Indonesia. Organic Geochem. 17, 3, p. 363-374.

Noeradi, Dardji (1994)- Contribution a l'etude geologique d'une partie occidentale de l'Ile de Java, Indonesie. Stratigraphie, analyse structurale, et etude quantitative de la subsidence des bassins sedimentaires Tertiaires. Approche de la geodynamique d'une marge continentale active au droit d'une zone de subduction. Doct. Thesis Universite de Chambery, p. 1-253.
(online at: http://edytem.univ-savoie.fr/archives/lgham/dardji/Dardji-Noeradi-these-1994+.pdf)
('Contribution to the geological study of a western part of Java island: stratigraphy, structural analysis and quantitative subsidence modeling, etc.'. Late Cretaceous- Paleocene oblique subduction, with Indo-Australian plate moving N-S. Creation of NE-SW oriented volcanic arc and intra-arc basin with sinistral faults trending N30°-40°E. This marginal basin closes in M Eocene (43 Ma), with ultrabasic basement uplift and block melange deposition of Ciletuh Fm. Closure coincides with start of pivoting of SE Asian continent to SW after India collision. New E-W trending volcanic arc forms in Late Oligocene- E Miocene in S part of island. Volcanism continues until end M Miocene (14 Ma). In NW Java rapid subsidence started in Late Oligocene (23 Ma), with formation of horsts and grabens. In Late Miocene speed of Indo-Australian Plate increases from 4 to 7 cm/yr, causing N-ward movement of volcanic arc axis to present-day position and deformation in Cimandiri-Bayah and NW Java basin. Regional compression N25°-30°E reactivates old N70°-80°E faults. Creation of pull-apart basin in Gulf of Pelabuhan Ratu in Late Miocene (10 Ma) with rapid subsidence)

Osberger, R. & E. von Krauss (1953)- Die Manganerz Lagerstatte Burahol bei Karangnunggal auf Java. In: Skizzen zum Antlitz der Erde, Festschrift Kober, Vienna, p. 336-353.
('The Burahol manganes ore deposits near Karangnunggal on Java'. On manganese oxide ores of Burahol hill near Karangnunggal, S of Tasikmalaya, SW Java, in andesitic breccias and tuffs in sequence of E Miocene deposits. Weathering of basic volcanic rocks supplied manganese, and kaolin beds in beginning stages of laterization provided alkaline environment needed to promote precipitation)

Paltrinieri, F., P. Saint-Marc & B. Situmorang (1976)- Stratigraphic and paleogeographic evolution during Cenozoic time in Western Indonesia. SEAPEX Offshore SE Asia Conf., Singapore 1976, Paper 10, p. 1-29.
(Overview of W Indonesia Cenozoic stratigraphy and paleogeography. In W Indonesia two phases of sedimentation, Eocene- to early M Miocene and late M Miocene- Late Pliocene. Three major orogenic events: early Tertiary, early M Miocene, Plio-Pleistocene)

Paltrinieri, F., S. Sajekti & Suminta (1976)- Biostratigraphy of the Jatibungkus section (Lokulo area) in Central Java. Proc. 5th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 195-204.

(Jatibungkus section (Karangsambung Fm) with continuous M Eocene (P 14)- earliest Oligocene (P 17) marine section with planktonic foraminifera. Jatibungkus Mb ~80m thick reefal limestone in middle of section between pF zones P14-P15, and with Late Eocene larger foraminifera Discocyclina and Pellatispira (LBF zone Tb). This is relatively coherent package in overall chaotic olistostrome area. Late Eocene faulting/ uplift event, tied to S-ward shift of subduction zone, caused period of non-deposition, with sedimentation resuming in Late Oligocene (zone N2) clay-breccia formation. Succession almost normal, although probably part of Eocene olistostrome complex)

Pandita, H. (2008)- Lingkungan pengendapan Formasi Sambipitu berdasarkan fosil jejak di Daerah Nglipar, Java. Jurnal Teknologi Mineral (ITB) 15, 2, p. 85-94.

(Fieldtrip guide S of Yogyarta)

Prasetyadi, C., A.H. Harsolumakso, B. Sapiie & J. Setiawan (2002)- Tectonic significance of pre-Tertiary rocks of Jiwo Hill, Bayat and Luk Ulo, Karangsambung areas in Central Java: a comparative review. Proc. 31st Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, 2, p. 680-700.
(Pretertiary rocks in Karangsambung (Luk Ulo subduction melange) and Bayat areas similar metamorphic rocks and SE-NW (WSW-ENE?) 'Meratus' structural trends. Karangsambung more 'ocean plate stratigraphy', with ultrabasic rocks and mid-Cretaceous pelagic cherts in sheared clay matrix (mainly in N), and with boudinage features sandstone beds in S part. Jiwo/ Bayat area possibly more continental, without 'block-in-matrix' structure, with (undated) Pretertiary phyllites and schists overlain by M Eocene clastics and Nummulites limestones, overlain by 'Old Andesites' (mainly marine) arc volcanics. Karangsambung probably closer to trench than Bayat)

Prasetyadi, C. & M. Maha (2004)- Jiwo Hills, Bayat-Klaten: a possible Eocene-origin paleohigh. Jurnal Ilmu Kebumian Teknologi Mineral (UPN, Yogyakarta) V, 17, 2, p. 61-64.

Prasetyadi, C., M.G. Rachman, S.E. Hapsoro, A. Shirly, A. Gunawan & I. Purwaman (2016)- Seismic-based structural mapping of RMKS fault zone: implication to hydrocarbon accumulation in East Java Basin. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 104-107.

(Rembang-Madura-Kangean-Sakala (RMKS) Fault zone in NE Java and further East is sinistral slip fault which started to develop in M Miocene. E-W trending)

Prasetyadi, C., I. Sudarno, V.B. Indranadi & Surono (2011)- Pola dan genesa struktur geologi Pegunungan Selatan, provinsi daerah Istimewa Yogyakarta dan provinsi Jawa Tengah. J. Sumber Daya Geologi 21, 2, p. 91-107.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/138/135)
('The pattern and genesis of geological structure of the Southern Mountains, provincial areas of Yogyakarta and Central Java province'. S Mountains structures dominated by faults, mainly oriented NE-SW (16) and N-S (14) and mainly sinistral, some reactivated as normal faults. Others oriented NW-SE (3) and E-W (3) and mainly dextral and normal faults)

Prasetyadi, C., E.R. Suparka, A.H. Harsolumakso & B. Sapiie (2005)- Eastern Java basement rock study: preliminary results of recent field study in Karangsambung and Bayat areas. Proc. 34th Conv. Indon. Assoc. Geol. (IAGI), Surabaya, p. 310-321.
(Karangsambung basement mid-Cretaceous- Paleocene subduction complex, characterized by tectonic block-in matrix structure. Melange structural dip mostly to S-SE, opposite of expected for NW-dipping subduction zone, therefore interpreted as overturned. With M Cretaceous limestone blocks with Orbitolina. Melange overlain by Eocene clastics. Bayat basement mostly phyllite and schists of unknown age, unconformably overlain by Eocene and M Miocene sediments)

Prasetyadi, C., E.R. Suparka, A.H. Harsolumakso & B. Sapiie (2006)- An overview of Paleogene stratigraphy of the Karangsambung area, Central Java: discovery of new type of Eocene rock. Proc. Int. Geosci. Conf. Exhib., Indon. Petroleum Assoc. (IPA), Jakarta 2006, 06-PG-09, 4p.
(First record of Early Eocene larger forams and M-L Eocene limestone blocks in metamorphosed tectonic melange Larangan area in N part of Luk Ulo melange complex, suggesting Late Eocene (collisional?) deformation after Cretaceous- Paleocene subduction-related deformation. E Eocene metasedimentary unit generally dips to S)

Prasetyadi, C., E.R. Suparka, A.H. Harsolumakso & B. Sapiie (2006)- The occurrence of a newly found Eocene tectonic melange in Karangsambung area, Central Java. Proc. 35th Conv. Indon. Assoc. Geol. (IAGI), Pekanbaru, 16p.
(Discovery of M Eocene Asterocyclina-bearing limestone blocks in polymict Larangan Complex at N side of Luk Ulo Melange complex indicates age of tectonic melange not only Cretaceous-Paleocene, but also M-L Eocene. Shifting of NE-SW Cretaceous subduction trend to Oligocene E-W trend due to collision of microcontinent. Two deformation phases prior to onset of 'Old Andesite' subduction-related volcanism: Cretaceous-Paleocene subduction-related and Late Eocene post subduction (collisonal?) deformation)

Prasetyadi, C., E.R. Suparka, A.H. Harsolumakso & B. Sapiie (2006)- The Larangan Complex: a newly found Eocene tectonic melange rock in Karangsambung area, Central Java, Indonesia. Proc. 17th Int. Geological Congress, Fukuoka, 1p. *(Abstract only)*
(Karangsambung melange complex does not only include Cretaceous-Paleocene Luk Ulo Complex, but also Eocene Larangan complex with M Eocene Asterocyclina-bearing limestone in melange)

Prasetyanto, I.W., Widodo & D. Wintolo (1997)- Mineralisasi logam mulia di Kecamatan Selogiri, Kabupaten Wonogiri, Propinsi Jawa Tengah. Proc. 17th Ann. Conf. Indon. Assoc. Geol. (IAGI), Jakarta, p. 865-869.
('Mineralization of precious metals in Selogiri, Wonogiri District, Central Java')

Prasetyo, A., J. Romora S., Yeftamikha, Fransiskus L.B & I.S. Nugroho (2016)- A petrographical review of metamorphic rocks from Ciletuh Complex in West Java and their related metamorphism in Central Indonesia region. In: R. Hidayat et al. (eds.) Proc. 9th Seminar Nasional Kebumian, Dept. Teknik Geologi, Gadjah Mada University, Yogyakarta, p. 624-633.
(online at: https://repository.ugm.ac.id/273596/)

(Ciletuh Cretaceous subduction complex in SW Java. Metamorphic rocks in Gunung Badak area consist of Grt-Ms-Qz schist, Ms phyllite, quartzite and serpentinite. In Tegal Pamidangan area Ms-Qz phyllite and slate (greenschist-facies). Protoliths of metamorphic rocks pelitic, ultramafic and quartz-rich rocks. No blueschist or eclogite-facies rocks recognized (but reported by endaang suhaeli et al. 1977). Presence of serpentinite among low-grade metamorphic rocks indicates metamorphic environment associated with oceanic crust/ mantle. Similar to Jiwo Hills, C Java, metamorphics)

Prasetyo, U., Aswan, Y. Zaim & Y. Rizal (2012)- Perubahan lingkungan pengendapan pada beberapa daerah di Pulau Jawa selama Plio-Plistosen berdasarkan kajian paleontologi moluska. Jurnal Teknologi Mineral (ITB) 19, 4, p. 173-180.
('Changes in depositional environment in some areas of Java during the Plio-Pleistocene based on paleontological studies of mollusks'. Three areas studied in W and C Java (in Bogor, N Serayu and Bobotsari Basins), all showing transition from shallow marine facies (with Turritella) in Late Pliocene to marginal marine (with Melanoides, Sulcospira, Tellina, Paphia) and non-marine (no molluscs) in Pleistocene (also as U.P. Wibowo ITB S2 Masters Thesis, 2009))

Pratomo, K.H., A. Sudjai, A. Bachtiar, M. Syaiful, D. Rahayu, P.H. Narendra, A. Krisyunianto & B. Sunarto (2009)- Tuban and Camar troughs (East Java basin) revival: new insight. Proc. 38th Ann. Conv. Indon. Assoc. Geol. (IAGI), Semarang, PITIAGI2009-189, 4p.
(Tuban and Camar Troughs in Offshore NE Java Basin surrounded by dry holes and generally condemned as lean, shallow and inadequate hydrocarbon kitchens. Recent well post-mortem re-evaluation and remapping of kitchens modifies understanding of petroleum system. Oil shows present in Tuban-1 and other dry holes may also have oil- gas show. Re-mapping of Tuban and Camar kitchen area better understanding of development of Pre-CD lacustrine-fluvial-deltaic source rock in these lows)

(Indentation of coastlines of N and S Central Java caused by two major Paleogene wrench faults with opposing trends and slips which terminate in southern C Java near Nusa Kambangan: (1) Muria-Kebumen Fault, left-lateral, trending SW-NE (Meratus trend); and (2) Pamanukan-Cilacap Fault, right-lateral, trending NW-SE (Sumatran trend). Maximum uplift of Cilacap-Kebumen exposed basement rocks in Luk Ulo area. S of maximum uplift region submergence of Southern Mountains across southern C Java)

Satyana, A.H. (2005)- Oligo-Miocene carbonates of Java, Indonesia: tectono-volcanic setting and petroleum implications. Proc. 30th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 217-249.
(Java Oligo-Miocene carbonates widely distributed, during time of "Old-Andesite" volcanism. Two trends: (1) North (Cepu-Surabaya-Madura, North Central Java and Ciputat-Jatibarang areas), comprising Kujung, Tuban, Baturaja and M Cibulakan formations and (2) South (Gunung Kidul- Banyumas- Jampang- Bayah-Sukabumi-Rajamandala). N Trend carbonates in back-arc setting, 75-150 km from contemporaneous volcanic arc in S Java. S Trend reefs on ridges in Bayah-Sukabumi-Padalarang areas not contemporaneous with volcanism. Volcanic quiescence across Java from 18- 12 Ma, when sea transgressed many areas in SE Asia, causing abundant reefal carbonates deposition along S Trend. N Trend carbonates prolific petroleum reservoirs. S Trend no hydrocarbons, but inadequately explored)

Satyana, A.H. (2006)- New insight on tectonic of Central Java, Indonesia and its petroleum implications. Abstract AAPG Int. Conf., Perth 2006. *(Extended Abstract)*
(C Java conspicuous indentation of coastlines compared to W and E Java. Two major Paleogene strike-slip faults with opposing trends and slips responsible for indentation: (1) SW-NE Muria-Kebumen Fault, left-lateral, and (2) NW-SE Pamanukan-Cilacap Fault, right-lateral. Faults caused indentations of N and S coastlines, subsidence of North C Java, uplift of Serayu Range and exposure of pre-Tertiary Luk Ulo melange complex, disappearance of S Mountains in southern C Java due to subsidence, and N-ward shift of Quaternary volcanic arc in C Java)

Satyana, A.H. (2007)- Central Java, Indonesia- a ñTerra Incognitaò in petroleum exploration: new considerations on the tectonic evolution and petroleum implications. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-G-085, p. 1-22.
(Two major Paleogene strike-slip faults with opposing trends and slips responsible for indentation of Java coastline: (1) SW-NE trending Muria-Kebumen Fault, left-lateral and (2) NW-SE, right-lateral Pamanukan-Cilacap Fault. Faults caused: uplift of Serayu Range and exposure of Luk Ulo melange, subsidence of N part of C Java and indentation of northern coastline, subsidence of S Mountains in southern C Java and indentation of S coastline, and N-ward shifting of Quaternary volcanic arc in C Java. Presence of two opposite regional strike-slip faults crossing each other in southern C Java has configured petroleum geology of C Java)

Satyana, A.H. (2009)- Disappearance of the Javaôs Southern Mountains in Kebumen and Lumajang depressions: tectonic collapses and indentations by Javaôs transverse major fault zones. In: International Conference on Javaôs Southern Mountains, Yogyakarta 2009, Gadjah Mada University, 8p.
(Two 'gaps' in Java Southern Mountains: (1) Kebumen Depression in C Java and (2) Lumajang Depression in SE Java. Two sets of fault zones, trending transversal to Java Island responsible for collapse of S Mountains in these areas)

Satyana, A.H. (2014)- Subvolcanic hydrocarbon prospectivity of Java: opportunities and challenges. Proc. 39th Ann. Conv. Indon. Assoc. Geoph. (HAGI), Solo, 4p.

(Presence of oil and gas seeps in volcanic areas of Java show presence of active petroleum systems under volcanic covers. This hydrocarbon prospectivity of Java Island so far unexplored. Focus areas for this target suggested here is at border between W Java- C Java, and subsided northern C Java)

Satyana, A.H. (2015)- Subvolcanic hydrocarbon prospectivity of Java: opportunities and challenges. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-105, 15p.
(Expanded version of Satyana (2014). Common oil and gas seeps in volcanic areas of Java show presence of active petroleum systems underneath volcanic cover, but so far unexplored. Areas with prospectivity: Banten Block, Majalengka-Banyumas area and N Serayu area. Seismic imaging and reservoir quality issues)

Satyana, A.H. (2016)- The emergence of Pre-Cenozoic petroleum system in East Java Basin: constraints from new data and interpretation of tectonic reconstruction, deep seismic, and geochemistry. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-573-G, 30p.
(Geochemistry of Sepanjang oil in Eocene reservoir from Kangean area in Java Sea and general East Java oils suggest possible presence of marine Lower Cretaceous-sourced oil, based on low oleanane and sterane content. Deep seismic lines in East Java Sea and South Java forearc suggest possibility of Pre-Eocene section in Australia-derived microcontinent(s) (But: proven oil source rocks on Australian NW Shelf older than Cretaceous, and without any oleanane?; JTvG)

Satyana, A.H. & C. Armandita (2004)- Deepwater plays of Java, Indonesia: regional evaluation on opportunities and risks. In: R.A. Noble et al. (eds.) Proc. Deepwater and Frontier Exploration in Asia and Australasia Symposium, Jakarta, Indon. Petroleum Assoc. (IPA), p. 293-319.
(Review of Mio-Pliocene deepwater sedimentation in Bogor, North Serayu and Kendeng Zones, across middle of Java. Depressions formed by isostatic subsidence compensating for uplifted volcanic arcs located to S. In Plio-Pleistocene time trough/basins significantly uplifted and deformed, and currently form fold and thrust belts. Deepwater plays viable in Java. Oil seeps and oil fields in N Serayu Trough in turbiditic volcaniclastic sandstones. Oil fields in E Java have reservoirs of Ngrayong sands considered as deepwater deposits on slope of Rembang Zone. Fields in Pliocene-Pleistocene volcaniclastic turbidites of E Kendeng Zone also show prospectivity of deepwater plays in Java. With Ngrayong Fm paleogeography)

Satyana, A.H., C. Armandita, B. Raharjo & I. Syafri (2002)- New observations on the evolution of the Bogor Basin, West Java: opportunities for turbidite hydrocarbon play. Buletin Geologi (ITB), Spec. Ed. (Prof. Soejono Martodjojo volume), 34, 3, p. 101-116.
(Outcrop studies in Sumedang area suggest Bogor Basin also received sediments from N (e.g. upper M Miocene Cinambo, Lower Pliocene Subang and Bantarujeg Fms) not just from S, as suggested by Martodjojo (1984). Most sands deposited in ponded basins on slope area and as submarine fans on basin floor)

(NE Java basin paper describing Oligo-Miocene deposition of carbonate buildups on ENE-WSW trending highs (W Cepu, E Cepu, Porong-BD platform), formed during Eocene rifting, followed by M Miocene and younger inversion)

Satyana, A.H. & M. Djumlati (2003)- Oligo-Miocene carbonates of the East Java Basin, Indonesia: facies definition leading to recent significant discoveries. AAPG Int. Conf., Barcelona, Spain, Ext. abstract, 5p.
(Brief but good overview of Oligo-Miocene carbonates distribution of East Java basin, showing isolated platforms on WSW-ENE trending faulted basement highs, formed during Paleogene rifting. Tectonic inversion started in mid-Miocene and peaked in Pleistocene time)

Satyana, A.H., E. Erwanto & C. Prasetyadi (2004)- Rembang-Madura-Kangean-Sakala (RMKS) Fault zone, East Java Basin: the origin and nature of a geologic border. Proc. 33rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 23p.
(Major E-W left-lateral wrench zone, forming deformed zone 15-40 km wide and 675 km long from Rembang in W through Madura and Kangean Islands to Sakala offshore in E. Fault Zone at hinge or shelf edge between stable E Sunda Shelf (Paternoster-Kangean micro-continent) in N and deep-water area with different basement lithology in S. Initiation of fault zone in late E Miocene in Sakala area, M Miocene in Rembang area. Flower structures on seismic sections, showing basement-involved, deeply-rooted vertical master faults with upward diverging splays with reverse separations. In map view, these splays are mapped as fold and fault belts trending W-E and WNW-ESE. Extensional component of wrench zone subsided Paleogene rifted blocks like Central Deep and formed normal faults. Tectonic inversion observed. Shale diapirism common S of fault zone in thick shale sequences deposited rapidly to S of RMKS FZ)

Satyana, A.H. & M.E.M. Purwaningsih (2002)- Geochemistry and habitats of oil and gas in the East Java Basin regional evaluation and new observations. Proc. 31st Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, 1, p. 68-102.
(Geochemical data from ~100 wells and seeps. Most oils from terrestrial- marginal marine facies. Offshore oils more terrestrial than onshore. Ngimbang, Lower Kujung and Lower Tuban shales sources of oils and thermogenic gases. Biogenic gases from Neogene Tawun- Lidah shales. High CO2 associated with thermal degradation of Paleogene Kujung carbonates)

Satyana, A.H. & M.E.M. Purwaningsih (2002)- Lekukan struktur Jawa Tengah: suatu segmentasi sesar mendatar. In: Proc. Conf. Sumberdaya geologi daerah istimewa Yogyakarta dan Jawa Tengah, IAGI Central Java section, Yogyakarta, p. 55-66.
(Indentation of C Java structure by wrench faults. Two wrench zones representing Paleogene tectonic elements of major shears in W Indonesia (NE-SW Sumatran Trend and SW-NE Meratus Trend) meet in C Java)

Satyana, A.H. & M.E.M. Purwaningsih (2003)- Geochemistry of the East Java Basin: new observations on oil grouping, genetic gas types and trends of hydrocarbon habitats. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 585-607.
(Similar to 2002 paper. Biogenic gas in M Miocene-Pliocene reservoirs in Terang-Sirasun, Oyong, Maleo (Madura straits), Kepodang (Java sea) Wonolelo seep in W Cepu, etc. High CO2 gas (30-80%) in two areas: Cepu High, offshore Java Sea)

Satyana, A.H. & M.E.M. Purwaningsih (2003)- Oligo-Miocene carbonates of Java: tectonic setting and effects of volcanism. Proc. 32nd Ann. Conv. Indon. Assoc. Geol. (IAGI) and 28th Ann. Conv. HAGI, Jakarta, 27p.
(Java Late Oligocene-Early Miocene widespread platform and reefal carbonates. Period also noted for 'Old Andesite' volcanism along S part of Java. Two trends: (1) N Trend, including Cepu-Surabaya-Madura, N Central Java, and Ciputat-Jatibarang areas consists of carbonates of Kujung, Prupuh, Tuban, Poleng, M Cibulakan and Baturaja and (2) S Trend, with Gunung Kidul- Banyumas- Jampang- Bayah- Sukabumi-Rajamandala areas. N Trend developed in back-arc setting, 75-150 km away from Oligo-Miocene volcanic arc

in S Java. No volcanic material found in these carbonates. S Trend in intra-arc setting. No reefal carbonates in G. Kidul-Banyumas-Jampang areas. Rajamandala reefs developed prior to E Miocene Jampang volcanism. Volcanic quiescence in Java from 18-12 Ma (M Miocene) resulted in significant reefal carbonates development along S Mountains of Java, like Wonosari/Punung in Gunung Kidul, Jonggrangan in Kulon Progo, Karangbolong/Kalipucang in Banyumas, and Bojonglopang in Jampang areas)

Sawolo, N., E. Sutriono, B.P. Istadi & A.B. Darmoyo (2009)- The LUSI mud volcano triggering controversy: was it caused by drilling? Marine Petroleum Geol. 26, 9, p. 1766-1784.

('Analysis of sedimentology and facies of the Kerek Formation between Biren and Kerek, Ngawi, East Java'. Good outcrops along Solo River. Measured section of 250m of SW dipping Kerek Fm sandstone-claystone turbiditic series. Banyuurip and Sentul Members deposited in middle-outer fan environment; age M- U Miocene (N13-N17). Sediments sourced from N (quartzose material) and southern mountains (andesite and tuff clasts))

Seubert, B.W. & F. Sulistianingsih (2008)- A proposed new model for the tectonic evolution of South Java, Indonesia. Proc. 32nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA08-G-034, p. 1-22.

(New model for tectonic evolution of Java, suggesting several continental fragments, separated by individual subduction zones, docked onto Java and underlie S Mountains. Old Andesites are arc-volcanic product of older subduction phase which predates present-day subduction, and formed above S-dipping subduction zone)

Sharaf, E.F. (2004)- Stratigraphy and sedimentology of Oligocene- Miocene mixed carbonate and siliciclastic strata, East Java basin, Indonesia. Ph.D. Thesis, University of Wisconsin, Madison, p. 1-220. *(Unpublished)*
(Oligocene-Miocene strata of E Java mixed carbonate and siliciclastic sediments. Multiple stages of isolated carbonate mound growth surrounded by deeper marine off-mound sediments or by shallow-marine siliciclastics.Three main intervals: Kujung (~28--22 Ma; carbonate mound and off-mound), Tuban (~22-15 Ma; mixed carbonate-siliciclastic) and Ngrayong (Serravallian,~15--12 Ma; siliciclastic progradion of tidally influenced deltas grading into turbidites, basinal shale, mudstone and chalk)

Sharaf, E.F., M.K. Boudagher-Fadel, J.A. Simo & A.R. Carroll (2006)- Biostratigraphy and strontium isotope dating of Oligocene-Miocene strata, East Java, Indonesia. Stratigraphy 2, 3, p. 239-257.
(Oligocene-M Miocene in E Java grouped into three stratigraphic intervals, Kujung, Tuban and Ngrayong Fms. Larger foraminifera and planktonic foraminifera overlap in occurrence in many localities. Biostratigraphic ranges of larger benthic and planktonic foraminifera tied to the ages from Strontium isotope dating)

Sharaf, E.F., M.K. Boudagher-Fadel, J.A. Simo & A.R. Carroll (2014)- A revision of the biostratigraphy and strontium isotope dating of Oligocene-Miocene outcrops in East Java, Indonesia. Berita Sedimentologi 30, p. 44-58.
(online at: www.iagi.or.id/fosi)
(Updated version of Sharaf et al. (2006, 2006) papers on NE Java basin Miocene biostratigraphy)

Sharaf, E., J.A. Simo, A.R. Carroll & M. Shields (2005)- Stratigraphic evolution of Oligocene-Miocene carbonates and siliciclastics, East Java basin, Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 89, p. 799-819.
(Multiple stages of carbonate mound growth in E Java Oligo-Miocene. Three phases (1) Kujung (mound carbonates), (2) Tuban (mixed carbonate-siliciclastic), and (3) Ngrayong (siliciclastic). Kujung unit (~28-22 Ma) limited to few outcrops. At base shallow-marine carbonates that grade laterally into deep-marine calcareous mudstone- chalk (lower Kujung). Lower Kujung sediments covered by chalk and marls. Tuban (~22-15 Ma) shallow-marine mixed carbonate and siliciclastics and marine shale and chalk. At least six cycles of deltaic deposition with episodes of carbonate mound growth. Ngrayong unit (~15-12 Ma) period of regional siliciclastic influx and progradation of tide-influenced deltas and grades into turbidites, basinal shale, mudstone, and chalk. Ngrayong beds truncated by Serravallian-Tortonian Bulu carbonates)

Shields, M.L. (2005)- The evolution of the East Java Basin, Indonesia. Ph.D. Thesis, University of Wisconsin, Madison, p. 1-402. *(Unpublished)*
(E Java Basin originated in Eocene on continental crust, developing NE-SW trending paleo-highs at inception. Paleo-highs separated at wavelength of 80-100 km. Geohistory profiles and low heat flows in wells point to basin origin by lithospheric flexure of continental crust, not rifting. Stratigraphy mainly shelfal carbonates with influx of quartz sandstone in Miocene. Quartzose source from N of basin in Borneo, associated with exposed granites. Only Pliocene-Recent sediments (<5 Ma) sourced from volcanic centers to S. Basin development four stages (1) crustal buckling, starting in M Eocene with sediments in lows on folded continental crust; (2) flexural deepening, starting in Late Oligocene with gradual subsidence until E Miocene; (3) foreland inversion, starting in M Miocene, until M Pliocene; (4) arc convergence in U Pliocene with N-ward vergence of Sunda magmatic arc. During Pleistocene N- verging thrusts on S side of basin initiated reversal of basin symmetry)

(Rebuttal of Rutten (1952- Geosynclinal subsidence versus glacially controlled movements in Java and Sumatra) critique of Smit Sibinga (1949) paper. Repeats conclusion that Pleistocene eustatic sea level changes do interfere with large scale sedimentation trends)

Smyth, H.R. (2005)- Eocene to Miocene basin history and volcanic activity in East Java, Indonesia. Ph.D. Thesis University of London, p. 1-476. *(Unpublished)*
(Exposed Cretaceous basement in E Java of arc and ophiolitic character. Archean zircons in Miocene volcanics indicate basement beneath E Java includes Australian origin continental crust. Arc volcanism starts in M Eocene, earlier than previously thought (Late Oligocene). Many Cenozoic deposits previously interpreted as continental clastics from Sundaland with significant volcanic component and local basement source. Many quartz sst described as 'mature' are primary, crystal-rich volcaniclastics. Extensive explosive Plinian-style volcanism in M Eocene- E Miocene of E Java. Potential super-eruption in S Mountains (Semilir Eruption) at ~20 Ma. Load of volcanic arc may have generated Kendeng zone flexural basin. Late Cenozoic deformation and associated uplift in number of phases and not single event)

Smyth, H.R., Q.G. Crowley, R. Hall, P.D. Kinny, P.J. Hamilton & D.N. Schmidt (2011)- A Toba-scale eruption in the Early Miocene: the Semilir eruption, East Java, Indonesia. Lithos 126, 3-4, p. 198-211.
(Major E Miocene 'Semilir eruption' in S Mountains of E Java, with main phase at ~20.7 Ma)

Smyth, H., R. Hall, J. Hamilton & P. Kinny (2003)- Volcanic origin of quartz-rich sediments in East Java. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 541-559.
(Volcanic arc active in S Java from M Eocene-E Miocene. After lull in M Miocene, Late Miocene-Recent arc activity ~50 km farther N. Most Eocene-Miocene sands onshore Java have high volcanogenic content)

Smyth, H., R. Hall, J. Hamilton & P. Kinny (2005)- East Java: Cenozoic basins, volcanoes and ancient basement. Proc. 30th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 251-266.
(E Java geology and history overview. Archean zircons suggest Gondwana continental crust below part of S Mountains)

Smyth, H.R., R. Hall & G.J. Nichols (2008)- Significant volcanic contribution to some quartz-rich sandstones, East Java, Indonesia. J. Sedimentary Res. 78, 5, p. 335-356.
(Cenozoic quartz-rich sandstones from E Java long been assumed to be product of erosion of continental source, but significant volcanic component. Quartz from acidic volcanic sources commonly overlooked)

Smyth, H.R., R. Hall & G.J. Nichols (2008)- Cenozoic volcanic arc history of East Java, Indonesia: the stratigraphic record of eruptions on a continental margin. In: A.E. Draut, P.D. Clift & D.W. Scholl (eds.) Formation and applications of the sedimentary record in arc collision zones. Geol. Soc. America (GSA), Spec.Publ. 436, p. 199-222.
(Indian Ocean lithosphere subducted continuously beneath Java from ca. 45 Ma, resulting in formation of volcanic arc, although volcanic activity not continuous. S Mountains Arc active from M Eocene- E Miocene (~45-20 Ma), and activity included significant acidic volcanism. Zircon ages in arc rocks indicates that acidic character of volcanism related to contamination by fragment of Archean- Cambrian continental crust beneath the arc. Activity in S Mountains Arc ended at 20 Ma with phase of intense eruptions. Volcanic quiescence from ~20-12 Ma, after which arc volcanism resumed in modern Sunda Arc, with axis 50 km N of older arc)

Smyth, H.R., P.J. Hamilton, R. Hall & P.D. Kinny (2007)- The deep crust beneath island arcs: inherited zircons reveal a Gondwana continental fragment beneath East Java, Indonesia. Earth Planetary Sci. Letters 258, p. 269-282.
(Inherited zircons from Oligo-Miocene volcanic arc rocks along E Java S coast only Archean- Cambrian zircons, probably from underlying Gondwana continental fragment, probably from W Australia. Clastics from N and W parts of E Java mainly Cretaceous zircons, not present in arc rocks to S. This implies continental crust was present at depth beneath arc in S Java when Cenozoic subduction began in Eocene.)

Soeparyono, N. & P.G. Lennox (1989)- Structural development of hydrocarbon traps in the Cepu Oil field Northeast Java, Indonesia. Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 139-156.
(Cepu oil fields in shallow water limey-clastic sequence in rifting back-arc basin with NE-SW basement faults. Deformation in early M Miocene caused basement fault reactivation in Nglobo-Semanggi with wrenching and development of flower structures, causing erosion of main reservoir rocks. Later Pliocene flower structures in Nglobo-Semanggi area, reflected at surface as en echelon anticlines. Tambakromo-Kawengan area minor N over S thrusting along E-W oriented listric reverse faults with detachment at shallow depths and development of Tambakromo-Kawengan hydrocarbon-bearing folds. Such folds related to imbricate blind thrusts parallel to Tambakromo-Kawengan thrust)

Soeparyono, N. & P.G. Lennox (1990)- Structural development of hydrocarbon traps in the Cepu oil fields, Northeast Java, Indonesia. J. Southeast Asian Earth Sci. 4, 4, p. 281-291.
(New model for Cepu oil fields. Generally shallow-water sequence developed in rifting back-arc basin with NE-SW oriented basement faults. Early M Miocene reactivation of basement faults in Nglobo-Semanggi area with flower structures caused areally restricted erosion of main reservoir rocks. Upper Pliocene deformation accelerated development of flower structures in Nglobo-Semanggi, shown at surface as en echelon, oil-bearing anticlines. Tambakromo- Kawengan area minor N over S thrusting along E-W oriented reverse faults with shallow detachment depth. Further hydrocarbon-bearing folds may exist N of Tambakromo-Kawengan structure: blind imbricate thrusts parallel to Tambakromo- Kawengan thrust)

(Seven species of fish otoliths 'of deep-sea character' from Mio-Pliocene marls of Bojonegoro 1 well, NE Java. Four species of Scopelus, also Macurus gracilis and Argentina sp.)

Stoehr, E. (1865)- Die Basaltklippe Batoe Dodol an Java's Ostkuste und ihre Hebung in der Jetztzeit. Neues Jahrbuch Mineral. Geol. Palaeont. 1865, p. 641-650.
(online at: https://www.biodiversitylibrary.org/item/151131page/667/mode/1up)
('The Batu Dodol basalt cliff at Java's East coast and and its recent uplift'. Dark-colored basalt cliff at easternmost coast of Java, covered by recent coral limestone up to 30-50' above present sea level, suggesting young uplift)

Suasta, I.G.M & I.A. Sinugroho (2011)- Occurrence of zoned epithermal to porphyry type Cu-Au mineralization at Wonogiri, Central Java. Proc. 36th HAGI and 40th IAGI Ann. Conv., Makassar, 15p.
(Wonogiri prospect in SE part of C Java province, 30km S of Solo. Randu Kuning prospect with (1) porphyry type Cu-Au mineralization at as quartz sulphide oxide sheeted and stockwork vein zones, and (2) epithermal Au ± base metal mineralization, mainly as quartz-carbonate- base metal veins hosted in intrusive and volcanic rocks proximal to Randu Kuning (see also Muthi et al. 2013))

Subagio (2008)- Struktur geologi bawah permukaan daerah Kebumen berdasarkan analisis pola anomali gaya berat dan geomagnet. J. Sumber Daya Geologi 18, 6, p. 391-407.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/259/239)
('Sub-surface geologic structure structures of the Kebumen area based on analysis of gravity and geomagnetic anomaly patterns'. High anomalies in E and W of area have positive circular patterns, probably representing andesite intrusives in Karangbolong and Kulon Progo Highs, and Pratertiary rock in Karangsambung area. Low anomaly anomaly in central area indicates Tertiary sedimentary basin)

Subagio (2013)- Anomali gayaberat dan potensi bencana geologi di kawasan Jawa Barat bagian Tengah. J. Sumber Daya Geologi 23, 2, p. 59-68.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/90/84)
('Gravity anomalies and geological hazard potential in the central part of West Java'. In C West Java Bouguer anomaly values 5-125 mGal. Lowest anomaly around Tagogapu, Padalarang area, showing sediment basin. Highest anomaly around Pelabuhanratu, reflecting presence of ultramafic rocks. Puncak area and surroundings are graben zone, filled by low density Quaternary volcanic rocks)

Subagio (2018)- Struktur geologi bawah permukaan Pegunungan Selatan Jawa Barat ditafsir dari anomali Bouguer. J. Geologi Sumberdaya Mineral 19, 4, p. 187-200.
(online at: https://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/429/364)
('Subsurface geological structure of the Southern Mountains of W Java interpreted from Bouguer anomalies'. W Java Southern Mountains characterized by high anomaly gradients, mainly along S coast., some reflecting normal faults. High anomaly around Ciletuh, Sukabumi shows 240 mGals, while in the northern area is 10 mGals. Highest anomalies associated with ultramafic outcrop at Ciletuh, where Moho level is at ~13 km below sea level. Low anomalies in N indicate sedimentary basin, partly covered by Quaternary volcanics)

Subandrio, A.S. & N.I. Basuki (2010)- Alteration and vein textures associated with gold mineralization at the Bunikasih Area, Pangalengan, West Java. J. Geologi Indonesia 5, 4, p. 247-261.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/281)
(Bunikasih vein system in Pangalengan district, 60 km S of Bandung, is low-sulfidation, adularia sericite epithermal gold deposit, hosted by Late Miocene andesitic volcanic at SW side of Malabar Volcano complex)

Subroto, E.A. et al. (2006)- Detailed petroleum geochemical analyses on sedimentary rocks collected from southern West Java, Indonesia. Proc. Ann. Conv. Indon. Assoc. Geol. (IAGI), 2006, p.

Subroto, E.A., E. Hermanto, P. Kamtono & K. Kamtono (2010)- Source rock geochemical study in the Southwestern Java, a potential hydrocarbon basin in Indonesia. AAPG Int. Conf., Rio de Janeiro 2010. Extended Abstract, Search and Discovery Art. 1023612, 12p.
(online at: www.searchanddiscovery.net/documents/2010/10236subroto/ndx_subroto.pdf)
(Geochemical study of SW Java Eocene- Miocene outcrop samples from Ciletuh and Gunung Walat. Best source quality in Miocene Cimandiri and Nyalindung Fms, Oligocene Batuasih Fm and Eocene Bayah Fm. Oligo-Miocene sediments immature- marginally mature and unlikely sources of gas, unless buried deeply in basin. Eocene Bayah Fm coals significant oil and gas potential and locally mature. No oil seepage in area)

Subroto, E.A., A. Ibrahim, E. Hermanto & D. Noeradi (2008)- Contribution of Paleogene and Neogene sediments to the petroleum system in the Banyumas Sub-Basin, Southern Central Java, Indonesia. American Assoc. Petrol. Geol. (AAPG) Int. Conf. Exhibition, Cape Town 2008, 6p. *(Extended abstract)*
(Oil samples from seeps and DST in Jati 1 well in Banyumas sub-basin, C Java, more fluviodeltaic than marine character. Biomarker distributions suggest all one family. Both Paleogene and Neogene intervals possible sources. Postulate NE-SW trending Paleogene basins across C Java ('Meratus Trend'))

Explanatory notes for 1929 1: 1 million scale geologic overview map of Central Java.)

Thommeret, J. & Y. Thommeret (1978)- 14C datings of some Holocene sea levels on the north coast of the island of Java. Modern Quaternary Research in Southeast Asia 4, p. 51-56.
(Terrace of presumed beach deposits with marine fossils 1.3-2.4 m above present sea level along N coast of Java at Jepara. Dated as 5000- 3650 years B.P. and interpreted as Holocene sea level highstand episode)

Thompson, S., D. Arpandi & F.X.Suyanto (1979)- Thermal maturity and oil generation with reference to the CMS-1 (Java) and Susu Selatan-1 (Sumatra) wells, Indonesia. Proc. 8th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 385-405.
(Liptinitic kerogen yield oil at earlier level of maturity than sapropelic kerogen.CMS-1 well (onshore NW Java) heavy waxy oils generated from liptinitic kerogen. Onset of oil generation at vitrinite reflectance 0.35% and spore colour index 3-3.5. Major oil generation at vitrinite reflectance 0.55%/ spore colour index 5. In Susu Selatan-1 well (N Sumatra), light oils generated from sapropelic kerogen. Optimum oil generation at vitrinite reflectance ~0.8%/ spore colour index 7.5. No heavy oil accumulations in this area)

Tiede, C., A.G. Camacho, C. Gerstenecker & J. Fernandez (2005)- Modelling the density at Merapi volcano area, Indonesia, via the inverse gravimetric problem, Geochem. Geoph., Geosys. (G3), 6, 9, p. 1-13.
(3-D model of anomalous density for Merapi and Merbabu by inversion of gravity field)

Tingay, M. (2010)- Anatomy of the ôLusiô mud eruption, East Java. Proc. ASEG Conf., Sydney 2010, 6p.

Tingay, M. (2015)- Initial pore pressures under the Lusi mud volcano, Indonesia. Interpretation (SEG) 3, 1, p. SE33-SE49.
(Lusi mud volcano at Porong, E Java erupted continuously since May 2006. Analysis of pore pressures immediately prior to Lusi eruption from nearby (150m) Banjar Panji-1 well indicate all sequences >350m below Lusi overpressured, and follow approximately lithostat-parallel pore pressure increase through Pleistocene clastics, Plio-Pleistocene volcanics (1870- 2833 m) and Miocene Tuban Fm carbonates, with pore pressure gradients of 17.2–18.4 MPa/km. Pore pressures in basal carbonates ∼23.0 MPa above hydrostatic. 'Textbook disequilibrium compaction overpressure')

Tingay, M. (2016)- What caused the Lusi Mudflow disaster in Indonesia? In: 2nd AAPG/EAGE/MGS Conf. Innovation in geoscience: unlocking the complex geology of Myanmar, Yangon 2015, Search and Discovery Art. 41791, 33p. *(Abstract + Presentation)*
(Lusi mudflow S of Surabaya, E Java, has been erupting continuously for 9 years, displaced 40000 people and caused >US$2.7 billion in damage. Ongoing debate whether the disaster was triggered by drilling kick in Banjar Panji-1 well (1 day earlier, 150m away), or natural event induced by 2006 Mw6.3 Yogyakarta earthquake (2 days earlier, 250km away). This study suggests drilling kick, not earthquake, caused catastrophic shear failure of borehole wall and subsequent reactivation of Watukosek fault)

Tingay, M., O. Heidbach, R. Davies & R. Swarbrick (2008)- Triggering of the Lusi mud eruption: earthquake versus drilling initiation. Geology 36, 8, p. 639-642.
(Lusi mud volcano in E Java unlikely to be triggered by Yogyakarta earthquake. Blowout in Banjar Panji-1 hydrocarbon exploration well was most likely mechanism for triggering Lusi mudflow)

Tingay, M., O. Heidbach, R. Davies & R. Swarbrick (2009)- The Lusi mud eruption of East Java. AAPG Int. Conf. Exhib., Cape Town 2009, 24p. *(Extended abstract and presentation)*
(Online at: www.searchanddiscovery.net/documents/2009/50187tingay/ndx_tingay.pdf)
('Lumpur Sidoarjo' mud eruption probably triggered by drilling of Banjar Panji 1 well in May 2006. Expelling mud up to 170,000 m3/ day. Mud flow now covers >700 ha of land to depths of up to 17m, engulfing 8 villages)

Tingay, M. M. Manga, M.L. Rudolph & R. Davies (2018)- An alternative review of facts, coincidences and past and future studies of the Lusi eruption. Marine Petroleum Geol. 95, p. 345-361.
(Review of likely causes of Lusi mud eruption in E Java. Drilling reports and data confirm wellbore was not intact, there was subsurface blowout, and there was connection between well and eruption. Yogyakarta earthquake too far away to have initiated new eruption. Strongly favor initiation of eruption by oil well drilling)

Tingay, M., M.L. Rudolph, M. Manga, R.J. Davies & C.Y. Wang (2015)- Initiation of the Lusi mudflow disaster. Nature Geoscience 8, p. 493-494.
(Repeat earlier conclusions that 'Lusi' mudflow eruption S of Surabaya was not triggered naturally but was consequence of Lapindo drilling operations)

Titani, K. (1942)- Oil-fields in Java. J. Mining Institute of Japan 58, 685, p. 309-316. *(In Japanese)*
(online at: www.jstage.jst.go.jp/article/shigentosozai1885/58/685/58_685_309/_pdf)
(Brief review of NE Java basin stratigraphy and oil fields))

Titisari, A. D. (2014)- Geochronology and geochemistry of Cenozoic volcanism in relation to epithermal gold mineralisation in western Java, Indonesia. Ph.D. Thesis, School of Earth Sciences, University of Melbourne, p. 1-297. *(Unpublished)*
(W Java hosts low-sulphidation epithermal gold deposits, with most important deposits in Pongkor, Cibaliung, Cikotok and Papandayan districts. Most volcanics with enriched LILE and LREE compositions characteristic of calc-alkaline arcs, but Papandayan basalts depleted LREE contents typical of island arc tholeiites. 40Ar/39Ar ages volcanic host rocks: Papandayan district ~18 Ma; Cibaliung district ~11 to ~9.5 Ma, Cikotok district ~18 - ~4.5 Ma, Pongkor district 2.7- ~2 Ma. Adularia crystallisation ages similar. Magmatic arc across W Java likely linked to SE Asia tectonic evolution, from E Miocene CCW rotation of Kalimantan to Late Miocene-Pliocene subduction. Three main events: E Miocene primitive tholeiite arc (20-18 Ma), M Miocene mature calc-alkaline arc (13-9 Ma) and Late Miocene- Pliocene evolved high-K calc-alkaline and shoshonitic arc (7-2 Ma). E Miocene Papandayan basement thinned island arc crust. Miocene- Pleistocene mineralisation of Cibaliung, Cikotok and Pongkor associated with calc-alkaline arc built on Sundaland continental crust)

Titisari, A.D., D. Phillips & Hartono (2014)- Geochemical variations on hosted volcanic rocks of Cibaliung epithermal gold mineralisation, Banten- Indonesia: implications for distribution of subduction components. J. Southeast Asian Applied Geol. (UGM) 6, 1, p. 39-52.
(online at: https://jurnal.ugm.ac.id/jag/article/download/7216/5655)
(Neogene Sunda-Banda arc hosts various styles of gold mineralisation. Major and trace element data for host basaltic andesites and rhyodacites of Cibaliung epithermal gold mineralisation characteristic of calc-alkaline arcs, with hydrous slab component)

Titisari, A.D., D. Phillips, Prayatna & E.P. Setyaraharja (2017)- 40Ar/39Ar geochronology of volcanic and intrusive rocks in the Papandayan metallic prospect area, West Java, Indonesia. Resource Geology 67, 1, p. 53-71.
(online at: http://onlinelibrary.wiley.com/doi/10.1111/rge.12118/epdf)
(Papandayan metallic district in W Java, Indonesia with epithermal Au-Ag vein system in Arinem area. 40Ar/39Ar ages of basalt (11.7, 18.2 Ma) and andesite (7.7 Ma) samples of Jampang Formation volcanic rocks. Diorite intrusives: Gunung Halang (13.0 Ma), Gunung Lingga (10.8 Ma) and Gunung Buligir (7.4 Ma). Gunung Wayang fine-grained diorite dike 3.95 Ma. Adularia in Arinem vein (18.3 Ma). K-Ar illite ages of Arinem vein (9.4, 8.8 Ma). Ages suggest possibly multiple hydrothermal events)

Titisari, A.D., D. Phillips & E.P. Setyaraharja (2014)- Magmatic arc evolution in the Pongkor epithermal gold mineralisation district. Proc. 7th Seminar Nasional Kebumian, Dept. Teknik Geologi, Gadjah Mada University, Yogyakarta, P3O-01, p. 488-503.
(online at: https://repository.ugm.ac.id/136277/1/488-503%20P3O-01.pdf)
(Pongkor epithermal gold mineralisation on NE flank Bayah Dome (~ 80 km SW of Jakarta) hosted in basaltic-dacitic volcanic breccias, lapilli tuffs and andesites. 40Ar/39Ar dating of andesites yielded average age of 2.74 ± 0.03 Ma, but may be age of hydrothermal alteration. Enriched LILE and LREE values characteristic of calc-alkaline arcs. Some andesite samples indicative of high-K calc-alkaline and shoshonite arcs. Temporal evolution from mature arc to evolved arc (high-K calc-alkaline- shoshonite volcanics)

Titisari, A.D., D. Phillips I.W. Warmada, Hartono & A. Idrus (2020)- 40Ar/39Ar Geochronology of the Pongkor low sulfidation epithermal gold mineralisation, West Java, Indonesia. Ore Geology Reviews 119, 15p.

(Pongkor gold deposit 90 km SW of Jakarta typical low sulfidation epithermal gold deposit. 40Ar/39Ar age results for adularia samples from Ciguha vein 1.8, 2.3 Ma and 1.9 Ma, plus one weighted mean age of 1.95 Ma. Adularia from Kubang Cicau veins age of 2.0Ma. Adularia ages similar to previously reported 40Ar/39Ar results, but significantly younger than previously reported K-Ar adularia dating results)

Tjia, H.D. (1961)- Tjatatan mengenai stratigraphy Pegunungan Karangbolong, Djawa Tengah. Proc. Inst. Teknologi Bandung (ITB) 1, 3, p. 18-22.
(online at: http://journal.itb.ac.id/index.php?li=article_detail&id=847)
('Notes on the stratigraphy of the Karangbolong Mountains, C Java'. Karangbolong Mts part of Java S Mountains. Oldest rocks 'Old Andesite Fm' composed of Oligocene- Aquitanian andesitic eruptive and intrusive rocks, unconformably overlain by Karangbolong Lst (Tf1-3, with Nephrolepidina, Trybliolepidina, Cycloclypeus spp.). To N uppermost limestone beds overlain by and interfingering with beds of Marl-tuff Mb of Tertiary f3. After this time marine sedimentation in this area came to halt)

(Miocene larger forams from W. Java: Lepidocyclina rutteni n. sp. from Tji Lalang beds and Lepidocyclina/ Miogypsina/ Cycloclypeus and Rotalia beccarii atjehensis n. var. from Nyalindung beds near Sukabumi)

Van der Vlerk, I.M. & J.A. Postuma (1967)- Oligo-Miocene Lepidocyclinas and planktonic foraminifera from East Java and Madura, Indonesia. Proc. Kon. Nederl. Akademie Wetenschappen, B, 70, 4, p. 392-399.
(Composite section of Oligo-Miocene sediments of E Java and Madura with Lepidocyclinas and planktonic foraminifera. Lepidocyclinas 'grade of enclosure' increases systematically from 36% to 65% up section. Oligo-Miocene boundary placed above Globigerina ciperoensis ciperoensis zone)

Van der Werff, W. (1996)- Variation in forearc basin development along the Sunda Arc, Indonesia. J. Southeast Asian Earth Science 14, 5, p. 331-349.
(Sunda Arc fore-arc areas between Sumatra and Sumba. Present forearc basin configuration initially controlled by extension and differential subsidence of basement blocks in response to Late Eocene India-Asia collision. Late Oligocene increase in convergence between SE Asia and Indian Plates associated with new pulse of subduction resulted in basement uplift and formation of regional unconformity along entire Sunda Arc. In Miocene, Sumba and Savu forearc sectors characterized by forearc extension. Forearc basins initially with submarine fan deposits, followed by basin and slope sediments derived from evolving magmatic arc. Incipient collision between Australia and W Banda Arc caused back-arc thrusting and basin inversion. S of Java, increase in size of accretionary prism and convergence rates resulted in folding/ uplift of distal forearc basin strata. Along Sumatra W coast uplift along inner side of forearc along older transcurrent faults. Initial forearc basin subsidence relates to age of subducting oceanic lithosphere. Flexural loading of evolving accretionary prism and across arc strike-slip faulting may result in additional forearc subsidence.)

Wagner, D., I. Koulakov, W. Rabbel, B.G. Luehr, A. Wittwer, H. Kopp et al. (2007)- Joint inversion of active and passive seismic data in Central Java. Geophysical J. Int. 170, p. 923-932.
(130 seismographic stations onshore and off C Java and operated for >150 days. Inversion images show strong low-velocity anomaly (−30%) in backarc crust N of active volcanoes. In upper mantle beneath volcanoes a low-velocity anomaly inclined towards slab, probably paths of fluids and melted materials in mantle wedge. Crust in forearc appears strongly heterogeneous. Onshore part two high-velocity blocks separated by narrow low-velocity anomaly, interpreted as weakened contact zone between two rigid crustal bodies. Recent Java earthquake at lower edge of this zone. Focal strike slip mechanism consistent with orientation of this contact)

Wagner, D. W. Rabbel, B.G. Luehr, J. Wassermann, T.R. Walter, H. Kopp et al. (2008)- Seismic structure of Central Java. In: D. Karnawati, S. Pramumijoyo et al. (eds.) The Yogyakarta Earthquake of May 27, 2006, Star Publishing, Belmont, California, p. 2.1-2.11.
(C Java tomographic data reveals two low velocity anomalies, one at foot of volcanic arc, on NE-SW trending zone that separates forearc in two rigid blocks, and was likey epicenter of 2006 earthquake. Aftershocks mostly in Gunung Kidul Mountains, in zone semi-parallel to and 10-15 km E of Opak River fault)

Wagner, T., A.E. Williams-Jones & A.J. Boyce (2006)- Stable isotope-based modeling of the origin and genesis of an unusual Au-Ag-Sn-W epithermal system at Cirotan, Indonesia. Chemical Geology 219, p. 237-260.
(Late Pliocene Cirotan low-sulphidation epithermal gold deposit in Bayah Dome of SW Java complex polymetallic assemblages and progressive enrichment in Sn-W and Au-Ag in late stages of mineralization. Five ore/ alteration stages. Metallogenic model explains enrichment in Sn and W by increased recycling of slab-derived sedimentary material during Pliocene subduction)

Wahab, A. & D. Martono (1985)- Application of oil geochemistry for hydrocarbon exploration in Northwest Jawa. Proc. 14th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 635-657.
(Analysis of source rocks in NW Java shows Lower Cibulakan (Talang Akar) sediments are main source in area. Distribution of mature source rocks delineated by applying Lopatin method)

Wakita, K. (2000)- Cretaceous accretionary-collision complexes in Central Indonesia. J. Asian Earth Sci. 18, p. 739-749.
(Cretaceous accretionary-collision complexes formed by accretionary or collision processes, forearc sedimentation, arc volcanism, back arc spreading. Oceanic plate subducted under Cretaceous arc from S, carried microcontinents from Gondwanaland. Accretionary wedge with fragments of oceanic crust (chert, siliceous shale, limestone, pillow basalt). Jurassic shallow marine allochthonous formation emplaced by collision of continental blocks. Collision exhumed high-P metamorphics from deeper part of pre-existing accretionary wedge. Cretaceous tectonic units rearranged by Cenozoic thrusting and lateral faulting during successive collision of continental blocks and rotation of continental blocks in Indonesian region)

Wakita, K., Munasri & W. Bambang (1991)- Nature and age of sedimentary rocks of the Luk-Ulo melange complex in the Karangsambung area, Central Java, Indonesia. Proc. Silver Jubilee Symposium on Dynamics of subduction and its products, LIPI, Yogyakarta, p. 64-79.
(Incl. Late Cretaceous age of radiolarite above pillow basalt at)

Wakita, K., Munasri & B. Widoyoko (1994)- Cretaceous radiolarians from the Luk-Ulo Melange complex in the Karangsambung area, Central Java, Indonesia. J. Southeast Asian Earth Sci. 9, p. 29-43.
(Five assemblages of Cretaceous radiolarians in shale and chert of Luk-Ulo Melange in Karangsambung area: I- Early Cretaceous ('up to Barremian'), II- Middle Cretaceous (Barremian-Albian?), III- early Late Cretaceous, IV- Late Cretaceous (Coniacian- M Campanian) and V- Late Cretaceous (Late Campanian-Maastrichtian). Siliceous- argillaceous rocks were deposited throughout Cretaceous time, and accreted at subduction trench in M- Late Cretaceous or earliest Paleocene. Fragmentation and mixing with schist and quartz porphyry must have occurred in Paleocene)

Waldron, H.H. (1962)- Geology of Djatiluhur damsite and vicinity, West Java, Indonesia. U.S. Geol. Survey (USGS) Prof. Paper 450-D, p. D21-D23.
(Brief review and map of folded Miocene clastic sediments with andesitic intrusions at Jatiluhur damsite, Bogor zone, W Java)

Waltham, D., R. Hall, H.R. Smyth & C. Ebinger (2008)- Basin formation by volcanic arc loading. In: A.E. Draut, P.D. Clift & D.W. Scholl (eds.) Formation and applications of the sedimentary secord in arc collision zones. Geol. Soc. America (GSA), Spec. Paper 436, p. 11-26.
(Paper quantifies flexural subsidence from loading by volcanic arc. Good fit of model to Halmahera Arc and E Java. Loads generated by arc sufficient to account for subsidence in basins within ~100 km of active volcanoes at subduction plate boundaries, if plate is broken. Basins will be asymmetrical with coarse volcaniclastic material close to arcand volcaniclastic turbidites farther away. Density contrast between arc and underlying crust required to produce arc basins means they are unlikely to form in young intra-oceanic arcs)

Wanner, J. (1938)- *Balanocrinus sundaicus* n.sp. und seine Epoke aus dem Altmiocaen der Insel Madura. Neues Jahrbuch Mineral. Geol. Palaontologie, Beilage Band 79 B, p. 385-403.
('Balanocrinus sundaicus n.sp. and its…from the Early Miocene of Madura Island'. New crinoid species from blue-grey marls, collected by Weber near Bawarukem River, northern C Madura. Associated with Miogypsina thecidaeformis, M. kotoi, eulepidinid Lepidocyclina, Katacycloclypeus (= more likely Middle Miocene?; JTvG))

Wanner, J. & E. Hahn (1935)- Miocaene Mollusken aus der Landschaft Rembang (Java). Zeitschrift Deutschen Geol. Gesellschaft, Berlin, 87, 4, p. 222-273.
('Miocene molluscs from the Rembang area (Java)'. Molluscs from area N and NNW of Bojonegoro (Sedan, Butak, Ngampel, Ngandong and Lodan). Mainly from M Miocene orbitoid-Cycloclypeus Lst (later called OK Limestone and Ngrayong Beds) and some from overlying Globigerina Marls series (later subdivided into Wonocolo, Ledok and Globigerina Marls Fms.). Wanner notes N to S facies changes. Richest mollusc localities on Dermawu-Mahindu and Gegunung anticlines. Molluscs mainly gastropods, 68 species, half of them new)

(online at: http://jrisetgeotam.com/index.php/jrisgeotam/article/view/278/pdf_88)
('Structural highs in the Majalengka subbasin based on gravity method'. Majalengka sub-basin in E part of Bogor Basin, NE of Bandung, covered by thick volcanic deposits, but with oil and gas seeps. Gravity model show NW-SE reverse faults and E-W and SW-NE shear faults. Depth of basement 2700-5000m. Kadipaten-Majalengka and Ujungjaya-Babakan Gebang structural highs may have hydrocarbon traps)

Warmada, I.W. (2006)- Karakteristik mineralogi dan proses pengendapan emas pada endapan emas-perak epitermal Gunung Pongkor, Jawa Barat. Media Teknik 28, 4, p. 32-36.
(Pongkor epithermal gold-silver deposit in W Java largest low-sulfidation deposit on Java. Formed in Pliocene (2.05 Ma). More than nine subparallel quartz-adularia-carbonate veins. Formation T ~220°C)

Warmada, I.W., B. Lehmann & M. Simandjuntak (2003)- Polymetallic sulfides and sulfosalts of the Pongkor epithermal gold-silver deposit, West Java, Indonesia. The Canadian Mineralogist 41, 1, p. 185-200.
(online at: http://rruff.info/doclib/cm/vol41/CM41_185.pdf)
(Pongkor gold-silver deposit Late Pliocene age (2.05 Ma) and largest low-sulfidation epithermal precious-metal deposit in Indonesia. Nine major subparallel quartz-'adularia'-carbonate veins with low sulfide content. Sulfides dominated by pyrite, chalcopyrite, sphalerite, galena. Gold occurs as Au-Ag alloy and uytenbogaardtite (Ag3AuS2))

Warmada, I.W., B. Lehmann, M. Simandjuntak & H.S. Hemes (2007)- Fluid inclusion, rare-earth element and stable isotope study of carbonate minerals from the Pongkor epithermal gold-silver deposit, West Java, Indonesia. Resource Geology 57, 2, p. 124-135.
(Pongkor gold- silver deposit near Bayah, SW Java, is largest low-sulfidation epithermal metal deposit in Indonesia, and is of Late Pliocene age (2 Ma). Nine subparallel, ~N-S trending quartz -adularia -carbonate veins with low sulfide content. Fluid inclusions indicate temperatures of 180-220°C and meteoric water origin)

Warmada, I.W., M.T. Soe, J. Sinomiya, L.D. Setijadji, A. Imai & K. Watanabe (2005)- Petrology and geochemistry of intrusive rocks from Selogiri area, Central Java, Indonesia. Proc. 2nd Int. Symp. Earth Resources Engineering and Geological Engineering Education (SEED), Yogyakarta 2005, p. 163-169.
(online at: http://warmada.staff.ugm.ac.id/Articles/petrology-geochem-slgr.pdf)
(Selogiri gold prospect in W part of S Mountains, C Java, porphyry copper-gold deposit, overprinted by low sulfidation epithermal gold quartz deposits. Intrusions dated as ~21.7 Ma (microdiorite; Jogmec) and ~12.5-11.9 Ma. Selogiri deposit formed during one or two intrusion periods, and short period of hydrothermal activities but did not create economic ore deposit)

Warmada, I.W., I. Sudarno & D. Wijonarko (2008)- Geologi dan fasies batuan metamorf daerah Jiwo Barat, Bayat, Klaten, Jawa Tengah. Media Teknik (UGM) 30, 2, p. 113-118.

('Geology and facies of metamorphic rocks in the West Jiwo area, Bayat, C Java'. Bayat area with metamorphic rock outcrops, intruded by igneous rocks (mainly diabase dikes). Phyllite, schist, gneiss and meta-sandstone widespread, locally also glaucophane schist, serpentinite and amphibolite. Three main metamorphic facies: greenschist, blueschist with transition to glaucophane greenschist, and amphibolite facies. Interpreted protolith of metamorphic rocks was melange of mafic/ultramafic rocks, pelitic rocks, carbonates and quartz sandstones)

Weeda, J. (1958)- Oil basins of East Java. In: L.G. Weeks (ed.) Habitat of oil, American Assoc. Petrol. Geol. (AAPG), Spec. Publ. 18, p. 1359-1364.
(In E-W trending E Java Tertiary basin 132 MBO produced since 1888 from 20 fields. Thick Miocene section, folded into 2 E-W trending zones in Plio-Pleistocene. Bulk of oil produced from M Miocene Ngrayong Sst (this was before Cepu oilfield discovery in Oligo-Miocene Kujung Fm Limestone; JTvG). Three oil types: (1) asphaltic oil from shallow Lidah and Kruka fields S of Surabaya from Pliocene U Globigerina Fm; (2) rel. light paraffinic oil from Upper Rembang and Lower Wonocolo sands in Ledok and nearby fields, and (3) heavy paraffinic oil in M Miocene Ngrayong sst at Kawengan)

White, J.V., A.N. Derewetzky, G.C. Geary, V.K. Hohensee, E.M. Johnstone, C. Liu, A.C. Pierce & J. Stevens (2007)- Temporal controls and resulting variations in Oligo-Miocene carbonates from the East Java Basin, Indonesia: examples from the Cepu area. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 549-559.
Five high-relief carbonate buildups drilled in Cepu area of E Java: Sukowati, Banyu Urip, Jambaran, Cendana and Kedung Tuban. Gross differences despite having all grown from a common, broad, probable E Oligocene carbonate platform. Timing of deposition of buildups established through robust (turns out to include bad dates; JTvG) Strontium isotope dating program. Carbonate deposition on buildups progressively terminated through time fromW to E)

Widyastuti, S., Abdurrokhim & Y.A Sendjaja (2016)- Asal sedimen batupasir Formasi Jatiluhur dan Formasi Cantayan daerah Tanjungsari dan sekitarnya, Kecamatan Cariu, Kabupaten Bogor, Provinsi Jawa Barat. Bull. Scientific Contr. (UNPAD) 14, 1, p. 25-32.
(online at: http://jurnal.unpad.ac.id/bsc/article/view/9813/pdf)
('Provenance of the Jatiluhur and Cantayan Fm sandstones in the Tanjungsari and surrounding area, Cariu district, Bogor, W Java'. M-L Miocene sandstones in Bogor Trough: (1) Jatiluhur Fm (feldspathic wacke,

derived from plutonic igneous rock, from Dissected Arc terrane) and Cantayan Fm (lithic arenite, derived from volcanic rock, from Transitional Arc- Undissected Arc terrane). Both units derived from magmatic arc terrane)

Wiedicke, M., H. Sahling, G. Delisle, E. Faber, S. Neben et al. (2002)- Characteristics of an active vent in the fore-arc basin of the Sunda Arc, Indonesia. Marine Geology 184, p. 121-141.
(Fluid venting at anticlinal structure at ~2910m water depth in forearc basin SW of Java, with water methane anomalies, elevated heat flow, vent-macrofauna (tube worms, bivalve Acharax), carbonate precipitation at sea floor and methane- rich pore fluids in sediment. Bottom-simulating reflectors (BSR) rise steeply towards vent, and lack of BSR below vent suggests perforation of hydrate-stability zone. Position on structure linked to oblique subduction suggests venting may be common along compressional /transpressional zones (Ujung Kulon FZ, Mentawai FZ) in NW fore arc of Sunda margin)

Wiedicke, M. & W. Weiss (2006)- Stable carbon isotope records of carbonates tracing fossil seep activity off Indonesia. Geochem. Geophys. Geosystems 7, 11, Q11009, 22p.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2006GC001292)
(Stable isotopes of carbonates in 20m long sediment cores from 1690-2995 m water depth in forearc basin off SW Java (Ujung Kulon) and SW Sumatra (Bengkulu) display significant 13C depletion, interpreted to be caused by methane seepage and associated authigenic carbonate precipitation near seafloor. Seep activity most intense between 3-7 kyr B.P. and 27-33 kyr B.P. Probable tectonic control of seepage. Benthic foram infauna at seep sites dominated by 5 species: Chilostomella oolina, Globobulimina pacifica, Hoeglundina elegans, Uvigerina peregrina and Bulimina striata. Epifauna mainly Pyrgo murrhina, Oridorsalis umbonatus, Cibicidoides wuellerstorfi and Sigmoilinopsis schlumbergeri)

Wijayanti, H.D.K., O. Verdiansyah, M.I. Novian, N.I. Setiawan & K. Rohman (2016)- Protolith of Joko Tuo marble, Bayat, Central Java; contribution to paleoenvironment and age of metamorphic rock. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 319-322.
(Low-metamorphic marble and phyllite form basement outcrop in Joko Tuo area, E Jiwo Hills, C Java. Presence of marble blocks and well-preserved mid-Cretaceous larger foram Orbitolina sp. in foliated chlorite-biotite-graphite)

Wijono, S. (1987)- Hubungan beberapa parameter sedimen dengan populasi foraminifera bentonik pada Formasi Ledok, Jalur Kedung Planangan, Kab. Blora, Jawa Tengah. Proc. 16th Ann. Conv. Indon. Assoc. Geol. (IAGI), p.

Zacchello, M. (2001)- The Eocene stratigraphic sequence of Nanggulan and the levels reported by K. Martin. Memorie Scienze Geol., Padova, 53, p. 49-53.
(M Eocene Nanggulan Fm of C Java ~300m thick and subdivided into ten levels. Lowest level NG1 with lignite, without marine fauna, overlain by deeping-upward facies clastic succession. With listings of molluscs species and comparison to the 21-level stratigraphy of Oppenoorth & Gerth (1929))

Zainudin, A. & D.H. Amijaya (2016)- Hubungan kekerabatan minyak bumi pada antiklin Gabus di daerah Grobogan dan antiklin Kawengan di daerah Bojonegoro, Cekungan Jawa Timur Utara berdasarkan data biomarker. In: R. Hidayat et al. (eds.) Proc. 9th Seminar Nasional Kebumian, Dept. Teknik Geologi, Gadjah Mada University, Yogyakarta, p. 139-148.
(online at: https://repository.ugm.ac.id/273483/)
('The relationship of oils from the Gabus anticline in Grobogan and Kawengan anticline in the Bojonegoro area, NE Java Basin based on biomarker data'. Oils from Gabus (Ledok Fm) and Kawengan (Wonocolo Fm and Ngryong Fm) anticlines are related. API Gravity 24-30 °API, viscosity 2034-71 mm2/ s. Pr /Ph ratio 5.48-11.54, suggesting non-marine rocks with terrestrial Type III kerogen (high land plants. Some biodegradation)

Zamparini, M. (2001)- Some molluscs and foraminifers from the Eocene-Oligocene of Nanggulan (Java, Indonesia). Memorie Scienze Geol., Padova, 53, p. 54-56.

Zaputlyaeva, A., A. Mazzini, A. Caracausi & A. Sciarra (2019)- Mantle derived fluids in the East Java sedimentary basin, Indonesia. J. Geophysical Research, Solid Earth, 124, 8, p. 7962-7977.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2018JB017274)
(Gas geochemistry from hydrocarbon fields and surface seepage sites near the Arjuno-Welirang volcanic complex and around Lusi mud eruption site. Mainly dry thermogenic gas. Presence of noble gases with mantle-derived He signature comparable to fluids emitted at Lusi and Arjuno-Welirang fumaroles)

Zaputlyaeva, A., A. Mazzini, M. Blumenberg, G. Scheeder, W. M. Kurschner, J. Kus, M.T. Jones & J. Frielin (2020)- Recent magmatism drives hydrocarbon generation in northeast Java, Indonesia. Nature Scientific Reports 10, 1786, 14p.
(online at: https://www.nature.com/articles/s41598-020-58567-6.pdf)
(Oil generation may be accelerated by rapid reactions when carbon-rich sediments are exposed to migrating magmatic fuids. Lusi eruption in NE Java surface expression of present-day deep interaction between volcanic and sedimentary domains, with ongoing generation of hydrocarbons induced by a recent magmatic intrusion from neighbouring Arjuno-Welirang volcanic complex)

Zeiza, A., F. Hakiki, F. Musgrove. I. Kerscher, I. Maura & S. Wertanen (2016)- Effects of pervasive hydrothermal dissolution on the giant Banyu Urip Field. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-G-585, 12p.
(Development drilling campaign in Banyu Urip field, Cepu Block, E Java confirmed most predictions of carbonate reservoir, except well-test derived average permeabilities and productivity higher than predicted. Overlying deep water sand units nearly perfectly pressure connected and of high quality. More fracture swarms in tight drowning cap facies than in higher porosity Platform Interior Dissolution occurred millions of years after carbonates deposition and drowning as result of hydrothermal fluids)

Zeiza, A., N. Stephens & P. Glenton (2017)- A novel approach to the Banyu Urip 3D geologic model update. Proc. 41st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA17-546-G, 13p.
(Updated geologic model of Oligo-Miocene carbonate and clastic reservoirs of Banyu Urip oil-gas field, Cepu Block, E Java. 46 wells drilled. Permeability from logs higher than core-based (matrix) permeability. Best quality reservoir in platform-interior zones (av. porosity 26%y). Drowning-cap dominated by deeper water facies with av. porosity ~15%. Margin zones cemented, recrystallized and rel. tight (av. porosity 9%))

Zeiza, A.D., H. Tanjung, K.P. Laya & W.A. Ramadhan (2007)- Carbonate mound deposit of Gunung Bodas, Bogor as part of analogue model for prospective mud mound hydrocarbon reservoirs in Miocene carbonates. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-SG-001, 6p.
(Gunung Bodas limestone hill in Bogor zone in Limestone member of M Miocene Bojongmanik Fm. Three major carbonate facies: massive coral-algal reef, back reef and mound facies)

Zeiza, A., S. van Simaeys, F. Musgrove, R. Sekti & F. Hakiki (2012)- The impact of differential subsidence rates in shallow water carbonate reservoir quality: an example from the East Java Basin, Indonesia. Proc. 36th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA12-G-026, p. 1-13.
(Carbonate reservoir quality in Cepu fields better in Miocene than in Oligocene. Diagenetic leaching controls reservoir quality. Reservoir quality correlated to subsidence rates: high rates in U Oligocene and U Burdigalian meant less time for fresh water lens to leach carbonates and enhance reservoir quality)

Zhang, Z., C. Wu, X. Yang, C. Zheng & J. Yao (2015)- The trinity pattern of Au deposits with porphyry, quartz-sulfide vein and structurally-controlled alteration rocks in Ciemas, West Java, Indonesia. Ore Geology Reviews 64, p. 152-171.
(Ciemas ore deposit in SW Java associated with E Miocene andesite, dacite and quartz diorite. Host rocks zircon ages ~17.1- 17.5 Ma. Au deposition primarily during late magmatic activity and belongs to metallogenic system from porphyry to epithermal type)

Zheng, C., Z. Zhang, C. Wu & J. Yao (2014)- Sulfur isotope composition of Ciemas gold deposit in West Java, Indonesia. Acta Geologica Sinica (English Ed.) 88, Suppl. 2, p. 852-853. *(Abstract)*
(Ciemas Miocene high sulphidation epithermal deposit in Sukabumi province, W Java. Sulfur isotopes uniform and small positive d34S values, suggesting magmatic origin mixture of mantle-type and slab-derived sedimentary components)

Zheng, C., Z. Zhang, C. Wu & J. Yao (2017)- Genesis of the Ciemas gold deposit and relationship with epithermal deposits in West Java, Indonesia: constraints from fluid inclusions and stable isotopes. Acta Geologica Sinica (English Ed.) 91, 3, p. 1025-1040.
(Two volcanic belts in West Java: (1) late Miocene- Pliocene belt, generating Pliocene-Pleistocene epithermal deposits; (2) late Eocene- E Miocene belt generating Miocene epithermal deposits. Data from Ciemas gold deposit E of Ciletuh Bay (hosted in 'Old Andesites') indicate mixing of magmatic fluid with meteoric water. Miocene epithermal ore deposits in S part of West Java more affected by magmatic fluids and higher degree of sulfidation than those of Pliocene-Pleistocene)

Ziegler, K.G.J. (1918)- Kort bericht over het voorkomen van een granietgesteente in het stroomgebied van de Tji Hara, District Tji Langkahan, Afdeeling Lebak, Residentie Bantam. Jaarboek Mijnwezen Nederlandsch Oost-Indie 45 (1916), Verhandelingen 2, p. 48-54.

III.2. Java Sea (incl. Sunda-Asri Basins, offshore NW Java basin)

Adhyaksawan, R. (2002)- Seismic facies and growth history of Miocene carbonate platforms, Wonocolo Formation, North Madura Area, East Java Basin, Indonesia. M.S. Thesis, Texas A&M University, College Station, p. 1-136. *(Unpublished)*

Adhyaksawan, R. (2003)- Seismic facies and growth history of Miocene carbonate platforms, Wonocolo Formation, North Madura area, East Java Basins, Indonesia. Proc. 29th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 163-184.
(Miocene Wonocolo Fm in Java Sea N of Madura area numerous isolated carbonate platforms over ~3000 km2 area. Five growth phases. Platforms in W larger than E and record history of platform initiation, backstepping, progradation, coalescence into composite platforms, and termination. Eastern platforms: 1) smaller, 2) more widely spaced, 3) steeper platform margins, 4) largely aggradational stratal geometries, 5) slightly thicker than W platforms, and 6) tops at greater burial depths than W platforms. Most differences attributed to faster subsidence rates in E from 12-6 Ma, probably related to differential loading by volcanic arc)

Ageng, C., Hairunnisa, D. Hidayat, D. Nugroho & N.I. Basuki (2014)- Facies analysis, rock type, and property distribution in upper interval of Baturaja Formation, Krisna Field, Sunda Basin. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-055, 19p.
(E Miocene Baruraja Fm carbonates in Krisna field five lithofacies. Reservoir formerly interpreted as reef complex, but lithofacies and seismic facies indicate two facies associations: skeletal mound and slope to basin)

Albab, A. & N.C.D. Aryanto (2017)- Seismic facies of Pleistocene-Holocene channel-fill deposits in Bawean Island and adjacent waters, Southeast Java Sea. Bull. Marine Geol. 32, 1, p. 31-39.
(online at: http://ejournal.mgi.esdm.go.id/index.php/bomg/article/view/373/287)
(Sparker seismic profiles in SE Java Sea around Bawean show widespread Pleistocene incised lowstand paleo-channels, with late Pleistocene-Holocene (partial) fill. Older paleo-channels buried by up to 50m sediments. Width of main paleo-channels ~4 km. Two channel types: U-shaped channels in W part and V-shaped channels in E. Internal structure of incised-channels consist of chaotic reflectors at bottom, overlain by parallel-subparallel and almost reflection-free, homogenous sediments)

Aldrich, J.B., G.P. Rinehart, S. Ridwan & M.A. Schuepbach (1995)- Paleogene basin architecture of the Sunda and Asri Basins and associated non-marine sequence stratigraphy. In: C.A. Caughey et al. (eds.) Proc. Int. Symp. on Sequence Stratigraphy in SE Asia, Jakarta, Indon. Petroleum Assoc. (IPA), Jakarta, p. 261-287.
(Nearly symmetric, fault bounded extension in Sunda and Asri basins early history, followed by shift to more asymmetric rift. Early Sunda Basin fill consists of Banuwati Fm and Zelda Mb of Talang Akar Fm. Banuwati Fm of Sunda Basin records overall transgressive event and culminates in widespread deposition of Banuwati Shale which is main source rock in Sunda Basin. Well log sequence stratigraphy and core study of non-marine Banuwati Fm in Sunda Basin identified alluvial fan, fluvial and shallow lacustrine facies)

Ardila, L.E. (1983)- The Krisna High: its geologic setting and related hydrocarbon accumulations. Proc. Offshore SE Asia Conf. 6, Singapore 1983, SE Asia Petroleum Expl. Soc. (SEAPEX), p. 10-23.
(Krisna Field 1976 discovery on W flank Sunda basin, Java Sea. Mainly stratigraphic trap. Old basement High fringed by E Miocene Baturaja reefal buildup))

Ardila, L.E. & I. Kuswinda (1982)- The Rama Field: an oil accumulation in Miocene carbonates, West Java Sea. Proc. ASCOPE/CCOP Workshop., Surabaya 1982, Techn. Paper TP/2, p. 341-382.

Arifin, L. & I.W. Lugra & P. Raharjo (2009)- Zona sesar di perairan Kalimantan Selatan (LP 1611). J. Geologi Kelautan 7, 1, p. 11-21.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/166/156)
('Fault zones in the waters S of Kalimantan'. Shallow seismic data indicate young NE-SW fault structures in Java Sea NE of Bawean, now probably inactive. Directions coincide with Muria-Meratus Tectonic Zone)

Arisandy, M., B. Abrar & W. Bahri (2015)- Limestone diagenesis reservoir quality of CD Carbonate Formation East Java Basin. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-038, 13p.
(Oligocene Ngimbang Fm ('CD") carbonates in 'Block P' E Java Sea, W of N Madura High, N of BD Ridge. Common larger foram wackestones, some coal floatstone, Most porosity is secondary. Two main diagenetic phases: (1) E-M Oligocene platform aggradation phase (keep up) with multiple times of exposure and dissolution by meteoric water; (2) Late Oligocene transgression (drowning) phase without exposure)

Armon, J., W.E. Harmony, S. Smith, B. Thomas, R. Himawan, B. Harman et al. (1995)- Complementary role of seismic and well data in identifying upper Talang Akar stratigraphic sequences- Widuri field area, Asri basin. In: C.A. Caughey et al. (eds.) Proc. Int. Symposium on Sequence stratigraphy in SE Asia, Indon. Petroleum Assoc. (IPA), Jakarta, p. 289-309.
(Four parasequences in uppermost Talang Akar Fm in Widuri field, off SE Sumatra).

(online at: http://scholarship.rice.edu/handle/1911/16969)
(Geophysical-geological study of marginal basin in W Flores Sea. Underlying crust transitional between Sunda craton continental crust to W and Banda back-arc oceanic crust to E. Half-grabens began to form in M Eocene by extensional reactivation of thrusts in peneplained Cretaceous accretionary prism basement complex. Extension and regional subsidence continued until E Miocene, when compression began to invert extensional faults of half-grabens as thrusts. Inversion most dramatic during Late Miocene and Pliocene and continues

today. Paleogene orthogonal extension, oriented N-S. Neogene depositional sequences determined from seismic stratal patterns and biostratigraphy data compare generally favorably to Haq et al. (1987) global cycle chart)

Emmet, P.A. & A.W. Bally (1996)- Evolution of Cenozoic inversion structures, East Java Sea, Indonesia. AAPG Ann. Conv., San Diego May 1996. *(Abstract only)*.
(Study of deep water (>200m) subbasin in E Java Sea. Pelitic basement deformed in Cretaceous accretionary prism and uplifted/ peneplained in E Tertiary. ENE- trending half-grabens formed in Sunda back-arc in M Eocene- E Oligocene. Basin-bounding faults listric and inferred to sole into sub-horizontal detachment at <10 km. Extensional structures controlled by pre-existing thrusts and shaly bedding planes in basement. Eocene rifting in few deep basins. Oligocene rifting more broadly distributed in shallower basins. Inversion began in E Miocene as basin-bounding faults reactivated and graben-fill sediments displaced towards adjacent horst blocks. Most inversions trend ENE and grew in bathyal water depth. Inversion progressed through Miocene and culminated in development of regional basement-involved inversion high (E extension of Kangean high), uplifted and truncated in latest Miocene. Despite regional compression which continues today at deep structural level, small-displacement domino-style normal faults ubiquitous at shallow structural level and apparently form on flanks of growing inversions by gravity sliding)

Emmet, P.A. & P.R. Vail (1996)- Cenozoic inversion structures, East Java Sea, Indonesia: can tectonic and eustatic influences on stratal architecture be distinguished? AAPG Ann. Conv., San Diego 1996.
(Abstract only. Extensional half-grabens in Sunda back-arc filled by M Eocene non-marine siliciclastics, including lacustrine coals, transgressed by Late Eocene shallow-water carbonates on margins of rift basins with shale dominant in basin axes. Late Oligocene- E Miocene regional sag with aggradation of shallow water carbonates on basin margins, deep-water carbonate mudstone and shale in basin axes. Onset of compression in E Miocene reflected by increase in subsidence and sedimentation rates. Paleogene extensional basins progressively inverted as thick wedges of Miocene and younger calcareous mudstone accumulated on flanks. In Miocene N margin of basin strongly progradational reflecting tectonic stability and dominant eustatic influence, S margin back-stepped due to higher tectonic subsidence related to inversion process. In deep basin, horizons defining growth phases of inversion structures correlate with eustatically-controlled unconformities on basin margins)

Emmet, P.A., J.W. Granath & M.G. Dinkelman (2009)- Pre-Tertiary sedimentary ñkeelsò provide insights into tectonic assembly of basement terranes and present-day petroleum systems of the East Java Sea. Proc. 33rd Ann. Conv. Indon. Petroleum Assoc., IPA09-G-046, 11p.
(E Java Sea deep seismic imaged up to 5 km of pre-M Eocene beds below angular unconformity, locally preserved in faulted synclines 20-50 km wide. These 'synformal keels' lie below known inversion structures, indicating Eocene extensional basins and Miocene inversions nucleated on pre-existing structures. E-W orientation of better imaged keels may represent fabric of source terrane, presumably Australian margin.)

(Main producer in Krisna field is Baturaja Fm carbonate reservoir. Also production from some wells from poor-quality 200' thick Krisna Sand of M Miocene Air Benakat Fm (270 MBO cumulative production (?))

Isworo, H, U.A. Saefulah & T. Prasetyo (1999)- Depositional model of the MB Field Mid-Main carbonate reservoir Offshore Northwest Java, Indonesia. Proc. 27th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 1-7.
(MB field MMC build-up, EUR ~34 MBO, is N-S elongated patch reef complex, formed during several build-up development stages. Several transgressive-regressive cycles in overal transgressive succession. Karst breccia facies also recognized. Result of study is retrograding carbonate build-up model)

Johansen, K.B. (2003)- Depositional geometries and hydrocarbon potential within Kujung carbonates along the North Madura Platform, as revealed by 3D and 2D seismic data. Proc. Ann. Conv. Indon. Petroleum Assoc. (IPA), 2003, Jakarta, 1, p. 137-162.
(Numerous prospects along N Madura Platform in Kujung I and II/III carbonates. Structures in Kujung II/III large, low relief inversion anticlines, similar to Bukit Tua and Jenggolo fields. Kujung II/III carbonates different facies in stable carbonate platform area. Central part of N Madura Platform Kujung I buildups up to 150-250m high, 10s of km2 in size, separated by lagoonal facies. Kujung I and II/III carbonates extensively karsted; probably several phases of exposure. Kujung I play combined stratigraphic/ structural. Build-ups encased in mostly non-permeable sequences, but 'thief-beds' potential risk. Source rock in up to 6 km deep kitchen in SE, with 3-4 km potentially mature source rocks, mixed lacustrine, deltaic and marginal marine sediments (Ngimbang- Kujung Fms). Most traps 10-50 km from mature source, so carrier beds in Ngimbang or Kujung Fm critical. Long distance migration main risk, but proven by discoveries along N Madura Platform)

Johansen, K.B. (2005)- New insight into the petroleum system in the East Java- South Makassar Area. Proc. 2005 SE Asia Petroleum Expl. Soc. (SEAPEX) Conf., Singapore, 17p.
(Back-arc extension in Paleocene-Eocene formed basins around SE part Eurasian Plate. Three trends (1) S Makassar-Central Deep area, main faults NE-SW; (2) Sakala-Lombok Ridge, faults mainly E-W; (3) offshore SW Sulawesi overall NW-SE fault trends. Important inversion phase, particularly along Madura/Kangean wrench zone, initiated in E Miocene. Older extensional faults reactivated and some Eocene basins inverted. S Makassar Basin little affected by inversion. Inversion several phases through M/U Miocene- Present. Large number of leads: Ngimbang carbonate and clastic plays over Lombok Sub Basin; Eocene clastics and potential Late Oligocene carbonate plays in S Makassar, etc. Viable source rock main challenge in area.)

Kaldi, J.G. & C.D. Atkinson (1993)- Seal potential of the Talang Akar Formation, BZZ area, offshore NW Java, Indonesia. Proc. 22nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 373-393.
(Seal potential comprises 1) seal capacity, 2) seal geometry and 3) seal integrity. In BZZ area best seal delta front shales: high seal capacity, thick, laterally continuous and very ductile. Potential is moderate in upper TAF transgressive carbonates: high seal capacity and continuous, but brittle and prone to fracturing. Delta plain shales and pro-delta shales poor seals due to limited seal capacity (delta plain) or too thin (pro-delta shales))

Kaldi, J.G. & C.D. Atkinson (1997)- Evaluating seal potential: example from the Talang Akar Formation, Offshore Northwest Java, Indonesia. In: R.C. Surdam (ed.) Seals, traps and the petroleum system, American Assoc. Petrol. Geol. (AAPG), Mem. 67, p. 85-101.
(Seal potential of various lithologies in U Oligocene Talang Akar Fm in offshore NW Java basin determined by (1) seal capacity (amount of hydrocarbon column height a lithology can support); (2) seal geometry (structural position, thickness and areal extent of seal); and (3) seal integrity. Best seal potential in delta-front shales (high seal capacity, thick, laterally continuous and very ductile))

Kaldi, J.G., D.S. MacGregor & G.P. O'Donnell (1997)- Seal capacity in dynamic petroleum systems: example from Pagerungan gas field, East Java Sea, Indonesia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum System of South East Asia and Australasia, Indon. Petroleum Assoc. (IPA), Jakarta, p. 829-836.
(Seal capacity measurements suggest Ngimbang Shale top seal over Pagerungan Field, E Java Sea, supports maximum gas column of 213 m, but actual gas column is 328 m)

Kaldi, J.G., G.W. OóBrien & T. Kivior (1999)- Seal capacity and hydrocarbon accumulation history in dynamic petroleum systems: the East Java Basin, Indonesia and the Timor Sea region, Australia. Australian Petrol. Prod. Expl. Assoc. (APPEA) J. 39, 1, p. 73-86.
(Seals in E Java Basin dynamic rather than absolute barriers to fluid flow. Data from largest gas field, Pagerungan, suggest dynamically filling and leaking capillary trap, which may have been volumetrically larger in past. Timor Sea Neogene tectonism caused extensional faulting and basin formation. Faulting caused breaching of traps, whereas subsidence in new depocentres was drive for renewed hydrocarbon expulsion and migration, principally gas. In traps with high seal capacities, this charge of gas flushed preexisting oil accumulations. In other cases, breached traps refilled with gas over periods as short as perhaps 2-3 My)

Lunt, P. (2019)- The origin of the East Java Sea basins deduced from sequence stratigraphy. Marine Petroleum Geol. 105, p. 17-31.
(East Java Basin composed of at least six different basinal areas, with unique stratigraphic histories and petroleum systems. Formed as continuation of extension around Makassar Straits, not as back-arc basin. Elongate and anastomosing faults along S edge of extending crust, created unique stratigraphic zone S of Rembang Line Fault. Mid-Oligocene tectonic event created new Sibaru Trough depocentre. Poorly defined Ngimbang Formation should be abandoned)

Magee, T., C. Buchan & J. Prosser (2010)- The Kujung Formation in Kurnia-1: a viable fractured reservoir play in the South Madura Block. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-G-005, 22p.
(Kurnia-1well near S coast Madura island drilled rel tight (basinal?) Kujung Fm limestones, but reservoir potential enhanced by fractures)

Manur, H. & R. Barraclough (1994)- Structural control on hydrocarbon habitat in the Bawean area, East Java Sea. Proc. 23rd Ann. Conv. Indon. Petroleum Assoc. 1, p. 129-144.
(Bawean area two phases, Paleogene rift and Neogene reactivation. Eocene-Oligocene doming and faulting followed by subsidence and tectonic quiescence until E Miocene. NE-SW trending grabens formed in M Eocene

and filled with alluvial clastics, lateritic clays and lacustrine shales (source rocks). Basement onlap began in Late Eocene- E Oligocene with transgressive marine sandstones and limestones including reefs. Paleogene fault zones reactivated in Neogene. Wrench faulting, basin inversion or renewed subsidence from Late Miocene to Recent. Late Miocene structures generally dry, postdate main hydrocarbon generation. Pre-Late Miocene structures more attractive targets)

Matthews, S.J. & P.J.E. Bransden (1995)- Late Cretaceous and Cenozoic tectono-stratigraphic development of the East Java Sea Basin, Indonesia. Marine Petroleum Geol. 12, p. 499-510.
(E Java Sea Basin metamorphic basement, overlain by up to 3 km marine Upper Cretaceous sediments. Contraction and peneplanation of Cretaceous sediments and basement before middle E Eocene produced regional unconformity. E Eocene extension reactivated Cretaceous thrusts. E Eocene- E Oligocene normal faulting pulses, affecting progressively larger area with time. Paleogene fault-controlled sub-basins with fluvial, coastal plain and shelf clastic and carbonate sediments, recording overall transgression. E Oligocene regional subsidence; sediments dominated by deep marine clastics. Regional intra-Oligocene unconformity overlain by Oligocene- lowermost Miocene deep water calcareous mudrocks and limestones, locally onlapping Eocene rocks. Continuous regional subsidence during inversion history, resulting in gradual reversal of depocentre location. Paleogene depocentres became Neogene highs, Paleogene platforms Neogene depocentres. Tertiary structural evolution mainly dip-slip fault movement during extensional and contractional phases. Geometries similar to positive flower structures evolved by reverse reactivation of geometrically complex extensional fault system)

Maulin, H.B., C. Armandita, M.M. Mukti, D. Mandhiri, D. Rubyanto & S. Romi (2012)- Structural reactivation and its implication on exploration play: case study of JS-1 Ridge. Proc. 36th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA12-G-072, p. 1-13.
(JS-1 Ridge in West Madura Offshore area at least three tectonic regimes: Eocene NE-trending extension-rifting, Neogene wrenching and Late Neogene compressional thrust folding. JS-1 Ridge is basement high on basement that probably is Australia-derived microcontinent 'Argoland', accreted to Sundaland in Paleocene. M-Late Miocene uplift in E part of basin, associated with E-W trending, down-to-S normal faults. Further uplift/ N-S compression in Late Miocene-E Pliocene. Most intense deformation in Late Pliocene- E Pleistocene. Main play E-M Miocene Kujung Fm carbonates)

Maulin, H.B., A. Nugraha, C. Sutisna, A. Prasetya, I. Harun, D. Rubyanto & B. Wibowo (2016)- JS-1 Ridge: exploration in ancient melange basement high. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 98-103.
(JS-1 Ridge in Java Sea is NE-tending horst-like structure, formed in Eocene or before, flanked by East Bawean Trough in W and Central Deep in E. Well basement penetrations in N part dominated by basic plutonic rocks (gabbro, basalt, and serpentinite in one well with ~81 Ma Ar/Ar age). Center of JS-1 Ridge composed of metamorphic rocks. In South diorite, volcano-clastics, to altered andesite (Ar/Ar age ~71 Ma). Southernmost area dominated by (meta-)volcanics, also possible Pretertiary sediments. JS1 rocks possibly represent E-M Cretaceous melange)

Maynard, K., M. Decker & W.A. Morgan (2005)- Thorough data acquisition during appraisal mitigates development risk of a thin karst reservoir, Bukit Tua reservoir, East Java, Indonesia. Petrol. Expl. Soc. Great Britain Carbonate Conf., Nov. 2005, p. *(Abstract only)*
(Early Oligocene carbonate reservoir model discrete thin karst zones <30' thick in offshore N Madura Platform wells. Increased permeability associated with karst confined to thin zones, leaving much of matrix with low permeability that is not expected to contribute to reserves. Karst zones exhibit varying degrees of porosity-permeability because of dissolution and probable fracture enhancement and flowed up to 4500 BOD at DST)

Maynard, K. & W.A. Morgan (2005)- Appraisal of a complex, platform carbonate, Bukit Tua discovery, Ketapang PSC, East Java Basin, Indonesia. Proc. 30th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 317-330.

(Bukit Tua 2001 N Madura platform, E Java Sea, oil and gas discovery in 300' section of E Oligocene Ngimbang Fm/ 'CD' platform carbonates on basement, and in overlying Kujung Fm. Many uncertainties remain regarding distribution of facies and porosity. Includes overview of regional setting)

(Miocene unincised and Pleistocene incised valleys imaged on 3D seismic on shelf offshore NW Java)

Posamentier. H.W. (2002)- Ancient shelf ridges- a potentially significant component of the transgressive systems tract: case study from offshore northwest Java. American Assoc. Petrol. Geol. (AAPG) Bull. 86, 1, p. 75-106.
(3-D seismic of Miocene off NW Java shows extensive shelf ridge deposits: linear bodies 0.3 - 2.0 km wide, >20 km long, and up to 17 m high. Features asymmetric, characteristically sharp-edged and thicker on one side.

Shelf ridge deposits tend to be sand prone and overlie ravinement surfaces. Ridges oriented parallel with axes of broad paleoembayments associated with structural fabric of basin. Ridges formed as result of erosion and reworking of sand-prone deltaic and/or coastal-plain deposits by shelf tidal currents, immediately after shoreline transgression. These deposits migrated across ancient sea floor, represent important component of transgressive systems tract, and have significant exploration potential.)

Posamentier, H.W. & P. Laurin (2005)- Seismic geomorphology of Oligocene to Miocene carbonate buildups offshore Madura, Indonesia. Soc. Expl. Geoph. (SEG) 2005 Ann. Mtg., Houston 2005, 4p. *(extended abstract)*
(Buildups N of Madura range from small patch reefs to platforms with outliers, and tide influenced elongate large patch reefs in Kujung 2, Kujung 1, and Wonocolo Fms. Clastic low-angle clinoforms from NNW beween deposition of Kujung 1 and Wonocolo Fms. Post Wonocolo basin subaerially exposed and veneered by fluvial systems. Small Kujung 2 patch-reef buildups <120- 500m wide. Across platform 100's of small circular buildups, with ~25-40m of relief. Larger Kujung 1 patch reefs coalesced to form NW-SE trending platform. Buildups within platform 600m- 2 km diameter and 200-300m thick. Smaller patch reefs 60-120m diameter at tops of buildups. Large build-ups off platform, up to 400m thick with diameters 1- 6.5 km. Anastamosing 200m deep and 650m wide channels normal to platform and terminate at buildup margin. Wonocolo buildups larger than Kujung buildups and have clinoform architecture: circular to elliptical, 4-10 km wide and up to 20 km long, separated by 1.2-2.5 km wide tidal channels)

Posamentier, H.W., P. Laurin, A. Warmath, M. Purnama & D. Drajat (2010)- Seismic stratigraphy and geomorphology of Oligocene to Miocene carbonate buildups offshore Madura, Indonesia. In: W.A. Morgan, A.D. George et al. (eds.) Cenozoic carbonate systems of Australasia, Soc. Sedimentary Geology (SEPM), Spec. Publ. 95, p. 175-194.
(Images of Miocene carbonate landscapes from 3D seismic off N Madura. Buildups range from small patch reefs to platforms with outliers. Tide-influenced elongate large patch reefs in Kujung 2 and K 1 and Wonocolo Fms. Clastics low-angle clinoforms from NNW. Top Wonocolo Fm subaerially exposed and site of densely spaced fluvial systems. Hundreds of small circular buildups of Kujung 2 range from 120-500m in diameter, and 25-40m of relief. Larger circular to elliptical patch reefs of Kujung 1 coalesced to form NW-SE trending platform. Buildups within platform 600m- 2 km wide and 200-300m thick. Smaller patch reefs at tops of buildups. Large buildups form off platform, up to 400m thick, 1-6.5 km wide. Anastamosing channels up to 200m deep and 650m wide, normal to platform. Woncolo buildups larger than Kujung (4-10 km wide, 20 km long), with internal clinoforms and separated from each other by tidal channels 1.2–2.5 km wide)

Posamentier, H.W., W. Suyenaga, D. Rufaida, R. Meyrick & S.G. Pemberton (1998)- Stratigraphic analysis of the Main Member of the upper Cibulakan Formation at E field, offshore northwest Java, Indonesia. Proc. 26th Ann. Conv. Indon. Petroleum Assoc., p. 129-153.
(Amplitudes in Upper Cibulakan Fm at E Field show E-W trending channel, likely deltaic. Biostratigraphic and sedimentologic data indicate open marine channel-fill. Main Member imaging reveals sand fields or patches, interpreted as sand waves migrating across transgressive surface of erosion)

Prasetya, A., S. Romi, A. Yumansa, R. Agustiana, M. Setiawan & I.M. Harun (2017)- An incised valley filled system on a Ngimbang Limestone sequence at JS-1 Ridge, offshore East Java Basin, Indonesia. Proc. 41st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA17-507-G, 19p.
(Seismic evidence of undrilled N-S oriented incised valley in mid-Oligocene at Top Lower Ngimbang Fm carbonate-dominated section on JS-1 Ridge in E Java Sea)

Prasetyo, H. (1992)- The Bali-Flores Basin: geological transition from extensional to subsequent compressional deformation. Proc. 21st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 455-478.
(Young back-arc thrusting N of Bali-Lombok-Flores, showing oceanic crust of Flores basin currently closing)

Prasetyo, H. & B. Dwiyanto (1986)- Single channel seismic reflection study of the eastern Sunda backarc basin, North central Flores, Indonesia. Bull. Marine Geol. Inst. Indonesia 2, 1, p. 3-11.

Prasetyo, H. & L. Sarmili (1994)- Structural and tectonic development of West-East Indonesian backarc transition zone; implications for hydrocarbon prospect. Bull. Marine Geol. Inst. Indonesia 9, 2, p. 23-60.
(W-E Indonesian Backarc Transition Zone (WEIBTZ) in E Sunda Arc System between Makassar Strait to N Bali and to E by NW-SE trending submarine ridge N of Flores. Tectonic phases: 1. Paleocene rifting; 2. M Miocene and younger basement-involved inversion to form 'Sunda Folds', related to collision of Buton micro-continent with Sulawesi arc. 3. Flexure of SE Sunda shield margin to S beneath volcanic ridge; 4. Neogene back arc fold-thrust zone, associated with Australian margin-Banda Arc collision and subduction of Roo Rise oceanic plateau in Sunda Trench S of Bali. Westward transition from well-defined accretionary wedge to fold structural styles indicates W-ward decrease in shortening. Back arc thrusting N of Lombok reflects initial stage of arc polarity reversal, in which oceanic crust of Flores Sea subducted S-ward beneath arc, while Bali Basin represents analog of initial stage of foreland fold-thrust belt. Back arc region of E Sunda arc currently closing)

Prasetyo, H., Y.R. Sumantri, B. Situmorang & S. Wirasantosa (1995)- The 'Doang Borderland System' in the Southeast Sunda Shield margin: implications for hydrocarbon prospect in the eastern Indonesia frontier region. In: Int. Seminar on the sea and its environments, Ujung Pandang 1995, p.
(Seismic, gravity, drill-holes, side-scan seafloor mapping and Airborne Laser Flourescensor data used to determine geologic-tectonic development of "Doang Borderland System", a NE-SW and E-W series of ridges and deep basins in E Sunda Backarc. Basement consists of mixed oceanic, continental and Paleogene volcanic rocks, suggesting multiphase deformation. At least five geologic- tectonic episodes: (1) Some of Pre-Tertiary and economic basement show compressive regime (subduction/ collision); (2) Most of DBS Paleogene extensional regime; (3) extensional regime inverted to form 'Sunda Fold' structures; (4) Flexural downbowing to S of SE Sunda Shield margin (N basin margin) alongN Sunda volcanic ridge; and (5) Backarc fold-thrusting since Neogene, associated with Australian margin- Sunda Arc collision and Roo Rise (oceanic plateau) subduction in Sunda Trench. Back arc portion of the DBS currently closing and will form suture zone in future)

(Brief discussion of bioturbation in M Miocene tide-dominated shoreface to offshore deposits of U Cibulakan Fm B-28 zone of B Field. Common sub-horizontal trace fossils Thalassinoides, Planolites, Chondrites, etc.)

Reksalegora, S.W., Y. Kusumanegara & P. Lowry (1996)- A depositional model for the ñMainò interval, Upper Cibulakan Formation: its implications for reservoir distribution and prediction, ARII ONWJ. Proc. 25th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 163-173.
(Two sandbody types in "Main" interval: (1): sharp-based, bioturbated, glauconitic sandstone, with Glossifungites surface and siderite mudclasts, N-S orientation, 1-2 km wide, 5-8 km long. Sandbodies of same age and similar facies in W Java outcrops pinch out over 500m. Lower bounding contact discordant with underlying interbedded sandstone and mudstone. Sandbody formed in response to sea-level lowstand. (2): middle to lower shoreface "cleaning upward", burrowed sandstone with sharp upper-contact. Lower contact burrowed, siltstones and mudstones. Laterally extensive and correlative over inter-field distances (10's of km).

Reynolds, J.R. (1995)- Northeast Java Basin. In: C. Caughey et al. (eds.) Seismic Atlas of Indonesian Oil and Gas Fields, Vol. 2: Java, Kalimantan, Natuna and Irian Jaya, Indon. Petroleum Assoc. (IPA), Jakarta, p. JAV11-JAV13.
(NE Java basin rel. stable northern platform (Java Sea) and series of deep basins to S (onshore), separated by 30-40 km wide, E-W trending Rembang inversion zone, which includes Madura Island. NE-SW trending Bawean Arch dominant positive feature offshore, which remained emergent from Eocene - E Miocene and was major source of clastic material to nearby depocenters. Smaller offshore highs, like JS-I-1 ridge, trend parallel to arch and separated by grabens and half-grabens with Eocene-Oligocene source rocks. With stratigraphic column and regional seismic line Trembul- Semanggi- Ledok- Kawengan fields)

Roberts, H.H., P. Aharon & C.V. Phipps (1988)- Morphology and sedimentology of *Halimeda* bioherms from the eastern Java Sea (Indonesia). Coral Reefs 6, 3-4, p. 161-172.
(Halimeda bioherms along W and S margins of Kalukalukuang Bank, E Java Sea. Numerous bioherms at N bank, with tops in 30-50m water depth. Fewer and thicker along deeper S margin. No reef-building corals below 15m. Upwelling of cold water and nutrient overloading from Pacific Troughflow water possible explanations for remarkable algal growth at expense of reef-building corals)

Roberts, H.H., C.V. Phipps & L. Effendi (1987)- *Halimeda* bioherms of the eastern Java Sea, Indonesia. Geology 15, p. 371-374.

(Bioherms composed mainly of Halimeda plates on Kalukalukuang Bank, 50-70 km E of central Sunda Shelf. Thickness up to 52m above Top Pleistocene surface. Presence and growth rate possibly related to upwelling of deep, nutrient rich S-moving Pacific Throughflow water from Makassar Strait)

Roberts, H.H., C.V. Phipps & L.L. Effendi (1987)- Morphology of large *Halimeda* bioherms, eastern Java Sea (Indonesia): a side-scan sonar study. Geo-Marine Letters 7, 1, p. 7-14.
(The most extensive, and thickest Halimeda bioherms reported from modern seas are along margins of Kalukalukuang Bank, E Java Sea. Features average 20-30m thick (max. 50m) and developed over large areas by coalescence of individual mounds. Morphologies range from small mounds (10-20m diameter) through hay-stack features (100m diameter) to broad swells. Upwelling of cold, nutritive water responsible for high Halimeda productivity and large bioherm development)

Roe, G.D. & L.J. Polito (1977)- Source rocks for oils in the Ardjuna sub-basin of the Northwest Java basin, Indonesia. In: Proc. Seminar Generation and maturation of hydrocarbons in sedimentary basins, Manila 1977. United Nations ESCAP CCOP Techn. Publ. 6, p. 180-194.

Marine geology/ seismic stratigraphy of SE part of submerged Sunda Shelf, N of E Java and Madura. Multiple Quaternary erosional features resulting from exposure during major sea level lows)

Sutanto, H., N. Andani, J.T. Musu, E.A. Subroto, A. Bachtiar & A.H. Satyana (2016)- Mesozoic-aged oils in the Northeast Java Basin, Indonesia: evidence from triaromatic dinosteroid. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-663-G, 17p.
(High Triaromatic Dinosteroid Index in 3 oil samples from Sepanjang Island 1,3,4 wells, SE of Kangean, may correlate to Cretaceous age, as also supported by previously reported Oleanane Index <20%, which is common for samples from older sources than Cenozoic. 'Supports idea that Cretaceous source rocks were deposited in marine setting while Australia-derived microcontinent was drifting N-ward before it collided with SE margin of Sundaland in Cretaceous' (NB: If 'triaromatic dinosteroid' biomarker indicates Mesozoic and younger marine dinoflagellates and oleanane indicates (Upper) Cretaceous and younger angiosperm land plants, couldn't the low oleanane/ high dinosteroid signify marine Tertiary, not necessarily Cretaceous, source facies?; JTvG))

Sutanto, H. & J.T. Musu (2014)- Application of oleanane and sterane index for biostratigraphic age determination: examples from Kangean oils, Northeast Java Basin. Lemigas Scientific Contr. Petrol. Sci. Techn. 37, 1, p. 15-24.
(NE Java Basin hydrocarbon source rock generally believed to be in Late Eocene- E Oligocene early synrift Ngimbang Fm. Occurrence of Alisporites sp. suggest presence of Cretaceous sediments, which may also be potential source rock. Crude oils from Paleogene Ngimbang Fm in Kangean oil field in offshore NE Java Basin classified as mixed oil, with organic matter from both marine and terrestrial sources, deposited under oxidizing and reducing conditions. Very low oleanane Index (<20%; marker for flowering plants) suggests oils originated from Cretaceous source rock)

Sutanto, H. & J.T. Musu (2015)- Marine depositional environment determination using hydrogen isotopic composition of individual alkanes: case studies from Kangean oils, the Northeast Java basin. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-207, 9p.
(Geochemistry of oils from well in Kangean (Sepanjang) area, Java Sea and Kawengan, NE Java basin. Sepanjang 1, 3 oils may be from mixture of marine and terrestrial kerogens, low oleanane% suggests marine shale source. Kawengan oil clearly terrestrial oil from deltaic source rock)

Sutanto, H., J.T. Musu, A.H. Satyana & A. Bachtiar (2015)- Mesozoic source rocks in Northeast Java Basin, Indonesia: evidence from biomarkers and new exploration opportunities. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-090, 17p.
(Similar to paper above: biomarkers in some oils from Eocene Ngimbang carbonates in Sepanjang Field, SE of Kangean in Java Sea, show stronger marine character and reducing conditions than typical Cenozoic 'Sundaland' oils and also show very low oleanane and sterane indexes, indicating source of oils may be Cretaceous in age. Presence of Lower Cretaceous Alisporites sp. in sediments analyzed, is another indication that there is Cretaceous source in area (proposed to be part of Australian-derived Paternoster-Kangean microcontinent, but Cretaceous marine sediments are also known all around the Sundaland margin; JTvG))

Sutisna, K., H. Samodra & A. Koswara (1993)- Geological map of the Kangean and Sapudi Quadrangle, Java, 1708-4, 1709-3, 1808-4, scale 1:100,000. Geol. Res. Dev. Center, Bandung.
(Kangean and Sapudi islands folded Oligocene-Pliocene sediments, mainly N-dipping. Oldest rocks Late Oligocene Cangkaramaan Fm marls with planktonic forams. Upper part interfingers with Oligo-Miocene Tambayangan (= Kujung) orbitoid limestone. Overlain by E-M Miocene Jukong-Jukong Fm limestone, unconformably overlainby Late Miocene-Pliocene marine Brakas Fm limestone-sandstones)

Sutiyono, S. (2009)- Reservoir water saturation and permeability modeling in the Pangkah Field. Proc. 33rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA09-G-022, p. 1-8.
(Ujung Pangkah Field is 1998 discovery in E Miocene platform margin carbonate reef build-up, offshore NE Java, in front of present day Solo river delta. Main producing Kujung-I Fm is complex carbonate reservoir. Paper is on initial petrophysical models to calculate water saturation and permeability)

Tognini, P., A.J. Bromley & N. Khifni (2007)- An alternative view on the existence of an effective petroleum system in the Bali-Lombok area. SEAPEX Exploration Conf. 2007, Singapore, 29p. *(Abstract + Presentation)*
(Bali-Lombok area water depth 200-1000m and extension of E Java Basin. Gravity data suggest thick Tertiary depocentre; part of Paleocene and M Eocene rift system that developed between. Two stage rift model that progressed from E to W. Marine transgression progressed from SE to NW. By end M Eocene Bali-Lombok area fully marine. By Late Eocene deep marine environment while areas to N had just been transgressed. Potential lacustrine and paralic source rocks only in Paleocene- E Eocene. Geochemical evidence of migrated hydrocarbons in dry wells. Basin modeling shows Paleocene- E Eocene source rock reached peak oil by end Eocene, so only Late Eocene- earliest Oligocene structures reasonable chance of capturing hydrocarbons)

Tonkin, P.C. (1995)- Determination of permeability in sandstone reservoirs affected by diagenetic kaolinite, Cinta Field, Southeast Sumatra. Proc. 24th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 45-59.
(Sunda Basin Cinta Field produces from Late Oligocene Talang Akar Fm sandstones and overlying Baturaja Fm reefal carbonates. Sandstones frequently large amounts of pore-filling kaolinite, from breakdown of potassium feldspars from volcanic detritus)

Tonkin, P.C. & R. Himawan (1999)- Basement lithology and its control on sedimentation, trap formation and hydrocarbon migration, Widuri-Intan oilfields, SE Sumatra. J. Petroleum Geol. 22, 2, p. 141-165.
(Widuri-Intan fields in NW Asri Basin produced ~310 MB Oil from Late Oligocene Talang Akar Fm fluvial-deltaic sandstones. Oil in structural and stratigraphic traps in sinuous-meandering channel sandstones. Reservoir sands interbedded with mudstone and coal and overlie Cretaceous basement rocks. Basement lithologies: (1) hornblende granodiorite; (2) metamorphic rocks (mainly mica schist); (3) plugs of metabasalt and related volcanic rocks; (4) dolomitic limestone. Basement topography influenced subsequent distribution of

fluvial channels and sand pinch-outs. Faults controlled by basement lithology, especially at boundaries of intrusives. NW-SE shear zone offset basement between main Widuri and Intan fields. Lidya field reservoir pinch-out onto eroded areas of basement silicification along shear zone. Drape and compaction over eroded volcanic plugs enhanced structural-stratigraphic plays. Reservoir at Indri field underlain by dolomitic limestone and exhibits karst sinkhole and collapse structures)

Camus, G., A. Gourgaud, P.C. Mossand-Berthommier & P.M.Vincent (2000)- Merapi (Central Java, Indonesia): an outline of the structural and magmatological evolution, with a special emphasis to the major pyroclastic events. J. Volcanology Geothermal Res. 100, p. 139-163.

(Merapi Volcano history four periods: Ancient (40,000- 14,000 yrs BP), Middle, Recent (starting at 2200 yrs BP) and Modern Merapi (since eruption of 1786). Mount St. Helens-type edifice collapse during Middle Merapi stage between 6700- 2200 y BP. During Recent Merapi stage, violent magmatic to phreatomagmatic eruptions twice interrupted growth of volcano. Modern Merapi characterised by persistent growth of summit dome, y interrupted by collapses of dome to generate frequent Merapi-type nuees ardentes (blocks-and-ash flows and associated surges). Previous stages characterised by long lava flows, alternating with violent explosive phases. Merapi lavas calc-alkaline, with ~50-60% SiO2. 90% of Merapi lavas high-K basaltic andesites)

Camus, G., A. Gourgaud & P.M. Vincent (1987)- Petrologic evolution of Krakatau (Indonesia): implications for a future activity. J. Volcanology Geothermal Res. 33, p. 299-316.
(Krakatau Volcano in Sunda straits characterized by phases, each beginning with construction of cone and ending with destruction and formation of caldera. Two last (pre- and post-1883) cycles well known, but older ones not clearly defined. Lava evolution shows cyclicity tied structural evolution, from basalts to basic andesites, acid andesites to dacites. Destructive stages correspond to dacitic terms. Anak Krakatau from 1927-1979 characterized by basalts and basic andesites, 1981 eruption close to dacitic)

Claproth, R. (1988)- Petrography and geochemistry of volcanic rocks from Ungaran, Central Java, Indonesia. Ph.D. Thesis, University of Wollongong, p. 1-500.
(online at: http://ro.uow.edu.au/theses/1398/)

(Ungaran volcano, C Java, forms part of second of three cycles of volcanism recognized on Java and was active between Late Pliocene- Late Pleistocene. Three stages of growth, interrupted episodes of cone collapse. Lavas are basalts, basaltic andesites and andesites. Most basalts are shoshonites, andesites are high-K calcalkaline. Shoshonitic rocks dominated early stages of activity. Low Mg-numbers indicate basalts crystallized from derivative melts, and do not represent mantle-derived magma)

Gerbe, M.C., A. Gourgaud, O. Sigmarsson, R. Harmon, J.L. Joron & A. Provost (1992)- Mineralogical and geochemical evolution of the 1982-1983 Galunggung eruption (Indonesia). Bull. Volcanology 54, 4, p. 284-298.
(Pyroclastic deposition of 1982-1983 eruption of Galunggung, W Java, lasted 9 months, with diversity of eruptive style, and progressive evolution from andesite (58 wt.% SiO2) to high-Mg basalt (47 wt.% SiO2). Galunggung basalts most primitive basalts known from W Java, with phenocrysts of olivine, diopside, etc.)

Gertisser, R., S.J. Charbonnier, V.R. Troll, J. Keller, K. Preece, J.P. Chadwick, J. Barclay & R.A. Herd (2011)- Merapi (Java, Indonesia): anatomy of a killer volcano. Geology Today 27, 2, p. 57-62.
(Merapi is Indonesia's most dangerous volcano. Over past two centuries volcanic activity dominated by prolonged periods of basaltic andesite lava dome growth and intermittent dome failures to produce pyroclastic flows every few years. Explosive eruptions, such as in 2010, more common in pre-historic time. Calc-silicate xenoliths brought up by Merapi magmas indicate assimilation of carbonate rocks from sub-volcanic basement)

Gertisser, R., S.J. Charbonnier, J. Keller & X. Quidelleur (2012)- The geological evolution of Merapi volcano, Central Java, Indonesia. Bull. Volcanology 74, 5, p. 1213-1233.
(Eight main volcano stratigraphic units distinguished in Merapi volcano of C Java, linked to three main evolutionary stages:Proto-Merapi, Old Merapi and New Merapi. Construction of Merapi complex began after 170 ka. Proto-Merapi volcanic edifices Gunung Bibi (109±60 ka) in NE and Gunung Turgo and Gunung Plawangan (~138, 135 ka) in S. Old Merapi started to grow at ~30 ka as stratovolcano of basaltic andesite lavas and pyroclastic rocks and was destroyed by flank failure after 4.8±1.5 ka. Shift from medium-K to high-K character of volcanics at ~1900 years BP)

Gertisser, R. & J. Keller (2003)- Temporal variations in magma composition at Merapi Volcano (Central Java, Indonesia): magmatic cycles during the past 2000 years of explosive activity. J. Volcanology Geothermal Res. 123, p. 1-23.

(Merapi Volcano in C Java frequently active in M-Late Holocene time, producing basalts and basaltic andesites of medium-K composition in earlier stages of activity and high-K magmas from ~1900 BP to present. Periods of high eruption rates alternate with shorter time spans of reduced eruptive frequency since first appearance of high-K volcanic rocks. Cyclic variations result from interplay of several magmatic processes)

Gertisser, R. & J. Keller (2003)- Trace element and Sr, Nd, Pb and O isotope variations in medium-K and high-K volcanic rocks from Merapi volcano, Central Java, Indonesia: evidence for the involvement of subducted sediments in Sunda Arc magma genesis. J. Petrology 44, 3, p. 457-489.
(online at: http://petrology.oxfordjournals.org/content/44/3/457.full.pdf+html)
(Merapi Holocene basalts-andesites medium-K affinity, high-K over past 1900 yrs, largely reflecting variable contributions from subducted sediment to mantle wedge which was similar to MORB-source mantle before subduction-related modification)

Giachetti, T., R. Paris, K. Kelfoun & B. Ontowirjo (2012)- Tsunami hazard related to a flank collapse of Anak Krakatau Volcano, Sunda Strait, Indonesia. In: J.P. Terry & J. Goff (eds.) Natural hazards in the Asia-Pacific region, Geol. Soc., London, Spec. Publ. 361, p. 79-90.
(Anak Krakatau volcano built on steep NE wall of 1883 Krakatau eruption caldera, and active on SW side, which makes edifice unstable. Hypothetical 0.280 km3 flank collapse directed SW-wards would trigger initial wave 43m in height that would reach islands of Sertung, Panjang and Rakata in <1 min, with amplitudes from 15-30m. Waves would propagate across Sunda Strait, at 80-110/ hour. Tsunami would reach cities on Java W coast (Merak, Anyer, Carita) 35-45 min after onset of collapse, with amplitude from 1.5-3.4m)

Gourgaud, A., J.C. Thouret & J.L. Bourdier (2000)- Stratigraphy and textural characteristics of the 1982-83 tephra of Galunggung volcano (Indonesia): implications for volcanic hazards. J. Volcanology Geothermal Res. 104, p. 169-186.
(online at: https://hal-insu.archives-ouvertes.fr/hal-00093118/document)
(Galunggung volcano in W Java 9-month-long eruption in 1982-83 with phreatomagmatic phase with ash columns 20 km high. Magma composition evolved from andesite to primitive magnesian basalt and progressive increase of ratio of xenoliths versus juvenile magma before increase of explosivity)

Abdurrachman (2014)- Insights from Pb and O isotopes into along-arc variations in subduction inputs and crustal assimilation for volcanic rocks in Java, Sunda arc, Indonesia. Geochimica Cosmochimica Acta 139, p. 205-226.
(New Pb isotope data for volcanoes across Java (Gede, Salak, Galunggung, Merbabu, Merapi, Ijen). Negative correlation between Pb isotopes and SiO2, combined with mantle-like δ18O values in Gede explained by assimilation of-primitive arc rocks and/or ophiolitic crust known to outcrop in West Java. Peak in δ18O whole-rock and mineral values in C Java volcanic rocks (Merbabu and Merapi) combined with along-arc trends in Sr isotope ratios suggest different or additional crustal assimilant of C Java volcanic rock, likely carbonate material. Strong E-to-W Java variations in Ba concentration attributed subducted source input)

Handley, H.K., J.P. Davidson, C.G. Macpherson & J.A. Stimac (2008)- Untangling differentiation in arc lavas: constraints from unusual minor and trace element variations at Salak Volcano, Indonesia. Chemical Geology 255, p. 360-376.
(Volcanic rocks from Salak Volcano, W Java show different minor and trace element geochemistry between central vent group lavas and rocks erupted at side vents)

Handley, H.K., C.G. Macpherson, J.P. Davidson and R. Gertisser (2006)- Along-arc heterogeneity in crustal architecture and subduction input at the Sunda arc in Java, Indonesia. Geochimica Cosmochimica Acta 70, 18, Suppl. 1 (Goldschmidt Conf. Abstracts), p. A227.
(Sunda Arc lavas across Java. Sr ratios increase from Krakatau in W to Merapi in C Java, but lower further E. Correlation between Sr ratio and volcano summit elevation indicates relation to lithospheric thickness. Other isotope ratios for W Java volcanics consistent with incorporation of subducted sediment dominated by terrigenous component. E Java volcanics greater involvement of subducted pelagic sediment and stronger slab-fluid imprint. Along-arc variation reflects decreasing thickness of turbidite deposits on down-going Indian Ocean lithosphere from Sumatra to Java)

Handley, H.K., C.G. Macpherson, J.P. Davidson, K. Berlo & D. Lowry (2007)- Constraining fluid and sediment contributions to subduction-related magmatism in Indonesia: Ijen Volcanic Complex. J. Petrology 48, 6, p. 1155-1183.
(Ijen Volcanic Complex in E Java on thickened oceanic crust. Caldera complex 20 km wide with 22 post-caldera eruptive centers. 'Old Idjen' volcanics unconformable on Miocene limestone. Lavas geochemistry suggest least contaminated mantle wedge source analysed in region. Indian-type mid-ocean ridge basalt (I-MORB) -like fertile mantle wedge first infiltrated by minor fluid from altered oceanic crust, prior to addition of <1% subducted Indian Ocean sediment (pelagic ooze and Mn-nodules))

Handley, H.K., C.G. Macpherson & J.P. Davidson (2010)- Geochemical and Sr-O isotopic constraints on magmatic differentiation at Gede Volcanic Complex, West Java, Indonesia. Contrib. Mineralogy Petrology 159, p. 85-98.

Handley, H.K., M. Reagan, R. Gertisser, K. Preece, K. Berlo, L.E. McGee, J. Barclay & R. Herd (2018)- Timescales of magma ascent and degassing and the role of crustal assimilation at Merapi volcano (2006-2010), Indonesia: constraints from uranium-series and radiogenic isotopic compositions. Geochimica Cosmochimica Acta 222, p. 34-52.
(Isotopic data sets from 2006 and 2010 eruptions at Merapi volcano,C Java, indicate relatively rapid ascent of more undegassed magma responsible for more explosive behaviour in 2010)

Handley, H.K., S. Turner, C.G. Macpherson, R. Gertisser & J.P. Davidson (2011)- Hf-Nd isotope and trace element constraints on subduction inputs at island arcs: limitations of Hf anomalies as sediment input indicators. Earth Planetary Sci. Letters 304, p. 212-223.
(New Nd-Hf isotope and trace element data for Javanese volcanoes, Hf anomaly variation may be controlled by fractionation of clinopyroxene or amphibole and does not represent magnitude or type of subduction input in some arcs)

Handini, E., T. Hasenaka, A. Harijoko & Y. Mori (2017)- Variation of slab component in ancient and modern Merapi products: a detailed look into slab derived fluid fluctuation over the living span of one of the most active volcanoes in Sunda Arc. J. Applied Geology (UGM) 2, 1, p. 1-14.
(online at: https://jurnal.ugm.ac.id/jag/article/view/30253/18263)
(Holocene eruptions of Merapi medium-K calc alkaline before 1900 years ago and high-K after that. Change attributed to increasing sediment input as volcano matures. Ancient Merapi sample higher input of slab derived fluid (1.5 % of sediment derived fluid) than 2006 eruption of Modern Merapi, opposite of suggested trend)

Harijoko, A., R. Uruma, Wibowo, E. Haryo, L.D. Setijadji, A. Imai, K. Yonezu & K. Watanabe (2016)- Geochronology and magmatic evolution of the Dieng volcanic complex, central Java, Indonesia and their relationships to geothermal resources. J. Volcanology Geothermal Res. 310, p. 209-224.

(Dieng volcanic complex three volcanic episodes: pre-caldera (>1 Ma), second (0.3-0.4 Ma) and youngest (after 0.27 M). Each episode distinct differentiation trends, indicating multiple shallow magma chambers)

Harmon, R.S. & M.C. Gerber (1992)- The 1982-83 eruption at Galunggung Volcano, Java (Indonesia): oxygen isotope geochemistry of a chemically zoned magma chamber. J. Petrology 33, 3, p. 585-609.
(Mt Galunggung in SW Java erupted four times in last two centuries. During most recent event in 1982-1983 305 million m3 of medium-K, calc-alkaline magma s erupted. Composition changed gradually during eruption from initial plagioclase (An60-75) and two-pyroxene andesites with ~58% SiO2 to final plagioclase (An85-90), diopside, and olivine (Fo85-90) bearing primitive magnesium basalts with ~47% SiO2. Eruption progressively tapped and drained magma chamber chemically stratified through extensive crystal fractionation)

(online at: http://journals.ums.ac.id/index.php/fg/article/view/1822/1274)
(Lahar term for rapidly flowing, high-concentration, poorly sorted sediment-laden mixtures of rock debris and water from a volcano. Resulting deposits poorly sorted, massive, made up of clasts (mainly volcanics) in mud-poor matrix Lahars may be direct result of eruptive activity or not temporally related to eruptions. Etc.)

Lavigne, F., J.C. Thouret, B. Voight, H. Suwa & A. Sumaryono (2000)- Lahars at Merapi volcano, Central Java: an overview. J. Volcanology Geothermal Res. 100, p. 423-456.
(Merapi volcano in C Java, is one of most active volcanoes in world. At least 23 of 61 reported eruptions since mid-1500s produced lahar deposits. Combined lahar deposits ~286 km2 on flanks and surrounding areas. Lahars commonly triggered by rainfalls of ~40mm in 2 hrs. Average velocities 5-7 m/s at 1000m)

Leterrier, J., Y.S. Yuwono, R. Soeria-Atmadja & R.C. Maury (1990)- Potassic volcanism in Central Java and South Sulawesi, Indonesia. J. Southeast Asian Earth Sci. 4, 3, p. 171-187.
(Neogene- Quaternary K-rich volcanics from back-arc of C Java and S Sulawesi 3 series: (1) silica-saturated or oversaturated potassic (SK); (2) weakly silica-saturated alkaline potassic (Muria 1, Genuk in Java; Baturape Fm, Cindako Fm, Camba 2a Fm and part of Lompobatang stratovolcano, S Sulawesi); and (3) silica-undersaturated ultrapotassic, usually leucite-bearing (Muria 2, Bawean in Java; Camba 2b Fm, Sopeng I Fm in Sulawesi). Rocks compatible with subduction-related environment, but in S Sulawesi emplacement post-dates latest known subduction. In C Java do not fit with model of increasing K2O with depth of Benioff plane, and location of UK series is independent from latter (Quaternary UK Series on Bawean away from 600 km isobath). Prefer genetic model for K-rich volcanic series by melting of mantle sources enriched in incompatible elements during previous subduction events, and possibly involving contribution of subcontinental mantle (C Java))

Maaskant, A. (1940)- Onderzoek van de plagioklasen uit de Krakatau-asch van 1883. Geologie en Mijnbouw, n.s., 2, 8, p. 160-167.

Nomanbhoy, N. & K. Satake (1995)- Generation mechanism of tsunamis from the 1883 Krakatau eruption. Geophysical Research Letters 22, 4, p. 509-512.
(Three models previously proposed for large tsunami generated by 1883 eruption of Krakatau: (1) large-scale caldera collapse of N part of Krakatau Island; (2) emplacement of pyroclastic flow deposits; (3) submarine explosion. Modeling suggests all three models displace same volume of water (11.5 km^3), but in different ways. Submarine explosion model of 1-5 min duration best explains generation of largest tsunami)

Nossin, J.J., R.P.G.A. Voskuil & R.M.C. Dam (1996)- Geomorphologic development of the Sunda volcanic complex, West Java, Indonesia. Int. Inst. Aerospace Survey and Earth Sciences (ITC) Journal, 1996, 2, p. 157-165.
(Sunda volcanic complex near Bandung characterized by one active volcano, Tangkuban Perahu, set in large caldera of former Sunda volcano. Another group of volcanoes to E (Bukittunggul-Manglayang complex) structurally related to Sunda complex. Sunda volcano blew up in probably two cataclysmic episodes and collapsed to leave caldera in which Tangkuban Perahu volcano arose)

Oba, N., K. Tomita & M. Yamamoto (1992)- An interpretation of the 1883 cataclysmic eruption of Krakatau from geochemical studies on the partial melting of granite. GeoJournal 28, 2, p. 99-108.
(Pumice from 1883 Krakatau eruption very different from other volcanics of Krakatau group, which are tholeiitic. Fragments of granitic rock in pumice flow are similar to W Malayan granites, and must have been captured by magma from underlying complex. Sialic crustal materials may have plunged into depths and partially melted to produce magma of granitic composition and mixed with ascending basaltic magma from upper mantle to produce pumice of dacitic composition)

Oba, N., K. Tomita, M. Yamamoto, S. Bronto, M. Istidjab, A. Sudradjat & T. Suhanda (1983)- Geochemical study of some volcanic products from Galunggung volcano, West Java. Reports Fac. Science, Kagoshima University (Earth Sci. & Biol.), 16, p. 1-20.
(online at: http://ir.kagoshima-u.ac.jp/bitstream/10232/5937/1/AN00040884_1983_001.pdf)
(Volcanic products of 1982 Galunggung eruptions range in chemical composition from basaltic andesite to basalt. Silica-contentof first stage (April 5-8 of 1982) ~55 wt %, later stages ~50%)

Oba, N., K. Tomita, M. Yamamoto, M. Istidjab, M. Badruddin, M. Parlin, Sadjiman, A. Djuwandi, A. Sudradjat & T. Suhanda (1983)- Geochemical study of lava flows, ejecta and pyroclastic flows from the Krakatau group, Indonesia. Reports Fac. Science Kagoshima University 15, p. 21-41.
(online at: http://ir.kagoshima-u.ac.jp/bitstream/10232/5932/1/AN00040884_1982_002.pdf)
(Rocks and ejecta of Anak Krakatau almost same lithologic and geochemical characteristics of island arc basaltic andesites. New volcanic ash different, more basic in composition. Volcanic rocks from Rakata three types: augite-hypersthene andesite, augiteandesite and olivine basalt. Pyroclastic flow from 1883 eruption, characterized by a large amount of volcanic glass and high-contents of SiO2, Na2O and K20 and low MgO, FeO and CaO; lithologically andesitic and geochemically dacitic. Granitic xenoliths of quartz monzonite in pyroclastic flow of Sertung)

Oba, N., K. Tomita, M. Yamamoto, M. Istidjab, A. Sudradjat & T. Suhanda (1986)- Geologic significance of granitic fragments found from pumice flow of 1883 eruption at the Krakatau Group, Indonesia. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 51-68.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986005.pdf)
(Pumice flow of 1883 Krakatau eruption at Rakata Kecil and Sertung differs from other volcanics of Krakatau Group which belong to Miyashiro's (1974) tholeiitic series. With lithic fragments of granitic rock (quartz monzonite- quartz monzodiorite; up to 30cm in size) similar in compositions to W Malay Peninsula granites. Granitic clasts presumably from underlying sialic crustal material at depth of Sunda Straits)

Supriyadi, B. (1992)- Peranan wrench fault pada akumulasi hidrokarbon di Pulau Madura. Proc. 21st Ann. Conv. Indon. Assoc. Geol. (IAGI), Yogyakarta, 1, p. 207-222.
('The role of wrench faults for hydrocarbon accumulation in Madura Island'.Madura Island >100 wells drilled since 1897 (most of them shallow). Deformed by reactivation of basement faults in early M Miocene, indicating start of wrench faulting. Later compression accelerated wrench faulting in Plio-Pleistocene. Hydrocarbons generated in Late Miocene in Ngimbang Fm, then migrated through wrench faults into younger horizons)

Surjaudaja, R., A.M. Ramdhan & I. Gunawan (2017)- Analisis mekanisme terjadinya tekanan-luap dan prediksi tekanan pori pada lapangan BD, Cekungan Jawa Timur. Bulletin of Geology (ITB) 1, 2, p. 85-93.
(online at: http://buletingeologi.com/index.php/buletin-geologi/issue/view/3/Paper-2)
('Analysis of mechanisms of overpressure and pore pressure prediction in the BD field, East Java basin'. Study of overpressure in Plio-Pleistocene deposits at BD field, Madura Straits. Main cause of overpressure is sediment loading, not smectite-illite transformation or hydrocarbon generation)

Surjono, S.S. & M. Gunawan (2018)- Onshore- offshore facies change of Ngrayong Sandstone in Madura area, Indonesia. ASEAN Engineering J. 8, 2, e-ISSN 2586-9159, p.1-15.
(online at: http://www.aseanengineering.net/aej/issue/2018-v8-no2/GeoE028_Formatted%20manuscript.pdf)
(M Miocene Ngrayong sandstone in NE Java basin clean sand facies and best reservoir. Reservoir quality decreases E-ward to Madura island, where more calcareous and shale. Ngrayong Sst evenly distributed across Madura Island and continues South into Madura Straits for 25-50 Km and 100-125 Km to E (well data). Facies changes more calcareous to E, and more shaly to South due to deeper marine environment)

Susilohadi (1998)- Quaternary sequence stratigraphy of Madura Strait, Indonesia. Proc. 33rd Sess. Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Shanghai 1996, 2, p. 362-383.
(Madura Strait characterized by syndepositional folding forming W-E trending basin between Madura and Java volcanoes. Basin with rapid subsidence and >200m of Quaternary deposits. Deposition interplay between Quaternary coarse-grained volcaniclastics deposition in S, marine fossiliferous mudstone from exposed Madura in N, and Quaternary sea level changes. During major sea level fall, E Kendeng zone and Madura Strait subaerially exposed, as shown by widespread thin fluvial and alluvial fan deposits)

Sutadiwiria, G. & H. Prasetyo (2006)- Uncertainty in geophysic-geology-reservoir modelling for Globigerinid sand carbonate in NE-Java Basin, Indonesia; case study: planning vs. actual of fields development at Madura Strait, Indonesia. In: Soc. Petrol. Engineers (SPE) Asia Pacific Oil & Gas Conference and Exhibition, Adelaide 2006, SPE 100957-MS, 6p. *(Extended Abstract)*

(In NE Java Basin Pliocene Mundu Fm Globigerinid sands carbonate with oil and gas MDA, TSB, O and M fields. Problems in reserves assessment include reservoir compartmentalization (structural and stratigraphic) variations in depth of fluids contacts, low-resistivity case in clean-oil zones, etc.)

Triyana, Y., G.I. Harris, W.A. Basden, E. Tadiar & N.C. Sharp (2007)- The Maleo Field: an example of the Pliocene *Globigerina* bioclastic limestone play in the East Java Basin, Indonesia. Proc. 31st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA07-G-115, p. 45-61.
(Maleo field 2002 discovery in Madura Straits. Gas column 49m in E Pliocene Mundu and M-L Pliocene Paciran (Selorejo) carbonates, consisting almost entirely of planktonic Globigerina shells. Structure partly filled 4-way closure. Gas ~99% methane, primarily biogenic. Lime mud matrix % primary control on reservoir quality. Porosity up to 60%. Globigerina carbonates deposition in ~150-250m deep water, possibly on detached platform. Some oil production from Globigerina reservoirs onshore. Maleo first offshore discovery of this reservoir type to be commercialized)

Wahab, A. & A. Suseno (1990)- Madura, land of opportunity. Geologi Indonesia (J. Indon. Assoc. Geol. IAGI) 13, 2, p. 33-46.

Wijaya, P.H. & D. Noeradi (2010)- 3D properties modeling to support reservoir characteristics of W-ITB Field in Madura Strait area. Bull. Marine Geol. 25, 2, p. 77-87.
(online at: http://ejournal.mgi.esdm.go.id/index.php/bomg/article/view/27/27)
(W-ITB gas field (not real name?) in W part of Santos Sampang PSC, NW Madura Straits, discovered in 2006. In W-ITB 1 well gas reservoirs in Selorejo and Mundu Fms, but in W- ITB 2 no gas reservoir in Mundu Fm)

IV. BORNEO (KALIMANTAN & NORTH BORNEO)

IV.1. Kalimantan/ Borneo General

Abidin, H.Z. (1996)- Hydrothermal fluid constraints on the Muyup gold deposit, East Kalimantan. J. Geologi Sumberdaya Mineral 6, 53, p. 2-8.
(Muyup gold prospect in NE part of SW-NE trending Miocene East-Central Kalimantan Volcanic belt)

Abidin, H.Z. (1996)- Petrology and geochemistry of volcanic and subvolcanic rocks from the Muyup gold prospect: implications for the tectonic development of the east Central Kalimantan volcanic belt. J. Geologi Sumberdaya Mineral 6, 57, p. 2-9.
(Muyup gold prospect in Latest Oligocene- M Miocene Muyup Volcanics at W margin Kutai Basin. Tied to SE-ward subduction of Proto-South China Sea plate under Borneo. Rel. high K content, and classified as shoshonitic and basaltic members of island arc calk-alkaline suite)

Abidin, H.Z. (1998)- The tectonic history and mineral deposits of the east-Central Kalimantan volcanic belt, Indonesia; a comparative study of the Kelian, Muyup and Masa Ria gold deposits. Ph.D. Thesis University of Adelaide, p. 1-286.
(online at: https://digital.library.adelaide.edu.au/dspace/handle/2440/19144)
(East-Central Kalimantan Early Miocene volcanic belt as result of subduction of South China Sea plate below Kalimantan. Andesitic and dacitic volcanics host several gold deposits in Kutai Basin (Kelian, Muyup) and Barito basin (Masupa Ria), all low sulphidation epithermal types)

Abidin, H.Z. (1998)- Mineralization and alteration of the Kelian gold deposit, East Kalimantan. J. Geologi Sumberdaya Mineral 8, 76, p. 2-10.
(Kelian gold deposit in E-C Kalimantan Volcanic Belt is low sulphidation epithermal gold deposit, genetically associated with Miocene volcanic and subvolcanic rocks. Mineralization consists of disseminations and stockworks, with minor sulphide veins. Mineralization generally at contact between andesite intrusives and (Eocene) pyroclastics. Several types of wallrock alteration)

Abidin, H.Z. (1998)- The genesis of Muyup gold prospect, East Kalimantan. J. Geologi Sumberdaya Mineral 8, 81, p. 10-22.
(Muyup small low sulphidation gold deposit discovered in mid-1980's in W part of Kutai Basin, hosted in Eocene Pamaluan Fm clastics. Associated with Muyup Volcanics of latest Oligocene- E Miocene East-Central Kalimantan Volcanic belt)

Abidin, H.Z. (1998)- Mineralization and alteration of the Masupa Ria gold prospect, East Kalimantan. J. Geologi Sumberdaya Mineral 9, 88, p. 16-27.
(Masupa Ria small gold deposit discovered in mid-1970's in East Central Kalimantan Volcanic Belt, ~150 km WSW of Kelian. Associated with E Miocene? volcanics and intrusions. Several ore bodies, mainly at contact between intrusive and volcanic rocks. Ore mineral mainly pyrite, sphalerite, chalcopyrite, stibnite and gold. (see also Thompson et al 1992))

Abidin, H.Z. (2001)- Iron oxides associated with the ultramafic rocks, Mt.Kukusan area, South Kalimantan. Indonesian Mining J. 7, 2, p. 14-23.

Abidin, H.Z. (2004)- Gold mineralization at the Pantain Bancah prospect, Pelaihari District, South Kalimantan. Majalah Geologi Indonesia (IAGI) 19, 2, p. 106-116.
(Gold prospect in S Meratus Mts)

Abidin, H.Z. & A.S. Hakim (2001)- Dismembered ophiolite complex in Mt. Kukusan Area, Batulicin District, South Kalimantan: synthetic origin and economic important. Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 28, p. 75-88.
(Kukusan area, E of Meratus Mts, SE Kalimantan, dismembered ophiolite complex with ultramafic rocks, chert and volcanic flows. Ultramafic rocks dominate and consist of dunite, serpentinite, harzburgite. Reddish chert

outcrops in N area, formed in deep sea environment and structural contact with ultramafics. Origin of Kukusan ophiolite complex still controversial (obduction or plutonic intrusion, may be result of Oligocene W-ward obduction of E Sulawesi ophiolite and Miocene- Pliocene collision of Sula micro continents)

Abidin, H.Z. & B.H. Harahap (1996)- Geochemistry of young volcanic rocks from the Kelian gold prospect, East Kalimantan. J. Geologi Sumberdaya Mineral 6, 60, p. 2-8.
(Kelian area in W Kutai basin in E Kalimantan, with Oligocene-Miocene volcanics of volcanic arc character and Pleistocene volcanics of non-orogenic character, similar to Oceanic Island Basalt but probably related to period of uplift and continental rifting volcanism within Sundaland)

Abidin, H.Z., P.E. Pieters & D. Sudana (1993)- Geology of the Long Pahangai Sheet, 1716, Kalimantan 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.
(C Kalimantan map sheet, showing Permo-Triassic(?) Busang Complex granite-gabbro and metamorphic rocks, overlain by folded Cretaceous Selangkai Gp sediments, unconformably overlain by near-horizontal Late Eocene sediments. In N Embaluh melange composed of imbricated Late Cretaceous- Paleocene-Eocene sediments and some Danau ultramafics. Late Oligocene- E Miocene Sintang andesite intrusives, etc.)

Abidin, H.Z. & E. Rusmana (1997)- Petrology and geochemistry of the Tertiary volcanic/sub volcanic rock from the Masupa Ria Gold prospect, East Kalimantan. Proc. 26th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. 237-253.
(Masupa Ria gold prospect in E-C Kalimantan volcanic belt. Volcanics High-K calk-alkaline island arc volcanism as result of subduction of S China Sea plate under Kalimantan in Late Oligocene (~24.4 Ma))

Abidin, H.Z. & Sukardi (1997)- Geochronology and geology of the East-Central Kalimantan volcanic belt, Indonesia. J. Geologi Sumberdaya Mineral 7, 64, p. 17-27.
(NE-SW trending, ~400 km long belt of calk-alkaline volcanics with gold mineralization across C and E Kalimantan. K-Ar ages of andesites at Kelian, Muyup and Masupa Ria gold prospects from ~14.2- 24.6 Ma (E-M Miocene). Quaternary basalt and dacite at Kelian 1.53- 0.97 Ma (Pleistocene). Late Oligocene-Miocene volcanism related to subduction of S China Sea plate under N Borneo margin of Sundaland basement complex)

Advokaat, E.L., N.T. Marshall, S. Li, W. Spakman, W. Krijgsman & D.J.J. van Hinsbergen (2018)- Cenozoic rotation history of Borneo and Sundaland, SE Asia revealed by paleomagnetism, seismic tomography, and kinematic reconstruction. Tectonics 37, 8, p. 2486-2512.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2018TC005010)
(Paleomagnetic data from Kutai basin show Borneo underwent ~35° CCW rotation in Late Eocene and additional ~10° CCW rotation since E Miocene. How rotation was accommodated relative to Sundaland not clear. Late Eocene- E Oligocene rotation possibly driven by change in motion of Australia relative to Eurasia, from E-ward to N-ward, which also led to initiation of subduction along E Sunda trench and proto-South China Sea to S and N of Borneo, respectively)

Albrecht, J.C.H. (1946)- Contributions to the geology of the region between Soengai Klindjau and Soengai Belajan, Northern Koetai, Borneo. Ph.D. Thesis Universiteit van Utrecht, Kemink, Utrecht, p. 1-115.
(Study of samples collected by Witkamp 1922-1925 from NW edge of Kutai Basin and adjacent Pretertiary basement outcrops. Oldest rocks 'Old Slates' (?Devonian and younger), overlain by Danau Fm (Permo-Carboniferous and U Triassic). Unconformably overlain by Lower Tertiary clastics with Eocene limestones with Pellatispira, Biplanispira and Nummulites. Illustrations of deep marine trace fossils Helminthoida, Palaeodictyon spp., etc. from E Tertiary platy marls at L. Atan)

AMDEL (1983)- K-Ar geochronology of five hornblendes from South Kalimantan. Geol. Res. Dev. Centre, Bandung, p. *(Unpublished)*
(Heryanto & Panggabean 2004: Includes 113 ± 1 Ma age for hornblende schist from Aranio River, Meratus Range, SE Kalimantan)

Amiruddin (1989)- The preliminary study of the granitic rocks of West Kalimantan, Indonesia. M.Sc. Thesis, Wollonggong University, Australia, B-Geol. 951, p. *(Unpublished)*

Amiruddin (2000)- Petrology and geochemistry of of the Sepauk Tonalite and its economic aspect in the Schwaner batholith, West Kalimantan. J. Geologi Sumberdaya Mineral 10, 100, p. 2-14.
(Cretaceous Sepauk tonalite part of largest granitoid batholith in W Kalimantan. Intermediate, I-type granite, with K-Ar ages 87-123 Ma, interpreted to belong to sunbduction-related volcanic arc. Intruded into Pinoh Metamorphics, with contact aureoles suggesting depth of emplacement 7-16km)

Amiruddin (2000)- Characteristics of Cretaceous Singkawang and Triassic Sanggau batholiths, West Kalimantan. J. Geologi Sumberdaya Mineral 10, 103, p. 2-15.
(NW Kalimantan Cretaceous Singkawang batholith (NW of Schwaner Mts) and Triassic Sanggau batholith (N of Schwaner Mts) both I-type granites ('compressive granite' or 'volcanic arc granite'), related to subduction. Triassic Sedua granite in small Sanggau batholith intruded into Permian(?) Embuoi metamorphic rocks with K-Ar ages 195-232 Ma (= Late Triassic). Contact aureoles suggest depths of emplacement ~6.5- 16 km)

Amiruddin (2000)- Cordilleran and Caledonian types Cretaceous orogenic granitic rock belts: with the granitic samples from West-East Kalimantan, Indonesia. J. Geologi Sumberdaya Mineral 10, 108, p. 2-15.
(Two type of Cretaceous granite in Kalimantan: (1) Cordilleran-type large Schwaner (Sepauk Tonalite) and Singkawang batholiths in S, I-type granites created during subduction from 129-86 Ma; and (2) Caledonian-type E-W trending belt of isolated granite and granodiorites plutons in N, I-type and S-type granites, emplaced between 81-75 Ma (= Campanian) within collision zone)

Amiruddin (2009)- Cretaceous orogenic granite belts, Kalimantan, Indonesia. J. Sumber Daya Geologi 19, 3, p. 167-176.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/203/194)
(Two types of Cretaceous granite belts in Kalimantan: (1) Schwaner-Ketapang 'Cordilleran-type' large batholiths, tied to 'mid'-Cretaceous subduction of oceanic crust below continent, emplaced from 86- 129 Ma and (2) two belts of 'Caledonian-type' 'post-collisional' Late Cretaceous (75-81 Ma= Campanian) isolated plutons, the E-W trending Sambas- Mangkalihat belt and Meratus in SE (see also companion paper of Hartono (2012))

Amiruddin (2012)- Cretaceous granitoid magmatism. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency (Bandung), Spec. Publ., p. 27-66.
(Review of widespread Cretaceous granitoids in Kalimantan.Two groups: (1) large, massive E-M Cretaceous batholiths in SW and W (Schwaner, Singkawang, Ketapang, Sanggau) and (2) Late Cretaceous isolated plutonic belts (Sambas- Mangkalihat small plutons in accretionary system all along N border of Kalimantan, W Meratus in SE Kalimantan). Radiometric ages of granitoids from 80-129 Ma)

Amiruddin & H.Z. Abidin (2005)- Preliminary indication of gold mineralization within the metamorphic rocks in Gunung Belanda area, Pelaihari, South East Kalimantan. Majalah Geologi Indonesia (IAGI) 20, 3, p. 123-128.
(Small, poorly studied epithermal gold prospect hosted in Huaran Metamorphics in S part of Meratus Mts of SE Kalimantan (Tempurung River, Pelaihari District)

Amiruddin & S. Andi Mangga (1999)- Geochemistry of Cretaceous peraluminous granite plutons in head water of the Mahakam River, East Kalimantan. J. Geologi Sumberdaya Mineral 9, 88, p. 2-10.
(U Cretaceous Topai and Nyaan Merah granites in N-C Kalimantan intruded into Cretaceous Embaluh Complex. Topai granite K-Ar ages ~75-77 Ma. Peraluminous S-type granites, probably derived from pelitic sediments. Tectonic setting syn-collisional, near collision zone?)

Amiruddin & D.S. Trail (1993)- Geology of the Nangapinoh sheet, Kalimantan, 1:250 000. Geol. Res. Dev. Centre (GRDC), Bandung, 49p. + map.

(Incl. large Early Cretaceous 'Sepauk Tonalite', intruding Pinoh Metamorphics. Aptian-Albian radiometric ages 107-112 Ma and 112-123 Ma)

Anggritya K.D. & B. Priadi (2016)- Basement characteristics of northern Barito Basin, Siung Malopot area, Central Kalimantan. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 301-309.
(Basement outcrops in Siung Malopot area in N part of Barito basin (277km NE of Palangkaraya) Cretaceous? low-metamorphic andesite and granodiorite. Also boulders of Early Tertiary limestone and presumably reworked latest Carboniferous - E Permian fusulinid foraminifera (Schwagerina))

Anonymous (1921)- Yzerertsafzettingen in Borneo. Verslagen Mededelingen Indische Delfstoffen en Hare Toepassingen, Dienst Mijnbouw Nederl.- Indie, Bandung, 9, p.
('Iron ore deposits in Borneo' (also spelled Ijzerertsafzettingen). Reviews of iron ore occurrences on Pulau Laut, Pleiari near Martapura (first discovered by Von Gaffron 1844, Rant 1854), Kota Waringin and Ketapang, and some others in W Borneo. Investigations in 1916-1919 were focused near outcropping peridotite bodies)

Anshari, G., A.P. Kershaw & S. Van der Kaars (2001)- A Late Pleistocene and Holocene pollen and charcoal record from peat swamp forest, Lake Sentarum wildlife reserve, West Kalimantan, Indonesia. Palaeogeogr. Palaeoclim. Palaeoecology 171, 3-4, p. 213-228.
(Palynological record of last 30 kyrs from peat swamp forest in Upper Kapuas River Basin, NW Kalimantan. Late Pleistocene temperatures cooler. Charcoal values rise throughout period, reflecting increased human impact, especially in last 1400 years)

Anshari, G., A.P. Kershaw & S. Van der Kaars & G. Jacobsen (2004)- Environmental change and peatland forest dynamics in the Lake Sentarum area, West Kalimantan, Indonesia. J. Quaternary Science 19, p. 637-655.

(Bobaris ophiolite complex along W flank of Meratus Mts, SE Kalimantan, is dismembered ophiolite sequence emplaced in Maastrichtian, Late Cretaceous)

Baharuddin, B. Djamal & B. Harahap (2003)- Geochemistry of the Tertiary rhyolite from West Kalimantan and its geodynamic implications. Buletin Geologi (ITB) 35, 2, p. 1-43.

Baharuddin & R. Heryanto (2001)- Cretaceous Selangkai Formation of West Kalimantan and its tectonic implications. In: A. Setiawan et al. (eds.) Deep-water sedimentation of Southeast Asia, Proc. 2nd Regional Seminar Indonesian Sedimentologists Forum (FOSI), Jakarta 2001, 3p. *(Extended Abstract)*
(Early to Late Cretaceous Selangkai Fm deformed flysch type series in Sintang Quadrangle, N of Melawi and S of Ketungau Basins. Deposited in submarine fan environment, >3000m thick. With Embaluh Group in E region and Boyan Melange possibly parts of accretionary complex of SW-dipping (restores to W-dipping in Cretaceous) Pacific Ocean subduction zone, which ties to Cretaceous Schwaner magmatic belt)

Baharuddin, R. Heryanto & H. Panggabean (2002)- Cretaceous Selangkai Formation of West Kalimantan and its tectonic implication. J. Geologi Sumberdaya Mineral 12, 123, p. 2-9.
(Cretaceous Selangkai Fm well exposed on Sintang Quadrangle, NW Kalimantan, mainly between Melawi and Ketungau-Manda Tertiary basins). Deformed flysch- type deposit accumulated in submarine fan environment. Thickness >3000m. Fossils indicate E-Late Cretaceous ages. With Embaluh Complex and Boyan Melange are part of accretionary prism complex at (present-day) S-dipping Late Cretaceous subduction zone, which is tied to Cretaceous Schwaner magmatic belt and reflect W-dipping subduction of Pacific Ocean crust)

Baharuddin, P.E. Pieters, D. Sudana & S. Andi-Mangga (1993)- Geology of the Long Nawan sheet 1717 area, Kalimantan. 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.

(C-E Kalimantan-Sarawak border area map, dominated by intensely folded Late Cretaceous-Paleogene Embaluh Gp metasediments, intruded by Late Cretaceous Topai granite. Locally overlain by M Eocene Nyaan volcanics and Pliocene Metulang Fm volcanics)

Baharuddin & E. Rusmana (2007)- Geochemical characteristics of the youngest volcanic rocks from Mount Acau, West Kutai Regency, East Kalimantan. J. Sumber Daya Geologi 17, Spec. Issue (163), p. 47-56.
(Quaternary Metulang Volcanics at Mount Acau with K/Ar ages of 0.93-0.01 Ma are basalt and basaltic andesite of low-K tholeitic and medium-K calk-alkaline types. Show characteristic intraplate magmatism, possibly due to backarc extension)

Baharuddin & P. Sendjaja (2014)- The petrology and geochemistry of the Cretaceous Schwaner volcanic/ subvolcanic rocks and its implication to the tectonic evolution of Sundaland. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Ann. Conv. Indon. Soc. Econ. Geol. (MGEI), Palembang, p. 129-144.
(Schwaner Mts Domain in W Kalimantan dominated by E-W belt of I-type granitoids, ~200 km wide and 500 km long, including mainly E Cretaceous (130-100 Ma)tonalites and granodiorites, probably rotated extension of continental E Asia belt. Some evidence that granitoids in Schwaner Mts domain become younger from N (124 Ma) to S (74 Ma). Late Cretaceous 'Kerabai Volcanics' range from basalt to rhyolite, subvolcanic rocks diorite to gabbro and dolerite, comprising calc-alkaline orogenic association, probably subduction-related magma associated with slow, low-angle subduction)

Baharuddin & J. Wahyudiono (2007)- Kontrol struktur pada pola zig-zag aliran Sungai Kayan di daerah Peso, Kalimantan Timur. J. Sumber Daya Geologi 17, 3, p. 178-186.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/288/259)
('Structural control on zig-zag pattern of the Kayan River in Peso, East Kalimantan'. Peso area downstream of Kayan River, mainly occupied by flysch-type deposits of Cretaceous Rajang-Embaluh Group, unconformably overlain by Tertiary sediments and intruded by Tertiary-Quaternary magmatics. Zig-zag pattern of Kayan River in area closely related to major NE- SW and NW-SE-trending faults)

Baldwin, J. (2008)- Kelian; a precursor to the carbonate-base metal gold model. In: P.C. Lewis (ed.) Proc. Terry Leach Symposium 2008, Bull. Australian Inst. Geoscientists 48, p. 1-7.
(Review of Kelian gold mine in C Kalimantan. Discovered in 1975, production started in 1992, mining completed 2003. Miocene epithermal mineralization system (see also Van Leeuwen et al. 1990, Davies et al. 2008)

Barker, S. M., J. Jong & F.L. Kessler (2015)- Structural comparison of the fold-thrust belts along the Circum-Borneo margins. Proc. SE Asia Petroleum Expl. Soc. (SEAPEX) Conf., Singapore 2015, 4.1, 18p. *(Extended Abstract + Presentation)*
(Comparisons of nine fold-thrust belts (FTB) that fringe E Sundaland around NW and W Borneo margins: Bunguran, W Baram Delta, E Baram Delta, N NW Sabah Trough, Sandakan, Tarakan and Kutai-W Sulawesi. Almost all are 'thin-skinned' and in at least four belts frontal thrusting can be linked to proximal extensional growth faults (Bunguran/Rajang Delta, Sandakan, Tarakan, Kutai))

(Translations of papers on geology of W Kalimantan and adjacent areas of Sarawak by Dutch geologists (Krekeler, Krol, Ter Bruggen, Zeijlmans van Emmichoven and Ubaghs), originally published in 1925-1939. Age of Danau Fm in Sarawak is Cretaceous, not Permo-Triassic as suggested by Zeijlmans (1939) for Kalimantan)

Haile, N.S. (1961)- Notes on Mesozoic orogeny in West Borneo. Proc. 9th Pacific Science Congress, Bangkok 1957, Geol. Geoph. 12, p. 117-120. *(Extended Abstract)*
(online at: http://archive.org/details/geologyandgeophy032600mbp)
(Also in 'Annual Report Geological Survey Dept., British Territories in Borneo, 1957, p. 17-23) Moderately folded U Triassic-Cretaceous of W Kalimantan and W Sarawak unconformable on highly deformed Permian or Carboniferous age rocks. This and synchronous granite intrusions indicate folding in Late Permian or E Triassic and in E Jurassic. No evidence of orogenic activity in Cretaceous)

Haile, N.S. (1973)- West Borneo microplate younger than supposed? Nature 242, p. 28-29.
(Short note suggesting W Borneo possibly not part of Sunda shield and extension of continental SE Asia, but younger. Partly supported by occurrence of steeply dipping 'Ketapang Complex' unmetamorphosed grey shale in Pawan River, W Kalimantan, with Albian- Cenomanian pollen (Caytonopollenites zone of Muller). Flanked by massive volcanic rocks of Matan Complex. Area may be built chiefly of Late Cretaceous and younger rocks)

Haile, N.S. (1974)- Borneo. In: A.W. Spencer (ed.) Mesozoic-Cainozoic orogenic belts; data for orogenic studies. Geol. Soc., London, Spec. Publ. 4, p. 333-347.
(Late Mesozoic- Tertiary orogeny affected N part of Borneo, over 900 km from Makassar Straits to S China Sea. Four zones recognized, in direction of increasing age of main periods of mobility from N to S: Miri (youngest deformation), Sibu (greatest mobility; thick deformed Late Cretaceous-Eocene flysch), Kuching (deformed Mesozoic marine sediments) and W Borneo Paleozoic metamorphic basement with Late Paleozoic-Mesozoic sediments)

Haile, N.S. (1979)- Rotation of Borneo microplate completed by Miocene: palaeomagnetic evidence. Warta Geologi (Newsletter Geol. Soc. Malaysia) 5, 2, p. 19-22.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1979002.pdf)
(Samples from latest Oligocene- E Miocene U Silantek Beds show reversed magnetism close to present-day field, indicating 50° CCW rotation of Borneo since Cretaceous was completed by time of deposition of U Silantek Beds)

Haile, N.S., M.W. McElhinny & I. McDougall (1977)- Palaeomagnetic data and radiometric ages from the Cretaceous of West Kalimantan (Borneo), and their significance in interpreting regional structure. J. Geol. Soc. London 133, 2, p. 133-144.
(W Kalimantan complex history of magmatism and cooling from M Jurassic- Late Cretaceous. Well-defined granitic magmatic event in Schwaner zone at ~79-86 Ma, also recognized in Sarawak, S China Sea islands, Malay Peninsula, S Sumatra, and Java Sea. Paleomagnetism of Late Cretaceous samples yield mean paleomagnetic pole at 21°E, 41°N, and 0° paleolatitude for W Kalimantan. Paleomagnetic pole not significantly different from Cretaceous pole estimated for Malay Peninsula. Since M Cretaceous W Kalimantan and Malay Peninsula behaved as one unit, have remained in present latitude, but rotated anticlockwise ~50°)

Haile, N.S. & E. Urquhart (1995)- Dating Mesozoic melange and other problematic formations in Southeast Asia. In: Proc. Int. Symposium Geology of SE Asia and adjacent areas, J. Geology, Geol. Survey Vietnam, Hanoi, 5-6, p. 308-309. *(Abstract only)*
(Mesozoic melange in Borneo in discontinuous belt from NW tip to E coast (= Danau Fm of Molengraaff; JTvG). Over part of length it forms S limit of U Cretaceous- U Eocene flysch/ accretionary prism of N Borneo. Fossils in blocks in melange include Lw Cretaceous radiolaria in cherts, U Cretaceous forams in sediment blocks and rare Eocene nannofossils in matrix. Overlain by undisrupted Plateau Gp with U Eocene forams and pollen)

Halewijn, M.J. (1838)- Borneo- Eenige reizen in de binnenlanden van dit eiland, Beschrijving der diamantmijnen te Soengi Roentie in Bandjermasin in 1824. Tijdschrift voor Nederlandsch Indie 1, 2, p. 81-84.
('Travels in the interior of Borneo- Description of the diamond mines at Sungei Runti in Banjarmasin in 1824'. One of first descriptions of open pit alluvial diamond mines in SE Kalimantan. Diamond-bearing beds 'lead-colored stone' ('batu tima') at ~12 feet depth)

Hall, R. & G.J. Nichols (2002)- Cenozoic sedimentation and tectonics in Borneo: climatic influences on orogenesis. In: S.J. Jones & L. Frostick (eds.) Sediment flux to basins: causes, controls and consequences. Geol. Soc. London, Spec. Publ. 191, p. 5-22.
(Sediment volume in basins around Borneo indicates >6 km removed by Neogene erosion. Implied tectonic uplift not reflected in high mountains on island. High weathering and erosion rates in tropical climate likely factor governing formation of relief. Rapid removal of material by erosion prevented tectonic denudation by faulting: around Borneo there was no lithospheric flexure due to thrust loading and no true foreland basins developed. Sediment deposited adjacent to orogenic belt in older, deep oceanic basins. Sediment yield of Borneo mountains comparable to Alps or Himalayas)

Hall, R., M.W.A. van Hattum & W. Spakman (2008)- Impact of India-Asia collision on SE Asia: the record in Borneo. Tectonophysics 451, p. 366-389.
(History of Borneo not consistent with island forming part of large block extruded from Asia. Clockwise rotations predicted by indentor model for Borneo incompatible with paleomagnetic evidence. Great thicknesses of Cenozoic sediments in Borneo and circum-Borneo basins derived from local sources and not from distant sources in Asia. Cenozoic geological history of Borneo records subduction of proto-S China Sea and Miocene collision after this ocean lithosphere was eliminated, and effects from long-term subduction beneath SE Asia)

Harahap, B.H. (1987)- The petrology of some young subvolcanic and volcanic rocks from West Kalimantan, Indonesia. M.Sc. Thesis, University of Tasmania, 234p.
(online at: https://eprints.utas.edu.au/19986/1/whole_HarahapBhaktiHamonangan1988_thesis.pdf)
(Petrography and chemistry of Tertiary volcanic rocks from C and W West Kalimantan (mainly subduction-related arc volcanics) and Quaternary basaltic andesites from Mt. Niut (intra-plate volcanism not related to subduction). K-Ar ages of intrusions near Sintang: in South 23.0-30.4 Ma, in North 16.4-17.9 Ma (similar to intrusives in nearby Sarawak))

Harahap, B.H. (1990)- Magmatism in West Kalimantan. J. Indon. Assoc. Geol. (IAGI) 13, 1, p. 63-90.

Harahap, B.H. (1993)- Geochemical investigation of Tertiary magmatic rocks from central West Kalimantan. Proc. 22nd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 304-326.
(Tertiary magmatic rocks in W Kalimantan mainly dacites, some rhyolites, basalts, andesites. Basalts in N province different source from S province. Volcanics in S intrude Cretaceous granodiorites, are most siliceous. Chemistry typical island arc, may be related to SE subduction under Sarawak accretionary prism)

Harahap, B.H. (1994)- Petrology of the Cretaceous subvolcanic and volcanic rocks from Singkawang area, West Kalimantan. J. Geologi Sumberdaya Mineral 4, 35, p. 15-24.
(Mid-Cretaceous volcanics from Singkawang area of W Kalimantan (W of Schwaner batholith) range from basalt to dacite, porphyritic, low-metamorphic, etc., with geochemistry typical of island arc lavas. One sample

from Damar Island dated as 106 Ma. Probably response to subduction from N, which may have been ancestral Pacific Ocean)

Harahap, B.H. (1994)- Petrology and geochemistry of Mount Niut Volcano, West Kalimantan. Bull. Geol. Res. Dev. Centre 17, p. 1-12.
(Pliocene basic volcanics)

Harahap, B.H. (1995)- The Boyan melange of West Kalimantan origin and tectonic development. Bull. Geol. Res. Dev. Centre (GRDC), Bandung, 18, p. 1-21.
(Boyan melange E-W trending belt in W Kalimantan, composed of km-size blocks of clastics, limestone (with Cenomanian Orbitolina), radiolarian chert, greenschist, large blocks (6 x 40 km) of sheared serpentinite, also granite (one 320 Ma K/Ar age), basalt, etc., in sheared chloritized dark 'scaly' shale. Common boudinage structures. Bounded to N and S by Selangkai Fm Turonian turbidites, with gradational contacts. Overall dips of beds/ cleavage to South. Interpreted as Late Cretaceous S-dipping subduction complex. Intruded by Miocene 'Sintang' dacitic rocks, one dated at 16.4 Ma)

Harahap, B.H. (1995)- Petrography and mineral chemistry of the Tertiary subducted related mafic subvolcanic rocks from West Kalimantan. J. Geologi Sumberdaya Mineral 5, 47, p. 2-15.
(Description of W-C Kalimantan basaltic- andesitic dykes and plugs in Nangapinoh and Sintang map sheets. (not clear what age; somewhere between Cretaceous- Miocene; JTvG))

Harahap, B.H. (1996)- Petrological characteristics of the Upper Miocene to Plio-Pleistocene volcanism in Kalimantan. J. Geologi Sumberdaya Mineral 6, 62, p. 21-31.
(Cretaceous- M Miocene volcanism in Kalimantan produced silica-rich calc-alkaline volcanic series in subduction-related volcanic arc systems. Upper Miocene- Plio-Pleistocene volcanics tholeiitic and alkaline and associated with ENE structural trend along highest points of Kalimantan. Basaltic lavas similar to intraplate continental basalts, not related to subduction)

Harahap, B.H. (1996)- Petrography and mineral chemistry of the Tertiary silicic subvolcanic rocks of the Sundaland of West Kalimantan. Bull. Geol. Res. Dev. Centre (GRDC), Bandung, 19, p. 75-95.
(95% of subvolcanic rocks of W Kalimantan are silica-rich dacites and rhyolites)

Harahap, B.H. (2012)- Regional geology and tectonics. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency (Bandung), Spec. Publ., p. 13-26.
(Review of regional geology of Kalimantan. Borneo result of Mesozoic amalgamation of ophiolitic, island arc and microcontinental fragments of S China and Gondwana origin. Today far from active margins and stabilized in Late Miocene, after which extensional processes common. Most of Kalimantan continental crust. W region is part of Sundaland Craton, with Schwaner Mts E Cretaceous granites (continuation of E Asian Magmatic Arc). NW Kalimantan domain Late Carboniferous sediments flanked by metamorphics, intruded by Permian- M-L Triassic biotite granites, unconformably overlain by Late Triassic Serian Volcanics and Jurassic- Cretaceous marine sediments. Oldest igneous rock Late Carboniferous- E Permian Lumo Granite in N Meratus Mts. Etc.)

Hardjadinata, K. (1995)- Studi ofiolit Pegunungan Meratus-Bobaris, Kalimantan tengara. J. Geologi Sumberdaya Mineral, 5, 40, p. 10-18.
('Study of ophiolite of the Meratus- Bobaris Mountains, SE Kalimantan'. Meratus- Bobaris Mts association of pillow basalts, gabbro, dunite, pyroxenite peroditite and plagiogranite represents incomplete ophiolite assemblage. Chemistry suggests formation in island-arc environment. M Cretaceous (116-95 Ma; Aptian-Cenomanian) radiometric ages of plagiogranite and metadiabase. Ophiolite emplacement result of collision of Eurasian and Pacific Ocean plates)

Harloff, C.E.A. (1933)- Over een nog onbekende pseudomorfose naar andalusiet in een contactgesteente van Borneo. De Mijningenieur 7, p. 121-124.
('About an unknown pseudomorphosis from andalusite in a contactmetamorphic rock from Borneo'. Andalusite in hornfels from unknown location in Borno partly converted to corundum and sericite)

Harrison, T. (1975)- Tektites as "date markers" in Borneo and elsewhere. Asian Perspectives 18, 1, p. 61-63.
(The only place in North Borneo with tektites is NW coastal region 20 miles from Brunei city, at base of Jerudong Beds, and K-Ar dated as 730,000 BP by Zahringer (1963). However, associated wood much younger, so tektites may be reworked)

Harting, A. (1925)- Bijdrage tot de geologie van Beraoe (met een geologisch schetskaartje van Beraoe 1:750,000). Verhandelingen Geologisch-Mijnbouwkundig Genootschap Nederland Kol., Geol. Serie 8 (Verbeek volume), p. 205-212.
('Contribution to the geology of Berau, with a geological sketch-map, 1:750 000'. S Tarakan Basin, E Kalimantan. Brief review of upper Berau River area. Pre-Tertiary steeply-dipping phyllites and quartzites with reddish radiolarian cherts and granites and diabase-like rocks, similar to Molengraaff's Danau Formation. Strike mainly E-W trending, more SW-NE in W part of area. Unconformably overlain by Eocene Nummulites-bearing clastics and carbonates, Oligo-Miocene Lepidocyclina limestones, overlain by Globigerina marls, then coal-rich beds, unconformably overlain by Plio-Pleistocene Sadjau and Bunyu beds. Gas seep on Rantau Panjang anticline)

Harting, A. (1930)- Enkele geologische waarnemingen langs de S. Kajan. De Mijningenieur 11, p. 176-179.
(Some geologic observations along the Kajan River'. On the direction of Pre-Tertiary at Brem-Brem falls near Bulungan and unconformably overlying, horizontal Eocene limestone)

Hartmann, M.A. (1937)- Der Batoe Mesangat in Nord-Koetai, eine imposante Vulkanruine in Borneo. Natuurkundig Tijdschrift Nederlandsch-Indie 97, 4, p. 214-225.
(online at: http://62.41.28.253/cgi-bin/...)
('The Batu Mesangat in N Kutai, an imposing volcano ruin in Borneo'. Mesangat massif between Telen and Belayan Rivers and between Poh and Atan mountains in N Kutai, about 1500m high. In area of Pre-Tertiary rocks, from S to N: folded Danau Fm (mainly E-W, occ. WSW-ENE trending sandstones- shales- radiolarites and limestone/marble lenses and dynamometamorphically altered diorite, serpentinite, peridotite and diabase). Locally younger volcanics (basalt, andesite) and Mesozoic intrusions of quartz porphyry, dacite, liparite. To N widespread black, red and green shales-schists, mainly SW-NE trending, possibly Late Paleozoic age, unconformable over Danau Fm, and thrusted over Danau Fm against Kutai Basin. Batu Mesangat is quartz porphyry intrusive complex of possible Mesozoic age)

Hartono, H.M.S. (1984)- Tectonic development of Kalimantan and adjacent areas. Bull. Geol. Res. Dev. Centre (GRDC) 9, p. 1-13.
(Kalimantan tectonic history: Permian- Carboniferous volcanic arc, with subduction from N/ NE. Late Triassic collision, a continuation of Burmese- W Malayan microcontinent collision with Indochina. Late Cretaceous melange in E Kalimantan and volcanics in SW Kalimantan are part of arc system extending SW towards Java-Sumatra. Tertiary subduction/ accretion from N/NW)

Hartono, H.M.S. (1985)- Summary of tectonic development of Kalimantan and adjacent area. In: Proc. Second EAPI/CCOP Workshop, Energy 10, p. 341-352.
(Review of tectonic development of Kalimantan. Pre-Late Triassic rocks present, but history not clear. Carboniferous-Permian arc postulated. Kalimantan cratonized and stabilized by collision tectonics in Late Triassic, correlating with Indo-Sinian orogeny in peninsular Malaysia and Thailand. Late Cretaceous-Early Tertiary arc development with granitic plutons in SW Kalimantan. Post-Late Triassic deposition either platform cover or active marginal accretion)

Hartono, U. (1997)- Tertiary basalts and microgabbros from Pulau Laut, South Kalimantan: a primitive magma in island arcs. J. Geologi Sumberdaya Mineral 7, 71, p. 2-8.
(Paleogene basalts and microgabbros at Gunung Jembangan high-MgO primitive magma, derived from depleted mantle source, possibly 20% melting of spinel lherzolite, probably in subduction setting)

Hartono, U. (2000)- The origin of Tertiary basaltic and low-Y andesitic volcanic rocks from the Meratus Range, South Kalimantan. J. Geologi Sumberdaya Mineral, 10, 103, p. 23-32.
Small dikes and plugs of Tertiary basaltic, andesitic and dacitic volcanic rocks in Meratus Range and Pulau Laut, associated with strike-slip faults. K-Ar ages 62-23 Ma (Paleocene- E Miocene). High MgO and low-Y primitive magma source)

Hartono, U. (2000)- Batuan kerak samudera. In: U. Hartono, R. Sukamto et al. (eds.) (2000)- Evolusi magmatik Kalimantan Selatan, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 23, p. 25-36.
('Oceanic crust rocks'. Review of SW Meratus Mountains ophiolites)

Hartono, U. (2003)- A geochemical study on the Plio-Pleistocene magmas from Kalimantan; their influence to the Tertiary mineralization system in Kalimantan. Majalah Geologi Indonesia (IAGI) 18, 2, p. 168-174.
(Plio-Pleistocene volcanics common along Kalimantan- Sarawak border. Matulang Fm basalts and basaltic andesites previously interpreted as intraplate magmatism. Geochemistry suggest mixing of deep mantle source and arc magma. Probably produced during extensional tectonism after Late Miocene collision of Miri-Luconia microcontinent with Kalimantan/Sundaland in NW Sarawak)

Hartono, U. (2003)- The role of South Kalimantan Tertiary volcanics in gold mineralisation. Prosiding Forum Litbang ESDM, 2003, p. 175-186.
(Widespread alluvial gold, but no economic primary gold deposits in S Kalimantan. Tertiary volcanics on Pulau Laut (Late Paleocene basalt and basaltic andesite + Eocene- E Miocene andesite) with rel. low gold mineralization. Geochemically look like subduction-related volcanics, but no subduction here in Tertiary?)

Hartono, U. (2006)- Petrogenesis of the Sintang Intrusives and its implications for mineralization in Northwest Kalimantan. J. Sumber Daya Geologi 16, 4 (154), p. 210-219.
(Late Oligocene- E Miocene Sintang intrusives of NW Kalimantan part of belt formed along N margin of Sundaland, can be followed from NW Kalimantan to Upper Tarakan/Mangkalihat, and is associated with gold mineralization. Mainly of granodiorites of adakite-type, probably derived from melting of subducted South China Sea oceanic crust, following M-L Oligocene compressional event in Kalimantan. Commonly with gold mineralization)

Hartono, U. (ed.) (2012)- Magmatism in Kalimantan. Centre for Geological Survey, Geological Agency, Bandung, Spec. Publ., p. 1-199.
(With chapters by Amiruddin, B. Harahap, I.G.B.E. Sutjipta, S, Bronto and U. Hartono. Major review of distribution of Cretaceous- Recent volcanic and plutonic rocks in Kalimantan, tectonic history and associated mineral deposits (see more detail under chapters))

Hartono, U. (2012)- Cretaceous arc magmatism. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency, Bandung, Spec. Publ., p. 67-114.
(Review of Cretaceous volcanic and sub-volcanic rocks in SE (U Cretaceous/ ~83-66 Ma Haruyan Fm arc volcanics of Meratus Mts), SW (U Cretaceous/ ~88-65 Ma Kerabai Volcanics SW of Schwaner Mts; probably consanguineous with 91-86 Ma Sukadana granite) and NW Kalimantan (Lower Cretaceous/106 Ma Raya Volcanics))

Hartono, U. (2012)- Pliocene- Pleistocene magmatism. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency, Bandung, Spec. Publ., p. 153-162.
(Review of Plio-Pleistocene (5.8- 1.7 Ma) Metulang and Niut volcanics of East-Central and NW Kalimantan. Differ from Tertiary volcanics, possibly 'non-orogenic' magmatism)

Hartono, U. (2012)- Tectono-magmatic evolution. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency, Bandung, Spec. Publ., p. 191-199.
(Most of magmatic activity in Kalimantan related to subduction processes. Not much information on pre-Cretaceous magmatic activity. E Cretaceous Schwaner and Singkawang batholiths may form continuation of E Asian magmatic arc and result from subduction of Paleo-Pacific Plate (from present-day North) along E Asia.

Subduction continues to Late Cretaceous (Kerabai Volcanics, Sukadana granite). Also Cretaceous accretionary/ subduction complex in SE Kalimantan, tied to subduction of Indian Plate at S side of Sundaland (Batang Alai granite, Haruyan Volcanics), terminating in Paleocene with Paternoster Plate collision. Eocene to Oligocene or M Miocene subduction of proto-S China Sea oceanic crust under N Kalimantan, creating Rajang accretionary prism and Muller, Piyabung, Sintang, Nyaan and Serantak volcanics. Etc.)

Hartono, U. H.Z. Abidin & I.G.B.E. Sutjipta (2012)- Mineralization. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency, Bandung, Spec. Publ., p. 163-190.
(Review of metallic mineral deposits in Kalimantan, all associated with magmatic belts. Kalimantan long history of alluvial gold mining. During 'gold rush' of 1980's-1990's several epithermal gold deposits discovered: E Kalimantan (Kelian, Muyup, Tasan, Busang, Seruyung, Jelai), C Kalimantan (Masupa Ria, Mt. Moro, Gunung Emas) and W Kalimantan (Sebuduk, Pandung, Salakaen, Bukit Timah) Most of these associated with Sintang Intrusives of Late Oligocene- M Miocene C Kalimantan magmatic arc. Small gold prospects also in S Kalimantan/ Meratus Mts (Miing, Pantain Bancah, Gunung Belanda), presumably also associated with Tertiary intrusives)

Hartono, U. & S. Bronto (2012)- Tertiary arc magmatism. In: U. Hartono (ed.) Magmatism in Kalimantan, Centre for Geological Survey, Geological Agency (Bandung), Spec. Publ., p. 115-152.
(Mineral deposits of Kalimantan mainly associated with Tertiary magmatism. Four main groups of Tertiary volcanics: (1) Eocene (~50 Ma) Piyabong/ Muller/ Nyaan volcanics in N-C Kalimantan (possibly arc volcanics from proto-S China Sea Plate subduction); (2) rel. widespread Oligocene- M Miocene (30-16 Ma) intermediate Sintang intrusives (>150) and Malasan volcanics in central parts (incl. common 'adakitic' rocks) (arc magmatism, also tied to S China Sea subduction); (3) M Miocene- Pliocene Jelai volcanics of NE Kalimantan; (4) Plio-Pleistocene Metulang/ Niut volcanics widespread along N border of Kalimantan)

Hartono, U., M.H.J. Dirk, P. Sanyoto & S. Permanadewi (1999)- Geochemistry and K/Ar results of the Mesozoic-Cenozoic plutonic and volcanic rocks from the Meratus Range, South Kalimantan. In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA ô98), Kuala Lumpur 1998, Bull. Geol. Soc. Malaysia 43, p. 49-61.
(online at: www.gsm.org.my/products/702001-100834-PDF.pdf)
(Three main periods of magmatic activity in Meratus Mts: (1) E Cretaceous (131-103 Ma; Barremian-Albian) subduction-related granitoids (mainly island arc?; e.g. Batangalai granite), (2) Late Cretaceous (82-66 Ma; Campanian- Maastrichtian) Haruyan Fm submarine island arc basalt-andesite and granitoids and (3) Tertiary (62-19.5 Ma) andesitic-basaltic volcanics and granitoids (limited distribution; on Palau Laut along strike-slip faults). Microdiorite at G. Kukusan K-Ar age 19.6 Ma. Parts of U Cretaceous- Tertiary andesites high-MgO, probably formed by reaction between ascending melts and mantle peridotite)

Hartono, U. & D. Djumhana (2000)- Batuan malihan. In: U. Hartono, R. Sukamto et al. (eds.) (2000)- Evolusi magmatik Kalimantan Selatan, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 23, p. 75-84.

(Review of volcanic rocks, Meratus Mts, SE Kalimantan)

Hartono, U., S. Permanadewi & M.H.J. Dirk (1997)- Petrology and geochemistry of the Tertiary volcanic and subvolcanic rocks, South Kalimantan. Proc. 26th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. 419-427.
(Reprinted in Bronto & Surono 2014. Tertiary volcanics of Pulau Laut and Meratus Range associated with strike-slip faults. Most volcanics high MgO content. K-Ar ages of plagioclase from Pulau Laut andesite and micro-gabbro 57.5 Ma and 62.5 Ma, hornblende 32.5- 19.5 Ma. Probably originated from U Cretaceous- Lower Tertiary subduction, but magma produced accumulated in lower crust- upper mantle before rising to surface in E-M Tertiary)

Hartono, U. & I. Saefudin (2000)- Evolusi magmatik. In: U. Hartono, R. Sukamto et al. (eds.) (2000)- Evolusi magmatik Kalimantan Selatan, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 23, p. 119-135.
(Review of magmatic evolution Meratus Mts, SE Kalimantan)

Hartono, U., P. Sanyoto, H.Z. Abidin, S. Permanadewi, W. Sunata, M.H.J. Dirk & I. Saefudun (1997)- Geochemical characteristics of the Cretaceous and Tertiary volcanics, South Kalimantan: implications for the tectono magnetic evolution. J. Geologi Sumberdaya Mineral 7, 66, p. 2-10.
(Cretaceous volcanics of Haruyan Fm in Meratus Mts and in Pulau Laut mostly porphyritic andesites, characteristic of subduction arc volcanism. Paleogene basaltic rocks along strike-slip faults on Pulau Laut MgO rich and characteristic of primitive magma (not shown on Rustandi et al. 1995 Pulau Laut geologic map?; Hartono 2003))

Hartono, U., R. Sukamto, Surono & H. Panggabean (eds.) (2000)- Evolusi magmatik Kalimantan Selatan. Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 23, p. 1-140.
('The magmatic evolution of South Kalimantan'. Collection of papers published earlier)

Hartono, U. & Sulistyawan (2010)- Origin of Cretaceous high magnesian andesites from southeast Kalimantan-geochemistry. J. Sumber Daya Geologi 20, 5, p. 261-276.
(online at: http://jgsm.geologi.esdm.go.id/index.php/JGSM/article/view/177/173)
(Anomalously high MgO content of some andesites ('boninites') found with normal volcanic arc andesites of U Cretaceous Haruyan Fm in Meratus Range and on Pulau Laut. Both originated from subduction zone-type magma. Two possible origins of high-Mg andesites: (1) melting of mantle wedge above slab; (2) reaction between silicic magma and hot mantle peridotite (boninites typically form in fore-arc environments during early stages of subduction?; JTvG))

Hartono, U. & Suyono (2006)- Identification of adakite from Sintang intrusives in West Kalimantan. J. Sumber Daya Geologi 16, 3 (153), p. 173-178.
(U Oligocene- E Miocene Sintang high-level intrusives widely exposed in W Kalimantan. Consist of microdiorite, granite/ microgranite, quartz diorite, dacite, andesite and minor rhyolite and rhyodacite. K-Ar analyses 30.4- 23.0 Ma in Melawai Basin, 17.9- 16.4 in Ketangau Basin. Published geochemical data suggest most rocks adakites. Products of arc magmatism, probably from melting of subducted S China Sea oceanic crust beneath Kalimantan. Subduction started in Late Oligocene when crust was still young)

Hashimoto, W. & T. Koike (1973)- A geological reconnaissance of the reservoir area of the Riam Kanan dam, East of Martapura, Kalimantan Selatan (South Borneo), Indonesia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 13, p. 163-184.
(Description of Cretaceous (Aptian-Senonian)- Lower Tertiary stratigraphy of area of Riam Kanan dam at Aranio, 40 km E of Banjarmasin, SW Meratus Mts. Area now mainly flooded by water reservoir. Review of works of Verbeek (1875), Hooze (1893), Martin (1889), Krol (1920) and Koolhoven (1935), with additional observations. Oldest rocks crystalline schist, bounded by Bobaris Peridotite. Basal Cretaceous (Cenomanian?) conglomerate mainly composed of schist, also peridotite. Overlying marine sediments with volcanics. Orbitolina from limestone farther North not O. concavata, but older form of O. scutum type, in Japan associated with Upper Aptian ammonites. Latest Cretaceous non-marine shales with estheriids)

Hashimoto, W. & T. Koike (1974)- On the Martapura Cretaceous system of Southeast Kalimantan, Borneo, Indonesia (Geology along the upper stream of the Riam Kanan River). Chigaku Zasshi = J. Geography, Tokyo, 83, 1, p. 1-18. *(in Japanese)*
(online at: www.journalarchive.jst.go.jp/...)
(1972 survey of Meratus Mts Upper Cretaceous sediments at upper Riam Kanan River, E and Riam Kiwa W of Bobaris Mts. Basal conglomerates, sandstones and siltstones, unconformable over schist, with Turonian ammonoids and Inoceramus. Overlying Benuariam/Atiin Fm porphyritic lavas, agglomerates and tuffs, and conglomerates, Tabatan Fm sandstones and conglomerates with Aptian-Albian Orbitolina in limestone pebbles and reworked Benuariam Fm. Overlying Rantaulajon Fm fissile shale rich in estheriids, indicating non-marine

facies, probably Senonian. Includes record of mid-Cretaceous Orbitolina in Meratus Mts at Hantakan, E of Barabai. Study of Eocene- Miocene suggests Early Oligocene Td stage is absent in area)

Hashimoto, W. & K. Matsumaru (1974)- *Orbitolina* from the Seberuang Cretaceous, Kalimantan Barat (West Borneo), Indonesia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 14, p. 89-99.
(Multiple localities of Selangkai Fm clastics at Seberuang River, U Kapuas, W Central Kalimantan with lenses of coral-bearing limestones rich in Orbitolina lenticularis. Fossils first described by Von Fritsch (1883), Martin (1899), Molengraaff (1900) and Zeijlmans (1939). Seberuang Orbitolina is Orbitolina lenticularis of Hofker (1966) groups II (within E Aptian) and I-II (Late Aptian). With map of all Orbitolina localities in W Indonesia)

Hattori, K., K.P. Burgath & S.R. Hart (1992)- Os-isotope study of platinum-group minerals in chromitites in alpine-type ultramafic intrusions and the associated placers in Borneo. Mineralogical Magazine 56, p. 156-164.
(online at: www.minersoc.org/pages/Archive-MM/Volume_56/56-383-157.pdf)
(187Os/ l86 Os ratios of ~1.04 in laurite grains in mid-Cretaceous (~110 Ma) chromitites from Bobaris and Meratus Mts, SE Kalimantan (and platinum group minerals in associated alluvial placers derived from ultramafics) suggest derivation from mantle, with no significant contribution of crustal 187Os. Also low ratio (1.06) in nugget from SE Sabah 40 Ma Darvel Bay ophiolite)

Hattori, K.H., L.J. Cabri, B. Johanson & M.L. Zientek (2004)- Origin of placer laurite from Borneo: Se and As contents, and S isotopic compositions. Mineralogical Magazine 68, 2, p. 353-368.
(Platinum-group mineral laurite (RuS2) from Pontyn River sediments, Tanah Laut, SE Borneo, derived from Meratus ophiolite. Formation of laurite in residual mantle or in magma generated from refractory mantle, followed by erosion after obduction of host ultramafic rocks)

Hattori, K. & S.R. Hart (1991)- Osmium-isotope ratios of platinum-group minerals associated with ultramafic intrusions: Os-isotopic evolution of the oceanic mantle. Earth Planetary Sci. Letters 107, p. 499-514.
(Includes Os-isotope data on Cretaceous Meratus ophiolite (two dismembered ophiolite bodies, obducted during subduction of Sundaland Plate at ~114 Ma; Pamali, Sungei Kalaan, Sungai Besar; SE Kalimantan) and Tertiary Darvel Bay (Sungei Edam, Sabah) ophiolites (extends N to ophiolite complex on Palawan Island, with Ar-age of metamorphic minerals of 36 Ma, in Miocene-age host rock stratigraphy))

Hendratno, A. & R. Al Furqon (2006)- Petrologi granit kordierit (studi kasis daerah Sungai Lumo- Kalimantan Tengah). Teknik Geologi Universitas Gajah Mada, p.
('Petrology of cordierite granite (study of Lumo River area, C Kalimantan))

Hennig, J., H.T. Breitfeld, R. Hall & A.M. Surya Nugraha (2017)- The Mesozoic tectono-magmatic evolution at the Paleo-Pacific subduction zone in West Borneo. Gondwana Research 48, p. 292-310.
(online at: http://searg.rhul.ac.uk/pubs/hennig_etal_2017%20Paleo-Pacific%20margin%20West%20Borneo.pdf)
(Metamorphic and magmatic rocks in NW part of Schwaner Mountains of W Kalimantan with mainly Cretaceous U-Pb zircon ages (~80-130 Ma). Triassic metatonalite near Pontianak with Triassic and Jurassic zircons formed at Paleo-Pacific margin of subduction under Indochina- E Malaya block. Geochemically similar Triassic rocks in Embuoi Complex to N and Jagoi Granodiorite in W Sarawak formed part of SE margin of Triassic Sundaland. One S-type granitoid (118.6 Ma) with inherited Carboniferous, Triassic and Jurassic zircons, indicating Sundaland basement. Two I-type granitoids with Cretaceous ages of 101.5 and 81.1 Ma. All three record Cretaceous magmatism at Paleo-Pacific subduction margin. Cretaceous zircons of metamorphic origin indicate recrystallisation at ~90 Ma, possibly related to collision of Argo block with Sundaland. Subduction ceased at that time, followed by post-collisional magmatism in Pueh (77.2 Ma) and Gading Intrusions (80 Ma) of W Sarawak (NB: West Borneo here viewed as part of Triassic Sundaland, extending to NW Schwaner zone and possibly further South; not SW Borneo block as previously assigned by Hall, etc.))

Heryanto, R. (1991)- Sedimentology of the Melawi and Ketungau basins, West Kalimantan, Indonesia. Ph.D. Thesis University of Wollongong, vol. p. 1-255, vol. 2 Figures.
(online at: http://ro.uow.edu.au/theses/1405)
(Melawi and Ketungau 'forearc' basins in W Kalimantan formed between E Tertiary Lubuk Antu subduction zone in N and Semitau High to S. Semitau High part of Late Cretaceous Boyan Melange subduction complex (with up to km-size blocks, incl. Cretaceous Orbitolina Limestone, ultramafics, Permian granitoid and metamorphic microcontinental fragments). Up to 7500m of Late Eocene- Oligocene shallow marine- terrestrial deposits in Melawi and Ketungau Basins. Three unconformities in Melawi Basin. Melawi Group and Alat Sst can be correlated with Kantu Fm and Tutoop Sst in Ketungau Basin. Sand provenance from N, from uplifted melanges. Both basins with coal seams. Uplift of Semitau High (Boyan Melange) along backthrusts during Paleocene- E Eocene produced accretionary prism flanked to S by forearc Melawi Basin. N-ward migration of Benioff Zone in Late Eocene created forearc Ketungau Basin between old and new (Lubok Antu Melange) outer arc ridges. With palynology analyses by B. Porthault. Oligo-Miocene Sintang intrusives ~23-31 Ma in S, ~16-18 Ma in N)

(Kalan area in C Kalimantan N of Schwaner Mts with 3000-4000m thick Permo-Carboniferous (or younger?; JTvG) low metamorphic sediments, surrounded by Cretaceous tonalitic intrusives. Two periods of tectonic deformation (1) plastic deformation, forming schistosity in metapelite, fracture cleavage in metasilt and regional folding (N70°E average axial direction; bedding planes av. strike N50°E, dip 50°S). With uranium mineralisation in fractures and schistosity; (2) brittle deformation that did not cause any extensive bed sliding, fracturing, etc. Fracture patterns may be result of large 'Kalan alignment' NE-SW sinistral strike-slip fault)

Kemmerling, G.L.L. (1915)- Topographische en geologische beschrijving van het stroomgebied van de Barito, in hoofdzaak wat de Doesoenlanden betreft. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap (2), 32, p. 575-641 and p. 717-772.
(online at: https://resolver.kb.nl/resolve?urn=MMUBA13:001661001:pdf)
('Topographic and geological description of the Barito drainage area, in particular the Dusun lands'. Mainly geographic description and review of stratigraphy. With 1:750,000 scale geologic map)

Khan, A.A. (2018)- An appraisal of the tectonic evolution of SW Borneo constraints from petrotectonic assemblage and gravity anomaly. Bull. Geol. Soc. Malaysia 66, p. 47-56.
(online at: https://gsm.org.my/products/702001-101756-PDF.pdf)
(Petrotectonic assemblages suggest early crust of SW Borneo evolved from depleted basaltic to enriched andesitic composition of intra-oceanic subduction melts and has undergone delamination. Due to intrusion and lateral spreading of hot upper mantle, lower crust has undergone partial melting, resulting in extrusion of tholeiitic magma into overlying basins. E-W trending Pre-Carboniferous inlier surrounded by Cretaceous intrusives and volcanics in Schwaner Mountains mark start of Cretaceous collision episode. Widespread oceanic rock assemblages, ophiolites, meta-sedimentary and igneous rocks in NW-SE zone signify derivation from paleo-ocean basin closure. Deformed Cretaceous flysch forms accretionary complex as dominantly Tertiary accretionary wedge to N. Indentation of Luconia micro-continent onto SW Borneo peri-continent edge after subduction had ceased. Sibu high segment of Luconia Block. Collision and subduction between Luconia micro-continent and SW Borneo peri-continent evolved "Sarawak Suture" and "Continental Arc")

Kim, I.J. (2005)- Occurrence of gold deposits of the Tumbang Lapan area of the Middle Kalimantan, Indonesia. Korean Soc. Econ. Environm. Geol. 38, 3, p. 347-353. *(In Korean, with English summary)*
(C Kalimantan Tumbang Lapan area (along tributary of Kahajan River) with Permian- Carboniferous Pinoh Metamorphic rocks, Cretaceous granites. Faults with gold-bearing hydrothermal quartz veins)

Kim, I.J. (2006)- Geochemical exploration for the stream sediments of the Tumbang Mirih in the Middle Kalimantan, Indonesia. Korean Soc. Econ. Environm. Geol. 39, 3, p. 301-328. *(In Korean, with English summary)*
(Common gold in Quaternary stream samples in Tumbang Mirih area in C Kalimantan)

Mazur, S., C. Green, M. Stewart, R. Bouatmani & P. Markwick (2011)- Rotation of Borneo revisited- new inferences from gravity data and plate reconstructions. In: Petrol. Geol. Conf. Exhib. (PGCE 2011), Kuala Lumpur, Warta Geologi 37, 1, p. 52. *(Abstract only; no figures)*

(online at: https://gsmpubl.files.wordpress.com/2014/09/warta37_1.pdf)
(Paleomagnetic data of 50+40° CCW rotation of Borneo since 80 Ma disputed. Large gravity lineaments running E-W through Kalimantan and into Sea of Kalimantan(?) as well as ENE-WSW gravity anomalies across Java Sea and into Sumatra are evidence of crustal continuity that is hard to reconcile with rotation model of Hall (2002). Alternative plate model predicts 12-13° of CW rotation for Kalimantan and Sarawak relative to S China since 30 Ma. N Sabah is separated from Sarawak and Kalimantan by plate boundary which implies common tectonic history for N Sabah and S Palawan and separate evolution until M Miocene docking of Palawan Block to N margin of Borneo and Cagayan Ridge)

(online at: http://jurnal.upnyk.ac.id/index.php/mtg/article/view/190)
('Lead- Zinc mineralization in the Riamkusik area, District Marau, Ketapang, W Kalimantan Province'. Massive sulphide mineralisation in SW Kalimantan with galena, magnetite, sphalerite, pyrite, stibnite, hematite, chalcopyrite, also some Au and Ag. In fault zone in Cretaceous volcanics/ andesitic intrusions (?))

Purwanto, H.S. & H. Riswandi (2010)- Jenis deposit ñmassive sulphideò Pb-Zn di dearah Riam Kusik, Kecamatan Ketapang, propinsi Kalimantan Barat. J. Ilmiah Magister Teknik Geologi (UPN) 3, 2, 12p.
(online at: http://jurnal.upnyk.ac.id/index.php/mtg/article/view/209)
('Type of "massive sulphide" Pb-Zn deposit in Riam Kusik, Ketapang District, West Kalimantan'. Massive sulphide mineralization with galena, chalcopyrite, sphalerite, etc., following E-W structural grain)

Retgers, J.W. (1891)- Mikroskopisch onderzoek eener verzameling gesteenten uit de afdeeling Martapura, Zuid-en Oost Afd. van Borneo. Jaarboek Mijnwezen Nederlandsch Oost-Indie 1891, Wetenschappelijk Gedeelte, p. 5-212.
('Microscopic study of a collection of rocks from the department Martapura, SE Kalimantan'. Petrographic description of rocks collected by Hooze in 1883-1888. Mainly various schists, including glaucophane schist, all presumed to be of Precambrian age (more likely mid-Cretaceous; JTvG). No location maps)

Retgers, J.W. (1893)- Uber kristallinische Schiefer, insbesondere Glaukophanschiefer, und Eruptivgesteine im sudlichen Borneo. Neues Jahrbuch Mineral. Geol. Palaontologie 1893, 1, p. 39-43.
('On crystalline schists, particularly glaucophane schists, and volcanic rocks in southern Kalimantan'. First record of high P- low T glaucophane schists from Meratus Mountains at Pengaron and further north, collected by Hooze. Also peridotites-serpentinites. Little or no granite and true gneiss)

Retgers, J.W. (1895)- Mikroskopisch onderzoek van gesteenten van de Oostkust van Borneo, verzameld door J.A. Hooze. Jaarboek Mijnwezen Nederlandsch Oost-Indie 1895, Wetenschappelijk Gedeelte, p. 78-98.
('Microscopic study of rocks from the east coast of Kalimantan, collected by J.A. Hooze'. Brief petrographic descriptions, many from Pulau Laut, of a.o. quartz sandstones from Kutai, porphyrite/ diabase, diorite, and serpentinite from Palau Laut, limestone from Laut straits, etc.)

Roberts, G.G., N. White, M.J. Hoggard, P.W. Ball & C. Meenan (2018)- A Neogene history of mantle convective support beneath Borneo. Earth Planetary Sci. Letters 496, 1, p. 142-158.
(Convective uplift possibly played role in sculpting Borneo physiography. Long wavelength free-air gravity anomaly of +60 mGal centered on Borneo coincides with distribution of Neogene basaltic magmatism and sub-plate slow shear wave velocity anomalies (anomalously hot asthenosphere?). Regional shortening does not account for km-scale regional elevation. Uplift history suggests Borneo topography grew in Neogene and ties to offshore Miocene transition from carbonate to clastic deposition. Regional uplift possibly partly generated and maintained by temperature anomalies within asthenospheric channel)

Robinson, G., N. Ratman & P. Senyaja (1996)- The accreted Meratus terranes Southeast Kalimantan. Bull. Geol. Res. Dev. Centre (GRDC), Bandung, 20, p. 35-56.
(At least 3 terranes accreted to SE Kalimantan from E between Barremian-Aptian and end-Paleocene. Meratus Mts consists of number of W-dipping partly subducted slabs of pre-Aptian oceanic crust, with granite and marine sediments. Stratigraphy includes Aptian-Paleocene arc volcanics, Barremian-Aptian granite, Aptian-Paleocene marine sediments and slivers of high P-low T metamorphic equivalents of these rocks. Meratus Mts uplifted and partly eroded at end-Paleocene, followed by deposition of Eocene- Pleistocene sediments (much of this is unlikely to be correct; JTvG))

Robinson, G.P., A.Y.S. Wah, B.T. Setiabudi, D.N. Sunuhadi, J.M. Hammarstrom, S. Ludington, A.A. Bookstrom, S.A. Yenie & M.L. Zientek (2013)- Porphyry copper assessment for Tract 142pCu7019, Central Kalimantan-Indonesia and Sabah and Sarawak, Malaysia. In: J.M. Hammarstrom et al., Porphyry copper assessment of Southeast Asia and Melanesia, U.S. Geol. Survey, Scient. Invest. Rep. 2010-5090-D, Appendix I, p. 149-163.
(online at: http://pubs.usgs.gov/sir/2010/5090/d/sir2010-5090d_text.pdf)
(Assessment of porphyry copper deposits in C Kalimantan- N Borneo dispersed belt of late Oligocene- Pliocene intermediate intrusives and volcanics. Relation of these intrusive rocks to subduction unclear, and tectonic setting for porphyry copper deposits in this tract likely post-subduction. All porphyry copper prospects likely of Miocene-Pliocene age. Only one known porphyry copper deposit: Mamut (Sabah; 1966))

Sarmili, L. (1997)- Indikasi mineral kasiterit dan mineral berat lainnya di perairan Kalimantan Barat dan sekitarnya. Proc. 26th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, Sumber Daya Min. Energi, p. 254-262.
('Indications of cassiterite and other heavy minerals in waters of West Kalimantan'. Presence of cassiterite in seafloor sediments off SW Kalimantan suggests presence in source area of granites with same properties as granites around Bangka- Belitung)

Sarmili, L. (1998)- Surficial cassiterite deposits dispersal in southwest Kalimantan waters. Bull. Marine Geol. Inst. (MGI), Bandung, 13, 2, p. 1-8.
(Similar to Sarmili (1999) paper below. High anomaly cassiterite deposit in SW Kalimantan waters indicates tin deposits not only adjacent to Bangka and Belitung Islands, but also further E near Kalimantan. Extension of anomalies supported by shallow seismic and magnetic data indicating occurrence of granitic basement close to sea bed. Granitic basement may be different from basement of Bangka-Belitung (main granitic of tin belt), but may belong to Anambas-Natuna granitic belt)

Sarmili, L. (1999)- Submarine cassiterite in southwest Kalimantan waters. In: Proc. 35th Sess. Coord. Comm. Coastal Offshore Geoscience Programmes E and SE Asia (CCOP), Subic Bay 1998, 2, Techn. Repts., p. 93-102.
(Discovery of cassiterite anomalies in W Kalimantan waters, indicating tin placers may form not only near Banka and Belitung islands but also off Kalimantan. Shallow seismic data and strong magnetic anomalies indicate granitic intrusions close to surface, interpreted as source of cassiterite. Granites of Bangka-Belitung are part of Main granite tin belt whereas W Kalimantan intrusions belong to Anambas-Natuna granitic belt)

Sastratenaya, A.S. (1991)- Deformation et mobilite du megaprisme tectonique de Pinoh-Sayan, Kalimantan, Indonesie. Doct. Thesis, Universite Louis Pasteur de Strasbourg, p. 1-188. *(Unpublished)*

('Deformation and mobility of the Pinoh-Sayan tectonic mega-prism, Kalimantan'. Kalan sector of Pinoh-Sayan uranium exploration area on N side of Schwaner Mts. Basement Permo-Carboniferous metasediments, intruded by E Cretaceous tonalite and Late Cretaceous monzogranites, unconformably overlain by Tertiary Melawi Fm continental deposits. Tectonic phases: (1) Triassic folding and schistosity development; (2) Jurassic-U Cretaceous 65° CCW rotation of pre-existing structures along major NE-SW Kalan lineament, characterized by folding of schistosity and development of large sinistral WSW-ENE shear zone; (3) End-Cretaceous- Miocene reactivation of above two main features, causing lateral expulsion of 'tectonic megaprism' formed by these features, while fore-land cover is folded)

Satyana, A.H. (1994)- The northern massifs of the Meratus Mountains, South Kalimantan: nature, evolution, and tectonic implications to the Barito structures. Proc. 23rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, 1, p. 457-470.
(Basement outcrops N of main Meratus Range contain similar Cretaceous subduction complex rocks and granodiorite. Form series of E-vergent thrusts, i.e. opposite direction of W-vergent main Meratus Range)

Satyana, A.H. (1996)- Adang-Lupar Fault, Kalimantan: controversies and new observations on the Trans-Kalimantan megashear. Proc. 25th Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 3, p. 124-143.
(Adang and Lupar faults are probably connected and form major WNW-ESE trans-Kalimantan left-lateral mega-shear fault zone, from Natuna to Makassar Straits, along which transpressional and transtensional deformation occurred)

Satyana, A.H. & C. Armandita (2008)- On the origin of the Meratus Uplift, Southeast Kalimantan- tectonic and gravity constraints: a model for exhumation of collisional orogen in Indonesia. Proc. 33rd Ann. Conv. Indon. Assoc. Geophys. (HAGI), Bandung 2008, 4p.
(Meratus Mts is collisional suture marking E-M Cretaceous collision of Schwaner and Paternoster continents. Presently, mountains are basement uplift separating Barito from Asem-Asem and Pasir Basins. Lack of gravity and magnetic expression of ultramafics suggests Meratus Mts are 'rootless', composed of thin allochthonous oceanic slab, exhumed in Late Cretaceous due to buoyancy of thick subducted Paternoster continent after oceanic front broke off. Lack of deformation on seismic data from S Makassar Strait and Paternoster terrane oppose common view that micro-continents colliding with E Sulawesi propagated their tectonic forces W-wards and uplifted Meratus Mts)

Satyana, A.H. & H. Darman (2000)- Kalimantan. In: H. Darman & F.H.Sidi (eds.) Outline of the geology of Indonesia, Chapter 5, Indonesian Association of Geologists (IAGI), Jakarta, p. 69-90.

('Note on the diamond mines at Landak, western province of Borneo'. Diamonds mined from alluvial deposits along Landak River in W Kalimantan mainly by ~600 Chinese miners. Richest mines farthest upstream. Most diamonds <4 carats, some ~40 carats. Diamonds processed in Pontianak and Singapore. No maps or figures)

Seavoy, R.E. (1975)- Placer diamond mining in Kalimantan, Indonesia. Indonesia (Southeast Asia Program Publications at Cornell University) 19, p. 79-84.
(Diamonds, gold and platinum in river and terrace gravels in Martapura and Pleihari regions, SE Kalimantan. Most placer gold from nearby Bobaris Mts. Platinum from weathering of layered ultrabasic rocks that form cores of Bobaris and Meratus Mts. Diamonds from kimberlite pipes associated with ultrabasic rocks of Bobaris Mts. Only small-scale mining by villagers)

Seeley, J.B. & T.J. Senden (1994)- Alluvial gold in Kalimantan, Indonesia: a colloidal origin? J. Geochemical Exploration 50, 1-3, p. 457-478.
(Placer gold deposits in Quaternary paleochannels and Pleistocene terraces in Ampalit and Cempaga Buang drainage basins near Kasongan, C Kalimantan. Nearby in N and NW basement outcrops (Permo-Triassic metamorphics and large Jurassic-Cretaceous granodioritic plutons, with NE structural trend throughout basement) and Oligo-Miocene volcanics-intrusives associated with epithermal gold deposits. Morphology of gold grains (common spherical grains) from Ampalit indicates gold grains possibly of colloidal origin, not mechanically transported to present domain, but transported via ground water to zone of aggregation)

Sendjaja, P., M.E. Suparka & E. Sucipta (2009)- Adakites rocks from Sintang, West Kalimantan and Una-Una Island, Central Sulawesi, Indonesia: evidence of slab melting of subducted young oceanic crust. In: 11th Reg.

Congress Geology, mineral and energy resources of Southeast Asia (GEOSEA 2009), Kuala Lumpur, p. 42-43. *(Abstract) (online at: www.gsm.org.my/products/702001-101669-PDF.pdf)*
(Adakites refer to group of silicic arc igneous-volcanic rocks primarily produced by direct melting of basaltic portion of subducted young (<25 ma) oceanic crust. Geochemical characteristic high silica (SiO_2 >56%), high Al_2O_3 (>15%), low MgO (<3%), high Sr, low Y. M Miocene adakitic granodiorite from Sintang, W Kalimantan and Quarternary adakites volcanic rocks from UnaUna Island, C Sulawesi similar patterns of LREE-enriched signature of island arc, confirming rocks produced in convergent margin environment)

Setiabudi, B.T. (2001)- Geochemistry and geochronology of the igneous suite associated with the Kelian epithermal gold deposit, Indonesia. Ph.D. Thesis, Australian National University (ANU), Canberra, p. 1-203.
(online at: https://digitalcollections.anu.edu.au/handle/1885/12888)
(Kelian large gold mine ~250 km W of Samarinda, C Kalimantan.E Miocene intrusive-related low sulphidation system in C Kalimantan Continental Arc. Miocence calc-alkaline suites from Kalimantan volcanic arc two trends (1) 'productive' igneous suites at Kelian, Muyup and Ritan, typical calc-alkaline series;(2) Magerang-Imang and Nakan suites with high MgO. Zircon ages of Magerang hornblende andesite 19.4 Ma and 19.6 Ma, Nakan andesite 20.0 Ma. Central Andesite porphyry at Kelian 3 age populations: 21.2, 20.5 and 19.7 Ma, with youngest date (Burdigalian) interpreted as emplacement age. Runcing Rhyolite porphyry 3 age populations between 19.3- 20.8 Ma. Kelian and Magerang andesites short interval of emplacement (0.5- 1 Ma))

Setiabudi, B.T. (2002)- Nested cannibalistic intrusions associated with the Kelian gold deposit, Indonesia: zircon U-Pb dating by Excimer laser ablation ICP-MS. Proc. 31st Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, 2, p. 894-911.
(Kelian and Magerang andesites 250km W of Samarinda, with short age range. Magmatism and mineralization within 0.5- 1.0 Myrs around 19.4 Ma (E Miocene). Produced two types of eithermal deposits. Detrital zircons in nearby rivers Tertiary populations of 1.7-2.8 Ma and 15.8-21.7 Ma; large Cretaceous peak at ~105 Ma))

Setiabudi, B.T. (2002)-Geochemistry of the igneous suite of the Kelian region, East Kalimantan, Indonesia: implications for the gensis of the Kelian deposit. Proc. 31st Ann. Conv. Indon. Assoc. Geol. (IAGI), Surabaya, 2, p. 912-933.
(E Miocene calk-alkaline arc volcanics of Kelian region two magmatic differentiation trends. Part of Central Kalimantan continental arc of andesitic- trachyandesitic rocks)

Setiabudi, B.T., I.H. Campbell, C.E. Martin & C.M. Allen (2007)- Platinum group element geochemistry of andesite intrusions of the Kelian region, East Kalimantan, Indonesia; implications of gold depletion in the intrusions associated with the Kelian gold deposit. Econ. Geol. and Bull. Soc. Econ. Geol. 102, 1, p. 95-108.
(Gold mineralization at Kelian mine younger than associated C and E andesite intrusions (~19-20 Ma) considered to be related to S-dipping subduction zone in NW Sarawak. Gold probably derived from slightly younger intrusions. Parallel Cu-Au-PGE patterns due to mixing between mafic and more felsic magma)

Setiawan, B. (1993)- Les lignees granitiques et les skarns mineralisees en Zn de Longlaai, Est-Kalimantan (Borneo, Indonesie). Thesis Ecole Nationale Superieure des Mines de Paris, p. 1-481. *(Documents du BRGM no. 227)*
('The granitic suites and Zn-mineralized skarns from Longlaai, E Kalimantan')

('Case study of three contaminated granitic bodies in the Longlaai area, Berau district, East-Kalimantan'. E Miocene Mamak, Gupak and Segah granitoids in NE Kalimantan with 'calcic' contamination)

Setiawan, B. & M. Fonteilles (1998)- Granitic magmas in individual massifs as liquids derived from a single andesite parental melt- two examples from N.E. Kalimantan, Indonesia. J. Geologi Sumberdaya Mineral 8, 77, p. 12-26.
(Two groups of E Miocene leucogranitic intrusions in Longlaai area in NE Kalimantan, Upper Segah and Longlaai, separated by 15km zone without intrusives. Intruded into Lower Eocene Geh Fm, Sr isotope age 22 ±

2 Ma. Interpreted to be formed by fractional crystallization processes from single deep seated andesitic magma chamber, resulting in 'normal' group and 'shoshonitic' type)

Setiawan, B. & L.M. Le Bel (1987)- Discovery of a new tin province, Long Laai area, East Kalimantan, Indonesia. In: C.S. Hutchison (ed.) Tin and Tungsten granites, Proc. IGCP Project 220 Mtg, Ipoh 1986, Techn. Bull. 6, p. 61-82.
(Tin-bearing adamellites in small intrusions in Long Laai area, NE Kalimantan. Radiometric age 26 Ma)

Setiawan, N.I., Y. Osanai, N. Nakano, T. Adachi & A. Asyŵari (2014)- Metamorphic evolution of garnet-bearing epidote barroisite schist from Meratus complex in South Kalimantan, Indonesia. Proc. 43rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, PIT IAGI 2014-106, 18p.
(First report on metamorphic evolution of garnet-bearing epidote-barroisite schist from Aranio River, etc. in Meratus Complex. P-T path of garnet-bearing epidote-barroisite schist and epidote-glaucophane schist: (1) first stage may be glaucophane - epidote assemblage (1.7-1.0 GPa, T 300-550 °C; maximum pressure limit of prograde stage); (2) peak P-T condition based on garnet rim, barroisite, phengite, epidote and quartz (550-690 °C, 1.1-1.5 GPa; albite epidote amphibolite-facies corresponding to depth of 50-60 km); (3) retrograde stage shows changing composition of amphiboles from Si-rich barroisite to actinolite (~0.5 GPa at 350 °C). Metamorphic rocks from Meratus Complex may have experienced high-P condition in epidote-blueschist facies before peak metamorphism in epidote-amphibolite facies. Garnet-bearing epidote-barroisite schist suggest higher geothermal gradient in Meratus Complex than in SW Sulawesi and C Java metamorphic terranes)

Setiawan, N.I., Y. Osanai, N. Nakano, T. Adachi & A. Asyŵari (2015)- Metamorphic evolution of garnet-bearing epidote-barroisite schist from the Meratus complex in South Kalimantan, Indonesia. Indonesian J. Geoscience 2, 3, p. 139-156.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/833)
(Same paper as Setiawan et al. (2014) above)

Setiawan, N.I., Y. Osanai, N. Nakano, T. Adachi, L.D. Setiadji & J. Wahyudiono (2013)- Late Triassic metatonalite from the Schwaner Mountains in West Kalimantan and its contribution to sedimentary provenance in the Sundaland. Berita Sedimentologi 28, p. 4-12.
(online at: www.iagi.or.id/fosi/berita-sedimentologi-no-28-borneo.html)
(Metatonalites in W Schwaner Mountains of W Kalimantan have calc-alkaline affinities and derived from subduction-related arc tectonic environment (proto-S China Sea subduction?). Some have adakite signature. Zircon dating shows magmatic age at 233± 3 Ma (~Carnian, Late Triassic), older than accepted ages for granitoids in Schwaner Mountains and oldest recorded here. Schwaner Mountains therefore sediment source not only from Cretaceous age granites, but also from Triassic age granites)

Setiawan, R. & I. Nurdiana (2007)- Petrologi batupasir Formasi Mentarang kelompok Embaluh, di daerah Longbia, Kalimantan Timur. In: Geologi Indonesia: dinamika dan produknya, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 33, 2, p. 193-205.
(Petrology of deep marine Late Cretaceous -E Eocene Mentarang Fm sandstone of Embaluh Group in Longbia district, E Kalimantan. Partly low-metamorphic interbedded sandstones, siltstone, and slaty mudstone. Mainly litharenites, recycled orogen. Sandstones provenance Semitau Ridge and Schwaner Mts in SW Kalimantan, probably also Embuoi and Busang Complex in S. Andesitic-basaltic rock fragments more common than sedimentary and metamorphic rocks. Volcanism probably related to tectonics in N Kalimantan)

Setijadji, L.D. (2009)- Alluvial gold in Central Kalimantan: its mode of occurrence, source and consequences for primary deposits. Proc. 38th Ann. Conv. Indon. Assoc. Geol. (IAGI), Semarang, 1p. *(Abstract only)*
(Alluvial gold deposits extensively distributed in C Kalimantan. Most deposits worked as small-scale traditional operations. Only large-scale dredging operation at Ampalit drainage basin near Kasongan in 1988-1992. Many alluvial gold deposits associated with muddy gravelly rocks. Much of gold may not be derived from Tertiary epithermal systems but from Mesozoic granite-related quartz veins)

Setijadji, L.D., N.I. Basuki & S. Prihatmoko (2010)- Kalimantan mineral resources: an update on exploration and mining trends, synthesis on magmatism history and proposed models for metallic mineralization. Proc. 39th Ann. Conv. Indon. Assoc. Geol. (IAGI), Lombok 2010, 14p.
(Kalimantan magmatic arcs Cretaceous and younger events. Subduction magmatism may ended after Late Cretaceous in much of island, followed by syn- and post-collision magmatism. Metallic mineralization in two main periods (1) Cretaceous or older, dominated by granitoid-related skarn iron and base metals in Schwaner and Meratus Mountains; (2) M-L Miocene gold and base metals mineralization associated with Sintang Intrusions. Miocene gold-bearing intrusions not products of ordinary subduction-zone magmatism, but derived from basalts source during major tectonic events following subduction)

Setijadji, L.D., N.R. Nabawi & I.W.Warmada (2014)- Tin occurrences in western Kalimantan island, Indonesia and implications on the new interpretation of the SE Asia tin-bearing granite belts. Proc. 4th Asia Africa Mineral Resources Conf., Algiers, p. *(Abstract ony)*
(Discovery of tin mineralization in Ketapang and Singkawang districts, W Kalimantan, suggests presence of S-type Triassic-Jurassic granites in Ketapang area, whose distribution is not well constrained due to overlapping of Cretaceous granitoids in Schwaner Mts, which are not known to produce tin. This suggests SW Kalimantan was already connected to Sumatra and Tin islands since at least Triassic-Jurassic)

Setijadji, L.D., F. Tamba & A. Idrus (2010)- Geology of the Ruwai iron and Zn-Pb-Ag skarn deposits Lamandau District, Central Kalimantan. In: N.I. Basuki & S. Prihatmoko (eds.) Proc. MGEI-IAGI Seminar Kalimantan coal and mineral resources, Balikpapan 2010, p. 175-185.
((also in Majalah Geologi Indonesia 2011, 26, 3, p. 143-154; online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/759)
(Fe and Zn-Pb-Ag skarn mineralization in Ruwai District, Schwaner Mountains, C Kalimantan, result of Late Cretaceous- E Tertiary granitoids intrusions. Initially reported by Frijling et al (1920). Oldest rocks in area Permo-Carboniferous Pinoh Metamorphics, Late Triassic- Mid Cretaceous Ketapang Complex limestone-sandstone- siltstone and Kuatan/ Metan andesitic-rhyolitic volcanics, all intruded by E and Late Cretaceous Schwaner Arc (Sukadana batholiths))

Setyadi, H., W, Yudanto, D. Kristanto, T.R. Setiawan, D. Iswanto, B. Santoso, I. Hardjana & A. Ismanto (2015)- Discovery, characteristic and inventory of Seruyung deposit, Nunukan District, North Kalimantan Province, Indonesia. In: N.I. Basuki (ed.) Proc. Indonesian Soc. Econ. Geol. (MGEI) 7th Ann. Conv., Balikpapan, p. 85-100.
(On Seruyung marginally economic gold deposit in NE Kalimantan, NW of Tarakan, dicovered in 1998. In Neogene andesitic volcanics, part of Miocene- Recent volcanic arc, built on Tidung Basin M Eocene-Miocene sediments, formed due to SE-ward subduction of Sulu Sea Plate. High sulphidation epithermal gold deposit, with mineralization mainly in vuggy quartz core zone with hydrothermal breccia hosted by volcanic breccia)

(Geochemical reconnaissance survey for gold in C Kalimantan delineated seven anomalies, associated with Cretaceous Sepauk Tonalite)

White, L., I. Graham, R. Armstrong & R. Hall (2014)- Tracing the Source of Borneoœs Cempaka diamond deposit. American Geophys. Union (AGU), Fall Mtg., San Francisco, EP21D-3565, 1p. *(Abstract only)*
(Detrital zircon ages from Cempaka alluvial diamond deposit in SE Kalimantan: 75-110 Ma (2/3; M-U Cretaceous), 223 Ma, 314-319 Ma, 353-367 Ma, 402-414 Ma, 474 Ma, 521 Ma, 549 Ma, 1135-1176 Ma, 1535 Ma and 2716 Ma. Cretaceous zircons euhedral with minor evidence of mechanical abrasion, likely derived from nearby Schwaner Mts granites. Triassic and older grains rounded and likely derived from Australia before Borneo rifted from Gondwana. Some ages resemble those of Merlin and Argyle diamond deposits of Australia. Geochemical data from diamonds implies association with lamproite intrusions)

White, L.T., I. Graham, D. Tanner, R. Hall, R.A. Armstrong, G. Yaxley, L. Barron, L. Spencer & T.M. van Leeuwen (2016)- The provenance of Borneo's enigmatic alluvial diamonds: a case study from Cempaka, SE Kalimantan. Gondwana Research 38, p. 251-272.
(Diamonds in alluvial deposits across C and S Borneo of unknown primary igneous source. Cempaka diamonds likely derived from at least two sources, one relatively local and/or involved little reworking, and other more distal with several periods of reworking. Distal diamond source interpreted to be recycled from diamond-bearing pipes of block that rifted from NW Australia. Local source possibly diamondiferous diatremes associated with eroded Miocene high-K alkaline intrusions N of Barito Basin, or from ophiolitic rocks exposed in nearby Meratus Mountains. Associated zircons mainly 75-110 Ma, similar to many other Borneo Tertiary sediments, others Triassic and older)

Williams, P.R. & B.H. Harahap (1986)- Geochemistry, age and origin of post subduction intrusive rocks in West Kalimantan and Sarawak. Bull. Geol. Res. Dev. Centre (GRDC), Bandung 12, p. 43-54.
(Major phase of Late Oligocene- E Miocene igneous activity in NW Kalimantan and Sarawak. Mainly I-type granodiorites. Concentrated in thickest parts of Late Cretaceous- Early Tertiary Melawi and Ketungau sedimentary basin and probably represents deep crustal remelting in passive, post-subduction environment)

Williams, P.R. & B.H. Harahap (1987)- Preliminary geochemical and age data from postsubduction intrusive rocks, northwest Borneo. Australian J. Earth Sci. 34, p. 405-415.
(Major phase of Late Oligocene- E Miocene igneous activity in W Kalimantan and Sarawak, NW Borneo, mainly associated with thickest parts of Late Cretaceous- E Tertiary Melawi and Ketungau sedimentary basins. Majority is granodiorite, similar to I-type granitoids. K/Ar ages 23-30.4 Ma from S part of region (Melawi Basin), 16.4- 17.9 in N part (Ketungau basin). Age of magmatism, tectonic position and geochemistry suggest it is related to deep crustal re-melting and intrusion in passive, post-subduction environment (Hartono 2006 suggests these are subduction-related adakites; JTvG))

Williams, P.R. & R. Heryanto (1986)- Geological data record, Sintang 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung, p. *(Unpublished)*
(Tate 1995: incl. tin occurrence in Lower Cretaceous Menyukung Granite in W Kalimantan)

Williams, P.R., C.R. Johnston, R.A. Almond & W.H. Simamora (1988)- Late Cretaceous to Early Tertiary structural elements of West Kalimantan. Tectonophysics 148, p. 279-298.
(Three W Kalimantan domains after E Cretaceous-Eocene convergent tectonics: (1) Schwaner Mountains, E-W across S and C West Kalimantan with subduction granitoids intruded into low-grade metamorphic rocks in E Cretaceous; (2) NW Kalimantan Late Carboniferous- Cretaceous sediments and volcanics; (3) NW Kalimantan Cretaceous flysch accretionary complex, a S continuation of mainly Tertiary Sarawak accretionary wedge. Boundary between Cretaceous accretionary domain and NW Kalimantan domain is transform fault marking W limit of Late Cretaceous S-dipping subduction. Growth of accretionary complex resulted in uplift of melange and flysch, on which extensional half graben formed with lacustrine deposits. Sedimentary basin formed between continental rocks to S and emergent accretionary complex to N, in forearc basin position. As accretion proceeded, locus of underthrusting migrated N and second melange ridge and sedimentary basin developed farther N. S-dipping subduction in E part of W Kalimantan in Late Cretaceous- Early Tertiary)

Williams, P.R., S. Supriatna & B. Harahap (1986)- Cretaceous melange in West Kalimantan and its tectonic implications. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 69-78.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986006.pdf)
(Same as Williams et al. (1990) below. Boyan melange of Semitau zone of NW Kalimantan, which separates Cretaceous- E Tertiary Ketungau and Melawi basins, is chaotic mixture of blocks (several m to several km) of greenschist, serpentinite, granite, limestone (incl. mid-Cretaceous Orbitolina Lst), quartzite and radiolarian chert in sheared argilitic matrix (generally steep S-dipping cleavage). Glaucophane schist reported by Zeijlmans (1939) not seen, Also 15km long/ 3 km wide slab of ultramafic rocks. Unlikely that melange is tectonic shear zone related to transcurrent faulting, but may be S part of Late Cretaceous- Paleogene subduction complex of Sarawak)

Williams, P.R., S. Supriatna & B. Harahap (1990)- Cretaceous melange in West Kalimantan and its tectonic implications. Bull. Geol. Res. Dev. Centre (GRDC), Bandung, 14, p. 29-37.
(Extensive Boyan tectonic melange in W Kalimantan implies existence of WNW trending suture zone just S of Semitau on Kapuas River. Chaotic sheared argillite with blocks of metamorphics and ultramafics, now recognized as Late Cretaceous melange, not coherent Jurassic as suggested in 1939. Melange bordered by highly deformed Cenomanian- Turonian turbiditic Selangkai Fm, with blocks of shallow detritus, including Orbitolina sandstone. Characteristics of subduction zone, but no known igneous activity of this age)

Williams, P.R., S. Supriatna, C.R. Johnston, R.A. Almond & W.H. Simamora (1989)- A Late Cretaceous to Early Tertiary accretionary complex in West Kalimantan. Bull. Geol. Res. Dev. Centre (GRDC), Bandung, 13, p. 9-29. *(Much the same as Williams et al. 1988)*

('Geological map of the Pontianak and Sambas sultanates and Mempwah and Landak districts in West Borneo'. Atlas to accompant Wing Easton (1904), with ten 1:100,000 scale maps, one geologic overview map 1:500,000, one plate of index fossils, one plate of cross-sections)

Wing Easton, N. (1914)- Geologisch overzicht van West Borneo; verschil en overeenkomst met Centraal en Zuidoost Borneo. Verslagen Geol. Sectie Geologisch Mijnbouwkundig Genootschap Nederland Kolonien 1, p. 179-189.
('Geological overview of W Borneo; differences and similarities with C and SE Borneo'; Verbeek ref. 2802)

Wing Easton, N. (1917)- Had Borneo vroeger een woestijnklimaat? Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 34, 5, p. 680-695.
('Did Borneo have a desert climate in the past?'. Thick, massive unfossiliferous, unfolded, Eocene(?) 'Plateau sandstone' of W Kalimantan does not look like marine or fluvio-deltaic deposit, and is believed to be eolian deposit, possible E-W trending dunes. This would imply much drier climate than today. 'Plateau sandstones' are rel. unconsolidated sands, erosional product of granites ('quartz porphyry'), up to 1000m thick. Also called Kajan Sst)

Wing Easton, N. (1919)- Kristallijne schisten in West Borneo. Verhandelingen Geologisch-Mijnbouwkundig Genootschap Nederland Kol., Geol. Serie 4, p. 315-318.
('Crystalline schists in West Borneo'. Rocks originally described from W Kalimantan by Wing Easton in 1904 as diabase, quartz porhytites etc., should probably be regarded as metamorphic rocks (epidote-chlorite schists, quartzites and amphibolites). Metamorphism must be Early Triassic or older in age)

Wing Easton, N. (1933)- De natuurlijke minerale koolstof en haar ontstaansmogelijkheden. Toepassing op de Borneo-diamanten. De Mijningenieur 14, 4, p. 60-74.
('The natural carbon mineral and it possible origins; applications to Borneo diamonds'. Data and speculations on origin and distribution of diamonds of Kalimantan. Believed to originate from not-yet-located kimberlites)

Wing Easton, N. (1933)- De oorsprong der Borneo diamanten. Geologie en Mijnbouw 20, p. 202-204.
(online at: https://drive.google.com/file/d/1_iQfWDMYohAXgpp83ZllzSnGpMo2NI7R/view)
('The origin of the Borneo diamonds'. Brief discussion suggesting 'Pamali Breccia' in Meratus Mts may be kimberlitic-type source of Kalimantan diamonds, an idea further elaborated by Koolhoven (1935) (but rejected by Bergman et al. 1987 and Burgath & Mohr 1991). (No figures, nothing new))

Witkamp, H. (1925)- Bij een voorlopige schets der Klindjau en Atan (Borneo). Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 42, p.
('Preliminary sketch of the Klindjau and Atan rivers' Upper Kutai Basin geological-geographic survey. (For more detailed map and descriptions of rocks collected see Albrecht (1946); JTvG))

Witkamp, H. (1927)- Beknopt overzicht van de geologische resultaten der Midden-Oost Borneo expeditie 1925. In: D.W. Buijs et al., Midden-Oost Borneo Expeditie 1925, Weltevreden, p. 105-116.
('Brief overview of geological results of the Central- East Borneo expedition 1925. Summary of geological observations made during geographic expedition. U Telen River area with 'Old Slate Formation', similar to that of W and C Borneo. Intensely folded, steeply dipping, striking E-W in W part of area of investigation (and like in W-C Borneo), farther East strike SSW-NNE, parallel to Tertiary folding directions. Relationship between Old Slate and Danau Fm not clear. Granitic massives present. Early Tertiary sandstones with abundant petrified wood and limestone unconformable over and probably 'deposited against a wall of Old Slates' (now at 1800m above sea level))

Witkamp, H. (1928)- De Kedang Rantau (O. Borneo). Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 45, p. 34-61.

Witkamp, H. (1928)- Een tocht naar den Goenoeng Ketam (Borneo). Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 45, p. 412-439.
('A trip to the Ketam mountain, Kalimantan'. Mainly geographic description)

Witkamp, H. (1932)- Diamantafzettingen van Landak. De Mijningenieur 13, 3, p. 43-55.
('Diamond deposits of Landak'. Summary of Witkamp report by Van Bemmelen. Diamonds only at gravely base and in lowest alluvial deposits, especially where directly on bedrock, and always associated with 'leboer' rock (lebur = black rounded pebbles, probably mainly corundum?). Diamonds probably reworked from 'Plateau Sandstone' conglomerates; primary igneous source unknown. Little or no remaining potential for diamond exploitation in lower Landak area, as all visible gravel deposits have been thoroughly worked by Chinese and local Malay and Dayak prospectors)

Witkamp, H. (1932)- Langs de Mahakam. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap 49, p. 30-56.

('On a new mineral from Borneo: Laurite'. Platinum-group mineral Laurite (RuS_2; Ruthenium- Osmium sulfide) from Pontyn River, Meratus Range, SE Kalimantan (probably derived from Meratus Mts ultrabasic rock). (also in: Annalen der Chemie und Pharmacie 139, p. 116-120))

Wurst, A. (2004)- Geology and genesis of the Permata-Batu Badingding-Hulubai and Kerikil Au-Ag low sulfidation epithermal deposits, Mt. Muro, Kalimantan, Indonesia. Ph. D. Thesis, University of Tasmania, p. 1-423.
(online at: http://eprints.utas.edu.au/15789/1/1Wurst_whole_thesis.pdf)
(Permata-Batu Badinding-Hulubai vein and Kerikil breccia-hosted deposits of Mt Muro, Kalimantan, represent two styles of Au-Ag, low sulfidation epithermal deposit. Andesitic-basaltic host rocks correlated with E Miocene Sintang volcanism and Pliocene Metalung volcanism. PBH and Kerikil similar structural trends and NNW

dilational settings that are result of NNW-directed compression and dextral movement on major NW striking basement structures)

Yang, Mu & S.L. Peng (2004)- Geodynamical features and geotectonic evolution of Kalimantan and adjacent areas. J. Central South University of Technology, China, 11, 3, p. 312-315.
(Brief overview of Kalimantan tectonic provinces. No new data, poor English)

Yuwono, Y.S., S. Priyomarsono, R.C. Maury, J.P. Rampnoux, A.R. Soeria-Atmadja, H. Bellon & P. Chotin (1988)- Petrology of the Cretaceous magmatic rocks from Meratus Range, Southeast Kalimantan. J. Southeast Asian Earth Sci. 2, 1, p. 15-22.
(With exception of Riam Andungan plagiogranites (part of Peridotitic Nappe) all volcanic and plutonic rocks of Aptian-Senonian Manunggul Fm, and plutonic rocks intruding peridotitic nappe, in Meratus Mts are of island-arc calc-alkaline affinity. Subduction-related tectonic environment proposed for Middle- Late Cretaceous of Meratus Range both before (U Aptian- Cenomanian Alino Fm) and after obduction of peridotitic nappe (U Turonian- Senonian Manunggul Fm))

Zaw, K.L., L.D. Setijadji, W. Warmada & K. Watanabe (2011)- Petrogenetic interpretation of granitoid rocks using multicationic parameters in the Sanggau Area, Kalimantan Island, Indonesia. J. Southeast Asian Applied Geol. (UGM) 3, 1, p. 45-53.
(online at: http://geologic-risk.ft.ugm.ac.id/fresh/jsaag/vol-3/no-1/jsaag-v3n1p045.pdf)
(Semitau Ridge is most important structural feature in Sanggau area, NW corner of Kalimantan. It is E-SE trending ridge spanning outcrops of Permo-Triassic foliated igneous rocks of Busang Complex (=Late Triassic?; JTvG) in E and Embuoi Complex in Sanggau. Granitoid rocks range from diorite to granite, products of calc-alkaline island arc affinity, segment of island arc. Sintang Intrusion post subduction or syn-collision tectonic setting(?) (no mention of ages; JTvG))

Zaw, K.L., L.D. Setijadji, W. Warmada & K. Watanabe (2011)- Petrochemistry of granitoid rocks from the Singkawang Region, Kalimantan Island, Indonesia. In: Int. Symp. on Earth Science and Technology, Fukuoka 2010, p. 20-23.

Zaw, K.L., L.D. Setijadji, W. Warmada & K. Watanabe (2011)- Geochemical characteristics of Mesozoic granitoid rocks and associated mineralization from the Western Kalimantan Island, Indonesia. In: Proc. Int. Symposium on Earth Science and Technology 2011, p. 321-324.

Zaw, K.L., L.D. Setijadji, W. Warmada & K. Watanabe (2011)- Implications for adakite petrogenesis from the West Kalimantan. Proc. 36th HAGI and 40th IAGI Ann. Conv., Makassar, JCM2011-022, 8p.
(Samples from Sintang Intrusive rocks are within adakite field. Sintang Intrusives supposedly post-collision magmatic event, with K-Ar ages of 23.0- 30.4 Ma in Melawi Basin, 16.4- 17.9 Ma in N; and 16.5±4- 19±5 Ma in Sarawak adjacent to Sintang. Some samples within adakite field, but not entirely typical. Magmatic products of ~28.1 Ma chemical characters of adakitic magmatism. Sintang adakites may tie to Luconia Block collision instead of subducted young oceanic plate)

Zeijlmans van Emmichoven, C.P.A. (1935)- Bijdragen tot de geologie van Borneo. 2. Het Eoceen ten Z. van S. Kerijau in het O. deel van het centrale Mullergebergte (Wester-afdeeling van Borneo). De Ingenieur in Nederlandsch-Indie (IV) 2, 11, p. 102-105.
('The Eocene S of S Kerijau in the E part of the central Muller Range.' See also English translation in Haile (1955, p. 279-285). First report of non-metamorphic Upper Eocene in W Kalimantan: non-marine clastics and shallow marine limestones with Nummulites/alveolinids/ discocyclinids in E part of Muller Mountains. Unconformable over intensely folded Cretaceous and 'Danau Fm' and overlain by volcanics of uncertain age)

Zeijlmans van Emmichoven, C.P.A. (1936)- On the supposed Lower Cretaceous age of Orbitolinidae of Japan and the Netherlands Indies. De Ingenieur in Nederlandsch-Indie (IV), 2, p. 24-29.
(Another harsh and probably unfair 6-page critique by Zeijlmans on sentence in Yabe & Hanzawa (1931), suggesting Orbitolina from Kalimantan should be assigned to Orbitolina scutum and signify Late Aptian age.

ZvE thinks it should be 'Middle Cretaceous' (whatever that means) (Orbitolinid specialist Schroeder in Sikumbang (1986) also identified the Meratus Mts Orbitolina as Late Aptian species, validating Yabe & Hanzawa (1931) conclusions; JTvG)

Zeijlmans van Emmichoven, C.P.A. (1938)- Korte schets van de geologie van Centraal Borneo. De Ingenieur in Nederlandsch-Indie (IV) 5, 9, p. 135-149.
('Brief sketch of the geology of Central Borneo'. Important overview of poorly known Kalimantan-Sarawak border area from Kuching/S China Sea in W to upper reaches of Mahakam River in E. Three E-W trending tectonostratigraphic zones. Oldest rocks crystalline schists, as exposed in Schwaner Mts. Overlain by intensely folded Permo-Carboniferous (dominantly phyllitic abyssal rocks, locally with fusulinids, and basic volcanics; also plants identified by Jongmans (1940) as Pecopteris cf. arborescens and Calamites ex gr. leioderma (p. 138; =Cathaysian Permian; JTvG), Upper Triassic flysch (with Monotis, Halobia and acid volcanic complexes) and folded Cretaceous (locally with Orbitolina). Tertiary mainly represented by Paleogene, locally deformed and metamorphosed)

Zeijlmans van Emmichoven, C.P.A. (1939)- Pretertiary geology of the island of Borneo. Proc. 6th Pacific Science Congress, San Francisco, p.

Zeijlmans van Emmichoven, C.P.A. (1939)- De geologie van het Centrale en Oostelijk deel van de Westerafdeling van Borneo. Jaarboek Mijnwezen Nederlandsch-Indie 68, Verhandelingen, p. 1-186.
('The geology of the Central and Eastern part of the Western District of Borneo' (see also English translation in Haile (1955, p. 159-272). Overview of work of geological survey in NW Kalimantan and parts of adjacent Sarawak. WNW-ESE trending belt of crystalline schists in W Kalimantan near Sarawak border, overlain by folded Permo-Carboniferous with fusulinid foraminifera, Pecopteris and basic volcanics (no conglomerates). Unconformably overlain by Upper Triassic marine fine clastics with Monotis and Halobia and acid volcanics. Unconformably overlain by relatively complete marine Cretaceous section in Sebaruang area, with Orbitolina at several levels. Upper Cretaceous folding event. Tertiary includes brackish-water Melawi fauna. In Upper Kapuas area intense post-Paleogene folding and metamorphism event. Geology of W and S part of W Kalimantan described by Van Bemmelen in same volume)

Zeijlmans van Emmichoven, C.P.A. (1940)- Het Schwanergebergte (westerafdeeling van Borneo). De Ingenieur in Nederlandsch-Indie (IV), 7, 7, p. 79-100.
('The Schwaner Mountains (W Borneo) '. Description of geology and petrology of Schwaner mountains- part 1. First of 2-part somewhat chaotic descriptions of (Permo-Triassic?) tonalite intrusions, 'pre-tonalite' mica schist, 'post-tonalite' sediments (U Triassic?), granodiorite, ?Tertiary volcanics, etc.. No maps, cross-sections)

Zeijlmans van Emmichoven, C.P.A. (1940)- Het Schwanergebergte (westerafdeeling van Borneo)- vervolg. De Ingenieur in Nederlandsch-Indie (IV), 7, 8, p. 103-122.
('The Schwaner Mountains (W Borneo)- continuation'. Description of geology and petrology of Schwaner mountains. Includes description of probably non-commercial Keraroe iron ore occurrence. Stratigraphy: (1) pre-Carboniferous crystalline schists, (2) Permian- Triassic tonalitic plutons, (3) Upper Triassic post-tonalitic sediments, affected by dynamo-metamorphism by younger, but pre-Cretaceous orogenesis, (4) Mid-Cretaceous? E-M Triasic and Jurassic absent)

(Separi area 40 km NE of Samarinda with extensive coal mining. Seven coal-bearing zones in ~1000m thick section of M-L Miocene Balikpapan Fm clastics on Samarinda anticlinorium. Coal seams 0.3- 9.5m thick, labeled A-H. Kutai basin tectoncs (1) M Eocene extension, same time as Makassar Straits; (2) Late Oligocene extension along NW-SE faults; (3) M Miocene inversions mainly on E facing half grabens)

Alam, H., D.W. Paterson, N. Syarifuddin, I. Busono & S.G. Corbin (1999)- Reservoir potential of carbonate rocks in the Kutai Basin region, East Kalimantan, Indonesia. J. Asian Earth Sci. 17, 1-2, p. 203-214.
(Kutai Basin few carbonate reservoirs: Oligocene (Bebulu Lst)- Late Miocene (Dian Lst). Build-ups composed of platy-corals, encrusting red algae and larger foraminifera. Generally isolated mounds, up to 1000' thick. Primary porosity preservation generally poor, due to calcite cementation. Secondary porosity sevelopment limited, due to retardation of subsurface fluid flow by non-permeable layers, and absence of subaerial exposure dissolution and karstification. Porosity mainly vugs, best in coarse-grained shelf-margin facies, not filled by calcite cement. Early hydrocarbon migration may retard diagenesis and preserve porosity)

Alam, S. (2001)- Seismic sequence stratigraphy and depositional history of the Pliocene -Pleistocene fans in the Ganal Block, offshore Kutai Basin, Indonesia. Ph.D. Thesis Texas A&M University, College Station, p. 1-143.
(Seismic stratigraphy study of Pliocene- Pleistocene deep water clastics at Kutai Basin slope and basin floor of Makassar Straits. Six sequences identified, with lowstand features submarine canyons, channels and fan lobes)

Cater, M.C. (1981)- Stratigraphy of the offshore area South of Kalimantan, Indonesia. Proc. 10th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 269-284.
(S Kalimantan Offshore Area altered pre-Tertiary, overlain separated unconformably by Eocene-Recent sediments. Karimundjawa Ridge separates main basins to E from Billiton Basin in W. Billiton Basin Oligocene-earliest Miocene in continental facies, more marine conditions in E with variable amounts of limestone)

Cavanna, G.R. E. Caselgrandi, E. Corti, A. Amato del Monte, M. Fervari, M. Bello, J. Aruan and C. Golding (2012)- Integrating the geophysical characterization of seismic thin beds with stochastic reservoir modeling: a case study from the Kutei Basin (Offshore Kalimantan, Indonesia). In: Proc. Int. Petrol. Techn. Conf. (IPTC), Bangkok 2012, IPTC 14570, 17p.

Chambers, J.L.C., I. Carter, I.R. Cloke, J. Craig, S.J. Moss & D.W. Paterson (2004)- Thin-skinned and thick-skinned inversion-related thrusting- a structural model for the Kutai Basin, Kalimantan, Indonesia. In: K.R. McClay (ed.) Thrust tectonics and hydrocarbon systems, American Assoc. Petrol. Geol. (AAPG), Mem. 82, p. 614-634.
(Regional compression reactivated basement extensional faults, inverting Paleogene depocenters as anticlines often flanked on one side by basement thrusts. Neogene section detached near top overpressured zone and deformed as thin-skinned fold-thrust belt. Response to inversion of Paleogene rift section controlled in part by heterogeneity in shallow section: syndepositional loading, delta progradation, normal faults, facies changes)

Chambers, J.L.C. & T. Daley (1995)- A tectonic model for the onshore Kutai Basin, East Kalimantan, based on an integrated geological and geophysical interpretation. Proc. 24th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 111-130.
(Models for Samarinda Anticlinorium included gravity slumping, shale diapirism and thrusting. Structures in Runtu Block are rigid deltaic- shelf sediments deformed into box-folds above folded shaly prodelta- bathyal sediments. Detachment at top or within over-pressured shales at base of Lower Miocene deltaics. Gravity data suggests semi-regional uplifts of over-pressured strata. Basement not visible on seismic, but gravity and aeromagnetics show it between 7-14 km deep. Models imply small amounts of shortening across near-surface structures and relatively large uplift. C Kutai Basin inversion of deep Paleogene rift basin gave rise to broad regional folding of shale-rich over-pressured section. Closer spaced folding in near surface, normally pressured, less ductile deltaic -shelf section of Samarinda Anticlinorium result of same inversion)

Chambers, J.L.C. & T.E. Daley (1997)- A tectonic model for the onshore Kutai Basin, East Kalimantan. In: A.J. Fraser, S.J. Matthews & R.W. Murphy (eds.) Petroleum Geology of Southeast Asia. Geol. Soc. London, Spec. Publ. 126, p. 375-393.

Clark, T., J. Hadiwijoto, B. Zagalai, S. Martinez & D. Staples (1994)- Serang Field re-evaluation. Proc. 23rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 339-353.
(Serang field N of Attaka field, N Mahakam, E Kalimantan, evolved from non-commercial discovery in 1973 to a field with proven reserves of 35 MBO and 275 GCF in Late Miocene deltaic sands)

Clark, T., M. Turk, J. Hadiwijoto & Y. Partono (1999)- Serang Field- discovery within a seismic "fault shadow". Proc. 27th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 323-341.
(Serang field off E Kalimantan. Structure for long time hidden in shadow under large listric normal fault. Main reservoir Upper Miocene fluvio-deltaic channel sands. Reefal carbonates preferentially developed on upthrown block in M Miocene- early late Miocene (reservoir quality rel. poor) and in Pliocene (very porous))

Clauer, N., T. Rinckenbach, F. Weber, F. Sommer, S. Chaudhuri & J.R. O'Neil (1999)- Diagenetic evolution of clay minerals in oil-bearing Neogene sandstones and associated shales, Mahakam delta basin, Kalimantan, Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 83, 1, p. 62-87.
(Study of clays in Handil and Tunu fields. Cllay fraction of Mahakam Delta Basin mixed-layer illite/smectite, kaolinite/dickite, detrital illite, and chlorite. Hydrocarbon generation took place in deeper synclinal zones and that oil migrated upward with brines, probably inducing most of illitization in upper sequence)

Cloke, I.R. (1997)- Structural controls on the basin evolution of the Kutai Basin and Makassar Straits. Ph.D. Thesis, University of London, p. 1-376. *(Unpublished)*
(Flexural modelling of Neogene load of Mahakam Delta suggests sediments 20 km landward of present day shelf-break loaded lithosphere with high elastic thickness, corresponding to oceanic lithosphere of 47 Ma. Landward of this point, the elastic thickness is less and suggesting stretched continental crust.)

Cloke, I.R., J. Craig & D.J. Blundell (1999)- Structural controls on the hydrocarbon and mineral deposits within the Kutai Basin, East Kalimantan. In: K.J.W. McCaffrey et al. (eds.) Fractures, fluid flow and mineralization, Geol. Soc., London, Spec. Publ. 155, p. 213-232.
(Deep Kutai Basin formed in M Eocene extension, linked to opening of Philippines Sea, Celebes Sea and Makassar Straits. Seismic profiles across N Kutai Basin show M Eocene NNE-SSW and N-S half-graben. Late Oligocene extension on NW-SE trending faults, reactivating basement structures. Syn-rift coals sufficiently deeply buried to generate hydrocarbons prior to inversion. Shortening since E Miocene resulted in breaching of traps and generation of new traps. M Eocene, Late Oligocene- E Miocene and Plio-Pleistocene volcanic activity set up several mineral deposits. Reactivation of NW-SE and NE-SW trending basement structures controlled location of hydrocarbon and mineral deposits)

Cloke, I.R., J. Milsom & D.J.B. Blundell (1999)- Implications of gravity data from East Kalimantan and the Makassar Straits: a solution to the origin of the Makassar Straits? J. Asian Earth Sci. 17, 1-2, p. 61-78.
(Gravity modeling and flexural backstripping suggest N Makassar basin underlain by M Eocene oceanic crust)

Cloke, I.R., S.J. Moss & J. Craig (1997)- The influence of basement reactivation on the extensional and inversional history of the Kutai Basin, Eastern Kalimantan. J. Geol. Soc. London 154, p. 157-161.
(Kutai basins formed in M- Late Eocene above Late Cretaceous/Early Tertiary orogenic complex. Basement fabrics influenced extension and inversion. Basement fabric on margins and Tertiary cover dominated by NE-SW, NW-SE and NNE-SSW-trending structures. Larger scale NW-SE narrow linear gravity lows cut NNE-SSW highs on gravity data within basin. NNE-SSW basin-bounding faults overlap in right stepping en-echelon manner. Opposing antithetic and synthetic half-grabens linked by oblique NW-SE transfer faults. Inversion utilized extensional faults as reverse faults; however, NW-SE-oriented structures were reactivated as zones of lateral offset along fold-thrust belt, whilst fault kinks oriented NE-SW reactivated as oblique-slip reverse faults)

Cloke, I.R., S.J. Moss & J. Craig (1999)- Structural controls on the evolution of the Kutai Basin, East Kalimantan. J. Asian Earth Sci. 17, p. 137-156.
(Kutai Basin formed in M Eocene by extension linked to opening of Makassar Straits. N margin inverted NNE-SSW trending Eocene half-grabens. Late Oligocene extension on NW-SE trending en-echelon faults under different stress regime, indicating rotation of extension direction between 45-90°. Early Miocene N6-N8 inversion along E-facing half-grabens on N and S margins. WNW-vergent thrusts indicate compression from ESE. Miocene collisions with N and E Sundaland triggered punctuated basin inversion. Inversion concentrated in weak continental crust below Kutai Basin and various Sulawesi basins, while stronger oceanic crust or attenuated continental crust of Makassar Straits acted as passive conduit for compressional stresses)

Combaz, A. & M. de Matharel (1978)- Organic sedimentation and genesis of petroleum in Mahakam Delta, Borneo. American Assoc. Petrol. Geol. (AAPG) Bull. 62, 9, p. 1684-1695.
(Mahakam delta organic material in source rocks generally continental and vegetal origin. Oils paraffinic, increase in gravity with depth, and very low sulfur content. Accumulations probably not far from source rocks, but originate at greater depths. Hydrocarbons could have migrated vertically about 3000m along faults)

(Review of East Kalimantan Barito, Kutei and Tarakan basins, all with M Eocene - U Oligocene Paleogene sediments. M Eocene dominated by fluvial settings, U Eocene common coastal to shallow shelf deposits. Carbonates developed in Oligocene in N and S; in Kutei Basin mainly shelf to bathyal clastics)

Darman, H. & K. Handoyo (2006)- "Deltaicò reservoir characteristics of giant fields of the Kutei and Baram Basins, Borneo. AAPG 2006 Int. Conf. Exhibition, Perth 2006, Search and Discovery Art. 20191 (2013), 6p. *(Abstract and Presentation)*
(online at: www.searchanddiscovery.com/documents/2013/20191darman/ndx_darman.pdf)
(Giant fields in two basins surrounding Borneo, Baram and Kutei, producing oil and gas from Miocene deltaic-shallow marine sandstones. Sandstones generally quartz dominated and derived from central part of Borneo. Structures of fields in Kutei Basin generally larger, but reservoirs less continuous (distributary mouth bars, interconnected by channel cuts))

Darman, H. & K. Handoyo (2008)- Deltaic reservoir characteristics of Kutei and Baram giant fields. In: J.A. Katili et al. (eds.) Tectonics and resources of Central and Southeast Asia (Halbouty volume), Pusat Survei Geol., Bandung, Spec. Publ. 34, p. 109-123.
(Kutei and Baram giant oil-gas fields both produce mainly from Miocene deltaic- shallow marine sandstones. These are part of progradational sequences, formed after large amounts of generally quartz-rich sediments began to pour from C Kalimantan into deep basins to N, W and E of Borneo in Early Miocene. Sands in Kutei basin structures generally larger, but deltaic reservoirs discontinuous. Baram coastal and shallow marine sandstones generally more continuous, but structures smaller)

Darman, H. & Y. Zaim (1994)- Sedimentologi endapan konglomerat batubara pada facies sungai, di daerah Samarinda, Kalimantan Timur. Buletin Geologi (ITB) 24, 1-2, p. *(also in Berita Sedimentologi 17, 2002)*
('Sedimentology of coal conglomerate deposits within channel facies in Samarinda Region, East Kalimantan'. Conglomerates with rounded-subrounded coal fragments in channel deposits of fluvial-deltaic Balikpapan Fm in Samarinda Region. Coal fragments may be transported wood or reworked fragments from older coal seam)

Darmawan, W., A. Subekti, E. Guritno, J. Smart, H. Mustapha, B. Nugroho & A. Bachtiar (2015)- Structural and stratigraphic evolution and implications for Paleogene syn rift exploration in North East Bangkanai, Upper Kutai Basin, Indonesia. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-112, 15p.
(NE Bangkanai PSC in NW onshore Upper Kutai Basin underwent M-L Eocene rifting (deltaic and shallow marine clastics overlain by Nummulites limestones) and NW-SE strike-slip fault reactivation and E Miocene E-W directed compression, which formed NE-SW and N-S trending inversion structures. Regional uplift in E Miocene triggered start of regressive system and deposited fluvio-deltaic to marine sediments of M Miocene Balikpapan Fm. Latest tectonism in Borneo in Pliocene- Recent. Syn-rift exploration play)

Daulay, B. (1994)- Tertiary coal belt in Eastern Kalimantan, Indonesia: the influence of coal quality on coal utilization. Ph.D. Thesis, Wollongong University, Australia, p. 1-326.
(online at: http://ro.uow.edu.au/theses/1413/)
(E Kalimantan second largest coal resources in Indonesia after Sumatra coalfields (Bukit Asam, Ombilin), but currently has highest coal production. Coal in Kutei, Barito, Asem Asem and Tarakan Basins, which developed as result of rifting in the Makassar Strait in mid-Tertiary. Economic coal deposits of Miocene age in all basins;

economic Eocene coals only in Barito and Asem Asem Basins. Evaluation of lateral and vertical variations in coal thickness and chemical and physical properties, with discussion of economic uses of E Kalimantan coals. Vitrinite and liptinite dominant macerals in both Eocene and Miocene coals. Inertinite is minor component, but higher in Miocene coals. Mineral content low in most coals except in some Eocene coals. Rank of Miocene coals soft brown coal to high volatile bituminous, Eocene coals subbituminous- high volatile bituminous. Miocene coals in Sangatta area locally altered to semi-anthracite by igneous intrusion.)

Debec, P. & G.P. Allen (1996)- Late Quaternary glacio-eustatic sequences and stratal patterns in the Mahakam delta. In: C.A. Caughey et al. (eds.) Proc. Int. Symp. on Sequence Stratigraphy in SE Asia, Jakarta 1995, Indonesian Petroleum Association IPA), p. 381. *(Abstract only)*
(Late Quaternary eustatic cycles formed small-scale depositional sequences in Mahakam delta. High frequency and asymmetry of Pleistocene eustatic cycles and rapid rates of sea-level rise and fall led to differences from published sequence stratigraphic models. 3D seismic maps show narrow, incised fluvial valleys dissected by dendritic erosion pattern (= converted highstand delta distributary channels). Incised valleys same size as deltaic distributaries, relatively straight channels, 1-1.5 km wide and up to 30m of incision. Due to rapid sea-level rise and low tide range transgressive deposits thin and do not fill incised valleys (remain as prominent valley systems on transgressed shelf). During highstand delta progradation shelf valleys fill with prodelta mud. Each depositional sequence two episodes of deltaic progradation: early lowstand, and highstand systems tract)

IPA 2016 Technical Symposium, Indonesia exploration: where from- where to, Indon. Petroleum Assoc. (IPA), Jakarta, 32-TS-16, p. 1-17.
(Kutai Basin mature basin, with high success rates drilling on surface anticlines, many of which are inversions of growth faults in delta systems. Two main remaining play types are stratigraphic traps along flanks of structural highs (e.g. Tunu) and drilling for isolated pressure compartments in overpressure zone)

Ferguson, A. & K. McClay (1997)- Structural modelling within the Sanga Sanga PSC, Kutei Basin, Kalimantan: its implication to paleochannel orientation studies and timing of hydrocarbon entrapment. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum Systems of SE Asia and Australia, Indon. Petroleum Assoc. (IPA), Jakarta, p. 727-743.
(Sanga Sanga PSC four large fields in M and U Miocene deltaic sandstones in NNE-trending structures of Mahakam fold belt. Gravity glide and strike-slip models do not simulate observed structures; thrusting, inverted extensional faults and differential load models only partially simulate structures. Preferred combined tectonic model for Mahakam fold belt is inversion of delta growth faults to form inverted graben structures, termed inverted delta growth fault model. Change from overall extension to contraction started at 14.0 Ma. Structures trending NNE are close to perpendicular to applied stress and become inverted)

Feriansyah, L.T., J.L.C. Chambers, S.H. Dewantohadi, M. Syaiful, Priantono & D.N. Imanhardjo (1999)- Structural and stratigraphic framework of the Palaeogene in the northern Kutei Basin East Kalimantan. Proc. 27th Ann. Conv. Indon. Petr. Assoc. (IPA), Jakarta, p. 443-455.
(Kutei basin 4 phases: (1) M-L Eocene extension; (2) L Eocene- Oligocene sag; (3) L Oligocene- E Miocene renewed extension/ subsidence; (4) E Miocene- Recent delta progradation coincident with older depocentres inversion; axis of deformation moves progressively E with time. Rapid facies variations in small extensional depocentres (~20 km wide, up to 70 km long). Intrabasinal highs with thin clastics or limestones. More regional depocentre in post-rift phase, beginning end-Late Eocene. Inversion process created two deformation styles: (1) inversion anticlines in Paleogene;(2) detached tight anticlines in thick Neogene. Detached section same amount of shortening (10-15%) as deeper inverted section)

Fernandes, H. & Djuhaeni (2018)- Analisis stratigrafi sikuen interval Pliosen pada lapangan Bunyu Tapa, Kalimantan Utara. Bulletin of Geology (ITB) 2, 1, p. 175-196.

(Tarakan Basin passive continental margin with Late Eocene-Recent sediments on continental to oceanic crust, created during M-L Eocene opening of Celebes Sea. M Miocene uplift of Borneo hinterland uplift triggered massive influx of turbidites in deep-water area, deposited as fans in front of Tarakan delta and buried by rapidly prograding Plio-Pleistocene Tarakan Delta slope deposits. Potential reservoir systems in deepwater unconfined toe of slope fans, confined intra-slope fans and intra-slope channel-levee systems)

Hemmes, K., H. Darman, L. Suffendy & Meizarwin (2001)- Depositional systems of the deep-water Tarakan Basin, Indonesia. In: A. Setiawan et al. (eds.) Deep-water sedimentation of Southeast Asia, Proc. 2nd Regional Seminar Indonesian Sedimentologists Forum (FOSI), Jakarta, 4p. *(Extended Abstract)*
(Tarakan Basin passive continental margin with Late Eocene-Recent sediments on continental to oceanic crust, created during M-L Eocene opening of Celebes Sea. Rifting ceased in E Oligocene with quiet marine conditions until M Miocene when uplift of Borneo hinterland triggered massive influx of turbidites in deep-marine area, deposited as unconfined toe of slope fans ahead of prograding Tarakan delta. In Plio-Pleistocene deep water fans buried by rapidly prograding delta-slope deposits, which triggered gravity-driven toe thrusting. Small intra-slope basins formed between thrust ridges. In S part of delta, W-dipping normal faults limited progradation, resulting in excessive thickening of Pliocene-Pleistocene deltaic sequence and limiting sediment influx into deep-water area. Several potential deep-water reservoir systems: (1) unconfined toe of slope fans, (2) confined intra-slope fans, and (3) intra-slope channel-levee systems)

Lelono, E.B. & C.A. Setyaningsih (2014)- Miocene palynology of the Barito Basin, South Kalimantan. Lemigas Scientific Contr. Petrol. Sci. Techn. 37, 1, p. 45-56.
(Rich palynomorph assemblages in Miocene of Barito Basin. Identified last occurrence of Florschuetzia trilobata (M-Late Miocene boundary) and first occurrence of F. meridionalis (E-M Miocene boundary). Other Miocene markers include Stenochlaenidites papuanus (Late Miocene) and Scolocyamus magnus (E-M Miocene). Brackish mangrove palynomorphs indicate marine influence during deposition)

Lemoy, C., A. Wahyudi & J. Luccioni (1988)- Detailed geological modeling and structural mapping in Bekapai Field: influence on the understanding of fluid movements and implications on oil recovery. Proc. 17th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 33-47.
(Bekapai field, offshore SE Mahakam Delta 1972 discovery, producing since 1974. Anticlinal structure with oil-gas in Late Miocene- Pliocene deltaics)

Lentini, M.R. & H. Darman (1996)- Aspects of the Neogene tectonic history and hydrocarbon geology of the Tarakan Basin. Proc. 25th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 168-172.
(Tarakan Basin one of three major Kalimantan Tertiary deltaic depocentres. Most production on dip oriented arches in mostly non-marine depositional environment. Forced regressions caused deposition of deltaic reservoirs far downdip in present day deep water. Tarakan Basin initiated simultaneously with formation of Celebes Sea by rifting between M-L Eocene and E Miocene on E-hading en echelon block faults. Increase in accommodation in M Miocene- Pliocene combination of subsidence and gravity-induced listric faulting. Dip-oriented arches formed during latest Pliocene- Recent transpression on wrench faults crossing Makassar Strait)

LeRoy, L.W. (1941)- Small foraminifera from the Late Tertiary of the Netherlands East Indies. 1. Small foraminifera from the Late Tertiary of the Sangkulirang Bay area, East Borneo. Quarterly Colorado School Mines 36, 1, p. 1-62.
(150 species of deep marine small foraminifera from Sangkoelirang marls in NE Kutai basin, collected in 1934 by NPPM (Caltex) geologists. Age presumably latest Miocene- E Pliocene)

Leupold, W. (1927?)- Geological description of Northeastern Borneo: landscapes of Bulungan and Berau. ~600p.
(Unpublished, pioneering report on geological survey and micropaleontology of large parts of NE Kalimantan. Copy of typescript reportedly in archive of Netherlands Centrum for Biodiversiteit (Naturalis), Leiden, as 'Verslag Boeloengan-Beraoe, Arch. 55 30031 (larger foraminifera from Leupold NE Kalimantan collection described in several papers by Van der Vlerk (1925, 1929))

Loiret, B. & J.F. Mugniot (1982)- Seismic sequences interpretation, a contribution to the stratigraphical framework of the Mahakam Area. Proc.11th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 323-334.

Lubis, M.I. & S. Djaelani (2016)- Petroleum systems in the southern margin of the Kutei Basin. Proc. IPA 2016 Technical Symposium, Indonesia exploration: where from- where to, Indon. Petroleum Assoc. (IPA), Jakarta, 24-TS-16, p. 1-12.
(South Sesulu Block at S margin of offshore Kutai Basin, with structural traps formed during end-Early Miocene inversion along left-lateral faults of Adang flexure zone. SIS-A1 well (2015) penetrated good quality M-L Miocene deltaic and upper slope sandstones and tested dry gas from Late Miocene sandstone. Late Oligocene-Miocene coals and shales in S Sesulu area good source rock potential)

Lubis, T., D. Kurniawan & H. Ellen (2011)- Facies modeling of fluvial reservoirs in "M" Field, Tarakan PSC Block. Proc. 36th HAGI and 40th IAGI Ann. Conv., Makassar, JCM2011-156, 16p.
(Mamburungan Field on SE Tarakan Island, NE Kalimantan, discovered in 1985; 30 wells drilled since. At least 80 stacked sandstone reservoirs in Late Miocene- Pliocene Tarakan Fm, fluvial-dominated in upper part, delta-dominated in lower part. Facies analysis of sands from log suggest N-S channel orientations)

Madden, R.H.C. & M.E.J. Wilson (2012)- Diagenesis of Neogene delta-front patch reefs: alteration of coastal, siliciclastic-influenced carbonates from humid Equatorial regions. J. Sedimentary Res. 82, 11, p. 871-888.
(On diagenetic alteration of E Miocene patch reef of Samarinda area, Kutai Basin, E Borneo, that formed coevally with siliciclastic influx, in humid equatorial setting. No marine cements; dominant diagenetic feature is pervasive neomorphic stabilization and cementation of aragonite reef components to calcite. Meteoric aquifer flow from adjacent landmass main diagenetic fluid. Late-stage fracturing, cementation, and chemical compaction relatively minor features. Continental groundwater flow resulted in pervasive stabilization and calcitization, features rare in arid or temperate counterparts)

Madden, R.H.C. & M.E.J. Wilson (2013)- Diagenesis of a SE Asian Cenozoic carbonate platform margin and its adjacent basinal deposits. Sedimentary Geology 286-287, p. 39-57.
(Study of diagenesis of Kedango Carbonate Platform of Kutai Basin during Eocene- Miocene. Most prevalent and pervasive diagenetic feature is neomorphic alteration and replacement of metastable bioclasts and micritic matrix, together with calcitisation of pore spaces. Burial fluids with marine character inferred as parent diagenetic fluid, since stable-isotope compositions for neomorphic spar consistent with precipitation from SE Asian Oligocene-Miocene seawater in burial environment)

Marheni, L., R. Adityo, A.E. Putra & E. Anggraeni (2009)- Tertiary tectonic of Barito Basin, South East Kalimantan, and implication for petroleum system. Proc. 38th Ann. Conv. Indon. Assoc. Geol. (IAGI), Semarang, PITIAGI2009-183, 15p.

(Literature review; no new data. Barito basin Eocene rifting, Late-Miocene- Pliocene inversion. Largest oil field is the Tanjung (1938), with highly paraffinic oil in Eocene Tanjung Fm and fractured basement. Warukin and Tapian Timur Fields produce more asphalitic oil from Miocene regressive Warukin Fm)

Marks, E., Sujatmiko, L. Samuel, H. Dhanutirto, T. Ismoyowati & B.B. Sidik (1982)- Cenozoic stratigraphic nomenclature in East Kutei basin, Kalimantan. Proc. 11th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 147-179.
(E Kutai Basin five deposystems: Pleistocene- Recent Mahakam Group (deltaic Handil Dua Fm to W, marine Attaka Formation to E); M Miocene- Pliocene Kampong Baru Group (deltaic Tanjung Batu Fm to W, marine Sepinggan Fm to E); M Miocene Balikpapan Group (uppermost carbonate to marine clastic Klandasan Tongue of Gelingseh Fm and paralic-deltaic Mentawir Fm); E-M Miocene Bebulu Group (carbonate Maruat Fm and deeper water clastic and carbonate Pulau Balang Fm) and Late Oligocene- E Miocene Pamaluan Fm)

Marshall, A.J. & H.O. Schumann (1981)- Stratigraphy and hydrocarbon potential of the Klandasan beds in the Kutei Basin, East Kalimantan, Indonesia. Proc. 10th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 285-295.
(Thick M Miocene (N9-N12) Klandasan Beds predominantly quartz sands, deposited at S margin of Kutei Basin. Interval 2310'-7574' in Bongkaran No. 1 selected as type section of Klandasan Beds)

Marshall, N. (2016)- Improving the age control of Eastern Borneoôs Miocene sedimentary record. Ph.D. Thesis University of Utrecht, Utrecht Studies in Earth Sciences 109, p. 1-214.
(online at: https://dspace.library.uu.nl/bitstream/1874/334448/1/Marshall.pdf)
(Collection of studies on Miocene of E Kalimantan (paleoenvironmental reconstruction, magnetostratigraphy, strontium isotope stratigraphy, cyclostratigraphy and paleomagnetic rotations). Mahakam Delta cyclic sediment alternations match Earth's orbital oscillations (20, 40 and 100 kyr cyclicity in M Miocene, 15-11Ma). Paleomag work on Eocene- Miocene sediments indicates Borneo island probably did not rotate drastically since at least ~40 Ma, Late Eocene, but data from Cretaceous basalts do suggest ~40° CCW rotation)

Marshall, N., V. Novak, I. Cibaj, W. Krijgsman, W. Renema, J. Young, N. Fraser, A. Limbong & R. Morley (2015)- Dating Borneoôs deltaic deluge: Middle Miocene progradation of the Mahakam Delta. Palaios 30, p. 7-25.
(Stratigraphic age model for 4km thick late E Miocene- early Late Miocene section of Samarinda region, E Kalimantan, using magnetostratigraphy, sequence stratigraphy and biostratigraphy. Two thin reef complexes at Samarinda dated at ~15 Ma (Batu Putih; 16m; early zone Tf2 with Lepidosemicyclina polymorpha and Nephrolepidina ferreroi) and 11.6 Ma (Stadion section, 10m; late Tf2 with Lepidosemicyclina and Cycloclypeus annulatus). Mahakam Delta went through major phase of buildout and progradation during Middle and earliest Late Miocene, during which time progradation across former shelf break took place in Samarinda area)

Marshall, N., C. Zeeden, F. Hilgen & W. Krijgsman (2017)- Milankovitch cycles in an equatorial delta from the Miocene of Borneo. Earth Planetary Sci. Letters 472, p. 229-240.
(Paleo-Mahakam delta of E Kalimantan, Borneo developed during globally warm M Miocene in equatorial setting. Statistical analysis of sandstone/shale alternations show distinct pattern of cycles with thicknesses of ~90, ~30, and ~17m, translating into periods of ~100, 40, and 20 kyr, matching orbital eccentricity, obliquity and precession cycles. Proximal paleo-Mahakam sedimentation dominantly controlled by allogenic orbital forcing, probably as consequence of glacioeustasy (also in Marshall 2016 thesis))

Martin, K. (1914)- Miocane Gastropoden von Ost-Borneo. Sammlungen Geol. Reichs-Museums Leiden, ser. 1, 9, 1, p. 326-336.

(28 sequences identified in M Miocene- Pleistocene of W Makassar Straits)

Morley, R.J. & H.P. Morley (2010)- Neogene climate history of the Makassar Straits, with emphasis on the the Attaka region, East Kalimantan, Indonesia. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-G-208, 17p.
(Reconstruction of M Miocene- Recent Neogene climate history of E Kalimantan, based on Quaternary Makassar Straits cores and Attaka field well samples, and compared to Natuna and Malay basins. Everwet tropical climate since Late Miocene. Some intervals with evidence for 100 ka eccentricity cycles)

Moss, S.J. (1998)- Embaluh Group turbidites in Kalimantan- evolution of a remnant oceanic basin in Borneo during the Late Cretaceous to Paleogene. J. Geol. Soc. London 195, p. 509-524.
(Turbidites outcrops in NW Borneo: Embaluh Group in Kalimantan and Rajang Group in Sarawak. Previous interpretation of Late Cretaceous- Paleogene deep marine deposition and deformation in accretionary prism implies S-dipping thrusts, N-ward stratigraphic younging, existence of arc- trench system and deformation and metamorphism of turbidites. New fieldwork established S-ward stratigraphic younging in Kalimantan, no evidence for S-dipping thrusts, metamorphism and accretionary complex-related deformation. Bulk of Rajang-Embaluh Gp postdates inboard subduction-related magmatism. Rajang-Embaluh Group turbidites formed in post-collisional foreland basin or remnant ocean basin. Lack of identifiable mountain belt and linked thrust system, and probable oceanic affinity of crust beneath Rajang-Embaluh Group basin favor latter)

Moss, S.J., A. Carter, S. Baker & A.J. Hurford (1998)- A Late Oligocene tectono-volcanic event in East Kalimantan and the implications for tectonics and sedimentation in Borneo. J. Geol. Soc. London 155, 1, p. 177-192.
N Kutai Basin rapid Late Oligocene (~25 Ma) cooling of Late Cretaceous sandstone, E Miocene arc volcanism at 23-18 Ma, E-ward shift of W basin margin and inception of delta deposition along new basin margins. Elsewhere in Borneo also major Late Oligocene-E Miocene thrust imbrication and volcanic arc activity, possibly caused by Australia-Philippine Sea Plate collision, Neogene counterclockwise rotation of Borneo or initial impingement of blocks of S China origin with N Borneo- S Palawan)

Moss, S.J. & J.L.C. Chambers (1999)- Tertiary facies architecture in the Kutai Basin, Kalimantan, Indonesia. J. Asian Earth Sci. 17, p. 157-181.
(Kutai Basin Jurassic- Cretaceous basement ophiolitic units overlain by Cretaceous turbidite fan. Basin initiated in M Eocene, with rifting and likely sea floor spreading in Makassar Straits, producing fault-bounded depocentres, followed by sag phase sedimentation. Eocene depocentres variable sedimentary fills depending on position. More uniform sedimentation in later Eocene and Oligocene. Tectonic uplift along S and N basin margins and related subsidence of Lower Kutai Basin in Late Oligocene. Subsidence associated with high-level andesitic-dacitic intrusives and associated volcanics. Miocene, basin fill overall regressive style of sedimentation, interrupted by periods of tectonic inversion throughout Miocene to Pliocene)

Moss, S.J. & J.L.C. Chambers (1999)- Depositional modeling and facies architecture of rift and inversion episodes in the Kutai Basin, Kalimantan, Indonesia. Proc. 27th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 1-22.
(Kutai basin initiated in M Eocene in conjunction with rifting/ sea-floor spreading in N Makassar Straits. Sedimentary fill of Eocene N-S/NE-SW trending, fault-bounded depocentres varies with position relative to sediment source, paleo-water depths and half-graben geometry. This contrasts with uniform sedimentary styles in Late Eocene and Oligocene. Late Oligocene ~N3 unconformity reflects uplift of C Kalimantan and extension Lower Kutai Sub-basin is associated with andesitic-dacitic intrusives and volcanics. Volcanism and basin

margin erosion supplied large volumes of material E-wards, along with material from inverted Paleogene depocentres. Miocene regressive sedimentation, interrupted by Miocene- Pliocene tectonic inversions)

Moss, S.J., J. Chambers, I. Cloke, D. Satria, J.R. Ali, S. Baker, J. Milsom & A. Carter (1997)- New observations on the sedimentary and tectonic evolution of the Tertiary Kutai Basin, East Kalimantan. In: A.J. Fraser, S.J. Matthews & R.W. Murphy (eds.) Petroleum Geology of Southeast Asia, Geol. Soc. London, Spec. Publ. 126, p. 395-416.
(Kutai Basin opened in M-L Eocene in Borneo. Extensional faulting in foreland setting S of Late Cretaceous/ Paleogene C Kalimantan fold belt with U Cretaceous granites. Paleogene stratigraphy basal conglomerates, shallow marine clastics and thick bathyal marine shales. Neogene stratigraphy dominated by deltaic clastics and carbonate platforms. Three Tertiary suites of igneous activity, variously interpreted as melting of orogenic root, extensional driven melting and/or subduction related melting. New model relates formation of Kutai Basin to opening of Celebes Sea and collapse of uplifted Late Cretaceous/Paleogene orogenic belt)

(Attaka Field 125 km NE of Balikpapan. Lower DR Sand in overpressure sequence at 10050- 10130'. Core and log data from 20 wells show deltaic depositional system, which could be divided into 5 coarsening upward units. Depositional environment interpreted as delta front and prodelta. Sand bars SW-NE orientation)

Rose, R. & P. Hartono (1978)- Geological evolution of the Tertiary Kutai- Melawi Basin, Kalimantan, Indonesia. Proc. 7th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 225-252.
(Kutei basin and Melawi-Ketungau areas connected in Paleogene, with Melawi-Ketungau area open to NW Borneo basin. Schwaner Block of SW Kalimantan and Kuching Arch of C Borneo yielded sediments throughout Tertiary. Paleogene deposition transgressive except in Melawi-Ketungau area where it was regressive. Greatest Kalimantan Paleogene carbonate development on Barito and Paternoster platforms. Isopach maps suggest Meratus range was Tertiary depocenter. Meratus graben Eocene- M Miocene sediments uplifted, folded and faulted in M-L Neogene. Obduction in Sabah area accompanied NW rotation which uplifted Kuching High and resulted in deposition of second generation regressive sediments to N and S and provided impetus for gravitational folds. Counter-clockwise rotation accomplished by M Tertiary. Late Neogene obduction of oceanic crust onto E Sulawesi partially closed Meratus graben)

(On evaluation of U-M Miocene thin-bedded oil sands in Tarakan Basin, which were commonly overlooked in reserves calculations, using dipmeter microresistivity curve processing)

Saller, A., R. Armin, L.O. Ichram & C. Glenn-Sullivan (1992)- Sequence stratigraphy of Upper Eocene and Oligocene limestones, Teweh area, Central Kalimantan. Proc. 21st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 69-92.
(Four major latest Eocene- Oligocene depositional sequences in Teweh area, straddling Barito Platform- Kutai basin. Each sequence 200-500m thick. During sequences 2-4 carbonate shelf in S part Teweh area, basinal shales to N. Overall deepening- backstepping of facies (to S or interior of platform). No evidence for 'global' 29-30 Ma mid-Oligocene Haq et al. 1987 sea level drop, which must either be of less magnitude, or different time. Looks like solid biostratigraphic and Sr-isotope age control, but little supporting data included)

Saller, A., R. Armin, L.O. Ichram & C. Glenn-Sullivan (1993)- Sequence stratigraphy of aggrading and backstepping carbonate shelves, Oligocene, Central Kalimantan, Indonesia. In: R.G. Loucks & J.F. Sarg (eds.) Carbonate sequence stratigraphy: recent developments and applications. Mem. American Assoc. Petrol. Geol. (AAPG) 57, p. 267-290.
(Teweh area of C Kalimantan with four major Oligocene carbonate sequences, each 200-500 m thick, with carbonate shelves developed in S part of Teweh area)

Saller, A.H., J.T. Noah, J.C. Waugaman & A.P. Ruzuar (2003)- Sequence stratigraphy of isolated carbonate buildups in a deltaic province, Kutei Basin, east Kalimantan, Indonesia. AAPG Ann. Conv., Houston 2002, Search and Discovery Art. 30014, 9p. *(Extended Abstract)*
(online at: www.searchanddiscovery.com/documents/2003/saller/images/saller)
(Kutei basin dominated by clastic deposition, but isolated carbonate buildups also common in Lower Oligocene- Holocene. Buildups accumulated during transgressions, preferentially on structural highs and margins of lowstand deltas. Pliocene outer shelf buildups that grew during single seismic-scale sequence typically 100m thick, 5 km long, 1 km wide. Thicker buildups consist of stacked sequences. Carbonate buildups drowned due to rapidly rising sea level and/or nutrient poisoning associated with approaching deltas)

Saller, A., S.W. Reksalegora & P. Bassant (2010)- Sequence stratigraphy and growth of shelfal carbonates in a deltaic province, Kutai Basin, Offshore East Kalimantan. In: W.A. Morgan, A.D. George et al. (eds.) Cenozoic carbonate systems of Australasia, Soc. Sedimentary Geology (SEPM), Spec. Publ. 95, p. 147-174.
(Kutai Basin Neogene dominated by deltaics, but carbonates also common. Carbonate-siliciclastic interactions studied in U Pleistocene and U Miocene-Pliocene off N Mahakam delta. U Pleistocene carbonates on siliciclastic shelf margins during ~110 kyr eustatic cycles. Carbonates also in two sequences in uppermost Miocene and lower Pliocene. Mio-Pliocene carbonate buildups on shelf margin ~255 m thick, 5 km long, 1 km wide and composed largely of bioclastic packstone and grainstone. Most Mio-Pliocene shelf-margin buildups filled with water, probably because overlying siliciclastics do not seal)

Saller, A. & S. Vijaya (2002)- Depositional and diagenetic history of the Kerendan carbonate platform, Oligocene, central Kalimantan, Indonesia. J. Petroleum Geol. 25, p. 123-150.
(Kerendan Berai Lst platform 11x16 km in W Kutei Basin. Aggradation during Oligocene transgression, contemporaneous with aggradation- backstepping of Barito shelf margin. ~1000m thick, three aggrading seismic sequences. Carbonate deposition started in Late Eocene, ended by drowning in Late Oligocene (~28.6 Ma). Three areas (1) platform interior/ lagoon wackestone-packstones with porosities <5%; (2) raised platform rim, 1-2 km wide, with wacke-, pack-, grain- and boundstones, with grainstones increasing toward platform margin. Greater porosity (5-13%) than platform interior because more grainstone and more dissolution by acidic waters from compacting basinal shales near platform margin; (3) platform margin and slope)
