BIBLIOGRAPHY OF THE GEOLOGY OF INDONESIA AND SURROUNDING AREAS

Edition 7.1 – 8 June 2020

J.T. VAN GORSEL

LIST OF CONTENTS **Page**

ABOUT THIS BIBLIOGRAPHY (Edition 7.1, June 2020)

The purpose of this bibliography is to facilitate access to the vast heritage of geological studies in Indonesia, as well as that of surrounding areas whose geological characteristics extend into parts of Indonesia (mainland SE Asia, SW Pacific, NW Australia). Awareness of the vast body of existing literature on the geology of Indonesia should improve the quality of future work, limit redundant research and maintain credit where credit is due.

This is a 'traditional' bibliography, with public-domain publications listed alphabetically by region or by subject. It resumes a tradition of annotated bibliography work that started with 13 issues by Verbeek between 1912 and 1925, listing 4000 titles on the geology of 'Netherlands Indies' and surrounding regions. This work was continued by Wing Easton (1926-1937), De Neve (1950, 1951), Steenhuis (1951), Klompe (1954-1957) and Tjia (1977). The Geological Survey of Indonesia maintains lists of their publications since 1979.

This bibliography aims to be a comprehensive listing of papers on regional geology, tectonics, structure, stratigraphy, biostratigraphy, paleontology, paleobiogeography, sedimentology, petrography, geochemistry and hydrocarbon occurrences, regardless of date, country or language of publication. Also included are selected papers from specialized fields like coal and mineral occurrences, modern volcanoes, Quaternary geology, mammals and hominid evolution, geothermal, petroleum production and engineering, geological modeling and economic analyses, but these are not complete listings.

Generally not included in this listing are (1) conference abstracts and 'student literature reviews', unless they contain new data or concepts not published elsewhere; (2) papers describing tools, methods, workflows, economic evaluations, project management, etc. without significant geological information; (3) papers in which locations of fields and wells were renamed and disguised beyond recognition; (4) 'vendor brochures' (papers promoting data sets, studies, organizations, farmouts, etc., unless they contain new, unbiased geological information or ideas). Relatively few papers were deliberately omitted for perceived poor quality or redundancy.

The first edition of this bibliography was published as a 700-page pdf addendum to: J.T. van Gorsel (2009) A bibliography and brief history of Indonesia geology literature. Proc. 33rd Ann. Conv. Indonesian Petroleum Association, Jakarta 2009, vol. 1, p. 429-460 (on CD-ROM edition). The 3rd edition (1099p.) went online in May 2011; followed by editions 4 (1253p.; November 2011), 5 (1655p.; October 2013), 6 (2202p., ~19,400 titles; October 2016) and 7.0 (2726p., 22,925 titles, July 2018).

This edition 7.1 of June 2020 contains >23,720 titles (>800 new entries since Ed. 7.0) on 2826 pages, with ~5900 links to open-access papers.

This bibliography is believed to be more comprehensive than what is available from academic reference data bases like Georef, which tend to capture few of the older publications or recent papers published in Indonesia. Besides, they tend to be dominated by not-always-informative conference abstracts and generally require subscription fees that are prohibitive to most academic and independent geoscientists in Indonesia.

Organization

Titles are classified primarily by area. For instance, a paper entitled 'Coal from SW Java' will be under 'Java', not under 'Coal, Petroleum Source Rocks'. Papers on a specific theme, covering multiple areas, like hydrocarbon occurrences, volcanism, source rocks, etc., will be under that topic. General geological and regional tectonic papers will be under 'Regional'.

Annotation and Links

Most papers are annotated with a summary of key points. Absence of annotation does not necessarily mean that these papers are less significant (usually because the paper or abstract were not available).

The ~5900 links to online digital versions of papers included in this bibliography are only for publications in open-access repositories. These links were valid at the time of entry, but unfortunately, internet sites tend to be updated frequently, so several of these links may no longer work. Many additional copyrighted papers can be found online through author's postings on www.academia.com, www.researchgate.com and other sites, or may be obtained by direct requests from authors. Access to other copyrighted digital papers generally require society memberships, institutional subscriptions or payments.

Geographic Names

Many of the geographic names used in this listing are names used at the time of publication or are names of popular usage or convenience, and may or may be not be the currently politically correct or preferred names.

Updates

It is our intention to continue to update this bibliography. Users noticing missing titles are requested to bring this to my attention at e-mail: jtvangorsel@gmail.com.

Copyright

Ownership rights of this bibliography remain with the author. Downloads from www.vangorselslist.com are free, but are intended for personal use only, and should not be re-distributed for commercial purposes.

Acknowledgements

The author wishes to acknowledge and thank:
- individuals who have shared copies of papers or titles, including (in alphabetical order): Tim Charlton (Guildford), Herman Darman (Jakarta), Tom Fraser (Perth), Jack Grant-Mackie (Auckland), David Haig (Perth), Ron Harris (Utah), Frank Huffman (Austin), Darwin Kadar (Bandung), Munasri (Bandung), Mike Murray (Brisbane), Peter Pieters (Foster, NSW), Carolus Prasetyadi (UPN, Jakarta), Awang Satyana (Jakarta), Bernard Seubert (Jakarta), John Taylor (Perth), Theo van Leeuwen (Jakarta), Ivan Yulianto (Jakarta) and others.

- Debbie Gilbert for moral support and building and maintaining the website and digital data base.

J.T. (Han) van Gorsel
Houston, Texas, USA

Common Abbreviations

Commonly used abbreviations include:
- Directions: *N, S, E, W = North, South, East, West*
- Journals: *J. = Journal, Bull. = Bulletin, Mag. = Magazine, Proc. = Proceedings, Soc. = Society*
- Geological units: *Fm = Formation, Mb= Member, Gp = Group*
- Rock Types: *Sst = Sandstone, Lst = Limestone*
- Time: *My = Million years, Ma = Millions of years ago, ka = thousands of years ago*
- Physical parameters: *T = Temperature, P = Pressure*
- Distances: *m = meter, km = kilometer, ' = feet*
- Rotations: *CW = clockwise, CCW = counterclockwise*
- ~ = about

"The first place to start in the hunt for oil is the library" (A.I. Levorsen, 1946)

PUBLICATION TRENDS THROUGH TIME

Figures 1, 2 and 3 illustrate historic trends in the publications on the geology of Indonesia, i.e. total numbers of publications, areas of interest, dominant languages, areas of interest and nationality of lead author, which all changed significantly trough time, reflecting changes in political situations, economic drivers and scientific developments over the last 150+ years. These graphs only include the ~11,000 papers that deal specifically with geology of areas in Indonesia, and do not include 'special topics' or 'Circum-Indonesia' papers (~50% of total in this Bibliography 7.0).

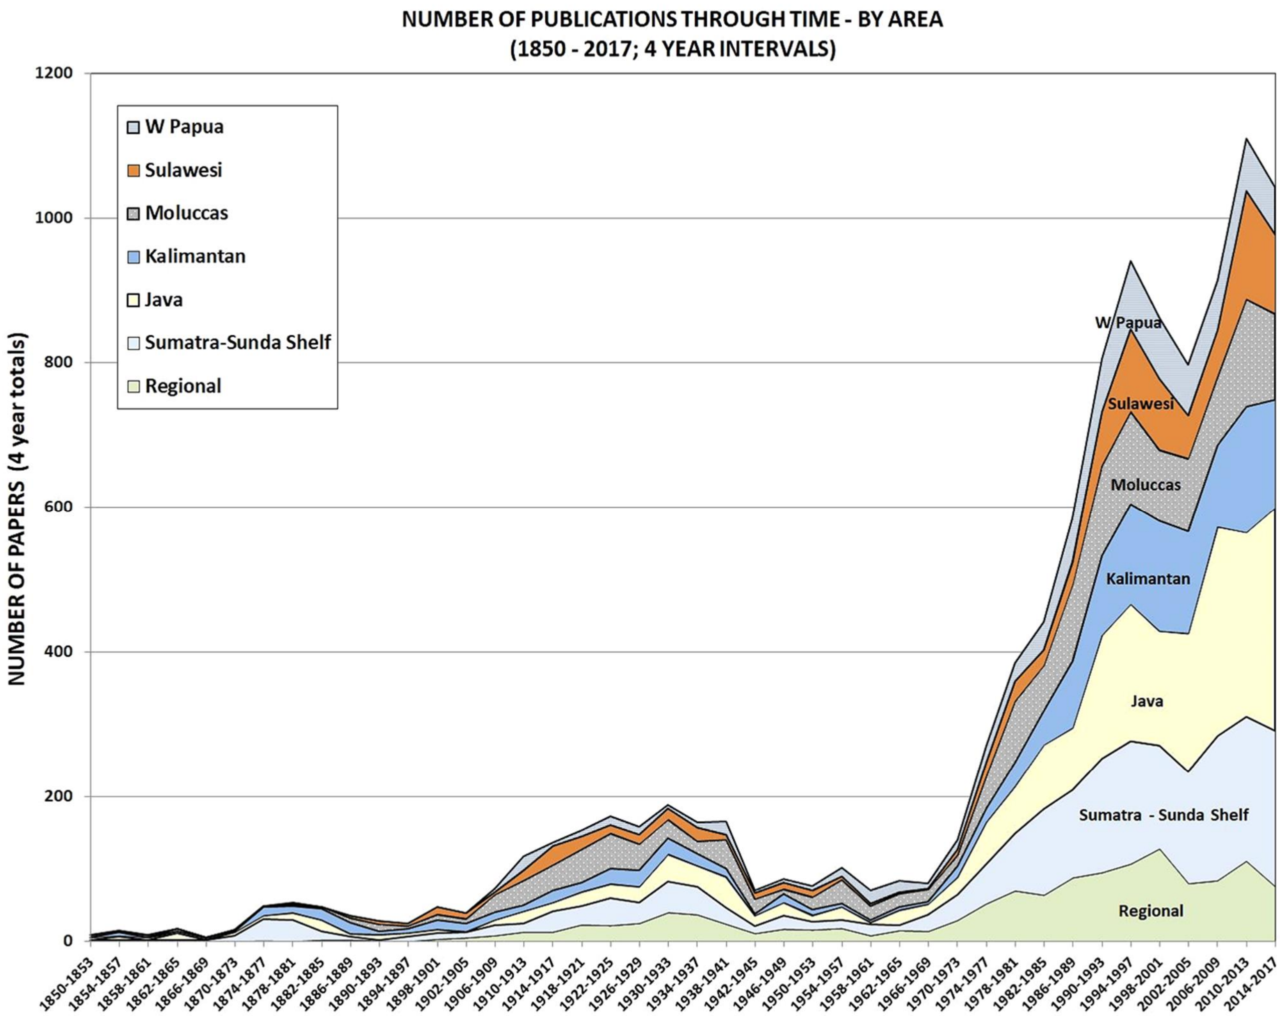

Fig. 1- Number of publications on the geology of Indonesia from 1850-2017, categorized by geographic areas. This graph represents a subset of ~10,630 geological papers in the current Bibliography that are tied to specific areas of Indonesia.

Four major periods may be distinguished (Figure 1):

(1) 1850-1905: Geoscience publications from this early period are mainly summaries of mineral, coal and oil exploration work, or initial reconnaissance surveys. They are generally short, poorly illustrated papers in Dutch and in German, focusing mainly on western Indonesia. Exceptions to this rule were the impressive first regional descriptions and maps by Verbeek on West Sumatra (1875), Bangka- Belitung (1897), SE Kalimantan and Java-Madura (1896).

(2) 1905-1940: This was a period of significant expansion of mapping and other geological studies, with many new hydrocarbon and metals discoveries. A systematic mapping program of Sumatra and Java was started by the government geological survey. There was an increase in industry, government and academic reconnaissance surveys into Eastern Indonesia and New Guinea. Many large volumes on surface geology,

paleontology, petrography, etc., were published of all parts of Indonesia. Principal languages were still Dutch and German, but English became increasingly common in the 1930's.

(3) 1940-1970: Survey and publishing activity had already started to slow down during the Great Depression of the 1930's, but came to an almost complete standstill between 1941 and 1950 (World War II, Revolutionary years), followed by very low levels of research and publishing until the late 1960's. The oldest geology paper in the bibliography in Indonesian language is from 1962.

(4) 1970-2018: After political changes in the late 1960's expansions of investment, exploration and research led to spectacular growth in resource-related and academic publishing after 1970.

The data in this bibliography suggests the total number of geoscience publications on Indonesia:
- increased from about 100 papers in 4 years in 1970 to >1000/ 4 years after 2005;
- it decreased after the Asian financial crisis of 1997, but came back to new record levels after ~2010.

Before 1945 the main languages of publication were Dutch and German, with increasing share of English-language papers after ~1915. Since 1945 by far the dominant language has been English, with increasing numbers of papers in Indonesian since the late 1970's (Figure 2).

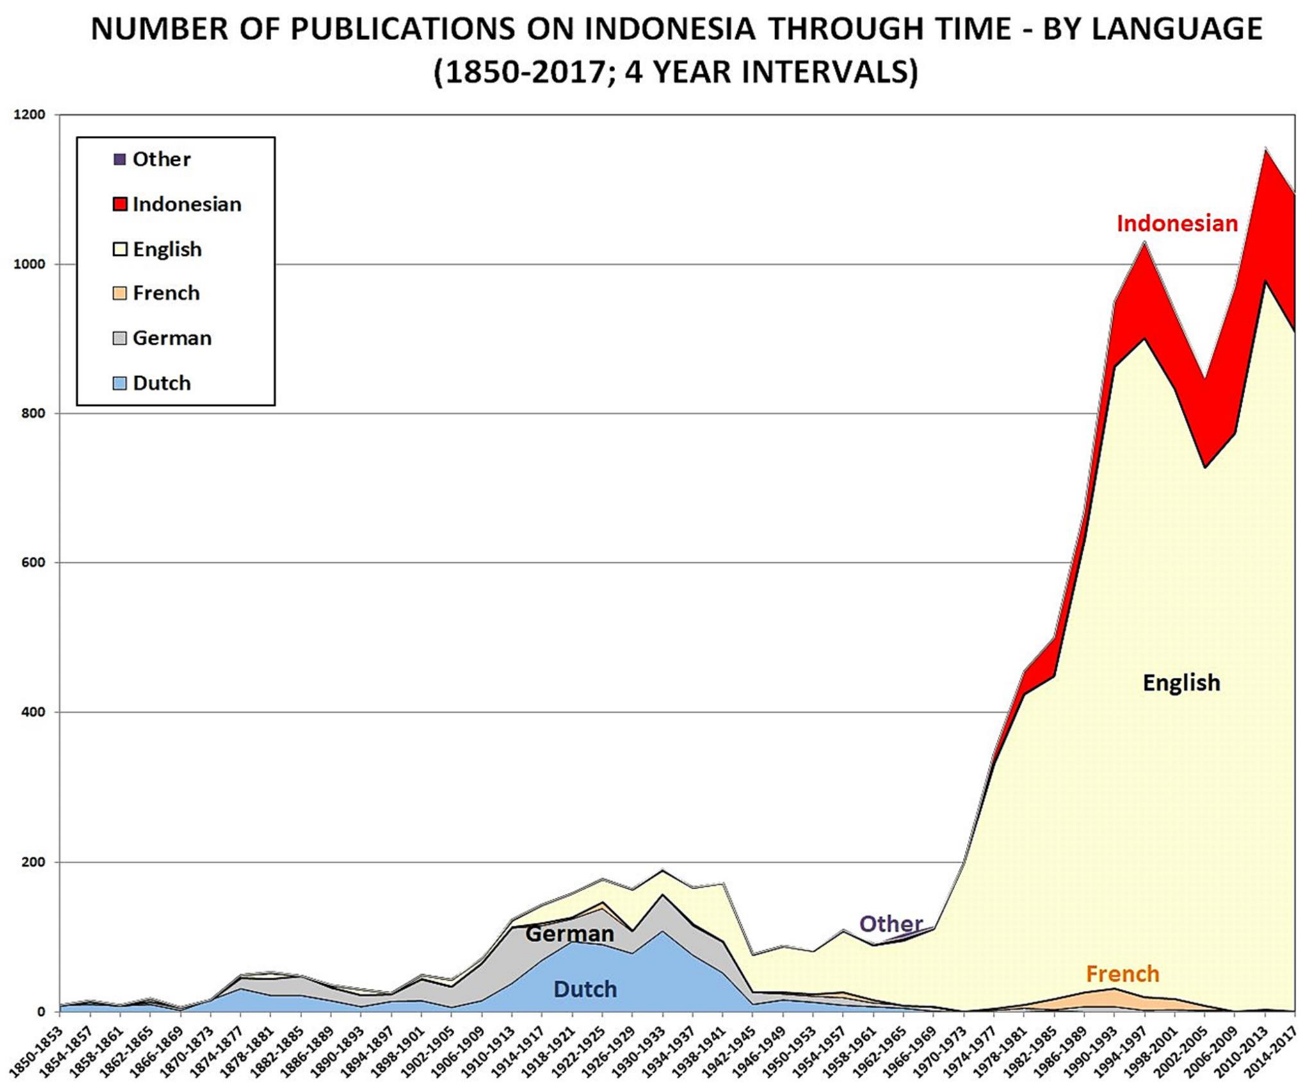

Fig. 2- Number of Indonesia geology publications through time, by language. Prior to 1945 the main languages of publication were Dutch and German, after which English became dominant. Indonesian has been the second most common language of publication since the 1970's.

Figure 3 shows the number of Indonesia geology publications through time, categorized by nationality of first author. This graph shows that until the late 1950's virtually all publications on Indonesian geology were by foreign nationals. After this, the number of publications with Indonesian nationals as first author gradually increases until ~60% of total today.

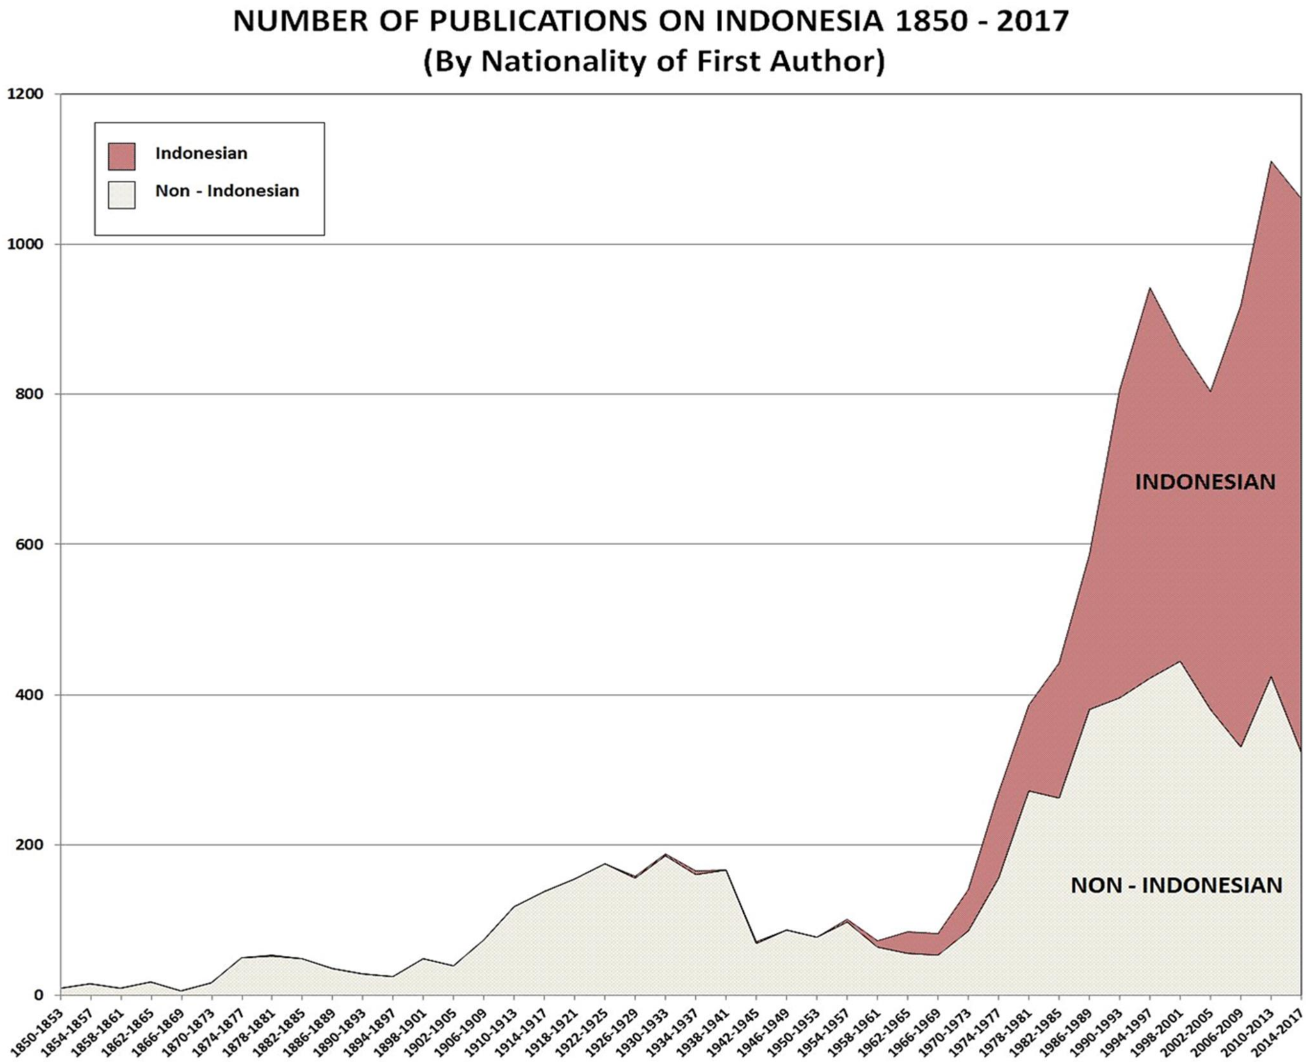

Fig. 3- Number of Indonesia geology publications through time, by nationality of first author.

I. REGIONAL GEOLOGY

I.1. Indonesia Regional Geology

Aadland, A.J. & R.S.K. Phoa (eds.) (1981)- Geothermal gradient map of Indonesia, 2nd ed.. Indon. Petroleum Assoc. (IPA), Spec. Publ., p. 1-43.
(Compilation of temperature data from petroleum wells in Indonesia. With two map sheets 1: 2,500,000. See also updated version by Thamrin & Mey, 1987)

Abdurrachman, M., S. Widiyantoro, B. Priadi, M.Z.A. Alim & A.H. Dewangga (2015)- Proposed new Wadati-Benioff zone model in Java-Sumatra subduction zone and its tectonic implication. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-376, 4p.
(Previous models of Wadati Benioff Zone (derived from earthquake hypocenters) in Java- Sumatra deemed too simple. In Java hypocenter depths recorded >500 km, while in Sumatra earthquakes all <300 km deep. In C and E Java area aseismic area between 300-500 km interpreted as tear zone in subducting plate)

Abendanon, E.C. (1914)- Geologische schetskaart van Nederlandsch Oost-Indie, schaa1:2,500,000. Koninkl. Nederlands Aardrijkskundig Genootschap, Smulders, 's-Gravenhage, Toelichting, p. 1-6 + 6 map sheets.
(online at: https://nl.wikipedia.org/wiki/Wikipedia:GLAM/Expedities/Mediadonaties/media/File:UB_Utrecht_-_CARTO_II_L_2_-_1914.jpg)
('Geological overview map of the Netherlands East Indies'. First geological overview map of Indonesia, 120x225cm, commissioned by Netherlands Royal Geographical Society. Compiled from published and unpublished maps by many authors. Java and Sumatra rel. complete, but much of Kalimantan, Sulawesi and New Guinea still uncharted territory)

Abendanon, E.C. (1914)- Grossfalten im Niederlandisch-Ostindischem Archipel. In: Die Grossfalten der Erdrinde, Chapter 2, Brill, Leiden, p. 38-57.
(online at: https://catalog.hathitrust.org/Record/006573206)
('Mega-folds in the East Indies Archipelago'. Chapter in Abendanon's 183-page book on his global tectonic theory of 'mega-folds': recently uplifted mountain chains, caused by shrinking of the globe, accompanied by extensional central rifts, gravity sliding, etc. Examples of 'mega-folds' in Indonesia in Sulawesi, Timor and Sumatra. In C Sulawesi Mountain chain W of Lake Poso looks like almost flat peneplain now uplifted to 2000m, cut by ~N-S faults/ rift valleys like Poso Depression. Timor also recently uplifted foldbelt with central graben. Etc. Very few illustrations)

Abendanon, E.C. (1915)- De geotektonische positie van de Nederlandsch-Indischen Archipel. In: Handelingen XV Nederlandsch Natuur- Geneeskundig Congres, Kleynenberg, Haarlem, p. 510-523.
('The geotectonic position of the Netherlands Indies Archipelago'. Old tectonic hypotheses of Abendanon including idea that distribution of old schists across Indonesia suggests that in geologically early periods the entire Indonesian Archipelago was occupied by mainland with high mountain chains. In C Sulawesi old fold trends E-W, Neogene folding more N-S trending. Whimsical shapes of Sulawesi and Halmahera can be explained by their location at junction of three geotectonic components)

Abendanon, E.C. (1919)- Aequinoctia, an old Palaeozoic continent. J. Geology 27, 7, p. 562-578.
(Early tectonic interpretation of tectonics of Indonesia. Presence of crystalline schists across E Indonesia suggests area from Borneo to New Guinea may all have been parts of one ancient continent, here named Aequinoctia, extending from Sulawesi to Tasmania)

Adinegoro, A.R. Udin (1973)- Stratigraphic studies by the Indonesian Petroleum Institute (LEMIGAS). United Nations ECAFE, CCOP Techn. Bull. 7, p. 55-74.
(Review of Cenozoic stratigraphic successions in NE Java, Jambi-Sumatra, NE Sumatra and E Kalimantan. One of first attempts to tie these local stratigraphies to global low latitude planktonic foram zonations)

Ali, J.R. & R. Hall (1995)- Evolution of the boundary between the Philippine Sea plate and Australia: paleomagnetic evidence from eastern Indonesia. Tectonophysics 251, p. 251-275.

(New paleomag from Sorong Fault Zone, Obi and Taliabu. Sula Platform Coniacian- Santonian paleolatitude at 19°± 6°, similar to Misool, suggesting Sula/Taliabu and Misool parts of single microcontinent, >10° farther N than expected if attached to Australia, implying region separated from Australia before Late Cretaceous. Obi contains rocks of Philippine Sea and Australian origin. Volcanic arc at S edge Philippine Sea Plate collided with New Guinea at ~25 Ma, changing Philippine Sea-Australian plate boundary from subduction to strike-slip)

Ali, J.R., S.J. Roberts & R. Hall (1994)- The closure of the Indo-Pacific ocean gateway: a new plate tectonic perspective. In: F. Hehuwat et al. (eds.) Proc. Int. Workshop Neogene evolution of Pacific Ocean gateways, IGCP-355, Bandar Lampung 1993, p. 10-20.
(online at: http://searg.rhul.ac.uk/pubs/ali_etal_1993_Indo-Pacific_Gateway.pdf)
(Reconstructions of W Pacific 45-10 Ma. Area N of Sorong Fault Zone ~40° CW rotation and 15° N-ward motion since ~25 Ma. Prior to 22 Ma collision between Australia (New Guinea)- Philippine Sea open Equatorial seaway between Indian and Pacific oceans. Connection mostly closed by initiation of Halmahera Arc at 11 Ma)

Alzwar, M. (1986)- Geothermal energy potential related to active volcanism in Indonesia. Geothermics 15, p. 601-607.
(90 geothermal areas identified in Indonesia, mostly located in active volcanic belts)

Amiruddin (2007)- Permo-Triassic magmatic arc and back arc basins of Gondwana land with reference of Eastern Indonesia, Papua New Guinea and Eastern Australia. Proc. Joint Conv. 32nd HAGI, 36th IAGI and 29th IATMI, Bali 2007, JCB2007-019, 1p. *(Abstract only)*
(Permian-Triassic granitoid plutons and volcanics exposed in E Indonesia, in belt from Banggai Sula in W through Birds Head (Netoni, Anggi, Maransabadi), Birds Neck, Central Range of W Papua (Eilanden, Idenburg) to PNG (Strickland and Kubor Granodiorites) in E, then belt continues S to E Australia through Cape York, NE Queensland to New England Fault Belt. Syn-collision and volcanic arc I and S-type granites)

Amiruddin (2009)- A review on Permian to Triassic active or convergent margin in southeasternmost Gondwanaland: possibility of exploration target for tin and hydrocarbon deposits in the Eastern Indonesia. J. Geologi Indonesia 4, 1, p. 31-41.
(online at: www.bgl.esdm.go.id/dmdocuments/jurnal20090104.pdf)
(Permian-Triassic magmatic-volcanic belts signify active Paleo-Pacific margin along New Guinea (Banggai, Netori, Anggi, Kwatisor, Kubor, etc. granites)- E Australia part of SE Gondwanaland. Granitic plutons of S-type and may be tin-bearing. Back-arc basins of S Papua and Galille-Bowen-Gunnedah-Sydney basins filled by fluvial, fluvio-deltaic to marine Permian-Triassic sediments, locally with coal, unconformably overlain by marine Jurassic-Cretaceous)

Anderson, R.N. (1980)- Update of heat flow in the East and Southeast Asian seas. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian seas and islands, 1, American Geophys. Union (AGU), Geophys. Monograph Ser. 23, p. 319-326.

Angelich, M.T., R.L. Brovey, M.E. Ruder & C.C. Wielchowsky (1986)- Use of Seasat-derived free-air gravity to interpret the structure of Southeast Asia. Proc. 15th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 1-18.
(In areas of low sea-bottom relief SEASAT-derived gravity data can be treated qualitatively as low-pass-filtered Bouguer gravity field. Examples from SE Asia)

Astjario, P. (1995)- A study of the uplifted coral reef terraces in the eastern part of Indonesia. In: J. Ringis (ed.) Proc. 31st Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Kuala Lumpur 1994, 2, p. 116-121.

Atkinson, C., T. Wain, H. Sugiatno & S. Hayes (2017)- Hidden basins and undrilled anticlines: The legacy of early oil exploration in Indonesia. SEAPEX Exploration Conference 2017, 9, Singapore, 36p.

Audley-Charles, M.G. (1965)- Permian palaeogeography of the northern Australia-Timor region. Palaeogeogr. Palaeoclim. Palaeoecology 1, p. 297-305.
('Autochthonous' Permian rocks of Timor believed to be detritus from Kimberley region of N Australia. This conflicts with suggestions of large crustal dislocations immediately N of Australia recently advocated on basis of regional paleomagnetic studies)

Audley-Charles, M.G. (1966)- Mesozoic palaeogeography of Australasia. Palaeogeogr. Palaeoclim. Palaeoecology 2, p. 1-25.
(Broad Triassic- Cretaceous paleogeographic sketch maps of Indonesia- N Australian region, following recent studies on Timor. Rather different from more recent work (incl. Audley-Charles 1988, etc.; e.g. conclusions: 'the spatial relationships between N Australia, Timor and the other parts of the archipelago have not greatly altered since the Middle Triassic' and 'the contention of some authors that continental drift has occurred between the N coast of Australia and SE Asia, is strongly contradicted by stratigraphic evidence, and by paleogeographic history of the region as developed in this article')

Audley-Charles, M.G. (1976)- Mesozoic evolution of the margins of Tethys in Indonesia and The Philippines. Proc. 5th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 25-52.

Audley-Charles, M.G. (1978)- The Indonesian and Philippine archipelagoes. In: M. Moullade & A.E.M. Nairn (eds.) The Phanerozoic geology of the world, II, The Mesozoic, Elsevier, p. 165-207.

Audley-Charles, M.G. (1981)- Geological history of the region of Wallaceôs Line. In: T.C. Whitmore (ed.) Wallaceôs Line and plate tectonics. Clarendon Press, Oxford, p. 5-25.

Audley-Charles, M.G., D.J. Carter & A.J. Barber (1974)- Stratigraphic basis for tectonic interpretations of the Outer Banda Arc, Eastern Indonesia. Proc. 3rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 25-44.
(Outer Banda Arc islands (Timor, Tanimbar, etc.) are imbricated N margin of Australian shelf and slope on which overthrust Asian elements and major olistostrome have been superimposed, all emplaced from N)

Audley-Charles, M.G., D.J. Carter & J.S. Milsom (1972)- Tectonic development of Eastern Indonesia in relation to Gondwanaland dispersal. Nature Physical Sci. 239, 90, p. 35-39.
(Reconstruction of Banda Arc region. Timor formed part of Australian continental margin since at least E Permian. Unusual Early Cretaceous reconstruction with Borneo- W Sulawesi- Sumatra- Java- Indochina and India all still part of Gondwanaland and attached to W Australia))

Bachri, S. (2013)- Peran system tunjaman, sesar mendatar transform dan pemekaran terhadap sebaran cekungan sedimen di Indonesia. J. Geologi Sumberdaya Mineral 14, 1, p. 19-27.
('The role of subduction systems, transform faults and rifting in the distribution of sedimentary basins in Indonesia'. Basins in W dominated by Tertiary basins and mainly controlled by subduction systems. In E Indonesia Pre-Tertiary and Tertiary basins with semi-concentric pattern and random pattern, controlled transform faults and transport of continental plates originating from Australia)

Badings, H.H. (1936)- Het Palaeogeen in den Indischen Archipel. Verhandelingen Geologisch-Mijnbouwkundig Genootschap Nederland Kol., Geol. Serie 11, 3, p. 233-292.
('The Paleogene in the Indies Archipelago'. Overview of Paleogene sediments in Indonesia and Philippines. With outcrop distribution/ basic paleogeographic maps for Tertiary a, b, c and d (Eocene- Oligocene). Useful compilation, but harshly criticized in series of papers by Van Bemmelen, Koolhoven, Ubaghs, etc. in 1936)

Baillie, P., J. Decker, D. Orange, P. Teas & N. Wagimin (2009)- IndoDeep: new insights into the geology of Indonesia. Proc. 2009 SE Asia Petroleum Expl. Soc. (SEAPEX) Conference, Singapore, p. 1-50. *(Abstract + Presentation)*
(Three 'conventional' paradigms in areas of TGS IndoDeep project: (1) Sumatra fore-arc unprospective, (2) not sufficient sediment thickness in Bone Bay to have generated hydrocarbons; (3) Cenderawasih Bay underlain by

oceanic crust and unprospective (pretty pictures of seismic lines and seafloor bathymetry but no explanations of new insights; JTvG))

Baker, S., R. Hall & E. Forde (1994)- Geology and jungle fieldwork in Eastern Indonesia. Geology Today 10, 1, p. 18-23.
(Brief account on fieldwork on coastal outcrops of Halmahera region by University of London)

Balazs, D. (1968)- Karst regions in Indonesia. Karszt-Es Barlangkutatas 5, Budapest, Globus nyomda, p. 3-57.
(online at: http://epa.oszk.hu/02900/02967/00005/pdf/EPA02967_karszt_es_barlangkutatas_1963-1967_05_003-062.pdf)
(Review of limestone karst development in Indonesia (mainly in Tertiary limestones). Tropical karst areas generally controlled by heavy torrential tropical rains and characterized by predominantly positive landforms (conical and pinnacle karst hills), while depressions (sinkholes, etc.) more common expression of dissolution in areas of slow rains in temperate belt)

Balazs, D. (1971)- Intensity of the tropical karst development based on cases of Indonesia. Karszt-Es Barlangkutatas 6, Budapest, Globus nyomda, p. 33-67.
(online at: http://epa.oszk.hu/02900/02967/00006/pdf/EPA02967_karszt_es_barlangkutatas_1968-1971_06_033-068.pdf)
(Discussion of karst weathering in Gunung Saribu (W Sumatra; Permo-Carboniferous), Gunung Sewu (S Mountains) and other localities on Java and SW Sulawesi (Maros))

Barber, A.J. (1985)- The relationship between the tectonic evolution of Southeast Asia and hydrocarbon occurrences. In: D.G. Howell (ed.) Tectonostratigraphic terranes of the Circum-Pacific region, Circum-Pacific Council Energy and Mineral Resources, 1, Houston, p. 523-528.
(SE Asia consists of cratonic Sundaland core of continental fragments that had stabilized by end-Mesozoic. Additional terranes added through Late Mesozoic- Tertiary in Sumatra, Borneo, E Indonesia and Philippines. Early Tertiary widespread extension, followed by Late Tertiary compression, resulting in favorable locations for hydrocarbon generation and accumulation)

Barber, A.J. (1993)- Dispersion, subduction and collision in Eastern Indonesia. Proc. 22nd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 1, p. 23. *(Abstract only)*

Barber, A.J. (2013)- The origin of melanges: cautionary tales from Indonesia. J. Asian Earth Sci. 76, p. 428-438.
(online at: http://searg.rhul.ac.uk/pubs/barber_2013%20Indonesian%20melanges.pdf)
(Description of two examples of melanges from Banda arc (Timor Bobonaro melange) and Sunda arc (Nias, Oyo melange, with common ophiolitic blocks). Evidence from Australian continental shelf S of Sumba shows large quantities of diapiric melange generated in accretionary complex. Comparable diapirs in Timor accreted at earlier stage. Evidence from Timor and Nias shows diapiric melange can be generated well after initial accretion process was completed)

Barber, A.J. & S. Wiryosujono (eds.) (1981)- The geology and tectonics of Eastern Indonesia. Proc. CCOP-IOC Working Group Meeting, Bandung 1979, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 2, p. 1-415.
(Conference volume with many benchmark papers on tectonics of Eastern Indonesia)

Barley, M.E., P. Rak & D. Wyman (2002)- Tectonic controls on magmatic-hydrothermal gold mineralization in the magmatic arcs of SE Asia. In: D.J. Blundell, F. Neubauer & A. von Avadt (eds.) The timing and location of major ore deposits in an evolving orogen, Geol. Soc. London, Spec. Publ. 204, p. 39-47.
(Most gold deposits in SE Asian arcs formed during tectonic reorganization intervals rather than steady-state subduction: (1) 25 Ma collision of Australian craton with Philippine Sea plate arc; (2) M Miocene/ 17 Ma mineralization following maximum extrusion of Indochina and cessation of S China Sea spreading; (3) majority and largest deposits formed since 5 Ma during plate reorganization with change in relative motion between Indian-Australian and Pacific plates between 5- 3.5 Ma following Philippine arc- Eurasia collision in Taiwan)

Baumann, P. (1982)- Depositional cycles on magmatic and back arcs: an example from Western Indonesia. Revue Inst. Francais Petrole 37, 1, p. 3-17.
(Five main depositional cycles in Eocene- Recent of Java, Sumatra: (1) M Eocene- E Oligocene (P11-P17), followed by uplift, block faulting, volcanism; (2) Latest Oligocene- E Miocene (P22/N3- N7?, ending with volcanism- uplift?; (3) late E Miocene- M Miocene (N8- N10-11; poorly known); (4) M- Late Miocene (N11/12-N14/17), followed by uplift, faulting; (5) Pliocene-Recent, starting with major transgression at Miocene-Pliocene boundary, N18. Major Late Pliocene- Recent volcanic phase)

Cawood, P., G. Zhao, G. Zhao, J. Yao, W. Wang, Y. Xu & Y. Wang (2018)- Reconstructing South China in Phanerozoic and Precambrian supercontinents. Earth-Science Reviews 186, p. 173-194.
(History of S China Craton (= Yangtze + Cathaysia blocks). Isolated outcrops of Archean rocks in Yangtze Block preserve record of Meso- to Neo-Archean magmatism, sedimentation and metamorphism associated with global craton formation and stabilization (Kenor supercontinent). Paleoproterozoic tectonostratigraphic records suggest Yangtze Block linked to NW Laurentia, whereas Cathaysia was joined to N India. During formation of Rodinia at end of Mesoproterozoic through Pangea in M Paleozoic, Cathaysia remained joined to N India. During final assembly of Gondwana in E Paleozoic suturing of India- S China with W Australia-Mawson blocks resulted in accretion of Sanya Block of Hainan Island with rest of Cathaysia. Accretion of Laurussia to Gondwana in M-Paleozoic to form Pangea corresponds with initiation of lithospheric extension along N margin of Gondwana and separation of continental blocks, including S China, which then drifted N across Paleo-Tethys to collide with Asian segment of Pangea in Permo-Triassic)

(E Indonesia interpreted in terms of rel. simple three plate indentation model)

Charlton, T.R. (1991)- Postcollision extension in arc-continent collision zones, eastern Indonesia. Geology 19, p. 28-31.
(Postcollisional extension common in E Indonesia orogenic belts, starting <5 My after compressional deformation (Timor area, Gulf of Bone in Sulawesi, Wandamen -Wondiwoi Terrane of W Papua). Extension results from decoupling of subducting oceanic lithosphere from unsubductable continental lithosphere. Superimposition of extension virtually unavoidable consequence of arc-continent collision)

Charlton, T.R. (2000)- Tertiary evolution of the Eastern Indonesia collision complex. J. Asian Earth Sci. 18, 5, p. 603-631.
(online at: https://pdfs.semanticscholar.org/7a4a/60abf67172f74729c322539e1e4c62ff2d78.pdf)
(Interpretations of last 35 My of tectonic evolution of E Indonesia, with plate reconstructions at 5 My intervals. Oldest reconstruction predates collisional deformation between N-moving Australian continent and E-W oriented, S- facing subduction zone extending from S margin of Eurasian continent E-wards. Beginning at ~30 Ma the Australian continental margin commenced collision with subduction zone along restored N margin, from Sulawesi in W to PNG in E. At ~24 Ma present-day pattern of oblique convergence between N margin of Australia and Philippine Sea Plate began. From ~18 Ma S-directed subduction commenced at Maramuni Arc in N New Guinea. Sorong Fault Zone strike-slip system active from ~12 -6 Ma)

Charlton, T.R. (2001)- Permo-Triassic evolution of Gondwanan eastern Indonesia, and the final Mesozoic separation of SE Asia from Australia. J. Asian Earth Sci. 19, 5, p. 595-617.
(E Indonesia continental fragments with Australian/Gondwanan affinities remarkably uniform Permo-Triassic tectonostratigraphy, ranging from granitoid belt in N, through continental platform, to intracontinental rift system in S. In rift system complementary upper and lower plate rifted margins recognised in N and S Banda Arcs. N granitoid belt initiated in mid-Carboniferous, intracontinental rift system began in latest Carboniferous- earliest Permian. Extension in N rift margin ceased in M Carnian, with decline in igneous activity in granitoid belt to North. Sibumasu Terrane originated on Gondwanaland margin, rifted away in E Permian. Gondwanan E Indonesia acted as continental connection between Sibumasu/Indochina and Australia in Permian- Triassic, permitting limited floral- faunal interchange between Gondwanaland and SE Asia until final separation in Late Triassic. M Carnian structural event in E Indonesia may be related to this separation)

(online at: www.iagi.or.id/fosi/berita-sedimentologi-no-24-timor-and-arafura-sea.html)
(Paleogeographic maps of S and E Banda forearc (Savu to Kai islands, incl. Timor-Tanimbar) and adjacent parts of NW Australian continental margin for E Permian, M-L Permian, E-M Triassic, Late Triassic, and E, M and Late Jurassic. Three main rift phases (E Permian, Late Triassic and M-Late Jurassic) separated by quieter tectonic intervals with low facies diversity)

Charlton, T.R. (2013)- Sundaland Timor Paleogene rifting and regional palaeotectonics. Proc. 37th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA13-G-005, p. 1-11.
(Alternative plate reconstruction of Paleogene of Indonesia- NW Australia, suggesting E Sundaland and Gondwanaland/ NW Australia remained attached until final separation by rifting in Paleogene. Main driver for model is similarity of Paleogene rifting in both Sundaland and on Timor island, which is interpreted as part of Australian continental margin)

Charlton, T.R. (2016)- Neogene plate tectonic evolution of the Banda Arc. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-21-G, 16p.
(New East Indonesia plate reconstructions at 1 My intervals from 30 Ma- Present. Main differences between previous reconstructions are >30° CCW rotation of Bird's Head since ~6 Ma, and origin of backarc spreading in N and S Banda Basins by process of 'fixed slot' subduction geometry, not trench rollback. Four phases: (1) 30-18 Ma: collision, then indentation of 'Greater Sula Spur' promontory into E continuation of Sunda Arc subduction system; (2) 18-12 Ma: Terranes N of Sorong Fault Zone move WSW relative to Australia, with motion of Pacific plate. (3) 12-6 Ma: Development of proto-Banda Arc by fixed-slot backarc spreading in N Banda Basin; (4) 6-0Ma: Collision around Banda Arc and rotation of Bird's Head)

Choi, D.R. (2005)- Deep earthquakes and deep-seated tectonic zones: a new interpretation of the Wadati-Benioff zone. In: F.C. Wezel (ed.) Earth dynamics beyond the plate paradigm, Bol. Soc. Geol. Italiana, Spec. Vol. 5, p. 79-118.
(Unorthodox non-plate-tectonic model for SE Asia tectonics, etc.)

Clements, B., P.M. Burgess, R. Hall & M.A. Cottam (2011)- Subsidence and uplift by slab-related mantle dynamics: a driving mechanism for the Late Cretaceous and Cenozoic evolution of continental SE Asia? In: R. Hall et al. (eds.) The SE Asian gateway: history and tectonics of Australia-Asia collision, Geol. Soc., London, Spec. Publ. 355, p. 37-51.
(Extensive Cretaceous-Paleocene regional unconformity from Indochina to Java may be due to subduction-driven mantle processes. Cessation of subduction, descent of N- dipping slab into mantle, and consequent uplift and denudation of sediment-filled Late Jurassic- E Cretaceous dynamic topographic low help explain extent and timing of unconformity. Sediments started to accumulate above unconformity from M Eocene when subduction recommenced under Sundaland)

Clements, B. & R. Hall (2011)- A record of continental collision and regional sediment flux for the Cretaceous and Palaeogene core of SE Asia: implications for early Cenozoic palaeogeography. J. Geol. Soc. London 168, p. 1187-1200.
(online at: http://searg.rhul.ac.uk/pubs/clements_hall_2011%20Sundaland%20emergence.pdf)
(Detrital zircons from Eo-Oligocene sandstones of SW West Java derived from local volcanic sources and Sundaland. Populations with ages of 50-80 Ma (from two discrete volcanic arcs in Java and Sulawesi), 74-145 Ma (E-M Cretaceous granites of Schwaner Mts of SW Borneo), 202-298 Ma (Permian-Triassic Tin Belt granites), 480-653 Ma and 723-1290 Ma (Proterozoic SE Asia basement once part of Gondwana). M Eocene sediment derived mainly from Tin Belt, Late Eocene and younger Borneo source more important. Microcontinental collision at Java margin (~80 Ma) halted Cretaceous subduction and resulted in elevation of large parts of continental SE Asia)

Courteney, S. (1996)- Western Indonesia-2: Middle Eocene, older sequences in rifts key to potential in Western Indonesia. Oil and Gas J. 94, 22, May 27, p. 71-74.
(Hydrocarbons in Sumatra, Natuna, Sunda Basin, Lombok, Barito, NW Java, possibly also E Java basins all tied to M Eocene source rocks, mainly lacustrine, limited to Paleogene rifts)

Curray, J.R. (1989)- The Sunda Arc: a model for oblique plate convergence. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. Sea Research 24, p. 131-140.
(Sunda Arc extends from Himalayas to Banda Arc. Variations along arc function of direction and speed of convergence across subduction zone and sediment thickness on underthrusting plate. Highly oblique convergence may lead to lateral terrane transport and opening - closing of marginal basins like Andaman Sea)

Daly, M.C., M.A. Cooper, I. Wilson, D.G. Smith & B.G.D. Hooper (1991)- Cenozoic plate tectonics and basin evolution in Indonesia. Marine Petroleum Geol. 8, 1, p. 2-21.

(BP plate reconstruction. evolution. India collision and indentation led to major clockwise rotation of SE Asia. Sumatran basins opened due to back arc extension in Eocene. Closure of marginal ocean basin resulted in major contractional event in Late Oligocene. Gulf of Thailand basins and Andaman Sea opened in response to rotation of Indochina and oblique convergence at Sunda trench. Inversion S end of these basins and uplift in Borneo coincided with collision of Reed Bank Terrane with Borneo. Opening of Makassar Straits, Kutei, Tarakan and Barito basins in Eocene. Inversion of these basins result of collision of Australia and Australia-derived microplates in Late Miocene/Pliocene. Pliocene foldbelt and foreland basin formation in New Guinea result of oblique arc collision. Basin evolution of SE Asia not result of lateral extrusion in front of India indenter; main effect of collision is CW rotation of Indochina and extension along Sumatran active margin. Includes Oligocene arc polarity reversal in Sumatra, Timor is part of NW Australian margin, etc.)

Daly, M.C., B.G.D. Hooper & D.G. Smith (1987)- Tertiary plate tectonics and basin evolution in Indonesia. Proc. 16th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 399-428.

(Depth to top subducting slab below Java volcanoes ~100km. Worldwide ranges 65-130 km. Inverse correlation between depth and descent speed of subducting plate. No correlation with age of subducting ocean floor or thermal parameters of slab)

Ernst, W.G., S. Maruyama & S. Wallis (1997)- Buoyancy-driven, rapid exhumation of ultrahigh-pressure metamorphosed continental crust. Proc. National Academy Sciences USA 94, p. 9532-9537.
(online at: www.pnas.org/content/94/18/9532.full.pdf)
(Preservation of ultrahigh-pressure (UHP) minerals formed at depths of 90-125 km require unusual conditions. Our subduction model involves (1) underflow of continental crust embedded in cold, largely oceanic crust-capped lithosphere, (2) loss of leading portions of high-density oceanic lithosphere by slab break-off as increasing volumes of microcontinental material enter subduction zone, (3) buoyancy-driven return to mid-crustal levels of thin (2-15 km thick), low-density slice, (4) uplift, backfolding, normal faulting and exposure of UHP terrane. Intracratonal position of most UHP complexes reflects consumption of intervening ocean basin and introduction of sialic promontory into subduction zone. UHP metamorphic terranes consist chiefly of transformed continental crust (otherwise could not return to shallow depths). UHP paragneisses contain crustal diamonds. Banda Arc used as example)

ESCAP (1976)- Stratigraphic correlation between sedimentary basins in the ECAFE regions (Vols. 3 and 4) Proc. Spec. Regional Working Group, UN ECAFE Mineral Resources Development Ser. 42, p. 1-263.

Escher, B.G. (1933)- On the relation between the volcanic activity in the Netherlands East Indies and the belt of negative gravity anomalies discovered by Vening Meinesz. Proc. Kon. Nederl. Akademie Wetenschappen, Amsterdam, 36, 6, p. 677-685.
(online at: www.dwc.knaw.nl/DL/publications/PU00016465.pdf)
(Pre-plate tectonics paper exploring the apparent relationships between belts of active volcanoes, dipping zone of earthquakes and zone of negative gravity anomalies as recently identified by Vening Meinesz (early recognition of what became known in 1960's as Benioff-Wadati subduction zones; JTvG))

Escher, B.G. (1933)- Over het indirecte verband tusschen het vulkanisme in Ned.-Indie en de strook van negatieve anomalie van Vening Meinesz. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap (2), 50, 5, p. 727-740.
('On the indirect relationship between volcanism and Vening Meinesz' belt of negative gravity anomalies in E Indies'. (Escher supports Vening Meinesz' idea of significant horizontal movements of crust in the Indonesian region, but disputed by Van Bemmelen 1933 and many other papers)

Escher, B.G., I.M. van der Vlerk, J.H.F. Umbgrove & P.H. Kuenen (eds.) (1931)- De palaeontologie en stratigraphie van Nederlandsch Oost-Indie, Leidsche Geol. Mededelingen 5 ('Feestbundel Prof. Dr. K. Martin'), 1, p. 1-648.
('The paleontology and stratigraphy of Netherlands East Indies'. Commerative volume at 80st birthday of Prof. Dr. K. Martin. Voluminous book with 20 chapters summarizing 'state of knowledge' of paleontology and stratigraphy in Netherlands East Indies. With listings of species and fossil localities and stratigraphic tables. No illustrations of fossils)

Evans, C.D., C.P. Brett, J.W.C. James & R. Holmes (1995)- Shallow seismic reflection profiles from the waters of east and southeast Asia: an interpretation manual and atlas. British Geol. Survey (BGS) Techn. Report, WC/94/60, p. 1-94.
(Includes shallow sparker profiles in Indonesia, illustrating Neotectonics of Lampung Bay (faults cutting Pleistocene sediments), Neotectonics and diapyrism off N Madura (Neogene-Recent compressional anticline, a diapyric structure and possible gas chimneys) and Seabed erosion of Sunda Shelf W of Kalimantan (incl. 20m deep/ 600m wide buried lowstand channels)

Fairhead, J.D., I. Somerton & G. Gifford (2004)- A new global satellite gravity dataset for screening and evaluating offshore basins in S.E. Asia. In: R.A. Noble et al. (eds.) Proc. Deepwater and frontier exploration in Asia & Australia Symposium, Jakarta, Indon. Petroleum Assoc. (IPA), DFE04-PO-006, 7p.

Fitch, T.J. (1970)- Earthquake mechanisms and island arc tectonics in the Indonesian-Philippine region. Bull. Seismological Soc. America 60, 2, p. 565-591.
(One of first papers applying plate tectonics concepts to Indonesia. New focal mechanisms from shallow-focus earthquakes in Indonesian-Philippine region suggest dominant thrust and normal faulting rather than strike-slip faulting. Along Sunda and Philippine arcs most activity between ocean trench and line of active volcanoes. Mechanism solutions from earthquakes in this zone all thrust type (underthrusting beneath island arc))

Fitch, T.J. (1972)- Plate convergence, transcurrent faults and internal deformation adjacent to southeast Asia and western Pacific. J. Geophysical Research 77, p. 4432-4460.
(Earthquake data used to delineate convergence and transcurrent fault zones in Indonesia. Weber Deep erroneously interpreted in earlier Fitch papers as E continuation of Java Trench. See also comment by Audley Charles and Milsom 1974)

Fitch, T.J. & W. Hamilton (1974)- Reply to Audley-Charles and Milsom comments on Fitch 1972 paper. J. Geophysical Research 79, 32, p. 4982-4985.
(Authors agree with Audley Charles and Milsom that Timor is product of collision of Banda island-arc system with continental shelf of Australia and New Guinea. Advancing arc has ramped up onto shelf, bulldozing shelf strata and incorporating them into imbricated and melanged material riding at front of arc. Timor trough, like Java trench with which it is continuous to W, is angle between gently dipping undersliding southern continental crustal plate and wedge of shuffled material above it to N)

Fitch, T.J. & P. Molnar (1970)- Focal mechanisms along inclined earthquake zones in the Indonesia- Philippine region. J. Geophysical Research 75, p. 1431-1444.
(28 new focal mechanisms for intermediate and deep-focus earthquakes in Indonesia-Philippine region. At intermediate depths of Sunda and Philippine arcs descending slab of lithosphere is under extension. Deep-focus mechanisms beneath Sunda arc suggest descending slab is under compression at great depth. In Banda Sea and N Celebes regions seismicity indicates possible contortions in underthrust slabs)

Fletcher, G.L. & R.A. Soeparjadi (1976)- Indonesia's Tertiary basins- the land of plenty. In: Proc. SEAPEX 1976, Offshore South East Asia Conf., Singapore, Paper 8, p. 1-54.
(Good overview of geology and hydrocarbon plays in Indonesian Tertiary basins)

Ford, R.J. (1988)- An empirical model for the Australasian tektite field. Australian J. Earth Sci. 35, p. 483-490.
(Australasian strewn-field contains radial sequence of tektite shapes ranging from rel. large unmodified impactite (Muong Nong type in S Laos, E Thailand), through dumb-bells and discs (thailandites, indochinites; 400-1000 km from impact site), and spheres (phillipinites, billitonites, javanites; 1000-3000 km from impact) to ablated button shapes (australites). Shapes of tektites from mainland SE Asia derived from uncongealed spinning glassy fragments passing through atmosphere. Sequence extends from suspected impact area in NE Cambodia to SE, to SE Australia and Tasmania)

Fortuin, A.R. & M.E.M. de Smet (1991)- Rates and magnitudes of Late Cenozoic vertical movements in the Indonesian Banda Arc and the distinction of eustatic effects. In: D.I.M. MacDonald (ed.) Sedimentation, tectonics and eustasy: sea level changes at active margins, Int. Assoc. Sedimentologists (IAS), Spec. Publ. 12, p. 79-89.

Gage, M.S. & R.S. Wing (1980)- Southeast Asian basin-types versus oil opportunities. Proc. 9th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 124-147.
(Genetic classification of 63 SE Asia basins. Over 35 billion bbl oil found, another 35 remains to be found. Four of 11 recognized basin types contain 84% of all SE Asian oil: ocean margin, backarc, wrench and suture-related basins)

Gaina, C. & D. Muller (2007)- Cenozoic tectonic and depth/age evolution of the Indonesian gateway and associated back-arc basins. Earth-Science Reviews 83, p. 177-203.
(Reconstruction of tectonics and depth history of Indonesian seaway and associated SE Asian back-arc basins. All marginal seas N of Australia formed in back-arc setting, with Caroline (37-24 Ma) and Celebes Seas (48-35 Ma) opening N of N- dipping subduction zone, and Solomon Sea (42-33 Ma) S of S- dipping subduction. Several major tectonic events N of Australia at ~45 Ma, related to relocation of subduction zone NW of Australia under Philippine Sea plate due to collision and accretion of old Pacific plate material to N-subducting Australian plate. Negative anomalous depth of several back-arc basins is ~650-800m (range 300-1100m), accompanied by negative regional heatflow anomalies, suggesting mantle-driven dynamic topography. Tomography shows marginal basins with negative dynamic topography underlain by massive buried slab material, suggesting negative dynamic topography and heatflow anomalies due to basin formation above slab burial grounds)

Grevemeyer, I. & V.M. Tiwari (2006)- Overriding plate controls spatial distribution of megathrust earthquakes in the Sunda-Andaman subduction zone. Earth Planetary Sci. Letters 251, p. 199-208.
(Thermal models and structural constraints derived from seismic and gravity data used to explain seismogenic behaviour in Sunda subduction zone. With respect to Java, oblique subduction of young oceanic crust shifts seismogenic coupling zone roughly 40 km trenchward offshore of N Sumatra and increases width of locked megathrust. Prominent positive gravity anomaly offshore Java caused by shallow mantle wedge underlying forearc basin. Serpentinized mantle wedge would limit width of coupling zone to 30–40 km, compared to N120 km off Sumatra. Sumatra remains therefore most vulnerable for future megathrust earthquakes, while shallow mantle wedge may limit violence of rupture off Java)

Gribi, E.A. (1973)- Tectonics and oil prospects of the Moluccas, Eastern Indonesia.In: B.K. Tan (ed.) Proc. Reg. Conference on the Geology of SE Asia, Kuala Lumpur 1972, Bull. Geol. Soc. Malaysia 6, p. 11-16.

Grunau, H.R. (1965)- Radiolarian cherts and associated rocks in space and time. Eclogae Geol. Helvetiae 58, p. 157-206.
(online at: https://www.e-periodica.ch/digbib/view?pid=egh-001:1965:583)
(Review of radiolarian cherts worldwide, incl. descriptions of ?Jurassic Danau Fm and Cretaceous Lupar Fm of Borneo, and similar rocks from Sumatra, Triassic and Cretaceous of Seram, Cretaceous of Timor, Jurassic-Cretaceous of E Sulawesi and Triassic of Malay Peninsula. Radiolarian cherts typical deep water 'geosynclinal' deposits (mainly Tethys eugeosyncline), typically intensely folded and associated with turbidites and ophiolites. As already concluded by Molengraaff (1909) these are remnants of former ocean basins)

Guntoro, A. (1995)- Tectonic evolution and crustal structure of the Central Indonesian region from geology, gravity and other geophysical data. Ph.D. Thesis University College London, p. 1-335. *(Unpublished)*
(Central Indonesian Region represents transition between mainly Eurasian elements of W Indonesia and Pacific-Australian elements of E Indonesia. Bounded by two subduction zones: in W by pre-Tertiary subduction zone at SE Sundaland margin, to E by E Tertiary subduction zone (Selayar-Bonerate ridge). Variations in gravity demonstrate that continental crust in CIR was attenuated by subduction roll-back and then subjected to rifting by extensional forces. Extension in Makassar Strait, C Java Sea and E Java Sea in Eocene, forming marginal basins. Bone Bay opened due to collision between Banggai- Sula microcontinent and Sulawesi in M Miocene and was followed by CW rotation of Java, Sumbawa and Flores which caused opening of Flores Sea)

Guntoro, A. (1999)- A new propose of geological division in the Indonesian archipelago from tectonic evolution point of view. In: H. Darman & F.H. Sidi (eds.) Tectonics and sedimentation of Indonesia, FOSI-IAGI-ITB Regional Seminar to commemorate 50th anniversary of Van Bemmelen's Geology of Indonesia, Bandung 1999, p. 20-21. *(Extended Abstract)*
(Indonesian archipelago often divided into E and W parts, with boundary in Makassar Straits and Lombok Strait. New subdivision introducing C Indonesia Province, transition between Eurasian W Indonesia and Pacific- Australasian related elements of E Indonesia. Boundary between W and C Indonesian regions is Pre-Tertiary subduction zone at SE Eurasian margin. Boundary between C and E Indonesia at Paleogene subduction complex accreted to this margin, marked by Selayar-Bonerate Ridge, separating Flores and Banda Seas. C Indonesian region Cretaceous- Eocene site of complex subduction, fore arcs and magmatic arcs and subsequent opening of Makassar Strait)

Hafkenscheid, E. (2004)- Subduction of the Tethys oceans reconstructed from plate kinematics and mantle tomography. Ph.D. Thesis University of Utrecht, Geologica Ultraiectina 241, p. 1-191.
(online at: http://dspace.library.uu.nl/handle/1874/591)
(On large-scale history of subduction win Tethyan region from Mediterranean to Indonesian archipelago by combining plate tectonic reconstructions with independent seismic tomography results. Plate tectonic reconstructions of Tethyan region generally agree on first-order motions. E Tethyan region characterised by active subduction of various oceanic basins. Subduction zones modelsfrom regional tectonic reconstructions, converted into seismic velocity anomalies, which are compared to tomographic images of mantle structure)

Hafkenscheid, E., S.J.H. Buiter, M.J.R. Wortel, W. Spakman & H. Bijwaard (2001)- Modelling the seismic velocity structure beneath Indonesia: a comparison with tomography. Tectonophysics 333, p. 35-46.
(Generally good agreement between modeled tomography velocity structure and Rangin (1999) and Lee & Lawver (1995) plate reconstructions)

Haile, N.S. (1973)- The recognition of former subduction zones in Southeast Asia. In: D.H. Tarling & S.K. Runcorn (eds.) Implications of continental drift to the earth sciences, vol. 2, Academic Press, London, p. 885-892.
(Early paper on plate tectonics application in SE Asia, focused around W Borneo- Malay Peninsula)

Haile, N.S. (1976)- The regional implications of paleomagnetic research in Southeast Asia. SEAPEX Proc. 3, p. 39-44.
(Review of recent paleomagnetic work in SE Asia. Cretaceous rocks from W Kalimantan suggest this part of Borneo lay on equator, as Malay Peninsula with which it formed part of single plate, which subsequently rotated ~45°. Late Mesozoic radiolarian cherts from SW arm of Sulawesi also indicate low latitudes and CCW rotation of 35°. At W end of Seram late Cenozoic Kelang Fm rotated probably anticlockwise ~ 80°. Triassic rocks from S C Seram high magnetic inclination, indicating origin in higher latitudes (~26°) than today (see also Haile 1978, 1981))

Haile, N.S. (1978)- Progress report on paleomagnetic research in Southeast Asia. In: Wiryosujono & A. Sudradjat (eds.) Proc. 2nd Regional Conf. Geology and Mineral Resources of SE Asia (GEOSEA), Jakarta 1975, Indon. Assoc. Geol. (IAGI), p. 33-36.
(New paleomagnetic research suggests Malay Peninsula moved S ~15° and rotated ~31° clockwise (CW) since Late Paleozoic. Malay Peninsula and West Kalimantan rotated together by ~40° CCW since Cretaceous, similar to SW Sulawesi)

Haile, N.S. (1981)- Paleomagnetism of Southeast and East Asia. In: M.W. McElhinny & D.A. Valencio (eds.) Paleoreconstruction of the continents, American Geophys. Union (AGU), Geodyn. Ser. 2, p. 129-135.
(Summary of paleomagnetic results from Borneo, Sumatra (40° CW rotation since Mesozoic, 34° of which accomplished since Oligocene), Sulawesi, Sumatra, Sumba, Timor, Seram (Seram at 12°S in Late Triassic, rotated CCW 98° since then). Late Mesozoic of W Kalimantan and SW Sulawesi little change from present latitude, but 49° and 33° CCW rotation)

Haile, N.S. (1981)- Paleomagnetic evidence and paleotectonic history and paleogeography of eastern Indonesia. In: A.J. Barber & S. Wiryosujono (eds.) The geology and tectonics of Eastern Indonesia, Proc. CCOP-IOC SEATAR Working Group Mtg., Bandung 1979, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 2, p. 81-87.
(Seram 74° anticlockwise rotation since Late Miocene. Timor Permian Cribas Fm higher paleolatitude (34°) than Maubisse Fm (27°), but within margin of error. SW Sulawesi E Cretaceous radiolarian chert formed at ~3° and, with Kalimantan and Malay Peninsula, may have rotated 30-40° anticlockwise since Jurassic. Similar cherts from E arm Sulawesi formed at 42°S)

Hall, R. (2008)- Continental growth at the Indonesian margins of SE Asia. In: J.E. Spencer & S.R. Titley (eds.) Ores and orogenesis: Circum-Pacific tectonics, geologic evolution and ore deposits, Arizona Geol. Soc. Digest 22, p. 245-258.
(Indonesia continental core reassembled from blocks rifted from Gondwana, and surrounded by subduction zones for much of Mesozoic and Cenozoic. Weak and thin lithosphere beneath much of Sundaland, responsive to changing forces at the plate boundaries. Continental growth mainly by arrival of continental fragments at subduction margins, with subordinate contributions from ophiolite and sediment accretion or arc magmatism)

Hall, R. (2009)- Southeast Asiaős changing palaeogeography. Blumea- biodiversity, evolution and biogeography of plants 54, 1-3, p. 148-161.
(online at: http://www.ingentaconnect.com/content/nhn/blumea/2009/00000054/f0030001/art00026)
(SE Asia grew incrementally by addition of continental fragments, mainly rifted from Australia, and added to margins of Sundaland as result of subduction. Sundaland almost permanent land area from beginning of Mesozoic. Addition of continental fragments of SW Borneo and later East Java-W Sulawesi formed larger emergent land area by Late Cretaceous. Subduction resumed at Sundaland margin in Eocene, leading to widespread rifting within Sundaland and formation of Makassar Straits. Australia began to collide with SE Asia at ~25 Ma, effectively closing former deep ocean between two continents)

Hall, R. (2009)- Hydrocarbon basins in SE Asia: understanding why they are there. Petroleum Geoscience 15, 2, p. 131-146.
(online at: http://searg.rhul.ac.uk/pubs/hall_2009_SE%20Asia%20hydrocarbon%20basins.pdf)

Almost all hydrocarbon basins in SE Asia began to form in Early Cenozoic and filled with Cenozoic sediments. Most are rifted basins formed by regional extension on continental crust. Weakness of Sundaland lithosphere, unusually responsive to changing forces at plate edges, meant that basins record complex tectonic history)

Hall, R. (2009)- The Eurasian SE Asian margin as a modern example of an accretionary orogen. In: P.A. Cawood & A. Kroner (eds.) Earth accretionary systems in space and time, Geol. Soc. London, Spec. Publ. 318, p. 351-372.
(Eurasian margin in SE Asia surrounds Sundaland continental core. Continental growth since Cretaceous in episodic way, related primarily to arrival of continental fragments at subduction margins, after which subduction resumed in new locations. There have been subordinate contributions from ophiolite accretion, and arc magmatism. Relatively small amounts of material accreted during subduction from downgoing plate. In E Indonesia the wide plate boundary zone includes continental fragments and several arcs. (This paper is first of several versions that show Early Cretaceous age of addition of SW Borneo Block to Sundaland and Late Cretaceous addition of E Java- W Sulawesi accreted block outboard of Meratus- C Java trend))

Hall, R. (2009)- Indonesia, Geology. In: R.G. Gillespie & D.A. Clague (eds.) The encyclopedia of islands, University of California Press, p. 454-460.

Hall, R. (2011)- Australia-SE Asia collision: plate tectonics and crustal flow. In: R. Hall, M.A. Cottam & M.E.J. Wilson (eds.) The SE Asian gateway: history and tectonics of the Australia-Asia collision, Geol. Soc. London, Spec. Publ. 355, p. 75-109.
(Jurassic- Recent Indonesia tectonic reconstruction. Sundaland core of SE Asia is heterogeneous assemblage of Tethyan sutures and Gondwana fragments. Fragments that rifted from Australia in Jurassic collided with Sundaland in Cretaceous and terminated subduction. From 90-45 Ma Sundaland surrounded by inactive margins with localized strike-slip deformation, extension and subduction. At 45 Ma Australia began to move N and subduction resumed beneath Sundaland. At 23 Ma Sula Spur promontory collided with Sundaland margin. From 15 Ma subduction hinge rollback into Banda oceanic embayment, major extension, and later collision of Banda volcanic arc with S margin of embayment. Sundaland has weak thin lithosphere, highly responsive to plate boundary forces and hot weak deep crust flowed in response to tectonic and topographic forces and sedimentary loading. Gravity-driven movements of upper crust, unusually rapid vertical motions, exceptionally high rates of erosion and massive movements of sediment characterized region)

Hall, R. (2011)- SE Asian reconstructions, plate tectonics and crustal flow- any importance for hydrocarbon exploration? SEAPEX Expl. Conf., Singapore 2011, Presentation, 82p. *(Abstract and presentation)*
(Most of SE Asia not rigid plate or multiple rigid microplates bounded by lithospheric faults. Sundaland formed by collision of Sibumasu and E Malaya-Indochina in Triassic and other fragments rifted from Australia in late Jurassic- E Cretaceous were added in Cretaceous (now in Borneo, Java, Sulawesi))

Hall, R. (2012)- Late Jurassic-Cenozoic reconstructions of the Indonesian region and the Indian Ocean. Tectonophysics 570-571, p. 1-41.
(online at: www.sciencedirect.com/science/article/pii/S0040195112002533)
(Mesozoic- Cenozoic plate tectonic reconstructions. Luconia-Dangerous Ground continental block rifted from E Asia and was added to E Sundaland N of Borneo in Cretaceous. Banda (SW Borneo) and Argo (E Java- W Sulawesi) blocks separated from NW Australia and collided with SE Asia between 110- 90 Ma. At 90 Ma Woyla intra-oceanic arc collided with Sumatra margin. Subduction beneath Sundaland terminated at this time. Between 90-45 Ma Australia remained close to Antarctica and there was no significant subduction beneath Sumatra and Java, while Sundaland was surrounded by inactive margins with some strike-slip deformation and extension, except for subduction beneath Sumba- W Sulawesi between 63- 50 Ma. At 45 Ma Australia began to move N; subduction resumed beneath Indonesia and has continued to present. Cenozoic deformation influenced by deep structure of Australian fragments added to Sundaland core, shape of Australian margin formed during Jurassic rifting, and age of now-subducted ocean lithosphere)

Hall, R. (2012)- Sundaland and Wallacea: geology, plate tectonics and palaeogeography. In: D.J. Gower et al. (eds.) Biotic evolution and environmental change in Southeast Asia, The Systematics Association, Cambridge University Press, p. 32-78.

Hall, R. (2013)- The palaeogeography of Sundaland and Wallacea since the Late Jurassic. J. Limnology 72, 2, p. 1-17.
(online at: www.jlimnol.it/index.php/jlimnol/article/view/685)
(Asia-Pacific boundary active continental margin until M Cretaceous. Subduction ceased around Sundaland in Late Cretaceous. From ~80 Ma most of Sundaland emergent and connected to Asia. One or more India-volcanic collisions in Eocene may have preceded India-Asia collision. During Late Cretaceous- E Cenozoic no significant subduction beneath Sumatra, Java and Borneo, until ~45 Ma when Australia began to move N; also time widespread rifting within Sundaland. During Paleogene E and N Borneo largely submerged. By E Miocene proto-South China Sea had been eliminated by subduction leading to emergence of land in C Borneo, Sabah and Palawan. Microplate or terrane concept of slicing fragments from New Guinea followed by multiple collisions in Wallacea implausible. Neogene subduction drove extension and fragmentation of Wallacea)

Hall, R. (2014)- Indonesian tectonics: subduction, extension, provenance and more. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-360, 13p.
(online at: http://searg.rhul.ac.uk/pubs/hall_2014%20Indonesian%20tectonics.pdf)
(Mainly summary of recent Royal Holloway group research. In E Indonesia subduction zones at different stages of development, from mature examples like Banda system that began to roll back from ~16 Ma, to younger systems such as N Sulawesi. Close relationship between subduction and extension, causing both dramatic elevation of land regions with exhumation of deep crust, and spectacular subsidence of basins. Many metamorphic rocks in Indonesia proved to be younger than previously suggested (SW Borneo, N and C Sulawesi, Seram). Triassic igneous and metamorphic rocks at W end of Schwaner region and N of Pontianak suggesting suture between Sundaland and SW Borneo further E than previously postulated)

Hall, R. (2014)- The origin of Sundaland. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Indon. Soc. Econ. Geol. (MGEI) Ann. Conv., Palembang, p. 1-25.
(online at: http://searg.rhul.ac.uk/pubs/hall_2014%20Sundaland%20origin.pdf)
(Updated version of SE Asia plate tectonic reconstruction. Core of SE Asia was assembled from continental blocks that separated from Gondwana in Paleozoic and amalgamated with Asian blocks in Triassic. Some fragments rifted and separated from Asia and later re-amalgamated with western part of SE Asian continental core in Mesozoic. Fragments of Cathaysian/Asian continental crust form parts of N Borneo and offshore shelf N of Sarawak and E of Vietnam. Other continental blocks rifted from Australia in Jurassic (SW Borneo, E Java-W Sulawesi, Sabah-NW Sulawesi, S Sulawesi-Sumba) and Woyla intra-oceanic arc of Sumatra and were added to Sundaland in Cretaceous. Subduction ceased around Sundaland in early Late Cretaceous)

Hall, R. (2017)- Southeast Asia: new views of the geology of the Malay Archipelago. Annual Review Earth Planetary Sci. 45, p. 331-358.
(Recent review of SE Asia tectonics. W part of SE Asia (Sundaland) heterogeneous and weak region, not underlain by thick, cold Precambrian lithosphere like typical cratons. In E subduction zones in different stages of development. Metamorphism in many parts of E Indonesia much younger than previously assumed. Close relationship between subduction rollback and extension, causing dramatic elevation of land, exhumation of deep crust and spectacular subsidence of basins)

Hall, R. (2018)- The subduction initiation stage of the Wilson cycle. In: R.W. Wilson et al. (eds.) Fifty years of the Wilson cycle concept in plate tectonics, Geol. Soc., London, Spec. Publ. 470, 23p.
(online at: http://sp.lyellcollection.org/content/specpubgsl/early/2018/02/12/SP470.3.full.pdf)

(Discussion of initiation of subduction process, with examples from East Indonesia (Banda, Sulawesi-Philippines))

Hall, R., B. Clements & H.R. Smyth (2009)- Sundaland: basement character, structure and plate tectonic development. Proc. 33rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA09-G-134, 26p.
(New plate reconstructions going back to 150 Ma, showing Borneo terranes separating from Australian NW shelf in Late Jurassic and colliding with Asia in Early Cretaceous)

Hall, R. & J.D. Holloway (eds.) (1998)- Biogeography and geological evolution of SE Asia. Backhuys Publishers, Leiden, p. 1-410.
(Collection of papers from 1996 conference on SE Asia tectonics and biogeography. Some papers available online at: http://searg.rhul.ac.uk/publications/papers/pdf_publications/..)

Hall, R. & C.K. Morley (2004)- Sundaland Basins. In: P. Clift, P. Wang et al. (eds.) Continent-ocean interactions within the East Asian marginal seas, American Geophys. Union (AGU), Geophys. Monograph 149, p. 55-85.
(Continental core of Sundaland, comprising Sumatra, Java, Borneo, Thai-Malay Peninsula and Indochina, was assembled during Triassic Indosinian orogeny. Region includes extensive shallow seas, is not significantly elevated, but not stable for long time. Today surrounded by subduction and collision zones. Cenozoic deformation recorded in numerous deep sedimentary basins along highlands. Sediment fill mostly locally derived. Conventional basin modeling fails to predict heat flow, elevation, basin depths and subsidence history of Sundaland and overestimates stretching factors. Can be explained by interaction of hot upper mantle, weak lower crust, and lower crustal flow in response to changing forces at plate edges)

Hall, R. & I. Sevastjanova (2012)- Australian crust in Indonesia. Australian J. Earth Sci. 59, 6, p. 827-844.
(at: http://searg.rhul.ac.uk/pubs/hall_sevastjanova_2012%20Australian%20crust%20in%20Indonesia.pdf)
(Core of SE Asia assembled from continental blocks that separated from Gondwana in Paleozoic and collided with Asian blocks in Triassic. Fragments of Gondwana/Cathaysia blocks rifted and separated from Asia and later re-amalgamated with SE Asian continental core. Mesozoic rifting of fragments from Australian margins followed by Cretaceous collisions. Cenozoic collision of Australia with SE Asian margin added more continental crust. Fragments of Cathaysian/Asian continental crust form parts of NW Borneo and offshore and Australian blocks underlie much of Borneo. W Sulawesi and Java rifted from Australia in Jurassic and arrived in present positions in Cretaceous. Sula Spur collided with SE Asian margin in E Miocene, then fragmented by subduction-driven extension)

Hall, R. & H.R. Smyth (2008)- Cenozoic arc processes in Indonesia: identification of the key influences on the stratigraphic record in active volcanic arcs. In: A.E. Draut et al. (eds.) Formation and applications of the sedimentary record in arc collision zones. Geol. Soc. America (GSA), Spec. Paper 436, p. 27-54.
(Record of Cenozoic subduction volcanic activity at SE Asia margins. Stratigraphic record in Indonesian region reflects complex tectonic history, including collisions, changing plate boundaries, subduction polarity reversals, elimination of volcanic arcs and extension. Growth of region in episodic way by addition of ophiolites and continental slivers, and as result of arc magmatism)

Hall, R. & W. Spakman (2002)- Subducted slabs beneath the eastern Indonesia-Tonga region: insights from tomography. Earth Planetary Sci. Letters 201, 2, p. 321-336.
(Tomographic images of mantle structure N and NE of Australia show anomalously fast regions, interpreted in terms of current and former subduction systems)

Hall, R. & W. Spakman (2004)- Mantle structure and tectonic evolution of the region North and East of Australia. In: R.R. Hillis & R.D. Muller (eds.) Evolution and dynamics of the Australian Plate, Geol. Soc. America (GSA), Spec. Paper 372, p. 361-381.

(Tomographic images of mantle show high seismic-velocity anomalies, interpreted as subducted slabs. Several generally flat deeper anomalies not related to present subduction. Mainly discussion of potential Tertiary subducted slabs around NE Australia-New Guinea)

(Map showing earthquake epicenters and depth recorded from 1961-1971, with interpreted subduction zones)

Hamilton, W. (1976)- Subduction in the Indonesian region. Proc. 5th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 3-23.
(Early plate tectonic interpretation of Indonesia)

Hamilton, W. (1977)- Subduction in the Indonesian region. In: M.Talwani & W.C. Pitman (eds.) Island arcs, deep sea trenches and back-arc basins, American Geophys. Union (AGU), Maurice Ewing Ser. 1, p. 15-31.
(As above. Outer-arc ridge between Java-Sumatra and active Java Trench is top of wedge of melange and imbricated rocks whose steep-moderate dips are sharply disharmonic to gently dipping, subducting oceanic plate beneath. Wedge has grown by scraping off of oceanic sediments and basement against and beneath its toe, and by internal imbrication. Outer-arc basin behind ridge originated from Paleogene continental shelf-and-slope assemblage whose seaward side was raised by melange stuffed beneath it by Neogene subduction. Banda Arc now colliding with Australian-New Guinea continent. Sumba is microcontinental fragment derived from Java Shelf. Philippines are product of aggregation of segments of various island arcs)

Hamilton, W.B. (1978)- Tectonic map of the Indonesian region. U.S. Geol. Survey (USGS) Map I-875-D, 1:5,000,000.
(online at: http://pubs.usgs.gov/imap/0875d/plate-1.pdf)
(Reprinted with corrections in 1981. Mainly surface geology with structural elements, not 'terrane map')

Hamilton, W. (1979)- Tectonics of the Indonesian Region. U.S. Geol. Survey (USGS) Prof. Paper 1078, p. 1-345.
(online at: http://pubs.usgs.gov/pp/1078/report.pdf)
(Classic, first comprehensive overview and synthesis of Indonesia tectonics in plate tectonics context, both land and offshore areas. An aging, but unrivaled masterpiece on geology of Indonesia, still with abundant good information, observations and insights. First to interpret Banda Sea as Neogene extensional basin. Etc.)

Hamilton, W. (1988)- Plate tectonics and island arcs. Geol. Soc. America (GSA) Bull. 100, p. 1503-1527.
(Discussion of plate tectonics, with many examples from Indonesia. Modern Sunda volcanic arc system, involving subduction of Indian Ocean lithosphere beneath Sumatra and Java, was inaugurated only in middle Tertiary time. Variations in composition of lavas along Sunda-Banda Arc reflects continental crust in Sumatra segment, transitional crust in Java and mature oceanic island arc developing from Bali to Sumbawa. Much of the older geology records subduction in quite different tectonic systems. Sumatra may have rifted from what is now medial New Guinea in M Jurassic time. Java constructed entirely by post-Jurassic subduction-related processes of magmatism and tectonic accretion. Etc.)

Hamilton, W. (1989)- Convergent-plate tectonics viewed from the Indonesian region. In: A.M.C. Sengor (ed.) Tectonic evolution of the Tethyan region, Kluwer Academic Publishers, Dordrecht, p. 655-698.
(Thorough review of plate tectonic elements and processes in zones of convergence, with examples from Indonesian region. Overriding plates generally rel. undeformed. Subduction systems along continental margins typically inaugurated by reversal of subduction after island arc or continental mass collision. High-pressure metamorphism only where crustal material subducted beneath overriding plate. Sunda Arc system changes along strike from continental in Sumatra to transitional in Java to mature oceanic island arc in Bali and Lombok. Sumatra Block separated from New Guinea in mid-Jurassic. Etc.)

Hamilton, W. (1989)- Convergent plate tectonics viewed from the Indonesian region. Geologi Indonesia 12, 1 (IAGI Katili special volume), p. 35-88.
(Same paper as above)

Hamilton, W.B. (1995)- Subduction systems and magmatism. In: J.L. Smellie (ed.) Volcanism associated with extension at consuming plate margins, Geol. Soc., London, Spec. Publ. 81, p. 3-28.
(Subducting oceanic plates not fixed. Hinges roll back into oceanic plates and slabs sink more steeply than inclinations of Benioff zones. Common regime in overriding plates is extensional; leading edges crumpled only in collisions. Shear coupling between subducting slabs and overriding plates limited to shallow depths. Subduction cannot occur simultaneously beneath opposite sides of rigid plate. Inception ages, collisions, polarity reversals and stage of petrological evolution vary greatly along continuous arc systems. Back-arc basins form by spreading behind migrating arcs. Etc.)

Hammond, J.O.S., J. Wookey, S. Kaneshima, H. Inoue, T. Yamashina & P. Harjadi (2010)- Systematic variation in anisotropy beneath the mantle wedge in the Java-Sumatra subduction system from shear-wave splitting. Physics Earth Planetary Interiors 178, p. 189-201.
(Splitting in S-waves from local earthquakes across Sumatra- Java subduction zone between 75- 300km depthp show trench parallel fast directions. Deeper local events shows larger time-lags and significant variation in fast direction. Significant differences between slab subducted beneath Sumatra and older slab beneath Java)

(Early paper on tectonic evolution of Sundaland in terms of plate tectonic model. Interesting paleo-tectonic maps of Sundaland since Permian. Infers W Borneo has been part of 'continental' Sundaland since Permian, with opposing subduction systems under Sundaland for Permian- Cretaceous)

Hutchison, C.S. (1975)- Ophiolite in Southeast Asia. Geol. Soc. America (GSA) Bull. 86, p. 797-806.
(Twenty belts of ultramafic assemblages identified in SE Asia (not including E Indonesia), but fewer than half can be classified as ophiolite. Complete ophiolite sequences only in NE Borneo and Philippine Islands; others incomplete or dismembered)

Hutchison, C.S. (1978)- Southeast Asian tin granitoids of contrasted tectonic setting. J. Physics of the Earth, Tokyo, 26, Suppl., p. 221-232.
(online at: https://www.jstage.jst.go.jp/article/jpe1952/26/Supplement/26_Supplement_S221/_pdf)
(Three major tin granitoid belts in SE Asia: (1) West (Phuket to Tenasserim). Tin associated with Cretaceous adamellite, granite and pegmatite; (2) Main Range (Bangka to S Thailand). Tin associated with Late Carboniferous and Late Triassic granite; (3) East (Billiton to Pahang-Trengganu). Tin-tungsten associated with Permian- M Triassic adamellite-granite)

Hutchison, C.S. (1980)- Southeast Asia. In: A.E. Nairn & F.G. Stehli (eds.) The Indian Ocean, The ocean basins and margins 6, Plenum Press, New York, p. 451-512.
(Substantial overview of Precambrian- Recent rocks distribution from Burma to W Indonesia)

Hutchison, C.S. (1983)- Multiple Mesozoic Sn-W-Sb granitoids of Southeast Asia. In: J.A. Roddick (ed.) Circum-Pacific Plutonic terranes, Geol. Soc. America (GSA) Mem. 159, p. 35-60.
(SE Asia complex array of granitoid belts, mainly of Mesozoic age. Eastern belt (E Malay Peninsula, Bangka and Billiton(?) is Andean-type Permian- Late Triassic calc-alkaline volcano-plutonic arc (peak ages ~222 Ma and 250 Ma). Probably underlain by continental basement (isoclinally folded Carbo-Permian metasediments, Permian limestones, Namurian shales and sandstones). Abundant volcanic and plutonic activity through Permian and ending active history in Late Triassic with subaerial ignimbritic flows. Narrow central belt of Permian-Triassic granitoids and metamorphic complexes with local Cretaceous granites. Main Range E margin is serpentine-marked Bentong-Raub suture zone. Main Range batholith Sn-granite mainly Late Triassic (~230 and 200 Ma), but with E Permian (~280 Ma) granites; grades W-ward through Penang, Langkawi, and peninsular Thailand to higher level plutons. N Thailand granites mainly Triassic. Main Range and N Thai granites no volcanic associations, and tied to collision and closure of central marginal basin in Late Triassic. Triassic granites and some Cretaceous granites associated with tin, tungsten and antimony deposits, thought to be recycled from continental infrastructure of Sundaland)

Hutchison, C.S. (1984)- Is there a satisfactory classification for Southeast Asian Tertiary basins. Proc. 5th South East Asia Offshore Conf., SE Asia Petroleum Expl. Soc. (SEAPEX), Singapore 1984, p. 6.64- 6.76.
(SE Asia Tertiary basins classification complicated by presence of microcontinents, originating from Jurassic-E Miocene rifting from S China and N Australian continental margins)

Hutchison, C.S. (1986)- Tertiary basins of S.E. Asia- their disparate tectonic origins and eustatic stratigraphical similarities. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 109-122.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986010.pdf)
(72 Tertiary basins in greater SE Asia developed by extensional tectonics, combined with wrench control. With exception of marginal seas sedimentation kept pace with subsidence. Basin unconformities, transgressions,

regressions good correspondence to global sea level changes, but may be artifact of overdependence on SE Asian basins for compilation of eustatic curves)

Hutchison, C.S. (1986)- Formation of marginal seas in Southeast Asia by rifting of the Chinese and Australian continental margins and implications for the Borneo region. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 2, Bull. Geol. Soc. Malaysia 20, p. 201-220.
(With exception of Okinawa and Ayu Troughs, all SE Asia marginal seas formed by processes other than backarc rifting. Andaman Sea is leaky transform system. W Philippine Sea, Banda Sea, Celebes Sea and Sulu Sea basins all remnants of former oceans now trapped behind younger arc-trench systems. S China Sea formed by post-Early Cretaceous rifting of continental margin of SE China. (NB: all these basins are probably younger than assumed by Hutchison, so some conclusions here are not valid; JTvG)

Hutchison, C.S. (1987)- Tectonic settings of tin-tungsten granites in Southeast Asia. In: C.S. Hutchison (ed.) Proc. IGCP Project 220 Conference, Techn. Bull. 6, Ipoh, Malaysia, SEATRAD Centre, p. 1-24.

Hutchison, C.S. (1989)- The Palaeo-Tethyan realm and Indosinian orogenic system of Southeast Asia. In: A.M.C. Sengor (ed.) Tectonic evolution of the Tethyan Regions, Kluwer, Dordrecht, p. 585-644.
(Extensive review with Paleozoic- Mesozoic reconstructions of SE Asia. SE Asia is composite of Precambrian continental blocks, overlain in part by Paleozoic carbonate-dominated platforms. Major suture in Song Ma, N Vietnam, welded Indosinia and S China blocks in E Carboniferous to form E Asian Continent together with N China Block. E Asian Continent in equatorial latitudes in Permian and developed Cathaysian Gigantopteris flora. W Borneo Basement is detached part of E Asian continent. Paleo-Tethys suture/ Indosinian orogenic system extends S from Dien Bien Phu through Thailand into Peninsular Malaysia (Raub-Bentong). All terrains E of suture have Cathaysian affinities, those to W are of Permian Gondwana affinity. Suture closed in Late Triassic. Most Jurassic-Cretaceous age formations are of continental molasse facies. S Sumatra contains Cathaysian flora at Djambi, but N Sumatra strong affinities with Gondwana part of Malay Peninsula. An Indosinian suture may separate the two, but not well defined)

Hutchison, C.S. (1989)- Geological evolution of South-East Asia. Oxford Monographs Geol. Geophysics 13, p. 1-368.
(Comprehensive textbook of SE Asia geology. See also 2007 second edition)

Hutchison, C.S. (1992)- The Eocene unconformity on Southeast and East Sundaland. Bull. Geol. Soc. Malaysia 32, p. 69-88.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1992016.pdf)
(Early Paleogene Sundaland landmass extended as far SE as W Sulawesi. Cratonic nature of Malay Peninsula and China did not extend into or beyond Borneo region of Sundaland, where pre-Eocene outcrops are dominated by Cretaceous rocks. Deep water sediments, melange and ophiolite terrains characteristic of non-cratonic SE peninsula of Sundaland. India collided with Eurasia by 45 Ma (anomaly 1), spreading ceased at NW Wharton Basin, etc.. Push of India resulted in clockwise rotation of Sundaland. Regional event causing major Eocene unconformity on and around Sundaland)

Hutchison, C.S. (1994)- Gondwana and Cathaysian blocks, Palaeotethys sutures and Cenozoic tectonics in South-East Asia. Int. J. Earth Sciences (Geol. Rundschau) 83, 2, p. 388-405.
(Triassic 'Indosinian Orogeny' suturing of Gondwanan and Cathaysian blocks closed Paleotethys Ocean. W Malaysia Sinoburmalaya block has Carboniferous-Permian mudstones with glacial dropstones and is traced into Sumatra. Cathaysian E Malaya block Late Permian Gigantopteris flora and fusulinid limestones with andesitic volcanism, similar to W Sumatra block (also E Permian volcanism, fusulinid limestones and early Cathaysian Jambi flora). S-SSE trending central Peninsular Malaysian Triassic orogenic belt swings SE from Singapore to Bangka, then E to Billiton. Paleo-Tethys suture (Bentong-Raub Line) unlikely to continue S along

Paleogene Bengkalis Graben, which transects NW-SE orogenic fabric of Sumatra. Oroclinal bending of Indosinian Orogen, from NW-SE in Sumatra to Peninsular Malaysia, attributed to Paleocene collision of India and indentation into Eurasia. Bending accomplished by clockwise rotation and right-lateral shear parallel to orogenic grain. Mesozoic Paleotethyan sutures transformed into Paleocene and younger shear zones)

(Major review of SE Asia oil-gas, coal and mineral deposits)

Hutchison, C.S. (1998)- The quest for an understanding of Southeast Asian Cenozoic tectonics and the importance of pre Tertiary structures. In: Offshore South East Asia Conference 1998 (OSEA98), Singapore, SE Asia Petroleum Expl. Soc. (SEAPEX), p. 73-74. *(Extended Abstract)*
(N-wards movement of Indian-Australian plate caused (1) cratonic India to begin its collision with continental Eurasia in Eocene, causing CW bending of pre-Tertiary fabric of Sundaland, predominantly by right-lateral wrench faulting, and (2) cratonic Australia to begin collision with Indonesian island arcs in Miocene, causing CCW bending, accomplished by left-lateral faulting (e.g. Sorong Fault). Fracture systems displaced micro-continents SE-ward from Sundaland and W-ward from Australia- New Guinea. N-S Indosinian fabric of Peninsular Malaysia bends East through Bangka and Billiton. Triassic correlation of NW Borneo possibly with E Vietnam. Most but not all Cenozoic structures follow pre-Tertiary fabric. Etc.)

Hutchison, C.S. (2007)- Geological evolution of South-East Asia, 2nd edition. Geol. Soc. Malaysia, Kuala Lumpur, p. 1-433.
(Second edition of 1989 textbook of SE Asia geology; with relatively minor revisions)

Hutchison, C.S. (2014)- Tectonic evolution of Southeast Asia. Bull. Geol. Soc. Malaysia 60 (C.S. Hutchison Memorial Issue), p. 1-18.
(online at: https://gsmpubl.files.wordpress.com/2015/04/bgsm2014001.pdf)
(Brief review of SE Asia tectonic history, mainly of Sundaland area (Malay Peninsula- Thailand- Sumatra). Key events Late Triassic collision Sibumasu and E Malaya/Indochina after Permian E-ward subduction beneath E Malaya and development of E-M Triassic Semanggol-Mutus basin foredeep. M-Late Triassic tin granites of Peninsular Malaysia continue in curve through Bangka and Billiton. Late Cretaceous- Paleocene belts of migmatites and plutons. Oroclinal bending of N Sundaland from E-W fabric in Billiton- Borneo to N-S in N Peninsular Malaysia, resulted from indentation of India. Much of Borneo rotated ~50° CCW between 30-10 Ma and ~40° between 80-30 Ma, caused by collision between Australian plate and Indonesian arc at Timor)

(New Guinea first collided with Sepik island arc at ~30 Ma. At ~20 Ma subduction pattern reorganization resulted in 8000 km long, E-W arc-trench system from Sumatra to Buru. Prior to arrival of Australian continent at SE Asian continental margin, a N-S oriented Sulawesi-Mindanao volcanic arc existed ~800 km E of Borneo. New Guinea and Sepik collided with Inner Melanesian island arc, opening Australian Plate to influence of WNW moving Pacific Plate. At ~10 Ma S-dipping subduction zone broke through N of Irian Jaya but no volcanism. Oil and gas in pull-apart basins of Irian Jaya in Tertiary deposits, but source rocks in collision zones likely Mesozoic. Exploration targets in E Indonesia: Arafura Shelf intracratonic basins, marginal (rift) basins skirting S and E of Banda arc, collision zones of Timor, Seram, E Sulawesi and W Papua thrustbelt)

Katili, J.A. & S. Asikin (1985)- Hydrocarbon prospects in complex paleo subduction zones. Proc. 14th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 83-103.
(No significant hydrocarbons in accretionary wedge of W Indonesia. Sumatra fore-arc basin lacks coarse quartz-rich reservoirs; hydrocarbon source rocks are immature. Arc-trench system of E Indonesia different. Two phases in Banda Arc: (1) Indian-Australian plate oceanic crust subducted under Banda oceanic plate, (2) subduction of Australian continental crust into Banda Arc subduction zone. Oceanic crust dipping in Sumatra-Java Trench covered by thin pelagic sediments, but parts of shelf -slope sequences of Arafura Platform carried into Tanimbar Trench and Aru Through. Consolidated lower part of sequence greater shear strength and little material from there scraped off and incorporated in wedge. If rich in organic material, tectonic processes in trench and beneath wedge will mature organic material. If reservoir rocks exist in front of wedge, migration and accumulation possible. Oil and gas in subduction complex of E Sulawesi may be explained in same way)

Longley, I.M. (1997)- The tectonostratigraphic evolution of Southeast Asia. In: A.J. Fraser, S.J. Matthews & R.W. Murphy (eds.) Petroleum Geology of Southeast Asia. Geol. Soc. London, Spec. Publ. 126, p. 311-340.
(Tertiary tectono-stratigraphic evolution of SE Asia four phases: (1) 50-43.5 Ma: Start of India-Eurasia collision, reducing in convergence along Sunda Arc subduction system, resulting in extension in adjacent fore-arc and back arc areas; (2) 43.5-32 Ma: termination of oceanic subduction beneath India-Eurasia collision zone caused plate reorganization, producing second phase of rifting, with onset of extension in S China Sea and Makassar Straits failed rift. First major collision of Luconia Shoals block with subduction along NW Borneo margin; (3) 32-21 Ma): first phase of S China Sea seafloor spreading, rotations creating Malay Basin and inversion along Sunda Arc ending rifting in these basins; (4) 21–0 Ma: cessation of first phase of seafloor spreading inS China Sea caused by collsion of Baram block with NW Borneo subduction system. Collisions in NW Borneo, Sulawesi and Timor areas, with rotation of Sumatra resulted in extensive structural inversion)

Longley, I.M. (2000)- Extrusion collusion and rotational confusion in SE Asian tectonic models. AAPG Int. Conf. Exhib. Abstracts, American Assoc. Petrol. Geol. (AAPG) Bull. 84, 9, p. 1458. *(Abstract only)*
(In Paleogene SE Asia experienced rift phase with no significant transtension or transpression. Extrusion tectonics also fails to explain origin of backarc basins of Sumatra and Java, Malay Basin, etc. Paleogene evolution mainly driven by M Eocene plate re-organisation caused by India-Eurasia collision, with extrusion tectonics as Neogene modifier to basins formed by Paleogene rifting. Model suggests all Tertiary rotations in SE Asia are clockwise, initially due to opening of S China Sea and later due to effects of extrusion tectonics)

Longley, I.M. (2002)- Extrusion tectonics- give it up!- it does not explain the Tertiary evolution of SE Asia. Indon. Petroleum Assoc. (IPA) Newsletter, June 2002, p. 16-19.

(Eocene larger foram assemblages can help distinguish between carbonates from Asian-Pacific-Mediterranean (Pellatispira-Assilina) or Australian- New Guinea (Lacazinella) realms (Nummulites and Discocyclina-Asterocyclina present in both realms))

MacPherson, C.G. & R. Hall (1999)- Tectonic controls of geochemical evolution in arc magmatism of SE Asia. Proc. 4th PACRIM Congress 1999, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, p. 359-368.
(Retreats or advances in subducting plates trench hinge important control on presence or absence of magmatism. Several locations in SE Asia show magmatism with geochemical signature of subduction, but are far from active subduction zones. Such magmatism requires earlier period of mantle enrichment by subduction

but may also result from localized extension. Adakitic magmatism occurred in tectonic settings where there is no evidence for subduction of young oceanic crust at that time)

Milsom, J. (2000)- Stratigraphic constraints on suture models for Eastern Indonesia. J. Asian Earth Sci. 18, p. 761-779.
(online at: https://pdfs.semanticscholar.org/4f6d/18a4c0e67d6a95281d4fb7916cf6d70b42de.pdf)
(Tectonostratigraphies of Outer Banda Arc island suggest these were once part of Sundaland margin and that N and S Banda Sea basins are Late Cenozoic extensional features (first author to propose the slab rollback model for Banda Seas, subsequently supported with tomographic data by Spakman and Hall 2010; JTvG). Three separate tectonostratigraphic groups (1) Sundaland margin (SW Sulawesi, Sumba) (2) Birds Head/ Sula Spur; with Late Paleozoic granites similar to central PNG; and (3) Banda Association (Buton, Buru, Seram, W Kai, Banda ridges, E Sulawesi; rifted from Gondwanaland in Jurassic)

Milsom, J. (2001)- Subduction in eastern Indonesia: how many slabs? Tectonophysics 338, 2, p. 167-178.
(Seismicity associated with arc-continent collision in E Indonesia testifies to past N-directed subduction of Indian Ocean lithosphere beneath Banda Sea. Shallow-intermediate seismicity around Banda Arc supports

subduction of two separate slabs, but between 150-500 km continuous 'shoehorn' shape. This shape confirms presence of subducted lithosphere beneath Seram in N, as well as beneath Timor in S. This is incompatible with subduction of two unconnected plates, and implies rapid E-wards retreat of subduction trace (first author to suggest 'roll-back' of subducting Indian Ocean slab as mechanism for creation of Banda Sea; JTvG))

Milsom, J. (2003)- Forearc ophiolites: a view from the western Pacific. In: Y. Dilek & P.T. Robinson (eds.) Ophiolites in earth history, Geol. Soc., London, Spec. Publ. 218, p. 507-515.

(Interesting comparisons between Caribbean oroclinal system and Banda Sea region of E Indonesia)

Milsom, J. & M.G. Audley-Charles (1986)- Post-collision isostatic readjustment in the Southern Banda Arc. Geol. Soc., London, Spec. Publ. 19, p. 351-364.
(Late Miocene-Mid-Pliocene compression resulted in emplacement from N of large thrust sheets on deformed Australian margin near Timor. During last 3 Ma compression unimportant but vertical movements common and rapid. In N Timor and Banda volcanic arc, uplift is occurring where gravity data suggest there should be subsidence. Possible explanation of high gravity values is cold, dense, subducted slab which is now sinking independently after rupture near continental margin. Because of rupture, sinking slab no longer exerts downward pull on overlying lithosphere which now rebounds isostatically)

Milsom, J., M.G. Audley-Charles, A.J. Barber & D.J. Carter (1983)- Geological-geophysical paradoxes of the Eastern Indonesia collision zone. In: T.W.C. Hilde & S. Uyeda (eds.) Geodynamics of the western Pacific-Indonesian region, American Geophys. Union (AGU) and Geol. Soc. America (GSA) Geodyn. Ser. 11, p. 401-411.
(Geology of Sunda and Banda arcs not all in accord with classic plate tectonic models; many unanswered questions)

Milsom, J., D. Masson & G. Nichols (1992)- Three trench endings in Eastern Indonesia. Marine Geology 104, p. 227-241.
(Terminations of Sunda, Philippine and New Guinea trenches in E Indonesia associated with presence of blocks of thickened crust. Transition between Sunda Trench and Timor-Tanimbar Trough consequence of collision with NW Australian continent. S termination of Philippine Trench defined by presence of oceanic plateau. New Guinea Trench terminates in W at N-trending Mapia Ridge seafloor rise. No clear indications of present day subduction along N margin of New Guinea and subduction may have ceased in W-most part of New Guinea Trench and oceanic crust of Ayu Basin W of Mapia Ridge and N of Birds Head postdates active subduction)

Milsom, J. & V. Rocchi (1998)- The long wavelength gravity field in SE Asia. J. Geol. Soc. China, Taipei, 41, 4, p. 489-495.
(In SE Asia long wavelength field strongly correlated with anomalously high seismic velocities in mantle due to presence of deep subducted lithosphere. Comparisons with tomography indicate long wavelength field influenced most strongly by mass excesses in lower mantle, below 600 km discontinuity. Gravity patterns suggest subduction zones formerly existed close to present-day E and possibly W coastlines of Borneo and that E-ward extension of active margin of Eurasian Plate to Banda Arc is very recent)

Milsom, J., Sardjono & A. Susilo (2001)- Short-wavelength, high-amplitude gravity anomalies around the Banda Sea, and the collapse of the Sulawesi Orogen. Tectonophysics 333, 1-2, p. 61-74.
(High-density ophiolitic rocks outcropping on islands around Banda Sea in many cases associated with strong gravity anomalies and steep gravity gradients. Bouguer gravity levels and gradients over extensive E Sulawesi Ophiolite generally low. Most positive anomalies in Banda Arc due to ophiolites superimposed on steep

regional gravity gradient but in W Seram spatial separation between two. On Buru gradient >10 mGal/km suggests presence of shallow, very dense rocks, despite absence of ophiolites in outcrop. Ophiolite distribution on Sulawesi and around Banda Sea compatible with ?Oligocene collision that produced Sulawesi orogen, which collapsed following collision with Australian-derived microcontinent)

Milsom, J., J. Thurow & D. Roques (2000)- Hydrocarbon source rocks and the paleogeography of Eastern Indonesia. SEAPEX Press 3, 4, p. 42-44, 49.
(Many of the islands surrounding Banda Sea are fragments of 'East Sulawesi Microcontinent' (ESM), which rifted off Australia- New Guinea margin in Late Triassic or E Jurassic, to collide with Eurasia margin in E Miocene. Parts of this continent are now in E Sulawesi, Buton, Buru and Seram and share Late Triassic bituminous marine shale deposits. Parts of Timor similar as well. Late Triassic of Sula Spur and New Guinea in continental facies and with granite intrusions, so clearly still part of Gondwana. In 'bacon-slicer model' Sula Spur therefore must have rifted off New Guinea at later date)

Mitchell, A.H.G. (1984)- Initiation of subduction by post-collision foreland thrusting and back-thrusting. J. Geodynamics 1, 2, p. 103-120.
(Ages of subduction zones bordering five collisional orogens suggest subduction may have initiated by foreland thrusts and backthrusts. Examples used include Late Jurassic at N Sunda Arc (Sumatra- Malaya), end-Miocene in Negros trench (Philippines) and incipient S-ward subduction of e Banda Sea beneath Timor)

(On timing of rifting and uplift events of Sundaland, constrained by palynology and sequence stratigraphy. Makassar/ Java Sea rifts initially formed at start of M Eocene (~49 Ma), with non-marine deposition and low paleo-elevations, followed by marine deposition in second rift phase in Late Eocene. Extensive uplift in Borneo began in latest E Miocene, and further uplift at ~8 Ma. N and W rifts of Sunda region initiated in Late Eocene, with synrift phase ending at ~31 Ma. Some rifts, especially in W Natuna and Malay Basin, characterised by Oligocene deep lake systems, which persisted for >6 Myrs)

Morley, R.J. (2018)- The complex history of mountain building and the establishment of mountain floras in Southeast Asia and Eastern Indonesia. In: C. Hoorn & A. Antonelli (eds.) Mountains, climate and biodiversity, Wiley, p. 475-494.

Morley, R.J. (2018)- Assembly and division of the South and South-East Asian flora in relation to tectonics and climate change. J. Tropical Ecology 34, 4, p. 209-234.
(Discussion of main phases of plant dispersal into and out of SE Asia in relation to plate tectonics and changing climates. Late Cretaceous poorly understood, but Paleocene topography mountainous, and climate probably seasonally dry. India's drift into perhumid low latitudes in Eocene brought dispersal into SE Asia of megathermal angiosperms which originated in W Gondwana, starting at ~49 Ma, and with terrestrial connection after~41 Ma. Oligocene seasonally dry climates except along E and SE seaboard of Sundaland, but with collision of Australian Plate with Sunda at end of Oligocene widespread perhumid conditions in region. With Late Miocene strengthening of Indian monsoon, seasonally dry conditions expanded. Some dispersals from Australasia after collision with Sunda. Pleistocene refuge theory applies to SE Asian region).

Morley, R.J. & H.P. Morley (2018)- Montane pollen indicates character of Mid Cenozoic uplands across Sunda Shelf. In: PESGB SEAPEX Asia Pacific E&P Conference, London, 4p *(Extended Abstract)*
(Montane pollen common element of palynomorph assemblages across Sundaland region and provides insight into paleoaltitudes and paleoclimates from Paleocene- Pliocene. In Late Eocene-Oligocene, Natuna Arch, Con Son Swell and Ammanite Ranges likely of sufficient altitude to support temperate broadleaf and cool temperate conifer forests at summits, with altitudes of 2500m or more. Late Miocene-Pliocene uplifts in Borneo, (Kinabalu, Meratus) and Sumatra Barisan Range. Volcanoes of Java formed in Pleistocene)

Nugroho, H. (2005)- GPS velocity field In the transition from subduction to collision of the Eastern Sunda and Banda Arcs, Indonesia. Masters Thesis, Brigham Young University, Utah, p. 1-89.
(online at: http://scholarsarchive.byu.edu/cgi/viewcontent.cgi?article=1552&context=etd)
(GPS measurements from 14 sites in active E Sunda- Banda arc during 2001-2003. Most blocks move in same direction as Australian lower plate, but at different rates. Block boundaries may exist between Lombok and Komodo, Flores and Sumba, Savu and W Timor, and between Timor and Darwin. Timor Trough may account for 20 mm/yr of motion between Timor and Darwin. Major transverse fault off W Timor separates Savu/ Flores/ Sumba block from Timor/Wetar Block. Flores thrust moves E Sunda arc N relative to Asia, by decreasing amounts to W. Back-arc Wetar Thrust system takes up most of plate convergence between Australia and Asia)

Nugroho, H., R. Harris, A.W. Lestariya & B. Maruf (2009)- Plate boundary reorganization in the active Banda Arc-continent collision: insights from new GPS measurements. Tectonophysics 479, 1-2, p. 52-65.
(GPS velocities suggest three Sunda Arc-forearc regions, ~500 km long, with different amounts of coupling to Australian Plate. Movements relative to SE Asia increases from 21% to 41% to 63% E-ward. Regions bounded by deformation front to S, Flores-Wetar backarc thrust system to N and poorly defined structures on sides. Suture zone between NW Australian margin and Sunda-Banda Arcs still evolving with >20 mm/yr of movement measured across Timor Trough between Timor and Australia)

Packham, G.H. (1993)- Plate tectonics and the development of sedimentary basins of the dextral regime in western Southeast Asia. In: B.K. Tan et al. (eds.) Proc. 7th Conf. Geology, Mineral and Energy Res. SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 497-511.
(Present regime of oblique subduction in SE Asia initiated in M Eocene. Resulting dextral shear drove basin genesis and development. Effects identified from Malay Basin to C Thailand in East. Late Eocene-Oligocene phase formed rifts in C Sumatra, later spreading N to Mergui Basin and S to Sunda Basin. In Oligocene, dextral shear initiated Thailand basins and Malay Basin. Subsidence- extension continued until late M Miocene. Late Oligocene-E Miocene back arc basins subsidence extended out from initial rifts possibly due to withdrawal of heat beneath basins by cold subducted slab. Transpressional deformation started in Sumatra basins in M Miocene and continued through Late Miocene- Pliocene, resulting in uplift of Barisan Mts. Sumatra forearc transferred to Burma Plate with establishment of dextral Sumatra FZ in Pliocene)

Packham, G.H. (1996)- Cenozoic SE Asia: reconstructing its and reorganization. In: R. Hall & D. Blundell (eds.) Tectonic Evolution of Southeast Asia, Geol. Soc. London, Spec. Publ. 106, p. 123-152.
(Cenozoic SE Asia three major tectonic events: collision of India- Eurasia, rotational history of Philippine Sea plate and ongoing collision of Australia with E Indonesia. Models of Eocene India-Eurasia collision imply extrusion along major strike-slip faults or crustal thickening and block rotation)

Packham, G.H. & D.A. Falvey (1971)- An hypothesis for the formation of marginal basins in the western Pacific. Tectonophysics 11, 2, p. 79-109.
(Small ocean basins, or marginal seas, mainly located on W margin of Pacific Ocean. Tectonically they belong to Eurasian and Indo-Australian crustal plates to W and are bounded on E side by island arc-trench systems. Basins generally reach normal oceanic depths, but also contain seamounts, linear seamount chains and areas of submerged continental crust (rises). No evidence of mid-ocean ridge systems. Marginal basins also characterized by high regional gravity anomalies, high heat flow and linear magnetic anomalies. Geological data suggest formation of marginal seas by rifting of volcanic arc from adjacent continent, possibly by generation of oceanic crust by mantle upwelling immediately behind andesitic island arc, producing asymmetrical seafloor spreading. In Indonesian region: Andaman Sea, Sulu Sea, Celebes Sea, Banda Sea, and South China Sea basins)

(online at: www.gsm.org.my/products/702001-101658-PDF.pdf)
(Discussion of diachronous opening of Tertiary marginal basins along E part of the Sundaland: (1) Proto S China Sea and S China Sea (with rifted off continental Palawan Block), (2) NW Sulu Sea, separated by Cagayan Arc; (3) late E Miocene Sulu Sea back-arc basin (W Mindanao and Sulu arc continental basement);

(4) M Eocene Celebes Sea basin (N Arm of Sulawesi), Late Miocene N Banda Basin, Pliocene S Banda Basin. Basin closures started in E Miocene)

Pubellier, M., J. Ali & C. Monnier (2003)- Cenozoic plate interaction of the Australia and Philippine Sea Plates: "hit-and-run" tectonics. Tectonophysics 363, 3-4, p. 181-199.
(NW New Guinea at least two marginal basins, both formed in back-arc settings. Older basin opened between M Jurassic- E Cretaceous, a remnant of which is now preserved as New Guinea Ophiolite. Its obduction started at 40 Ma and finally emplaced on Australian margin at ~30 Ma. Younger basin active in Oligocene- M Miocene and obducted in E Pliocene. W edge of Philippine Sea also hitherto unexplained Oligocene deformation of Philippine arc. Extensive area of oceanic crust extended Australian Plate N of craton. As Australia began N-ward drift in E Eocene, this lithosphere was subducted. Thus, portion of Philippine Sea Plate carrying Taiwan-Philippine Arc to present site may have actually been in contact with ophiolite now in New Guinea and obduction led to deformation of Philippine Sea Plate. Neogene Plate kinematics transported deformed belt in contact with Sunda block in Late Miocene-Pliocene)

Pubellier, M. & F. Meresse (2013)- Phanerozoic growth of Asia; geodynamic processes and evolution. J. Asian Earth Sci. 72, p. 118-128.
(On mechanism of Tertiary accretion processes in SE Asia. Early stages illustrated in E Sunda arc where subduction of Sunda Trench is blocked in Sumba and Timor region, and flipped into Flores Trough. Another stage, where part of upper plate basin has disappeared is in Celebes Sea (and Makassar Basin?). Next stage is consumption of marginal basin where both margins collide and accretionary wedge is thrust over margin, as in NW Borneo and Palawan. These events predate arrival of conjugate margin of large ocean, which marks beginning of continental subduction as observed in Himalaya-Tibet region. Closure generally diachronous through time. Ophiolite obducted in such context generally of back-arc origin rather than relict of vanishing large ocean, which is rarely preserved)

Pubellier, M., C. Monnier, R. Maury & R. Tamayo (2004)- Plate kinematics, origin and tectonic emplacement of supra-subduction ophiolites in SE Asia. Tectonophysics 392, p. 9-36.
(Majority of SE Asia ophiolites originated in backarc or island arc settings along edge of Sunda (Eurasia) and Australian cratons, or within Philippine Sea Plate. Ophiolites accreted to continental margins during Tertiary. Relatively 'autochthonous ophiolites' resulted from shortening of marginal basins like S China Sea or Coral Sea, and 'highly displaced ophiolites' developed in oblique convergent margins. Some ophiolites in front of Sunda plate represent supra-subduction zone basins formed along Australian Craton margin in Mesozoic)

Pubellier, M. & C.K. Morley (2014)- The basins of Sundaland (SE Asia): evolution and boundary conditions: J. Marine Petroleum Geol. 58, B, p. 555-578.
(Major review of origin and evolution of Cenozoic basins of Sundaland. All basins in supra-subduction setting, but many different types, rift basins most widespread. Rift basin initiation is diachronous, with basins >45 Ma developing in E, and <45 Ma in C and N Sundaland, due to earlier onset of subduction rollback in Sulawesi-Celebes Sea area. Andean margin growth in NW Sundaland, Proto-South China Sea slab-pull and Andean margin collapse in NE Sundaland)

(Eight geodynamic reconstructions maps Early Tertiary- Present. 35 distinct crustal blocks distinguished. All marginal basins opened in Cenozoic, after complete closure of Tethys. Final Tethys suture traced from S Sumatra-C Java, Meratus Range in Borneo to W Philippines)

Rangin, C., M. Pubellier & L. Jolivet (1989)- Collision entre les marges de l'Eurasie et de l'Australie: un processus de fermeture des bassins marginaux du Sud-Est Asiatique. Comptes Rendus Academie Sciences, Paris 309, p. 1223-1229.
('Collision between the margins of Eurasia and Australia: a process of closing of marginal basins of SE Asia'. Convergence between Philippine Sea and Indo-Australian plates interpreted as E-M Miocene collision between

two thinned continental margins with marginal basins floored by oceanic crust. This 'soft collision' initiated progressive subduction and closure of these basins and predate 'hypercollision' between Eurasia and Australia. So-called 'exotic fragments' also include Timor and Seram as parts of thinned continental margins of Eurasia and Australia respectively)

Rangin, C., W. Spakman, M. Pubellier & H. Bijwaard (1999)- Tomographic and geological constraints on subduction along the eastern Sundaland continental margin (South-East Asia). Bull. Soc. Geologique France 170, 6, p. 775-788.
(Tomographic model suggests rel. continuous active margin from Taiwan to Java before collision of Banda Block with Sundaland in M Miocene. N-dipping slab below Timor- Banda Arc reflects new subduction after this collision (12- 0 Ma). Shortening within Sunda Block accommodated by subduction of SE Asia marginal basins that opened in Paleogene. Closure of Sulu and Celebes basins is recent, whereas subduction of Proto-South China Sea marked by 300 km long slab below Borneo)

Ranneft, T.S.M. (1972)- The effects of continental drift on the petroleum geology of W Indonesia. Australian Petrol. Explor. Assoc. (APEA) J. 2, p. 55-63.

Richards, S., G. Lister & B. Kennett (2007)- A slab in depth: three-dimensional geometry and evolution of the Indo-Australian Plate. Geochem. Geophys. Geosystems 8, 12, Q12003, p. 1-11.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2007GC001657)
(3D image of subducted Indo-Australian plate below SE Asia and show geometry of subducted slab at depth is related to geometric evolution of SE Asia over past 50 Ma. Once semi-continuous subducting Indo-Australian plate segmented during collision between India, Australia and subduction margin to N. Complexities and evolution of subducted plate manifest in evolution of overriding plate)

Richter, B.W. (1996)- The Tertiary tectonic evolution of Southeast Asia; insights from paleomagnetism and plate reconstructions. Ph.D. Thesis, University of California, Santa Barbara, p. 1-247. *(Unpublished)*
(Paleomagnetic studies of parts of mainland SE Asia. Shan Plateau of Myanmar 33± 8° CW rotation relative to S China Block since M Cretaceous= 15.4 ± 5.4 ° CW rotation relative to Indochina Block. Peninsular Malaysia CCW declinations, similar to Borneo, Celebes Sea and Sulawesi, supporing hypothesis that much of Sundaland region rotated 35-40° CCW as rigid block since M Cretaceous. Java-Australia boundary probably passive margin until M Oligocene, so N-ward movement of Australia since Late Eocene initially pushed Borneo N-ward, driving CCW rotation of Borneo and Malaysia. Philippine Sea Plate rotating CW and moving NW through much of Tertiary, and arc fragments of this plate collided with Borneo through Tertiary)

Richter, B. & M. Fuller (1996)- Palaeomagnetism of the Sibumasu and Indochina blocks- implications for the extrusion tectonic model. In: R. Hall & D.J. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc. London, Spec. Publ. 106, p. 203-224.
(Paleomagnetic data implications for extrusion tectonic model: (1) Sundaland only rotated 25-30° CW relative to S China during Tertiary; (2) SE-ward translation only 300-500 km; and (3) Sundaland composed of smaller sub-blocks, some of which moved N. This indicates deformation of Sibumasu dominated by oblique Indian Ocean Plate subduction, while deformation of Indochina dominated by extrusion, driven by Indian Craton)

Richter, B., I. Norton, E. Schmidtke & M. Fuller (1992)- Paleomagnetic rotations from Southeast Asia- implications for tectonic reconstructions of Sundaland. In: M. Flower et al. (conv.) Southeast Asia structure, tectonics and magmatism, Texas A&M University Symposium, College Station 1992, 3p. *(Abstract only)*
(Paleomagnetic data from Thailand- E Myanmar suggest ~45° CW rotation since Cretaceous. Peninsular Malaysia, Borneo, SW Sulawesi and Celebes Sea mainly CCW declinations)

(Variations in buoyancy of subducting lithosphere control subduction rate, slab dip and position of volcanic arc. More buoyant slab segments correlate with slower subduction rates and steeper slab dip. In Banda and S Apennine subduction systems subduction slowed and ended shortly after entry of continental lithosphere into trench. Time period of ~10 m.y. needed for model subduction rates to slow to near zero, longer than ~3 m.y. observed in Banda systems. Possible explanation is slab break-off or formation of large slab windows during the last stages of subduction allowing slab to steepen rapidly into final position)

Satyana, A.H. (2010)- Gravity tectonics in Indonesia- a companion to plate tectonics: cases of isostatic exhumation and gravitational sliding. Proc. 39th Ann. Conv. Indon. Assoc. Geol. (IAGI), Lombok, PIT-IAGI-2010-205, 12p.
(At several areas in Indonesia geologic phenomena can not be explained by plate tectonics only. Uplifts in collision zones of Indonesia (Meratus (SE Kalimantan), Batui (E Sulawesi), Central Ranges of Papua, and Timor-Tanimbar uplifts may be caused by isostatic exhumation of once subducted microcontinents in collision zones. Compressional structures such as Samarinda Anticlinorium (E Kalimantan) and N Serayu fold-thrust belt (N C Java) may be related to gravitational gliding after hinterlands uplifts. Collision of microcontinents is by plate tectonics, but their subsequent uplifts of collisional through gravity tectonics)

Satyana, A.H. (2012)- Accretion and dispersion of Southeastern Sundaland: the growing and slivering of continent and petroleum implications. AAPG Int. Conv. Exh., Singapore 2012, Search and Discovery Art. 30261, 39p. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2012/30261satyana/ndx_satyana.pdf)
(Sundaland made up of terranes from N Gondwanaland, which rifted, drifted, and amalgamated in Late Paleozoic- Mesozoic. A number of SE Sundaland crustal masses accreted to original SE Sundaland (Schwaner Core) in 150-60 Ma. Starting at ~50 Ma (M Eocene), some of accreted mass of SE Sundaland rifted and drifted apart (SW Sulawesi, Flores Sea Islands, Sumba), due to transtension rifting related to tectonic escape of India-Eurasia collision and/or back-arc spreading by rollback of slower subduction, resulting in opening of Makassar Straits and Bone Basins, segmentation of E Java Basement and slivering of Sumba terrane)

Satyana, A.H. (2013)- Gravity tectonics in Indonesia: petroleum implications. Proc. 37th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA13-G-161, p. 1-14.
(Examples of gravity tectonics (compressional structures not requiring tectonic shortening) in Indonesia: (1) Meratus Uplift, SE Kalimantan, (2) Samarinda Anticlinorium (E Kalimantan), (3) growth faults and toe thrusts in Tarakan offshore and N Makassar Basins, and (4) N Serayu Anticlinorium, C Java (reminescent of Van Bemmelen's 'undation theory'; JTvG))

Satyana, A.H. (2014)- New consideration on the Cretaceous subduction zone of Ciletuh- Luk Ulo- Bayat-Meratus: implications for southeast Sundaland petroleum geology. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-129, p. 1-41.
(Cretaceous subduction under SE Sundaland more complex than previously considered. Subduction ceased in Bantimala and Meratus trenches in mid-Cretaceous due to docking of W Sulawesi and Paternoster-Kangean microcontinents, respectively. Late Cretaceous subduction migrated to Paternoster trench resulting in volcanic and magmatic rocks as well as forearc sediments in Meratus and Bantimala. Subduction in Ciletuh and Luk Ulo continued into Late Cretaceous. Bayat area may not be subduction continuation of Luk Ulo due to absence of subduction zone rock assemblages. Presence of NW Australian-derived microcontinents (W Sulawesi, Paternoster-Kangean, SE Java) opens petroleum possibilities in pre-Tertiary deposits)

Satyana, A.H. (2014)- Tectonic evolution of Cretaceous convergence of Southeast Sundaland: a new synthesis and its implications on petroleum geology. Proc. 43rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, 28p.
(SE Sundaland recorded subduction of oceanic plate in Jurassic- Late Cretaceous (Meratus, Bantimala, Luk Ulo, Ciletuh). Subduction ceased in Bantimala and Meratus trenches in mid-Cretaceous due to docking of W Sulawesi and Paternoster-Kangean microcontinents. In Late Cretaceous, subduction migrated to Paternoster trench, resulting in volcanic- magmatic rocks and forearc sediments in Meratus and Bantimala. In Paleogene Meratus and Bantimala separated by opening of Makassar Straits. Subduction in Luk Ulo and Ciletuh trenches continued into Late Cretaceous (but no Late Cretaceous subduction-related metamorphic rocks). Jiwo Hills, Bayat, not subduction zone, but part of SE Java Microcontinent that docked in E Cretaceous)

Satyana, A.H. (2018)- Contribution of post-2000's petroleum exploration in Indonesia to some issues of tectonics: solutions to problems, new knowledge, and hydrocarbon implications. Proc. 42nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA18-591-G, 23p.
(Recent petroleum exploration contributed to solving debates on tectonics of Indonesia: (1) N Makassar Straits opening mechanism and nature of basement (extended continental crust from interpretation of volcanic geochemistry in well), (2) origin of Sumba micro-continent (rifted block from Sulawesi), (3) basement of Cendrawasih Bay (Pacific Plate oceanic/ arc volcanic crust). Some issues now better defined: (4) forearc areas of Sumatra- W Java (with Paleogene rift structures), and (5) foredeep areas of Seram-Tanimbar-Timor troughs (foredeeps, not subduction troughs). New knowledge of tectonics: (6) presence of Late Paleozoic-Mesozoic

sections of Gondwanan micro-continents in East Java and S Makassar Straits (from interpretation of seismic and geochemical data), and (7) multiple rifts/terranes of Gorontalo Basin (from seismic interpretation))

Satyana, A.H., C. Armandita & R.L. Tarigan (2008)- Collision and post-collision tectonics in Indonesia: roles for basin formation and petroleum systems. Proc. 32nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA08-G-140, 18p.
(Collision following subduction and accretion of buoyant crustal masses and post-collision tectonics significant for basin formation and resultant petroleum systems. Examples of collisions important for petroleum geology: (1) Meratus (SE Kalimantan), (2) Buton and Banggai (E Sulawesi), (3) Seram, (4) Timor-Tanimbar, (5) Lengguru (Birds Head of Papua) and (6) Central Range of Papua)

Satyana, A.H., R.L. Tarigan & C. Armandita (2007)- Collisional orogens in Indonesia: origin, anatomy, and nature of deformation. Proc. Joint Conv. 36th IAGI, 32nd HAGI, and 29th IATMI, Bali 2007, p. 1003-1061.
(Extensive review of Indonesia collisional orogens: (1) Meratus: collision of Schwaner continental core with Paternoster micro-continent, (2) Sulawesi: collision of Banggai-Sula microcontinent and E Sulawesi Ophiolite, (3) Molucca Sea: collision of accretionary wedges of Sangihe and Halmahera arc-trench systems, (4) Seram: collision of Seram/N Banda arc and Bird's Head micro-continent, (5) Lengguru: collision between Bird's Head of N margin of Australian continent, (6) Papua Central Range: collision of island arc to S of Philippine Sea plate and N margin of Australian continent, and (7) Timor-Tanimbar: collision of Australian continent and Timor-Tanimbar/ S Banda arc)

Schneider, C.F.A. (1876)- Geologische Uebersicht uber den hollandisch-ostindischen Archipel. Jahrbuch kon. kaiserl. Geol. Reichsanstalt, Vienna, 26, 2, p. 113-134.

Schwartz, M.O., S.S. Rajah, A.K. Askury, P. Putthapiban & S. Djaswadi (1995)- The Southeast Asian tin belt. Earth-Science Reviews 38, p. 95-290.
(N-S trending SE Asian tin belt 2800 km long/ 400 km wide, from Myanmar- Thailand to Malay Peninsula and Indonesian Tin Islands Bangka- Belitung. Five granitoid provinces: (1) Main Range in W Malay Peninsula, S Peninsular Thailand and C Thailand (184-230 Ma; almost entirely biotite granite, 55% of tin production); (2) Northern Province of N Thailand (200-269 Ma; 0.1% of tin production, also mainly biotite granite); (3) Eastern Province of E Peninsular Malaysia- E Thailand (Malaysian part subdivided into E Coast Belt (220-263 Ma), Boundary Range Belt (197-257 Ma) and Central Belt (79-219 Ma; wide compositional range; tin deposits only in biotite granite in E Coast Belt) (3% of production); (4) Western Province in N Peninsular and W Thailand and Burma (22-149 Ma; biotite granite, 14% of tin production); (5) Granitoids of Indonesian Tin Islands (193-251 Ma) do not permit grouping into above units; most tin deposits associated with Main Range-like plutons)

Scotese, C.R., L.M. Gagahan & R.L. Larson (1988)- Plate tectonic reconstructions of the Cretaceous and Cenozoic ocean basins. Tectonophysics 155, p. 27-48.

(Nine global reconstructions of ocean basins and continental plates for E Cretaceous- Pleistocene times. Late Cretaceous and Early Tertiary plate reorganizations in Indian Ocean e result of progressive subduction of intra-Tethyan rift/ spreading system)

Setiawan, N.I. (2013)- Metamorphic evolution of Central Indonesia. Ph.D Thesis, Kyushu University, p. 1-318. *(Unpublished)*
(Study of metamorphic complexes of S Sulawesi, Kalimantan, C Java)

Setiawan, N.I., S. Husein & M.F. Alfyan (2014)- Speculative models of exhumation of High-Pressure Low-Temperature metamorphic rocks from central part of Indonesia: an implementation of concepts and processes. Proc. Seminar National Kebumian 7, Universitas Gadjah Mada, Yogyakarta 2014, P3O-02, p. 504-523.
(online at: https://repository.ugm.ac.id/135217/1/504-523%20P3O-02.pdf)
(Published exhumation models of high-P/low-T metamorphic rocks in subduction zones suggest buoyancy is only effective force to exhume rocks from deeply subducted levels to base of crust. Serpentinites are extremely buoyant and may facilitate exhumation. Requires rapid uplift and cooling to maintain high-P minerals in rocks. Presence of melange units intercalated with high-P metamorphics and chaotic occurrence of different metamorphic facies typically in subduction channel environment)

Setiawan, N.I., Y. Osanai & M.I. Khalif (2016)- U-Pb detrital zircon geochronology of metamorphic rocks from South Kalimantan, South Sulawesi, and Central Java, Indonesia: related metamorphism and tectonic implications in Central Indonesia region. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 289-292.
(High P metamorphics from Meratus in SE Kalimantan, Bantimala in S Sulawesi and Luk Ulo in C Java generally tied to NW-directed Cretaceous subduction. Zircons show no metamorphic rims and therefore viewed as detrital grains and provenance ages of metamorphic rock protoliths. Youngest detrital zircon ages in Bantimala- Meratus ~199-194 Ma, in Luk Ulo ~100 Ma. Ages from Bantimala glaucophane-quartz schist ~430-199 Ma (Silurian- E Jurassic), Barru garnet schist ~1930, 1730, 1600-1400 Ma, 1050 Ma (Proterozoic), and 550-280 Ma (Cambrian-Permian); Meratus epidote-barroisite schist 232 ± 39 Ma (Late Triassic; range 296-194 Ma); Luk Ulo gneiss mainly 127-100 Ma (E Cretaceous; also older)

Setiawan, N.I., Y. Osanai, N. Nakano, T. Adachi, Y. Tatsuro, K. Yonemura, A. Yoshimoto, J. Wahyudiono & K. Mamma (2013)- An overview of metamorphic geology from central Indonesia: importance of South Sulawesi, Central Java and South-West Kalimantan metamorphic terranes. Bull. Graduate School Social and Cultural Studies, Kyushu University 19, p. 39-55.
(online at: https://qir.kyushu-u.ac.jp/dspace/bitstream/2324/26209/1/p039.pdf)
(Study of metamorphic complexes at Bantimala and Barru (S Sulawesi; High P), Luk Ulo (C Java; High P; pelitic schist, eclogite, blueschist), Meratus (S Kalimantan) and Nangapinoh area of Schwaner Mountains (W Kalimantan). Metamorphic rocks from S Sulawesi, C Java and S Kalimantan E Cretaceous ages (~110-130 Ma) and possibly derived from single subduction complex. Metamorphic rocks in Schwaner Mountains metatonalite, with U-Pb zircon ages suggesting Late Triassic magmatic ages (~233 Ma), i.e. older than most Schwaner Mts granitoids (Late Jurassic-Cretaceous), but within range of NW Kalimantan granitoids (Carboniferous-Triassic; 204-320 Ma))

Setiawan, N.I., Y. Osanai, N. Nakano, T. Adachi, K. Yonemura, A. Yoshimoto, L.D. Setiadji, K. Mamma & J. Wahyudiono (2014)- Geochemical characteristic of metamorphic rocks from South Sulawesi, Central Java, South and West Kalimantan in Indonesia. ASEAN Engineering J., C, 3, 1, p. 107-127.
(online at: www.seed-net.org/download/GeoE013_revised_060513.pdf)
(Metamorphic complexes as products of Cretaceous subduction outcrop in C Java, S Kalimantan and S Sulawesi. Mainly high-pressure metamorphic rocks from metabasic and sedimentary protoliths. Metabasic rocks from S Sulawesi and C Java basalts with both MORB and within-plate signatures. Metatonalites from Schwaner Mountains calc-alkaline arc volcanics; adakitic metatonalite age of 233± 3 Ma (Late Triassic))

Setijadji, L.D. (2010)- Cretaceous subduction zones in Indonesia: paleogeography, arc granitoid plutonism and metallic mineralizations. Proc. IGCP 507 Project Symp. Paleoclimates in Asia during the Cretaceous, Yogyakarta 2010, p. 59-60. *(Abstract only)*
(Two or three separate Cretaceous subduction zones in W Indonesia, with oceanic crust subducting under Eurasia plate (1) M-Lt Cretaceous Sumatra-Meratus arc, E and N- facing subduction, 2000 km long, with granitoid plutonism from W Sumatra (Sikuleh, Manunggal, Ulai, Garba and Sulan granites; 120-75 Ma), N of Java, to Meratus Mountains of SE Kalimantan; (2) S-facing subduction at NW Kalimantan, resulting in two granitoid plutonic arcs, i.e. late E Cretaceous Schwaner Arc and Late Cretaceous Sunda Shelf Arc. Both are parallel in E-W direction, ~1500 km long, in W-C Kalimantan, with Late K arc south of Early K arc. Cretaceous arc granitoid plutonism very different from Triassic granitoids of Bangka- Belitung)

Seubert, B.W. (2015)- Volcaniclastic petroleum-systems- theory and examples from Indonesia. Proc. 39th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA15-G-026, 19p.
(Potential volcaniclastic reservoirs present in Indonesia across range of stratigraphic intervals, but underexplored. Presence of volcanic material may enhance preservation and of organic matter and maturation of hydrocarbons. Porosity prediction still problematic. Examples of volcaniclastic reseroirs in Indonesia: Bengkulu, W, C and E Java, S Sulawesi, etc.)

Sevastjanova, I. & R. Hall (2011)- Detrital zircon from the Banda Arc: insights into the palaeogeographic reconstructions. In: Conf. Sediment provenance studies in hydrocarbon exploration & production, Geol. Soc., London, 2011, p. 27-28. *(Abstract only)*
(Zircon U-Pb ages from Karimunjawa Arch (SW Borneo Block) similar to those from Seram, suggesting similar source areas. Mesoproterozoic zircons in Karimunjawa Arch uncommon on Cathaysian Blocks, providing evidence against Cathaysian affinity for SW Borneo Block. Triassic zircons abundant in Karimunjawa Arch. Zircons suggest existence of local Permian-Triassic zircon source in E Indonesia and/or on Australia NW Shelf)

Sevastjanova, I., R. Hall & S. Zimmermann (2012)- Detrital zircon provenance and insights into palaeogeographic reconstructions of the Banda Arc. In: 1st Congr. Int. Geologia de Timor-Leste, Dili 2012, Abstract book, p. 103-105. *(Abstract only)*

Simandjuntak, T.O. (1992)- Tectonic development of the Indonesian archipelago and its bearing on the occurrence of energy resources. Indonesia. J. Geologi Sumberdaya Mineral 2, 9, p. 2-23.
(Review of Indonesian tectonics and relation to hydrocarbons, coal, geothermal potential. Indonesia triple junction convergence since Neogene. Pre-Neogene tectonics (1) Paleozoic- Mesozoic_Paleogene convergence in W Indonesia; (2) Mesozoic- Paleogene divergence in E Indonesia, producing allochthonous terranes in E Indonesia. Permian convergence recorded by Permian andesitic volcanics, similar to rocks present in W Kalimantan and E Main Range of Malay Peninsula. Similarities between E Indonesian microcontinents include Permo-Carboniferous metamorphics, Permo-Triassic plutonics, overlain by Mesozoic passive margin seqeunce, E Cretaceous mostly missing, Late Cretaceous radiolarian calcilutites and Tertiary platform carbonates, etc.;generally regarded as derived from New Guinea. No plate reconstructions)

Simandjuntak, T.O. (1992)- Review of tectonic evolution of Central Indonesia. J. Geologi Sumberdaya Mineral 2, 15, p. 2-18.
(C Indonesia nine tectonic provinces or belts: (1) W Sulawesi Magmatic Arc (Late Cretaceous- Paleogene flysch and arc volcanics and some probably Cretaceous granitoids); (2) C Sulawesi Metamorphic Belt (tightly folded schist, incl. blueschist, N-S fold axes, probably Late Cretaceous metamorphism); (3) E Sulawesi Ophiolite Belt (>1000km long belt from E Arm Sulawesi to Kabaena and Buton in SE, possibly up to 15km thick; in places with deformed Late Cretaceous radiolarian chert, K-Ar ages of ophiolite ~93-37 Ma; E Miocene obduction?); (4) Banda Micro-continents (Banggai-Sula, Seram-Buru platform, Misool-Birds Head, etc., terranes of Paleozoic metamorphic basement with Permo-Triassic granitic plutons, overlain by Late Triassic sediments, E Jurassic hiatus, M-L Jurassic passive margin sediment, etc.; originated from N Papuan margin); (5) Banda Sea floor (Cretaceous?)/ Sulawesi Sea floor (Eocene), (6) N Maluku Basin and Talaud-Tifore Ridge; (7) Minahasa- Sangihe Volcanic Arc; (8) W Halmahera Province (Tertiary Arc volcanics) and (9) E Halmahera Province (ophiolites of poorly known age))

Simandjuntak, T.O. (1993)- Neogene tectonics and orogenesis of Indonesia. In: G.H. Teh (ed.) Proc. Symp. Tectonic framework and energy resources of the western margin of the Pacific Basin, Kuala Lumpur 1992, Bull. Geol. Soc. Malaysia 33, p. 43-64.
(online at: www.gsm.org.my/products/702001-101022-PDF.pdf)
(Indonesian Archipelago developed during Neogene convergence of 3 megaplates, Eurasian craton, Pacific plate and Australian craton. Five major crustal elements, 4 orogenic belts: Sunda orogeny, (2) Banda orogeny, (3) Melanesian orogeny, (4) Talaud orogeny. 'Transitional Complex': between 3 major plates composed of 17 disctinct units: E Sulawesi, Banggai-Sula, Timor-Tanimbar, Misool-Birds Head, etc.)

Simandjuntak, T.O. (1993)- Neogene tectonics and orogenesis of Indonesia. J. Geologi Sumberdaya Mineral 3, 20, p. 2-32.
(Similar to other Simandjuntak (1993) above)

Simandjuntak, T.O. (1994)- Tectonic evolution of Central Indonesia. In: J.L. Rau (ed.) Proc. 29th Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Hanoi 1992, 2, p. 91-113.
(Central Indonesia is triple junction of Indo-Australian, Pacific and Eurasian plate convergence. Seven tectonostratigraphic provices, various episodes of convergence and divergence. Reconstructions show Banda Microcontinent (which subsequently breaks up into Banggai-Sula, Tukang-Besi, Seram-Buru, Misool-Birds Head, etc.) attached to Papua New Guinea part of Australian continent in Triassic-Jurassic time (similar to Pigram, Struckmeyer reconstructions, but not Hall and others))

Simandjuntak, T.O. (1994)- Neogene orogeny and mountain building in Indonesia. In: J.L. Rau (ed.) Proc. 30th Sess. Comm. Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Bali 1993, 2, p. 47-86.
(Neogene tectonics of Indonesia marked by five different orogenic belts, Barisan, Sunda, Banda, Talaud and Melanesian)

Simandjuntak, T.O. (1998)- Tsunamis in active plate margins of Indonesia. Proc. 33rd Sess. Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Shanghai 1996, 2, p. 334-361.
(Overview of active tectonics across Indonesia and relation to tsunamis. Tsunamis triggered by earthquakes below seafloor, most of them over graben-like structures in areas of extensional tectonics, but transtensional zones also have tsunami potential)

Simandjuntak, T.O. (2000)- Geotectonic of Indonesia: the birth of the Indonesian Archipelago. J. Geologi Sumberdaya Mineral 10, 104, p. 8-21.
(Tectonic development of Indonesia initiated by collision in Sumatra and Kalimantan in E Triassic of Paleozoic microcontinents detached from Gondwana, followed by reccurring subduction systems until today. In Sumatra 3 terrnanes: (1) SE part of Sibumasu Terrane (Mergui, Tigapuluh Mts and Kuantan- Duabelas Mts); (2) SE end of Lhasa- W Burma Terrane (Woyla, Sikuleh, Natal and Asai-Garba Terranes); (3) SE-most Malaysia Terrain (Gunungkasih-Lingga-Singkep). W Kalimantan and Meratus also parts of S-most China- Indochina terranes. Irian Jaya and PNG part of N Australian continental margin, which rifted in Triassic, followed by development of passive margin in Jurassic- Cretaceous and carbonate platform in Paleogene. At end-Paleogene promontory of Australian continent collided with oceanic island arc at S margin of Philippine Sea Plate. Prior to Neogene emplacement of allochthonous microcontinents from N margin of Australia in Banda Sea, E Indonesia was part of N Indian Ocean and S Philippine Sea plates, in which a number of oceanic island arcs formed in Paleogene. Six Neogene orogenic belts in Indonesian region. No reconstruction maps (refers to map of 1999 Indonesian-Japanese Geotectonics Working Group; Sato et al.))

Simandjuntak, T.O. (2000)- Neogene tectonics of Indonesia. AAPG Int. Conf. Exhib., American Assoc. Petrol. Geol. (AAPG) Bull. 84, 9, p. 1492. *(Abstract only)*
(Seven distinctive Neogene orogenies in Indonesia: 1) Sunda Orogeny in Java and E Indonesia: normal convergence producing Andean type orogenic belt, 2) Barisan Orogeny: oblique convergence and dextral transpressional wrenching in Sumatra, 3) Talaud Orogeny in N Maluku Sea: double-arc collision with sinistral transpressional wrenching, 5) Banda Orogeny: M Miocene collision between Banggai-Sula, Tukangbesi- Buton and Mekongga Platform against E Sulawesi ophiolite belt; 6) Melanesian Orogeny in Irian Jaya and PNG: oblique convergence with thin-skinned tectonics, 7) Dayak Orogeny in Kalimantan: triple junction extensional tectonics with hot spots of Neogene volcanics)

('Indonesian geodynamics and human survival: from geography to the sciences of the earth system'. Three major tectonic theories for Indonesia: (1) undation theory, (2) plate tectonics and more recently (3) plume tectonics becoming fashionable)

Spakman, W. & H. Bijwaard (1998)- Mantle structure and large-scale dynamics of South-East Asia. In: P. Wilson & G.W. Michel (eds.) The geodynamics of S and SE Asia (GEODYSSEA) Project. Sci. Techn. Report STR/14, Geoforschungszentrum, Potsdam, Germany, p. 313-339.
(Tomography data general agreement with previous findings (e.g. subduction of Indian plate below Sunda Arc), but do not find detachment of (or tear in) slab around 400 km below Sumatra. Sunda slab bends W toward Andaman island arc below N Sumatra. Subduction below Sunda arc imaged down to 1500km, indicating penetration into lower mantle. Subduction below Sulawesi is S extension of Philippines subduction. Slab also imaged below Halmahera (Molucca collision zone))

Spakman, W. & R. Hall (2010)- Surface deformation and slab-mantle interaction during Banda arc subduction rollback. Nature Geoscience 3, p. 562-566.
(with supplementary material, movie at http://searg.rhul.ac.uk/current_research/plate_tectonics/index.html)
(Tomography velocity model of mantle under suggests Banda arc results from subduction of single slab. Jurassic embayment of dense oceanic lithosphere enclosed by continental crust once existed within Australian plate. Banda subduction began at ~15 Ma when active Java subduction tore E-ward into embayment. Present morphology of subducting slab only partially controlled by shape of embayment. As Australian plate moved N, Banda oceanic slab rolled back towards SSE. Increasing resistance of mantle to plate motion folded slab and caused strong deformation of crust)

Spakman, W., C. Rangin & H. Bijwaard (1998)- Tomographic constraints on the tectonic evolution of SE Asia. In: AAPG Int. Conf. Exhib, American Assoc. Petrol. Geol. (AAPG) Bull. 84, 9, p. 1495. *(Abstract only)*
(New 3D image of P-wave seismic velocity heterogeneity of lithosphere and mantle of SE Asia. Subducted oceanic slab found below most of Sunda arc but with varying depth penetration. A 500 km long slab under Burma separated from Andaman-Sumatra slab (~700 km deep) by 300-400 km wide gap associated with Andaman Basin. Central Sunda slab penetrates lower mantle to 1500 km, but subduction below Banda arc confined to 700 km. No clear slab imaged below W New Guinea; long N dipping slab under E New Guinea)

Spicak, A., R. Matejkova & J. Vanek (2013)- Seismic response to recent tectonic processes in the Banda Arc region. J. Asian Earth Sci. 64, p. 1-13.
(Analysis of shallow (<100 km) seismological data. 11 domains of earthquakes identified. Two discrete recent subduction zones in region: N- dipping Banda subduction in S and S-dipping Seram subduction in N; no W-dipping subduction zone observed to interconnect Banda and Seram zones into a single bent subduction zone. Instead, area between them is cut by elongated domain of earthquakes corresponding to W-ward continuation of Tarera-Aiduna fault zone)

Tjia, H.D. (1991)- Active tectonics in the Indonesian Archipelago-2. Proc. 20th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. 281-300.
(During Quaternary vertical displacement in Indonesian archipelago ranged from +2000m to -2000m). Most uplift vertical, as suggested by untilted appearance of most of highest terraces. Lateral slip movements response to convergence of SE Asia, India-Australia and Pacific plates. Influence of Pacific convergence reached W of Makassar Straits, Indian-Australian convergence only traceable in Java and Sumatra. Discussion of uplifted calcirudites at Banyuwangi, E Sulawesi raised reef terraces at Luwuk and Peleng island,etc.)

Tjia, H.D. (1998)- Meridian-parallel faults and Tertiary basins of Sundaland. Bull. Geol. Soc. Malaysia 42, p. 101-118.
(online at: www.gsm.org.my/products/702001-100852-PDF.pdf)
(Pre-Tertiary core of Sundaland contains numerous N-S striking regional faults. In Malay Peninsula Thai-Bentong- Bengkalis FZ coincides with Raub-Bentong suture, which existed since M Triassic. N-S faults of Sundaland functioned as (1) originators/ initiators of Tertiary basins (Mekong, Nam Con Son), (2) determinants of basin location (C Thailand, Gulf of Thailand, Balam-Pematang Trough, BengkalisTrough, Benakat Gully, Asri, Seribu, Arjuna, basement depressions in Malacca Strait), and (3)modifiers of basin geometry (Peusangan fault in N Sumatra basin; dextral offsets of old series in Malay basin))

Tjia, H.D. (2001)- Wrench tectonics in Sundaland; subsurface and offshore evidence. In: G.H. Teh et al. (eds.) Geological Society of Malaysia Ann. Geol. Conf. 2001, Pangkor Island, p. 71-77.
(online at: https://gsmpubl.files.wordpress.com/2014/10/agc2001_12.pdf)
(Wrenching widespread in Sundaland. Principal stress directions from wrench patterns, well-bore breakouts and major earthquakes show most of Sundaland currently subjected to N-S stress. Towards margins stress trajectories deviate due to convergence of adjoining megaplates and SE extrusion of Indosinia. Until onset of M Miocene most wrenching transtensional, forming pull-apart depressions and modifying structure of large

depocentres. Cessation of spreading in Philippine Sea and Caroline basins by M Miocene changed wrenching into transpression, accompanied by slip-sense reversals and structural inversion)

Tjia, H.D. (2014)- Wrench-slip reversals and structural inversions: Cenozoic slide-rule tectonics in Sundaland. Indonesian J. Geoscience 1, 1, p. 35-52.
(online at: http://ijog.bgl.esdm.go.id/index.php/IJOG/article/view/174/174)
(Sundaland Oligocene transtension evolves into post-E Miocene transpression at Langhian time (~17-15.5Ma), after end of S China sea spreading)

Tjia, H.D., S. Fujii, K. Kigoshi, A. Sugimura & T. Zakaria (1972)- Radiocarbon dates of elevated shorelines, Indonesia and Malaysia. Part 1. Quaternary Research 2, 4, p. 487-495.
(Four radiocarbon dates of elevated strandlines in tectonically active areas of E Indonesia and E Malaysia indicate uplift rates between 4.5- 9 mm/ year during past 24,000 yr. Data from S arm of Sulawesi indicate rates of uplift of 1.4-2.5 mm/ year. At Langkawi islands, W Malaysia, one of regionally common shorelines at 2 m above sea level dated at 2590 ± 100 yr BP)

Tjia, H.D., S. Fujii, K. Kigoshi, A. Sugimura & T. Zakaria (1974)- Late Quaternary uplift in Eastern Indonesia. Tectonophysics 23, 4, p. 427-433.
(Radiocarbon dates of 15 samples from raised shorelines on various islands of E Indonesia suggest rates of tectonic uplift up to 12.5 mm/year)

Tjia, H.D. & K.K. Liew (1996)- Changes in tectonic stress field in northern Sunda Shelf basin. In: R.Hall & D. Blundell (eds.) Tectonic Evolution of Southeast Asia, Geol. Soc. London, Special Publ. 106, p. 291-306.
(Tertiary basins of N Sunda Shelf underlain by normal and attenuated continental crust with moderate- high geothermal gradients >5°C/100 m. In Malay basin, U Oligocene and younger sediments >12 km thick; other basins, 4-8 km thick. Malay, Penyu and W Natuna basins are aulacogens meeting at triple junction that marks Late Cretaceous hot spot in centre of Malay Dome. Sub-basins developed as pull-apart basins within regional, N-NW striking, wrench fault zones. Initial basin subsidence Eocene-Oligocene, with extension prevailing until E Miocene. M-Late Miocene regional compression caused inversions of basin-fill. Some N-striking wrench faults indications of up to 45 km right-lateral displacement, possibly post-Miocene)

Villeneuve, M., R. Martini, H. Bellon, J.P. Rehault, J.J. Cornee, O. Bellier, S. Burhanuddin, F. Hinschberger, C. Honthaas & C. Monnier (2010)- Deciphering of six blocks of Gondwanan origin within Eastern Indonesia (South East Asia). Gondwana Research 18, p. 420-437.
(manuscript online at: https://hal-insu.archives-ouvertes.fr/file/index/docid/462636/filename/Villeneuve-GondwanaResearch-2010.pdf)
E Indonesia 3 main plates (Eurasian, Indo-Australian, Philippine-Pacific), 7 blocks (six from NE Gondwanan margin, Halmahera from Pacific plate). Timor and Kolonodale (or Argo) blocks came from NW Australian margin. Lucipara, Seram and Banggai-Sula blocks originated from W extension of PNG while Irian Jaya block is still linked to N Australian margin. Timor and Kolonodale blocks detached from Gondwana in Jurassic; Lucipara, Seram and Banggai-Sula detached from PNG in Neogene. All Gondwanan blocks collided with Eurasian active margin near Sulawesi. Timor and Kolonodale joined Eurasian margin by end Paleogene. Lucipara, Seram and Banggai-Sula collided with Sulawesi between M Miocene- M Pliocene and, with Kolonodale, suffered opening of N and S Banda back-arc basins by Late Miocene. Timor block moved S with S margin of S Banda basin and collided with N Australian margin in M Pliocene)

Villeneuve, M., J.P. Rehault, J.J. Cornee, C. Honthaas & W. Gunawan (1998)- Geodynamic evolution of Eastern Indonesia from the Eocene to the Pliocene. Comptes Rendus Academie Sciences, Paris, Ser. IIA, Earth Planetary Sci., 327, 5, p. 291-302.
(Geodynamic reconstruction based on evolution of 4 continental blocks, trapped by convergence of Asian, Australian and Pacific plates: (1) Banda (= dismembered E Sulawesi, Buru, Seram, Sinta Ridge), (2) Banggai-Sula, (3) Lucipara (S Banda Ridges, Tukang-Besi Ridge + Kur, Tanimbar; Oligocene-E Miocene arc, with E Miocene metamorphism event) and (4) Halmahera. Main events: (1) Late Eocene-Oligocene collision Banda block- Sulawesi; (2) E Miocene collision Lucipara Block (incl. Tukang Besi)- Banda Block in Buton; (3) Late Miocene extension with opening of N. Banda, S. Banda, Savu basins; (4) E Pliocene collision Banggai Sula- E Sulawesi; (5) Late Pliocene collisions of Australia and Banda and Irian Jaya blocks. Timor with its Late Miocene calc-alkaline intrusions in N was part of Banda Arc before M Pliocene collision with Australia)

(Early version of Wakita series of papers on Cretaceous accretionary complexes at SE Sundaland margin, particularly Luk-Ulo melange complex in C Java and Bantimala Complex of S Sulawesi)

Wakita, K. (1997)- Oceanic plate stratigraphy and tectonics in East and Southeast Asia. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution in Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 388-401.
(Components of ancient accretionary complexes include pillow basalt, limestone, radiolarian chert and shale, ultramafic rocks, glaucophane schist, etc. Radiolarian biostratigraphy useful for reconstruction of accretionary complexes, as shown in example of Luk-Ulo Melange of C Java. Lithologic successions in different tectonic units similar and reflect 'Oceanic Plate Stratigraphy' sequence:(1) birth of oceanic plate at oceanic ridge, (2) formation of volcanic islands near ridge covered by reefs (= Orbitolina Limestone?; HvG), (3) calcilutite sedimentation at flank of volcanic islands, (4) pelagic deposition of radiolarians on oceanic plate, (5) mixing with detrital clays to form hemipelagic siliceous shale, and (6) sandstone- shale near trench of convergent margin. Radiolarian biostratigraphy of Luk Ulo show Valanginian- Campanian oceanic chert deposition)

Wakita, K. (1999)- Mesozoic melange formation in Indonesia; with special reference to Jurassic melanges of Japan. In: G.H. Teh (ed.) Proc. 9th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA ô98), Kuala Lumpur 1998, Bull. Geol. Soc. Malaysia 43, p. 19-30.
(online at: www.gsm.org.my/products/702001-100838-PDF.pdf)
(Cretaceous melanges in (1) C Java (Luk Ulo; mainly HP metamorphics, bedded cherts siliceous shale, ultramafics, etc.; overlain by Eocene), (2) S Sulawesi (Bantimala; also mainly HP metamorphics, ultramafics, bedded cherts etc.) and (3) S Kalimantan (Meratus; mainly bedded chert, ultramafics, schist; unconformably overlain by Eocene). Clasts of metamorphic and ultrabasic rocks derived from blocks exhumed following microcontinent collision; incorporated within melanges during microcontinental collision)

Wakita, K. (2000)- Cretaceous accretionary: collision complexes in central Indonesia. J. Asian Earth Sci. 18, 6, p. 739-749.
(Cretaceous accretionary complexes in W Java (Ciletuh), C Java (Karangsambung, Jiwo), S and C Sulawesi and SE Kalimantan (Meratus, Pulau Laut) reflect Cretaceous convergent SE margin of Sundaland craton, which was surrounded by marginal sea, with immature volcanic arc at periphery. Oceanic plate subducted beneath arc from S, carrying microcontinents detached from Gondwanaland. Accretionary wedge with fragments of oceanic crust. Jurassic shallow marine allochthonous formation was emplaced by collision of continental blocks in Bantimala, S Sulawesi. Collision exhumed very high pressure metamorphic rocks from deeper parts of accretionary wedge)

Wakita, K. & I. Metcalfe (2005)- Ocean plate stratigraphy in East and Southeast Asia. J. Asian Earth Sci. 24, p. 679-702.
(Ancient accretionary wedges recognized by glaucophane schist, radiolarian chert and melange. Typical 'Ocean Plate Stratigraphy' (OPS) from old to young: pillow basalt s(birth of oceanic plate at mid-ocean ridge), limestone (ridge covered by reefs), radiolarian chert (pelagic sediment), siliceous shale (mixed radiolarians and detrital grains in hemipelagic setting) and shale- sandstone (sedimentation at or near trench of convergent margin). Radiolarian biostratigraphy provides information on time and duration of ocean plate subduction)

Westerveld, J. (1949)- Fasen van gebergtevorming en ertsprovincies in Nederlands Oost-Indie. De Ingenieur 1949, 12-13, p. 1-25.
('Phases of mountain building and ore provinces in Netherlands East Indies'.Review of tectonics of Indonesia and associated mineral deposits. W of New Guinea four concentric orogens: (1) Late Jurassic 'Malaya orogen', connecting W Borneo with E Burma through Malaya, with tin, gold and bauxite; (2) Cretaceous 'Sumatra

orogen' (Sumatra-Java- SE Borneo), with Au-Ag-bearing base metals in Sumatra, iron laterites and diamond-gold placers in Borneo (3) M Miocene 'Sunda orogen' from W Burma through inner Sunda islands to W arc of Sulawesi, with epithermal Au-Ag-and Mn-ores; (4) Late Cretaceous- M Miocene 'Moluccas orogen' with nickel and lateritic iron ores on peridotites. Good maps of ore deposits)

Westerveld, J. (1952)- Phases of mountain building and mineral provinces in the East Indies. Repts. 18th Sess. Int. Geological Congress, Great Britain 1948, Sect. 1, 13, p. 245-255.
(Abbreviated, English version of Westerveld (1949))

Wheeler, P. & N. White (2000)- Quest for dynamic topography: observations from Southeast Asia. Geology 28, 11, p. 963-966.
(Absence of measurable dynamic topography in SE Asia)

Wheeler, P. & N. White (2002)- Measuring dynamic topography: an analysis of Southeast Asia. Tectonics 21, 1040, doi:10.1029/2001TC900023, p. 1-24.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2001TC900023)
(Models of dynamic topography generated by subducting slabs, predict ~1-2 km of subsidence on wavelengths of 100- 1000 km. Existence of such subsidence important for understanding basin formation, relative sea level changes, etc. Analysis of SE Asia constrains maximum amplitude of dynamic subsidence to ~300m with range of 0-500 m, less than predicted. Distribution of anomalous subsidence suggests this may not be caused by dynamic topography and subducting slabs)

Whittaker, J.M., R.D. Muller, M. Sdrolias & C. Heine (2007)- Sunda-Java trench kinematics, slab window formation and overriding plate deformation since the Cretaceous. Earth Planetary Sci. Letters 255, p. 445-457.
(Plate motions and reconstructions of subducted ocean floor used to analyse subduction kinematics and observed upper plate strain since 80 Ma along Sunda-Java trench. Upper plate advance and retreat is main influence on upper plate strain, but subduction of large bathymetric ridges also significant. Compression in Sundaland back-arc region linked to upper plate advance. Sundaland backarc extension correlates with (a) retreat of upper plate, and (b) advance of upper plate with more rapid advance of Sundaland margin due to hinge rollback. Subduction of large bathymetric ridges causes compression in upper plate, especially Wharton Ridge subduction under Sumatra between 15-0 Ma)

Wichmann, A. (1890)- Bericht uber eine im Jahre 1888-89 im Auftrag der Niederlandischen Geographischen Gesellschaft ausgefuhrte Reise nach dem Indischen Archipel, Part 1: I. Java and II. Celebes. Tijdschrift Kon. Nederlands Aardrijkskundig Genootschap (2) 7, p. 907-994.

Zimmermann, S. & R. Hall (2014)- Provenance of Mesozoic sandstones in the Banda Arc, Indonesia. Proc. 38th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA14-G-301, 13p.
(online at: http://searg.rhul.ac.uk/pubs/zimmermann_hall_2014%20Banda%20arc%20sandstones.pdf)
(Triassic and Jurassic sandstones from outer Banda Arc islands Timor, Babar and Tanimbar texturally immature, with volcanic quartz. Heavy minerals mainly from acidic igneous and metamorphic rocks and also ultramafic material. Zircon populations similar to Triassic sandstones of Birds Head, not nearby Australian continent. Cretaceous sandstones from Sumba, E Timor and Tanimbar with zircons suggesting reworking of Triassic and Jurassic sediments, but also Jurassic and Cretaceous zircons. These represent fragments rifted from Australian margin in Late Jurassic and added to SE Asia in Late Cretaceous which record volcanic activity associated with rifting and accretion to active Sundaland margin)

Zimmermann, S. & R. Hall (2016)- Triassic and Jurassic sandstones in the Banda Arc: provenance and correlations with the Australian NW Shelf. Proc. 40th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA16-77-G, 18p.
(online at: http://searg.rhul.ac.uk/pubs/zimmermann_hall_2016%20Banda%20sandstones%20IPA.pdf)
Most Triassic-Jurassic sandstones of Banda Arc between Timor and Tanimbar quartz-rich and of recycled origin and/or continental affinity, but commonly texturally immature and with volcanic quartz and lithics. Heavy mineral assemblages dominated by rounded stable minerals, but also angular grains and origin from acid igneous and metamorphic sources. Detrital zircon ages Archean-Mesozoic, suggesting source mainly from Birds Head/ Sula Spur, W and C Australia in Triassic. In Jurassic new local sources close to Timor and recycled NW Shelf material. Tanimbar Islands and Babar sediment came from both Australian continent and Birds Head. Sandstones in Timor dominant acid igneous signature in E and metamorphic sources in W (NB: no mention of key papers on similar topic by Ely 2009, 2014, Zobell 2007, Kwon et al. 2014, JTvG))

(Correlation tables of E Permian formations and faunas from Gondwanan and peri-Gondwanan regions. Incl. Malay Peninsula and Timor Somohole ammonoid fauna (E Sakmarian?) and Bisnain brachiopod fauna (Late Sakmarian?)

Archbold, N.W. (2001)- Wallace lines in eastern Gondwana: palaeobiogeography of Australasian Permian brachiopoda. In: I. Metcalfe, J.M.B. Smith et al. (eds.) Faunal and floral migrations and evolution in SE Asia-Australasia, Balkema, Lisse, p. 73-83.
(Australian continent was major component of NE Gondwana in Permian. Surrounding what is now Australia, were additional elements of NE Gondwana that are now incorporated into New Zealand, New Caledonia, New Guinea, Timor, SE Asia, Himalaya and S Tibet. Pronounced provincialism of global marine faunas in Permian. Brachiopoda can be used to define Westralian and Austrazean provinces)

Archbold, N.W. (2002)- Peri-Gondwanan Permian correlations: the Meso-Tethyan margins. In: M. Keep & S.J. Moss (eds.) The sedimentary basins of Western Australia 3, Proc. West Australian Basins Symposium, Perth 2002, p. 223-240.

(Permian of 16 regions of NE Gondwana compared with Australian continent. Paleoclimatic changes and tectonic events: (1) Asselian- E Artinskian change from cold to temperate environments, associated with basaltic volcanism and initial rifting of peripheral N Gondwanan margin; (2) Late Artinskian-Kungurian warming with onset of carbonate deposition in several Cimmerian terranes. Basaltic volcanism in several terranes indicative of rifting and opening of Meso-Tethys; (3). Roadian (Late Ufimian) and (4) Wordian-Capitanian: widespread, subtropical, marine carbonates on Cimmerian blocks as they drifted N and on N parts of Meso-Tethys S margin. Equivalent carbonates in subsurface W Australia. Andesitic volcanism in E Australia; (5) Wuchiapingian: marine transgressions extending into NW basins of Australia; (6) Changhsingian: minor marine transgressive events in Trans-Himalaya with Selong section of Tibet most complete Permo-Triassic for S Meso-Tethys margin)

Archbold, N.W., C.J. Pigram, N. Ratman & S. Hakim (1982)- Indonesian Permian brachiopod fauna and Gondwana-South-East Asia relationships. Nature 296, p. 556-558.
(First description of late E Permian articulate brachiopods in Birds Head. Assemblage similar to Thailand Rat Buri Limestone, suggesting geographical proximity of Thailand and Irian Jaya in E Permian)

Archbold, N.W. & G.R. Shi (1995)- Permian brachiopod faunas of Western Australia: Gondwanan-Asian relationships and Permian climate. J. Southeast Asian Earth Sci. 11, 3, p. 207-215.
(W Australian Permian brachiopod faunas mixture of Gondwanan, endemic Westralian and Asian (Tethyan) genera. Presence of Tethyan genera largely temperature dependent; no apparent geographical barriers to migration of such genera into intracratonic basins of W Australia. Paleotemperature curve indicates peak warm conditions in Sterlitamakian and Late Baigendzhinian and subtropical conditions in Dzhulfian)

Archbold, N.W. & G.R. Shi (1996)- Western Pacific Permian marine invertebrate palaeobiogeography. In: Z.X. Li, I. Metcalfe & C.M. Powell (eds.) Breakup of Rodinia and Gondwanaland and assembly of Asia, Australian J. Earth Sci. 43, 6, p. 635-641.
(Permian of W Pacific 4 provinces for Asselian-Tastubian (Indoralian, Himalayan, Cathaysian, Verkolyma), 6 for Sterlitamakian-Aktastinian (Austrazean, Westralian, Cimmerian, Cathaysian, Sino-Mongolian, Verkolyma), 7 for Baigendzhinian- E Kungurian (Austrazean, Westralian, Cimmerian- with Sibumasu and Himalayan subprovinces- Cathaysian, Sino-Mongolian, Verkolyma) and 3 for Kazanian-Midian (Austrazean, Cathaysian, Verkolyma). Changing pattern of provincialism best understood in terms of evolution of Sino-Mongolian Sea in N and rift-drift history of Cimmerian continental blocks in S, and climate amelioration during Permian)

Arias, C. (2006)- Northern and Southern Hemispheres ostracod palaeobiogeography during the Early Jurassic: possible migration routes. Palaeogeogr. Palaeoclim. Palaeoecology 233, p. 63-95.
(Australian E Jurassic ostracod faunas similar to W Tethyan and C European assemblages, probably indicating communication route along western Tethys, aided by action of western currents)

Asama, K. (1976)- *Gigantopteris* flora in Southeast Asia and its phytopalaeogeographic significance. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 17, p. 191-207.
(Gigantopteris flora is typical Cathaysian flora, best developed in N and NE China and Korea, but also in Yunnan and extending S to Malay Peninsula (Johore). Gigantopteris species described from E Permian Jambi flora of W Sumatra by Jongmans & Gothan 1935 differ from typical Gigantopteris flora. Djambi flora may still belong to Cathaysian flora, but probably older than typical Gigantopteris flora. W New Guinea Permian flora most likely part of Glossopteris flora)

Asama, K. (1984)- *Gigantopteris* flora in China and Southeast Asia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 311-323.
(Mainly on classification and evolution of 'Cathaysian' Permian Gigantopteris flora. C Sumatra Permian Jambi flora typical Asian Gigantopteris flora, not Gondwanan Glossopteris flora)

Audley-Charles, M.G. (1983)- Reconstruction of eastern Gondwanaland. Nature 306, p. 48-50.
(Model of E Gondwanaland on basis of distribution of floras and faunas, lithofacies patterns and identification of Triassic magmatic arc that characterized E margin of Gondwanaland. Continental fragments that rifted from

N Australia-New Guinea in Jurassic identified as S Tibet-Burma-Thailand-Malaya and Sumatra. Sumatra attached to New Guinea through Triassic. Original site of deposition of 'Maubisse' subtropical Permian limestones and tropical Late Triassic limestones, overthrust onto N margin of Australia in late Cenozoic collision, is located in this greater Gondwanaland)

Audley-Charles, M.G. (1988)- Evolution of the southern margin of Tethys (North Australia region) from Early Permian to Late Cretaceous. In: M.G. Audley-Charles & A. Hallam (eds.) Gondwana and Tethys. Geol. Soc., London, Spec. Publ. 37, p. 79-100.
(online at: http://searg.rhul.ac.uk/pubs/audley-charles_1988%20N%20Australia%20evolution.pdf)
(Review of Mesozoic stratigraphies of Banda terranes and Permo-Carboniferous- Cretaceous paleogeography. Mid-Permian rift event removed continental blocks now in Asia from Gondwana. Present NW Australia- New Guinea margin formed in Jurassic with breakup of S. Tibet/Burma/Malaya/ W and E Borneo/Sumatra/W Sulawesi/ Banda allochthons. E Sulawesi/ Banggai-Sula/ Kemum still part of N Guinea margin in Early Cretaceous. Margin E of Scott Plateau modified by Tertiary collisions with arc systems)

Audley-Charles, M.G., P.D. Ballantyne & R. Hall (1988)- Mesozoic-Cenozoic rift-drift sequence of Asian fragments from Gondwanaland. Tectonophysics 155, p. 317-330.
(online at: http://searg.rhul.ac.uk/pubs/audley-charles%20et%20al%201988.pdf)
(Reconstruction of continental blocks dispersal from E Gondwanaland from Latest Jurassic- Late Miocene. Burma-Malaya-Sumatra rifted off New Guinea in Jurassic and colliding with SE Asia in Late Cretaceous (clearly too late; JTvG), etc.)

Audley-Charles, M.G. & R. Harris (1990)- Allochthonous terranes of the Southwest Pacific and Indonesia. Philos. Trans. Royal Soc. London, A 331 (1620), p. 571-587.
(Mesozoic breakup of Gondwana and subsequent collisional events led to formation and emplacement of allochthonous terrranes in fold-thrust mountain belts. Many allochthonous terranes of SW Pacific and E Indonesia accreted during last 3 Ma))

Audley-Charles, M.G. & R. Harris (1991)- Allochthonous terranes of the Southwest Pacific and Indonesia. In: J.F. Dewey, I.G. Gass et al. (eds.) Allochthonous terranes, Cambridge Unversity Press, Cambridge, p. 115-127.
(Same paper as Audley-Charles & Harris (1990) above)

Baumgartner, P.O., P. Bown, J. Marcoux, J. Mutterlose et al. (1992)- Early Cretaceous biogeographic and oceanographic synthesis of Leg 123 (Off Northwestern Australia). Proc. Ocean Drilling Program (ODP), Scient. Results 123, p. 739-758.
(Neocomian fossil record off NW Australia important southern high-latitude affinities and weak Tethyan influence. Pelagic radiolarian chert and nannofossil limestone dominant in Tethyan Lower Cretaceous, but only minor lithologies in Exmouth-Argo sites, suggesting Argo Basin not part of Tethys Realm)

Beckinsale, R.D. (1979)- Granite magmatism in the tin belt of South-East Asia. In: M.P. Atherton & J. Tarney (eds.) Origin of granite batholiths: geochemical evidence, Shiva Publ. Ltd, Kent, p. 34-44.

Ben-Avraham, Z. (1978)- The evolution of marginal basins and adjacent shelves in East and Southeast Asia. In: S. Uyeda (ed.) Active plate boundaries of the Western Pacific, Tectonophysics 45, p. 269-288.
(In Mesozoic W Pacific Ocean and E Indian Ocean were parts of Tethys Sea, moving N relative to Antarctica, causing E-W Mesozoic ridge system, E-W trending magnetic anomalies and N-S transform faults. In Late Cretaceous-Eocene segments of spreading ridge gradually submerged at trenches to N, causing gradual change in direction of Pacific plate motion, separating Pacific and E Indian Ocean plates. Only remnant of Mesozoic ridge system today at W Philippine Basin)

Bird, P. (2003)- An updated digital model of plate boundaries. Geochem. Geophys. Geosystems 4, 3, 1027, p. 1-52.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2001GC000252/epdf)
(Global plate boundaries, showing 14 larger plates (incl. Australia, Eurasia, Pacific, Philippine Sea) and 38 small plates (in SE Asia-SW Pacific: Sunda, Burma, Molucca Sea, Banda Sea, Timor, Birds Head, Maoke, Caroline, Mariana, N Bismarck, Manus, S Bismarck, Solomon Sea, Woodlark, New Hebrides (Maoke Plate is newly-defined small tectonic plate in West Papua, underlying western Central Range/ Mamberamo area to Cenderawasih Bay)

Blendinger, W., W.M. Furnish & B.F. Glenister (1992)- Permian cephalopod limestones, Oman Mountains: evidence for a Permian seaway along the northern margin of Gondwana. Palaeogeogr. Palaeoclim. Palaeoecology 93, p. 13-20.
(Cephalopod limestones of M Permian (M Guadalupian, Wordian) age at base of Hawasina nappes in Oman Mts are condensed sequence on N side of Arabian platform (or allochthonous unit thrust onto N margin). Ammonoid and conodont faunas remarkably similar to W Mediterranean (Siclily Sosio Lst) and Timor, suggesting unrestricted faunal exchange in Permian seaway along pelagic N margin of Gondwana (or distal margins of Cimmerian terranes?; JTvG))

Bodet, F. & U. Scharer (2000)- Evolution of the SE Asian continent from U-Pb and Hf isotopes in single grains of zircon and baddeleyite from large rivers. Geochimica Cosmochimica Acta 64, p. 2067-2091.
(Three Paleoproterozoic crust-formation episodes in mainland SE Asia (2.5 Ga, 2.2-2.3 Ga and ~1.9 Ga), identified from zircons of Red River, Mekong, Salween and Irrawaddy Rivers)

Boucot, A. (2003)- Some thoughts about the Shan-Tai Terrane. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 4-13.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2002/6368.pdf)
(Review of stratigraphy and fossils of Silurian- Permian of Shan-Tai (= Sibumasu) terrane of W Thailand. Rel. cool climate 'Gondwanan' faunas through E Permian. Includes carbonate-rich Ordovician, Silurian black graptolite shales, E Devonian carbonates and 'tentaculite' mudstones, E Permian pebbly mudstones, etc.)

Boucot, A.J. (2007)- What happens at the northern end of the Shan-Thai terrane, where does it go from there. In: W. Tantiwanit (ed.) Int. Conf. on Geology of Thailand: Towards sustainable development and sufficiency economy (GEOTHAIô07), Bangkok, Dept. Mineral Resources, p. 373-377.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/2007/12752.pdf)
(Scattered Cambrian- E Devonian lithofacies and biogeographic data from Himalayan area (Nepal, Xizang) consistent with Shan-Thai Terrane (= Sibumasu) having originally been E extension of former. E extension of S end of Shan-Thai Terrane in Sumatra is poorly known, with S half of New Guinea being a possibility)

Brandon-Jones, D. (2001)- Borneo as a biogeographic barrier to Asian-Australasian migration In: I. Metcalfe et al. (eds.) Faunal and floral migrations and evolution in SE Asia-Australasia. Balkema, Lisse, p. 365-372.

Brayard, A., G. Escarguel & H. Bucher (2007)- The biogeography of Early Triassic ammonoid faunas: clusters, gradients and networks. Geobios 40, p. 749-765.
(E Triassic ammonoid assemblages, incl. Timor, which is 'highly connected' with Afghanistan and S China, defining an equatorial Tethyan group)

Brayard, A., G. Escarguel, H. Bucher & T. Bruhwiler (2009)- Smithian and Spathian (Early Triassic) ammonoid assemblages from terranes: paleoceanographic and paleogeographic implications. J. Asian Earth Sci. 36, p. 420-433.

(Cluster analysis of E Triassic ammonoid faunas. Timor grouped with Afghanistan, South China, Oman, Iran, etc., as S Tethyan cluster. (Very little detail on locations/ origin of samples; JTvG))

Brookfield, M.E. (1996)- Paleozoic and Triassic geology of Sundaland. In: M. Moullade & A.E.M. Nairn (eds.) The Phanerozoic geology of the world, 1, The Palaeozoic, B, Elsevier, Amsterdam, p. 183-264.

Brookfield, M.E. (1996)- Reconstruction of Western Sibumasu. In: J. Geology, Spec. Issue, Proc. Int. Symp. Geology of Southeast Asia and adjacent areas, Hanoi 1995, Geol. Survey of Vietnam B, p. 65-80.
(Core of Sibumasu terrane (Shan Plateau, Kanchanaburi, W Malaya) is S-facing Paleozoic passive margin, rifted off Gondwanaland in Permian and collided with Indochina in Triassic-E Jurassic. Equivalent of Qiantang Block of C Tibet)

Brookfield, M.E. & V.J. Gupta (1988)- The Devonian of Northern Gondwanaland: a Himalayan viewpoint and terrane analysis. In: N.J. MacMillan et al. (eds.) Devonian of the World, Proc. 2nd Int. Symposium on the Devonian System, Calgary, 1, Regional Syntheses, Canadian Soc. Petrol. Geol., Mem. 14, p. 579-589.
(Microcontinents that rifted off N Gondwana like Lut, Helmand, Nowshera, Karakorum, High Himalaya and Thai-Malaya terranes have Devonian stratigraphies indicating they were part of Gondwanaland in Devonian)

Buerki, S., F. Forest & N. Alvarez (2014)- Proto-South-East Asia as a trigger of early angiosperm diversification. Botanical J. Linnean Soc. 174, p. 326-333.
(online at: https://academic.oup.com/botlinnean/article/174/3/326/2416344)
(Angiosperms (flowering seed plants) originated abruptly in E Cretaceous (Hauterivian), followed by rapid diversification in Hauterivian-Aptian. Islands in SE Asia region today probably played major role in angiosperm diversification in Late Jurassic- E Cretaceous (but no discussion of support from actual fossil botanical records of SE Asia; HvG)

Buffetaut, E. (1981)- Elements pour une histoire paleobiogeographique du Sud-est Asiatique: l'apport des vertebres fossiles continentaux. Bull. Soc. Geologique France (7) 23, 6, p. 587-593.
('Elements for a paleobiogeographic history of SE Asia: the contribution of continental vertebrate fossils'. Incl. report of Jurassic fresh-water crocodilian Sunosuchus from NE Thailand, of Laurasian affinity)

Buffetaut, E. (1984)- The palaeobiogeographical significance of the Mesozoic continental vertebrates from South-East Asia. Mem. Soc. Geologique France, N.S., 147, p. 37-42.

Bunopas, S. & S. Khositanont (2004)- Did Shan-Thai twice marry Indochina and then India?: a review. Bull. Earth Sci. Thailand (BEST) 1, p. 1-27.
(Shan-Thai (= Sibumasu) and Indochina microcontinents migrated from W Australia since latest Devonian, to settle in Late Norian. During Late Triassic both microcontinents drifted up latitude and stayed in N Hemisphere. Pre-first continent-continent collision between Shan-Thai and Indochina occurred just under Equator as early as Early Triassic. Breakup of Pangea in Late Cretaceous time. At 45 Ma Himalayan extrusion, caused by 2nd continent-continent collision, began and have its paroxysm in M Miocene. Etc.)

Bunopas, S., P. Vella, H. Fontaine, S. Hada, C. Burrett, P. Haines, S. Potisat, T. Wongwanich, P. Chaodumrong, K.T. Howard & S. Khositanont (2001)- Growth of Asia in the Late Triassic continent- continent collision of Shan-Thai and Indochina against South China. Gondwana Research 4, 4, p. 584-585.
(Abstract only. Late Triassic (M-L Norian) continent-continent collision between Shan-Thai (=Sibumasu) and Indochina microcontinents resulted in formation of axial core of SE Asia. Continent-continent collision terminated marine environments between Shan-Thai - Indochina and S China. Lower-Middle Triassic volcanic arc-trench systems developed on E active margin of Shan-Thai W of Pha Som Suture zone from Nan-Uttaradit-Sra Kaeo and Bentong-Raub line. Etc.)

Bunopas, S., P. Vella, H. Fontaine, S. Hada, C. Burrett, P. Haines, S. Potisat, T. Wongwanich, P. Chaodumrong, K.T. Howard & S. Khositanont (2002)- Growing of Asia in the Late Triassic continent- continent collision of

Shan-Thai and Indochina against South China. In: N. Mantajit (ed.) Proc. Symposium on Geology of Thailand, Bangkok 2002, Dept. Mineral Resources, p. 129-135.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/2002/6385.pdf)
(Extended version of Bunopas et al. 1991, Gondwana Research (2001). Collision of Sibumasu (Shan-Thai) and Indochina in late Norian terminatedPaleotethys in SE Asia, along suture zone from W Yunnan- Nan-Uttaradit-Sra Kaeo- Yala to Raub-Bentong at 23°N above Equator. Cenozoic CW rotation of Thailand of >30°)

Bunopas, S., P. Vella, H. Fontaine, S. Hada, C. Burrett, P. Haines, S. Potisat, T. Wongwanich, P. Chaodumrong, K.T. Howard & S. Khositanont (2002)- Shan-Thai and Indochina, Lower Paleozoic Gondwana derived paired microcontinents growing Pangea by first continent-continent collision in Late Norian with South China suffered second continent-continent collision of India to Asia. In: Geodynamic processes of Gondwanaland-derived terranes in East and Southeast Asia, their crustal evolution, emplacement and natural resources potential, Phitsanulok 2002, p. 120-133.

Buratti, N. & S. Cirilli (2007)- Microfloristic provincialism in the Upper Triassic Circum-Mediterranean area and palaeogeographic implication. Geobios 40, 2, p. 133-142.
(Two U Triassic (Carnian) palynoflora provinces: (1) Onslow of NW Australia (incl. European forms Camerosporites, Aulisporites, Enzonalasporites, Ovalipollis, Samaropollenites, Infernopollenites, Minutosaccus) and (2) Ipswich of S and E Australia. W Timor floras from U Triassic pelagic deposits placed in Onslow microflora. Suggests Onslow microflora assemblages, with minor variations, present from W Tethys to N Australian margin (W Timor))

Burollet, P.F. & C. Salle (1986)- Problemes tectoniques en Indonesie. In: P. Le Fort et al. (eds.) Evolution des domaines orogeniques d'Asie meridionale (de la Turquie a l'Indonesie) (Pierre Bordet Memorial Volume), Mem. Sciences de la Terre 47, Nancy, p. 113-127.
('Tectonic problems in Indonesia'. Brief review of tectonics of Indonesia, with more detail on Tanimbar- Kai islands)

Burrett, C.F. (1974)- Plate tectonics and the fusion of Asia. Earth Planetary Sci. Letters 21, p. 181-189.
(Early paper describing amalgamation of Asia. Nine blocks defined. Paleogeographical, paleontological and tectonic evidence suggest Asia did not fuse completely until well into Mesozoic)

Burrett, C., N. Duhig, R. Berry & R. Varne (1991)- Asian and South-western Pacific continental terranes derived from Gondwana, and their biogeographic significance. In: P.Y. Ladiges et al. (eds.) Australian biogeography, Australian Syst. Botany 4, 1, p. 13-24.
(Most small geological terranes in Indo-Pacific region rifted from Gondwana. Shan-Thai terrane rifted from Australia in Permian and collided with Indo-China in Triassic. Parts of Sumatra and Kalimantan may have rifted from Australia in Cretaceous and carried angiosperm flora to North. Other terranes now in SE Asia and Pacific were part of Australian continent at various times in Cenozoic)

Burrett, C., J. Long & B. Stait (1990)- Early-Middle Palaeozoic biogeography of Asian terranes derived from Gondwana. In: W.S. McKerrow & C.R. Scotese (eds.) Palaeozoic palaeogeography and biogeography. Geol. Soc., London, Mem. 12, p. 163-174.
(Contiguity of Shan-Thai (=Sibumasu) Terrane and NW Australia suggested by faunal affinities in Late Cambrian trilobites, Ordovician molluscs, stromatoporoids, brachiopods and conodonts. Re-evaluation of E Paleozoic paleomagnetism places Shan-Thai against NW Australia. N China Block was next to N Australia/ New Guinea, rifted off in E Devonian or earlier. S China micro-vertebrates and conodonts suggest Shan-Thai still close to Australia in M Devonian)

Burrett, C. & B. Stait (1986)- Southeast Asia as a part of an early Palaeozoic Australian Gondwanaland. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 103-107.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986009.pdf)

(Provenance of Paleozoic sediments from Thailand and Malaysia and trilobite- mollusc studies suggest Sibumasu block was adjacent to NW Australia in Ordovician. Probable Upper Carboniferous glacial sediments in Thailand and Malaysia, with boulders from cratonic source and detrital diamonds. Early Carboniferous breakup most likely. Collision with Indochina Block in Triassic)

Burrett, C.F. & B. Stait (1986)- Southeast Asia as a part of an Ordovician Gondwanaland- paleogeographic test of a tectonic hypothesis. Earth Planetary Sci. Letters 75, p. 184-190.
(Upper Cambrian- Ordovician micro- and macrofaunas very close similarities between Thailand-Malaysia Sibumasu Block and NW Australia, suggesting E Paleozoic proximity)

Burrett, C., M. Udchachon & H. Thassanapak (2016)- Palaeozoic correlations and the palaeogeography of the Sibumasu (Shan-Thai) terrane - a brief review. Research and Knowledge 2, 2, p. 1-17.
(online at: https://rk.msu.ac.th/wp-content/uploads/2017/09/01-Clive-Burrett4-compressed.pdf)
(Review of Cambrian-Permian predominantly shelfal marine siliciclastics and carbonates of Sibumasu Terrane in NW Malaysia (Langkawi), S Thailand (Satun), Shan States of Myanmar and Baoshan Block of W Yunnan. Continuous platform sequences in W Sibumasu and deep-water shales and cherts in E Sibumasu, without significant unconformities. Silurian-Devonian faunas mainly peri-Gondwana distributions. Sibumasu part of Australia until E Permian breakup (oriented with Baoshan near Himalayan margin; Sumatra closer to West Papua). Late Triassic (late Norian?) collision with Indochina/Sukhothai Arc terrane)

Burrett, C., K. Zaw, S. Meffre, C.K. Lai, S. Khositanont, P. Chaodumrong, M. Udchachon, S. Ekins & J. Halpin (2014)- The conýguration of Greater Gondwana- evidence from LA ICPMS, U-Pb geochronology of detrital zircons from the Palaeozoic and Mesozoic of Southeast Asia and China. Gondwana Research 26, p. 31-51.
(Detrital zircon ages from Paleozoic-Mesozoic in Malaysia, Thailand, Laos, Vietnam, Cambodia and China, compared to zircon ages from Australia, Asia. Indochina and S China terranes and Tethyan Himalayas close to similar source areas. E Paleozoic paleobiogeographic data suggest N China was close to Gondwana, but not supported here. Similarity between Ordovician Tarutao Fm of Sibumasu and Tumblagooda Sst of W Australia and Tethyan Himalaya. Quartzite and granite clasts in Permian glaciomarine deposits of Sibumasu with age spectra similar to W and N Australia (incl. 1850 Ma Barramundi Orogeny). Triassic Lampang and Song Groups of N Thailand detrital zircons suggest Indochina terranes source for basins of Sukhothai Terrane)

Cai, F., L. Ding, A.K. Laskowski, P. Kapp, H. Wang, Q. Xu & L. Zhang (2016)- Late Triassic paleogeographic reconstruction along the Neo-Tethyan Ocean margins, southern Tibet. Earth Planetary Sci. Letters 435, p. 105-114.
(online at: https://manuscript.elsevier.com/S0012821X15007906/pdf/S0012821X15007906.pdf)
(Petrographic and detrital zircon analyses of U Triassic sandstones from N margin of India (Tethyan Himalaya Sequence, S Tibet) dominated by Indian-affinity Precambrian detrital zircons, but nearby areas with populations of Permian- E Jurassic (291-184 Ma) zircons for which there is no known Indian source, so probably derived from continental crustal fragments that were adjacent to NW margin of Australia. May be part of Late Triassic submarine fan along N Australian shelf, together with age-equivalent beds in W Sulawesi, Timor and W Papua with similar zircon age populations. U Triassic Mailonggang Fm from S margin of Eurasia (S Lhasa terrane) dominated by Permian zircons from proximal Lhasa terrane sources; differs from Tethyan Himalaya beds, suggesting separation from Greater India by Neo-Tethys Ocean)

Cai, J.X. & K.J. Zhang (2009)- A new model for the Indochina and South China collision during the Late Permian to the Middle Triassic. Tectonophysics 467, p. 35-43.
(Indochina and South China separated from Gondwana in Silurian Analysis of E Paleozoic suggests Indochina may be extended to include N Vietnam, part of Qinzhou tectonic zone and S Hainan Island (traditionally regarded as parts of S China). U Paleozoic turbidites and mid-oceanic ridge basalts along new Dian-Qiong suture illustrate ocean between Indochina and S China consumed by S-directed subduction under Indochina in Late Permian- M Triassic)

Cai, Z.R., J.Y. Xiang, Q.T. Huang, Z.X. Yin, Y.J. Yao, H.L. Liu & B. Xia (2016)- Textural and map contrasts of the subduction-collision boundary between the Philippine Arc and the Sunda margin. Arabian J. Geosciences 9, 4, p. 1-10.
(Review of active subduction-collision boundary between Philippine Arc and Sunda margin, from Taiwan, S along Manila Trench, through thrust fault zone of Mindoro, to Negros Trench at E edge of Sulu Sea, then through thrust fault zone of Zamboanga to Cotabato Trench at E side of Celebes Sea/ Sangihe Arc)

Campbell, H.J. & J.A. Grant-Mackie (2000)- The marine Triassic of Australasian and its interregional correlation. In: H. Yin et al. (eds.) Permian-Triassic evolution of Tethys and Western Circum-Pacific, Developments in palaeontology and stratigraphy 18, Elsevier, p. 235-255.
(Review of stratigraphy/ fauna of marine Triassic outcrops of E Indonesia, New Caledonia, Australia and New Zealand. Including brief summaries of PNG (Yuat River gorge argillites with Anisian ammonites), Misool, Seram, Buru (Norian- Rhaetian Fogi Beds with Misolia), Timor-Roti and SE Sulawesi-Buton (late Norian Monotis subcircularis in Winto beds). No maps, strat columns)

Capitanio, F.A. & A. Replumaz (2015)- Subduction and slab breakoff controls on Asian indentation tectonics and Himalayan western syntaxis formation. Geochem. Geophys. Geosystems 14, 9, p. 3515-3531.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/ggge.20171/pdf)
(On link between large-scale Asian continent deformations and Indian slab subduction and breakoff. Formation of C Asian intracontinental faulting, the Bangong-Red River Fault and Altyn Tagh fault followed successive Indian slab breakoff episodes

(Brief version of Chatterjee et al. 2017)

Chatterjee, S., C.R. Scotese & S. Bajpai (2017)-The restless Indian plate and its epic voyage from Gondwana to Asia: its tectonic, paleoclimatic, and paleobiogeographic evolution. Geol. Soc. America, Spec. Paper 529, p. 1-147.
(Review of tectonic evolution of India plate since breakup of Gondwana in Late Jurassic, partial isolation in E Cretaceous, collision with Kohistan-Ladakh arc at ~80 Ma (= continuation of Woyla Arc of W Sumatra?), Cretaceous- Paleogene boundary Shiva impact and Deccan volcanism. In Late Cretaceous (~67 Ma), Indian plate motion acceleration between two transform faults that facilitated N-ward movement, etc.)

Chen, H., S. Sun, J. Li, F. Heller, J. Dobson, M. Haag & K.J. Hsu (1993)- Early Triassic paleomagnetism and tectonics, South China. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 269-276.
(Paleomagnetic data from Lower Triassic limestones in S China support existence of four continental blocks, in E Triassic all scattered in E Paleotethys low latitude, separated by oceans: Yangtze, Xianggui, Cathaysia and Dongnanya (=S China Sea NW margin). Cathaysia block ~90° CW rotation. Permian on Hainan island ~25° CCW rotation)

Chen, X.F., J. Ye, Y. Xiang & X. Chen (2017)- Metallogenic characteristics of the major type deposits in Southeast Asia. Acta Geologica Sinica (English Edition), 91, Suppl. 1, p. 257-258.
(online at: https://onlinelibrary.wiley.com/doi/pdf/10.1111/1755-6724.13283)
(Extended Abstract. Major types of deposits in SE Asia: porphyry type copper (gold-molydenum), orogenic type gold, skarn type copper-gold, epithermal type gold-silver. Other deposits include intrusion-related golds, VHMS, MVT, SEDEX, IOCG, granitoid-related tungsten-tin, REE and potash deposits).

Chen, Y., V. Courtillot, J.P. Cogne, J. Besse, Z. Yang & R. Enkin (1993)- The configuration of Asia prior to the collision of India: Cretaceous paleomagnetic constraints. J. Geophysical Research 98, B12, p. 21927-21941.
(Paleomagnetic data from C Asia show 1700±610 km of shortening of S Asia since Cretaceous absorbed by distributed deformation between S Tibet and Siberia craton, based on Cretaceous poles from Junggar, Tarim, Tibet, Indochina, S and N China and Mongolia blocks. Remarkable consistency between upper and lower Cretaceous results, suggesting Cretaceous time of little displacement. Paleogeographic reconstruction of Asia in Cretaceous)

Chiu, J.M., B.L. Isacks & R.K. Cardwell (1991)- 3-D configuration of subducted lithosphere in the western Pacific. Geophysical J. Int. 106, p. 99-111.

(online at: https://academic.oup.com/gji/article/106/1/99/740584)
(Interesting 3-D displays of subducting slabs in W Pacific region (incl. Indonesia) (Benioff-Wadati zones of deep earthquake hypocenter distributions. Depth of deepest earthquakes decreases in W direction along Sunda Arc)

Chumakov, N.M. & M.A. Zharkov (2002)- Climate during Permian- Triassic biosphere reorganizations, 1: Climate of the Early Permian. Stratigraphy Geol. Correl. 10, 6, p. 586-602.

Chumakov, N.M. & M.A. Zharkov (2003)- Climate during Permian- Triassic biosphere reorganizations, 2. Climate of the Late Permian and Early Triassic: general inferences. Stratigraphy Geol. Correl. 11, 4, p. 361-375.

Claude, J. (2017)- The continental fossil record and the history of biodiversity in Southeast Asia. In: S. Morand et al. (eds.) Biodiversity conservation in Southeast Asia- Challenges in a changing environment, Chapter 2, 13p.
(Brief review of land plant assemblages in SE Asia,from Late Paleozoic-now)

Cloetingh, S. & R. Wortel (1986)- Stress in the Indo-Australian plate. Tectonophysics 132, p. 49-67.
(Modeling of state of stress in Indo-Australian plate. Regional stress field along Sunda arc varies from compression seaward of and parallel to Sumatra trench to tension perpendicular to Java-Flores segment)

Cobbing, E.J., D.I.J. Mallick, P.E.J. Pitfield & L.H. Teoh (1986)- The granites of the Southeast Asian tin belt. J. Geol. Soc., London, 143, p. 537-550.
(Four granite provinces, each with its own pattern of cassiterite mineralization: (1) Main Range Province (Triassic), 2. Eastern Province, 3. Western (Peninsular Thailand-Burma) Province, 4. North Thailand Migmatitic Province. Peninsular Malaysia granites from Main Range and E Provinces two contrasted suites which correspond to I and S-types)

Cobbing, E.J. & P.E.J. Pitfield (1986)- South-East Asia granite project- Field report for Thailand 1985. British Geol. Survey, Overseas Report MP/86/16/R, p. 1-213.
(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/1985/1633.pdf)

Cobbing, E.J., P.E.J. Pitfield, D.P.F. Darbyshire & D.I.J. Mallick (1992)- The granites of the South-East Asian tin belt. British Geol. Survey, Overseas Memoir 10, p. 1-369.
(online at: http://pubs.bgs.ac.uk/publications.html?pubID=B04056)
(Extensive study of granites in Malaysia, Indonesia, Thailand and Myanmar. Not all granites have age-equivalent volcanics. Distinct belt. In Malaysian segment Permo-Triassic- lower Jurassic Eastern Belt with tin deposits (incl. Bangka- Belitung calk-alkaline I-types in Indonesia) (mainly cassiterite-magnite skarns), while neighboring Central Belt more gold-bearing. Western Province Cretaceous granites with tin in S-type granites only. Rb-Sr ages for Bangka granites mainly ~220 Ma (213-229 Ma (Norian); in line with Priem and Bon (1982)). Some age results of 200 Ma, 251-252 Ma; Barber et al. 2005)

Cocks, L.R.M. & R.A. Fortey (1988)- Lower Palaeozoic facies and faunas around Gondwana. In: M.G. Audley-Charles & A. Hallam (eds.) Gondwana and Tethys, Geol. Soc., London, Spec. Publ. 37, p. 183-200.
(Ordovician and Silurian paleogeographic maps, some with W Papua data control points)

Cocks, L.R.M. & T.H. Torsvik (2013)- The dynamic evolution of the Palaeozoic geography of eastern Asia. Earth-Science Reviews 117, p. 40-79.
(Paleogeographical reconstructions for 11 intervals from M Cambrian- end Permian through E Asia region, centred on continental blocks of N China, S China and Annamia (Indochina). Annamia and S China left Gondwana margin area together during Lower Devonian opening of Paleotethys Ocean, but shortly afterwards they separated into two, not to reunite until Triassic. Cambrian- Permian rocks in Japan largely represent active volcanic arcs which originally lay to SE of S China. Neotethys Ocean opened in M Permian, dividing Sibumasu and Tibetan terranes from Gondwana, and Paleotethys Ocean started to close)

Copley, A., J.P. Avouac & J.Y. Royer (2010)- India-Asia collision and the Cenozoic slowdown of the Indian plate: Implications for the forces driving plate motions. J. Geophysical Research, Solid Earth, 115, 3, B03410, 14p.
(Plate motion of India changed dramatically between 50-35 Ma, with convergence between India and Asia dropping from 15 to 4 cm/yr, coincident with onset of India-Asia collision. Apparent relationship between plates velocities and length of subduction zones along boundaries, probably reflecting importance of slab pull as driving mechanism)

Copper, P. & C.R. Scotese (2003)- Megareefs in Middle Devonian supergreenhouse climates. Geol. Soc. America (GSA), Spec. Paper 370, p. 209-230.
(>7 Mid-Devonian 'Great Barrier Reefs', including S. China plate (Vietnam-Hunan, ~1700 km), E Australia-New Guinea (spottily preserved isolated platforms; ~2000 km) and Canning Basin (~400 km))

Crame, J.A. (1986)- Late Mesozoic bipolar bivalve faunas. Geol. Magazine 123, 6, p. 611-618.
(Bipolar bivalve genera probably existed through greater part of late Jurassic- Cretaceous, probably controlled by global climatic zonation. Examples of 'anti-tropical genera: Buchia s.l. and inoceramids (Retroceramus) in latest Jurassic, Aucellina in E Cretaceous, etc.)

Crowell, J.C. (1995)- The ending of the Late Paleozoic ice age during the Permian period. In: P.A. Scholle et al. (eds.) The Permian of Northern Pangea, Springer, Berlin, 1, p. 62-74.

Crowell, J.C. (1999)- Pre-Mesozoic ice ages: their bearing on understanding the climate system. Geol. Soc. America (GSA), Mem. 192, p. 1-106.
(Cenozoic Ice Age from ~43 Ma-Recent, preceded by warmer interval of ~70 My back into mid-Cretaceous time. Next older Mesozoic icy intervals are E Cretaceous (~105-140 Ma) and Jurassic (~160-175 Ma and ~188-195 Ma). Late Paleozoic Ice Ages waxed and waned between ~256-338 Ma. Iciness expanded during Late Devonian-E Carboniferous (353- 363 Ma). Ordovician-Silurian strong and short ice age between ~429-445 Ma. During Late Proterozoic-Cambrian, three or four ice ages (~520–950 Ma). At some localities glaciation occurred at low latitudes)

Cuneo, N.R. (1996)- Permian phytogeography in Gondwana. Palaeogeogr. Palaeoclim. Palaeoecology 125, p. 75-104.
(Review of Gondwanan phytogeogeographic units for five Permian time slices. Nothing on SE Asia)

Dagys, A.S. (1993)- Geographic differentiation of Triassic brachiopods. Palaeogeogr. Palaeoclim. Palaeoecology 100, p. 79-87.
(Maximum paleobiogeographic differention of Triassic brachiopods in Late Triassic, with at least five biochores: Boreal, N Tethyan, peri-Gondwanian, Notal or Maorian and E Pacific. E part of peri-Gondwana Tethys with Misolia, Timorhynchia)

Damborenea, S.E. (2002)- Jurassic evolution of Southern Hemisphere marine palaeobiogeographic units based on benthonic bivalves. Geobios 35, Suppl. 1, p. 51-71.
(Latest Triassic- earliest Cretaceous distribution of bivalves in S Hemisphere. Tethyan Realm with Australian unit restricted to Late Triassic. Late Jurassic Maorian Province extends to Antarctic and W Pacific localities incl. Timor, Sula, Buru, Seram, but overall endemism diminishes from Oxfordian to Tithonian-Berriasian. Oxfordian-Kimmeridgian Malayomaorica has Austral distribution, reaching Australia-New Guinea. Austral Province of Indo-Pacific Region (South Temperate) strongly developed at beginning of Cretaceous, incl. Australia, New Zealand, New Guinea)

Darbyshire, D.P.F. (1987)- Rb/Sr and Sm/Nd isotope studies of granites of Southeast Asia. Warta Geologi 13, p. 117-120.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1987003.pdf)
(Summary of British Geological Survey program of radiometric dating of SE Asia granites (see also Cobbing et al. 1992))

Delescluse, M. & N. Chamot-Rooke (2007)- Instantaneous deformation and kinematics of the India-Australia Plate. Geophysical J. Int. 168, 2, p. 818-842.
(Present-day deformation distributed around Afanasy Nikitin Chain in Central Indian Basin (CIB; shortening) and within Wharton Basin (WB; strike-slip). N portion of NinetyEast ridge (NyR) major discontinuity for strain and velocity. Taking into account intraplate velocity field in vicinity of Sumatra trench, we obtain convergence rate of 46 mm/ yr towards N18°E at epicentre of 2004 Aceh mega-earthquake. Predicted shortening in CIB and WB and extension near Chagos-Laccadive in agreement with deformation measured from plate reconstructions and seismic lines, suggesting continuum of deformation since onset of intraplate deformation around 7.5-8 Ma)

Denham, D. (1973)- Seismicity, focal mechanisms and the boundaries of the Indian-Australian plate. In: P.J. Coleman (ed.) The Western Pacific: island arcs, marginal seas, geochemistry. University of Western Australia Press, p. 35-53.

Deng, J., Q. Wang, G. Li, C. Li & C. Wang (2013)- Tethys tectonic evolution and its bearing on the distribution of important mineral deposits in the Sanjiang region, SW China. Gondwana Research 26, p. 419-437.
(online at: http://www.cugb.edu.cn/uploadCms/file/20600/papers_upload/20141011142419767420.pdf)
(Sanjiang region in SE Tibet Plateau and NW Yunnan formed by amalgamation of Gondwana-derived continental blocks and arc terranes from Paleozoic-Mesozoic. E Paleozoic ophiolites (473-439 Ma) in Changning-Menglian belt indicate existence of Proto-Tethys ocean. Proto-Tethys succeeded in E Devonian by Paleo-Tethys. Changning-Menglian main ocean existed from M Devonian- M-Triassic. E-ward subduction of oceanic plate from E Permian to E Triassic formed >1500 km arc terrane from Yunnan to E Tibet. Numerous Late Triassic S-type granite plutons (230-219 Ma), produced W-Sn deposits. E-ward oceanic subduction of Mesotethys (Late Permian- M Cretaceous) produced E Cretaceous granitoids with skarn-type Pb-Zn and Sn-Fe deposits in Baoshan and Tengchong blocks. Neo-Tethys subduction (Late Cretaceous-~50 Ma) beneath Tengchong block formed S-type granitoids with skarn-type and greisen-type Sn-W deposits. Etc.)

Dercourt, J., L.E. Ricou & B. Vrielynck (eds.) (1993)- Atlas Tethys, Palaeoenvironmental maps. Gauthier-Villars, Paris, p. 1-307.
(Fourteen plate reconstructions and paleogeography maps of Tethys Oceans from mid-Permian-Tortonian. Maps do not include much of SE Asia)

De Wever, P. & F. Baudin (1996)- Palaeogeography of radiolarites and organic-rich deposits in Mesozoic Tethys. Geol. Rundschau 85, 2, p. 310-326.
(Siliceous and marine organic-rich deposits both result of high planktonic productivity, but sometimes associated, sometimes separate in space and time. Siliceous marine phtanite family facies contains organic material and are blackish (vs red/green for radiolarite facies) and deposited generally in shallower environments. Paleogeographic analysis for three Mesozoic high sea-level intervals (Toarcian, Kimmeridgian and Cenomanian) show: (a) in Jurassic siliceous deposits closer to open ocean waters than organic-rich ones; (b) during Cretaceous times often associated)

De Wever, P., F. Baudin, J. Azema & E. Fourcade (1995)- Radiolarians and Tethyan radiolarites from primary production to their paleogeography. In: J. Dercourt & A.E.M. Nairn (eds.) The ocean basins and margins 8, The Tethys Ocean, Plenum Press, p. 267-318.

Dewey, J.F., S. Cande, S. & W.C.I. Pitman (1989)- Tectonic evolution of the India/ Eurasia collision zone. Eclogae Geol. Helvetiae 82, p. 717-734.
(online at: http://dx.doi.org/10.5169/seals-166399)
(Since collision of India with Eurasia at ~45 Ma in M Eocene, N-S intracontinental convergence continued at ~5 cm/ year. Convergence accommodated principally by lithospheric thickening in widening zone between E transpressive sinistral megashear from Makran- Baikal and W dextral megashear from Sumatra to Tanlu Fault System. Lateral extrusion or escape was not major factor in accommodating India/Eurasia convergence)

Dickins, J.M. (1985)- Late Palaeozoic glaciation. Bureau Mineral Res. J. Australian Geol. Geophysics 9, p. 163-169.
(online at: www.ga.gov.au/metadata-gateway/metadata/record/81179/)
(Review of Carboniferous- Permian glaciation in Australia- SE Asia. Main widespread terrestrial glaciation across Gondwana in Asselian (earliest Permian). In all areas rel. warm conditions returned in Sakmarian)

Dickins, J.M. (1985)- Palaeobiofacies and palaeobiogeography of Gondwanaland from Permian to Triassic. In: K. Nakawara & J.M. Dickins (eds.) The Tethys, Tokai University Press, Tokyo, p. 83-92.

Dickins, J.M. (1992)- Permian geology of Gondwana countries: an overview. Int. Geology Review 34, p. 986-1000.
(Earliest Permian of most Gondwanan areas characterized by glacial deposits and cold-water marine faunas. In W Australia glaciation confined to Asselian, followed by amelioration and rise in sea level in Sakmarian)

Dickins, J.M. (1996)- Problems of a Late Palaeozoic glaciation in Australia and subsequent climate in the Permian. Palaeogeogr. Palaeoclim. Palaeoecology 125, p. 185-197.
(Two main periods of glaciation: (1) Namurian (E Carboniferous) possibly extending into beginning of Late Carboniferous; (2) Asselian (earliest Permian). End of glaciation asssociated with worldwide eustatic rise in sea-level in basal Sakmarian (after this no good evidence for glaciation in Australia). In some places in Australia subtropical or tropical conditions in U Sakmarian, U Artinskian, Kungurian, Kazanian and Dzhulfian, all separated probably by colder periods. Marine Carboniferous Levipustula fauna may represent less cold sea water than E Permian Eurydesma fauna)

Dickins, J.M. (2000)- The northern margin of Gondwanaland: uppermost Carboniferous to lowermost Jurassic and its correlation. In: H.F. Yin, J.M. Dickins et al. (eds.) Permian-Triassic evolution of Tethys and Western Circum-Pacific, Developments in Palaeontology Stratigraphy 18, Elsevier, p. 257-270.
(In latest Carboniferous- early E Permian no apparent continuous sea in Tethys sensu Suess. Earliest Permian land barrier separated C Asian Sea from southern sea connecting 'Gondwana' countries. Youngest recognized marine deposits connecting through warm water C Asian Sea not younger than E Permian (Sakmarian). In U Permian-Triassic a N shore of Gondwanaland can be traced with southern sediment source. N shore of Tethys largely remains to be delineated)

Dickins, J.M. & Phan Cu Tien (1997)- Indosinian tectogeny in the geological correlation of Vietnam and adjacent regions. In: J.M. Dickins et al. (eds.) Late Palaeozoic and Early Mesozoic Circum-Pacific events and their global correlation. Cambridge University Press, p. 87-96.
(Review of U Devonian- Triassic stratigraphy of Vietnam. Indosinian orogeny manifested by Dzhulfian (U Permian) widespread unconformity and volcanic activity. Second Indosinian orogenic phase at end-Carnian, with widespread intrusive activity and deposition of coal-bearing molasse)

Dickins, J.M., Y. Zunyi, Yin Hongfu et al. (eds.) (1997)- Late Palaeozoic and Early Mesozoic Circum-Pacific events and their global correlation. Cambridge University Press, p. 1-255.
(Mainly mainland E Asia papers; nothing on Indonesia)

Diener, C. (1916)- Die marinen Reiche der Triasperiode. Denkschriften Kaiserl. Akademie Wissenschaften, Wien, Math.- Naturwiss. Klasse, 92, p. 405-549.
(online at: www.landesmuseum.at/pdf_frei_remote/DAKW_92_0405-0549.pdf)
('The marine realms of the Triassic period'. Review of global Triassic macrofaunas as known in 1916. Four main faunal provinces (Boreal, Mediterranean, Himalayan and Andean), based on cephalopods, bivalves, etc. Indonesian area groups in Himalayan Domain. Brief reviews of Triassic on Timor, Roti, Savu, Sumatra, Seram, Buru. Only Timor has complete Triassic section, with cephalopods and corals very similar to Alps. In other areas Triassic starts with Carnian transgression. Triassic of Sumatra mainly shallow marine clastics)

Domeier, M. (2018)- Early Paleozoic tectonics of Asia: towards a full-plate model. Geoscience Frontiers (Beijing) 9, 3, p. 789-862.

(online at: https://www.sciencedirect.com/science/article/pii/S1674987117302074)
(Extensive review of Cambrian- Silurian plate tectonics of Asia. Not much on SE Asia- Indonesian region)

Domeier, M. & T.H. Torsvik (2014)- Plate tectonics in the late Paleozoic. Geoscience Frontiers (Beijing), 5, p. 303-350.
(online/open access at: www.sciencedirect.com/science/article/pii/S1674987114000061)

Doust, H. (2017)- Petroleum systems in Southeast Asian Tertiary basins. Bull. Geol. Soc. Malaysia 64 (Geol. Soc. Malaysia 50th Anniversary Issue 2), p. 1-16.
(online at: www.gsm.org.my/products/702001-101723-PDF.pdf)
(Productive Tertiary basins in SE Asia similar geodynamic developments, with 5 facies associations: (1) lacustrine (early synrift of Sundaland; mainly oil) (2) paralic (late synrift); (3) open marine shelf (post-rift, E Indonesia and Philippines) (4) deeper marine (post-rift; mainly gas) and (5) pre-Tertiary (E Indonesia and Thailand, mainly terrestrial). Around Borneo thick late postrift passive margin delta sequences with oil- and gas-prone coaly source rock; transported terrigenous organic material common in related deep marine environments and contributes to marine source facies. In SE Asia terrestrial and lacustrine source rocks rel. difficult to locate, variable in quality and often distributed in thin beds)

Doyle, P. (1992)- A review of the biogeography of Cretaceous belemnites. Palaeogeogr. Palaeoclim. Palaeoecology 92, p. 207-216.
(Belemnites display Boreal and Tethyan marine faunal realms from Early Jurassic- earliest Cretaceous. Austral marine realm was lacking. In late Barremian- early Aptian Austral Realm was initiated with first Gondwanan family, Dimitobelidae. Tethyan belemnite realm cannot be recognised after Cenomanian)

Doyle, P. & P. Howlett (1989)- Gondwana Antarctic belemnite biogeography and the break-up of Gondwana. In: J.A. Crame (ed.) Origins and evolution of Antarctic biota, Geol. Soc., London, Spec. Publ. 47, p. 167-182.
(In Late Jurassic, belemnite genera Hibolithes and Belemnopsis abundant and widespread in Tethys, characterizing Tethyan Realm from S Europe and Asia to Antarctica. Distinct S Hemisphere 'Austral' belemnite realm was absent, although some endemicity exists at species level. Late Jurassic Indo-Pacific belemnites dominated by Belemnopsis with Hibolithes as minor element of fauna)

Duan, L., Q.R. Meng, N. Christie-Blick & G.L. Wu (2017)- New insights on the Triassic tectonic development of South China from the detrital zircon provenance of Nanpanjiang turbidites. Geol. Soc. America (GSA) Bull., 11p.
(Triassic turbidites of Nanpanjiang basin reflect collision between S China and Indochina blocks. Turbidite system filled primarily from E to W. U-Pb ages and Hf isotope data for detrital zircons from M Triassic turbidites suggest provenance not from collisional orogen, but from poorly preserved arc at convergent plate boundary of S China. Zircon ages clusters: ~250-300 Ma, 350-400 Ma, 400-550 Ma, 900-1050 Ma and ~1600-1950 Ma. Andean-type (Paleo-Pacific subduction) Cathaysian margin of S China probable source for much of sediment of S China block. New model for Triassic tectonic evolution of S China)

Duan, L., Q.R. Meng, G.L. Wu & S.X. Ma (2012)- Detrital zircon evidence for the linkage of the South China block with Gondwanaland in early Palaeozoic time. Geol. Magazine 149, 6, p. 1124-1131.
(Detrital zircons from Lower Devonian sections in S China block dominant Grenvillian and Pan-African populations, similar to E Paleozoic from Gondwana, Tethyan Himalaya and WAustralia. Hf isotopes indicate contributions of juvenile crust at 1.6 Ga and 2.5 Ga. S China block was integral part of E Gondwana in E Paleozoic, not continental block in Paleo-Pacific or fragment of Laurentia)

Ehiro, M. (1996)- Permian and Triassic paleogeography based on ammonoid fossils of East Asia. Chikyu Monthly, 18, p. 724-729. *(in Japanese)*

Ehiro, M. (1997)- Ammonoid palaeobiogeography of the South Kitakami palaeoland and palaeogeography of eastern Asia in Permian to Triassic time. Proc. 30th Int. Geological Congress, Beijing 1996, 12, Palaeontology and historical geology, VSP, Utrecht, p. 18-28.

(Biogeographic analysis of Permian- Triassic ammonoids in E Asia suggests Kikatami Terrane in NE Japan, was in equatorial realm near S China/ Khanka Terranes. Four ammonoid provinces in Permian: (1) Boreal, (2) Equatorial American, (3) Equatorial Tethyan (incl. S China, SE Asia, Iran, Timor; with E Permian perrinitids, M Permian Timorites, Waagenoceras?) and (4) Peri-Gondwanan (incl. Australia, Himalayas, Salt Range))

Ehiro, M. (1998)- Permian ammonoid fauna of the Kitakami Massif, Northeast Japan- biostratigraphy and Paleobiogeography. In:Y. Jin et al. (eds.) Permian stratigraphy, environments and resources 2, Palaeoworld 9, p. 113-122.
(online at: http://work.geobiology.cn/ebook/)
(Similar to above. Late M Permian Timorites- Waagenoceras ammonites of 'allochthonous Timor' affiliated with Tethyan instead of peri-Gondwanan assemblages)

Enay, R. & E. Cariou (1996)- Identification du Kimmeridgien du domaine Indo-Sud-Ouest Pacifique: la faune a *Paraboliceras* (Ammonitina) de l'Himalaya a la Nouvelle-Zelande. Comptes Rendus Academie Sciences, Paris, ser. 2, 322, 6, p. 469-474.
('Recognition of the Kimmeridgian Stage in the Indo-SW Pacific: the Paraboliceras fauna from the Himalayas to New-Zealand'. Kimmeridgian Stage not easily recognizable in Indo-SW Pacific because of lack of European taxa. Faunal sequence of Spiti Shales in C Nepal shows faunas with Paraboliceras (previously thought be of Tithonian age) are diagnostic of Kimmeridgian. This endemic Kimmeridgian biogeographic association extends from Himalayas to New Zealand.)

Enay, R. & E. Cariou (1997)- Ammonite faunas and palaeobiogeography of the Himalayan belt during the Jurassic: initiation of a Late Jurassic austral ammonite fauna. Palaeogeogr. Palaeoclim. Palaeoecology 134, 1, p. 1-38.
(Jurassic ammonite faunas form basis for new biogeographical interpretation of U Bathonian- Tithonian/ Berriasian peri-Gondwanan faunas. Low diversity Austral ammonite fauna around E and S Gondwanaland, from Himalaya to Patagonia)

Enay, R. & E. Cariou (1999)- Jurassic ammonite faunas from Nepal and their bearing on the palaeobiogeography of the Himalayan belt. J. Asian Earth Sci. 17, 5-6, p. 829-848.
(M-L Jurassic Himalayan ammonite faunas rel. low diversity and dominance of indigenous genera. Faunas extending from Himalayas to Antarctica represent an actual biogeographical unit: Indo Pacific Realm. With Blanfordiceras wallichi in Tithonian)

Enkin, R.J., Z. Yang, Y. Chen & V. Courtillot (1992)- Palaeomagnetic constraints on the geodynamic history of the major blocks of China from the Permian to the present. J. Geophysical Research 97, p. 13953-13989.
(Review of paleomagnetic data of China region suggests major blocks probably in contact in Permian-Triassic, but Jurassic key age for present configuration. During Cretaceous, Chinese poles agree with poles from other continents transferred onto Eurasia. Much of China affected by small (<20°) rotations, interpreted as deformation caused by extrusion away from India collision)

ESCAP (1990)- Triassic biostratigraphy and paleogeography of Asia. ESCAP Atlas of Stratigraphy IX, Min. Res. Dev. Ser. 59, United Nations, New York, p. 1-92.
(Brief descriptions of Triassic across Asia, incl. Malaysia and Timor)

Fan, W., Y. Wang, Y. Zhang, Y. Zhang, F. Jourdan, J. Zi & H. Liu (2015)- Paleotethyan subduction process revealed from Triassic blueschists in the Lancang tectonic belt of Southwest China. Tectonophysics 662, p. 95-108.
(Subduction of Paleotethys Ocean and subsequent continental collision recorded in blueschists in Lancang SE Paleotethyan belt in SW China. Suyi blueschists zircon U-Pb age of 260 ± 4 Ma and glaucophane formed during prograde metamorphism with 40Ar/39Ar plateau age of 242 ± 5 Ma (M Trias). Protolith formed at 260 Ma and originated from basaltic seamount. Basaltic rocks subducted down to 30-35 km under Lincang arc to form epidote blueschists at ~242 Ma. Blueschists subsequently transported to shallower crustal levels in response to continuous underthrust of subducted slab and continent–continent collision in M-L Triassic)

Fang, N.Q., Q. Feng, S. Zhang & X. Wang (1998)- Paleo-Tethys evolution recorded in the Changning-Menglian Belt, western Yunnan. Comptes Rendus Academie Sciences, Paris, Sciences de la Terre, 326, p. 275-282.
(Changning-Menglian belt of W Yunnan is ~400km long, 60 km wide remnant of Paleo-Tethyan archipelago. With E Devonian- M-L Triassic volcano-sedimentary record, incl. flysch, radiolarites, MORB basalts, seamount carbonates. Flanked by Cathaysian Lincang-Simao massif in E (M-L Devonian paleolatitude ~38-43°S) and Gondwanan Gengma-Baoshan massif in W (Devonian paleolatitude ~0-4.5°S; with Permo-Carboniferous moraine deposits))

Fang, Wu (1989)- Paleozoic paleomagnetism of the South China block and the Shan Thai block: The composite nature of Southeast Asia. Ph.D. Thesis, University of Michigan, p. 1-165.
(Paleomag of Paleozoic samples from E Yunnan (S China Block) and W Yunnan (N end of Shan-Tai Block). Contrasting paleolatitudes for Devonian samples: equatorial position for E Yunnan, of ~40° for W Yunnan, which probably was part of Gondwana supercontinent)

Fang, Z.J. (1991)- Sibumasu biotic province and its position in Paleotethys. Acta Palaeontologica Sinica 30, 4, p. 344-349.
(Sibumasu province characterized by: (1) No reliable Gondwana cold-water biota or glacial deposits (interpreted glaciomarine pebble-bearing layers are debris flows; molluscs identified as Eurydesma are Schiziodus). Temperate and warm water fauna dominant; carbonates not common; (2) No tropical Cathaysian biotas and reef complexes. Absence of Late Paleozoic coal seams and occurrence of mixed Permian Cathaysian-Gondwana flora in W Yunnan suggest Sibumasu between equatorial coal swamp zone (Cathaysian flora) and S temperate coal swamp zone (Glossopteris flora); (3) Contains Peri-Gondwana and Cathaysian elements but also European, Ural and Boreal elements; (4) Common endemic genera and species)

Fang, Z.J. (1994)- Biogeographic constraints on the rift-drift accretion history of the Sibumasu block. J. Southeast Asian Earth Sci. 9, 4, p. 375-385.
(Paleozoic biogeographic history of Sibumasu block stages: (1) Cambrian-Ordovician with Australian faunal affinities; (2) Silurian-Devonian with Rhenish-Bohemian faunal affinities; (3) Carboniferous- Permian independent biotic province, different from both peri-Gondwanaland (no true E Permian glacial deposits) and Cathaysian biotas (no Permian coals) in Tethyan realm. Towards end Permian, Cathaysian elements more important, especially in E margin, indicating Cathaysian and Sibumasu biotas began to merge. Sibumasu rifted from Gondwanaland in M Ordovician or earlier and sutured to East Continent in Late Permian and E Triassic)

Fang, Z.J., Z.C. Zhou & M.J. Lin (1992)- On several questions concerning Changning-Menglian Suture from perspect of stratigraphy. J. Stratigraphy 16, p. 292-303.

Fedorov, P.I. & A.V. Koloskov (2005)- Cenozoic volcanism of Southeast Asia. Petrology 13, 4, p. 352-380.
(Three main periods of activity in Cenozoic volcanic complexes of SE China, Vietnam, Thailand and S China Sea: E Tertiary, Miocene and Pliocene-Quaternary. First period characterized by potassic basalt (Vietnam) and tholeiitic bimodal (SE China) volcanism. Subsequent periods dominated by intraplate-type tholeiitic and alkaline volcanism and minor bimodal tholeiitic magmatism (basalts and rhyolites of Okinawa Trough))

Fernandez, V., J. Claude, G. Escarguel, E. Buffetaut & V. Suteethorn (2009)- Biogeographical affinities of Jurassic and Cretaceous continental vertebrate assemblages from SE Asia. In: E. Buffetaut (ed.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia, Geol. Soc., London. Spec. Publ. 315, p. 285-300.
(Late Jurassic- Early Cretaceous vertebrate assemblages from Khorat Gp of Thailand strong provincialism)

Ferrari, O.M., C. Hochard & G.M. Stampfli (2008)- An alternative plate tectonic model for the Palaeozoic-Early Mesozoic Palaeotethyan evolution of Southeast Asia (Northern Thailand-Burma). Tectonophysics 451, p. 346-365.
(Alternative model for Cambrian- Triassic geodynamic evolution of SE Asia. Differs in Paleotethys suture location in Thailand at Mae Yuam fault. Closure of E Paleotethys related to S-ward oceanic subduction that triggered E Neotethys opening as back-arc, due to Late Carboniferous- E Permian arc magmatism in Mergui

(Burma) and Lhasa block (S Tibet) and absence of arc magmatism E of suture. To explain Carboniferous-E Permian and Permo-Triassic arcs in Cambodia, U Triassic magmatism in E Vietnam and L-M Permian arc volcanics in W Sumatra, we introduce Orang Laut terranes, which detached from Indochina and S China during back-arc opening due to W-ward subduction of Paleopacific. This also explains location of Cathaysian W Sumatra block W of Cimmerian Sibumasu block (see also comments by Metcalfe 2009))

Fielding, C.R., T.D. Frank & J.L. Isbell (2008)- The late Paleozoic ice age- a review of current understanding and synthesis of global climate patterns. Geol. Soc. America (GSA), Spec. Paper 441, p. 343-354.
(Late Paleozoic ice age was series of 1-8 My duration discrete glacial events separated by periods of warmer climate. After smaller precursor events massive expansion of ice at Carboniferous-Permian boundary, and glaciation became bipolar. Ice sheets at maximum in Asselian- E Sakmarian, after which they decayed rapidly over much of Gondwana. Minor glaciations continued in Australia and Siberia through late E- M Permian)

Flower, M., R.M. Russo, K. Tamaki & N. Hoang (1998)- Mantle contamination and the Izu-Bonin-Mariana (IBM) 'high-tide mark': evidence for mantle extrusion caused by the Tethyan closure. Tectonophysics 333, p. 9-34.
(Discussion of SE Asia- W Pacific tectonics and plate kinematics. W Pacific back-arc basins opened in 3 main episodes of arc-trench rollback: (1) Eocene W Philippine Sea and Celebes Sea, (2) Oligocene-Miocene Japan, South China, Sulu and Makassar Seas, and (3) Late Miocene- Quaternary Okinawa, Mariana Troughs and Andaman Sea. Extrusion of Tethyan astenosphere, contaminated by sub-Asian cratonic lithosphere, was major cause of W Pacific arc rollback and basin opening)

Flower, M., K. Tamaki & N. Hoang (1998)- Mantle extrusion: a model for dispersed volcanism and DUPAL-like asthenosphere in East Asia and the Western Pacific. In: M.F.J. Flower et al. (eds.) Mantle dynamics and plate interactions in East Asia, American Geophys. Union (AGU), Geodyn. Ser. 27, p. 67-88.
(On dispersed volcanic clusters over much of Asia and W Pacific following India-Asia and Australia-Indonesia collisions: (1) variably potassic tholeiites and alkali basalts in tension gashes, pull-apart basins, etc., and (2) shoshonite series (K-rich boninite) at extensional, near-collision shear zones and sundered arcs)

Fluteau, F., J. Besse, J. Broutin & M. Berthelin (2001)- Extension of Cathaysian flora during the Permian-climatic and paleogeographic constraints. Earth Planetary Sci. Letters 193, 3, p. 603-616.
(Mixed Gondwanan, Euramerian and Cathaysian floral elements in 'Mid' Permian Gharif Fm of Oman (see also Berthelin et al. 2003))

Fontaine, H. (1986)- Shan-Thai Block and Indochina Block during the Carboniferous and the Permian; palaeontological and stratigraphical data. In: Proc. First Conf. Geology of Indochina, Ho Chi Minh City 1986, Gen. Dept. of Geology Vietnam, 1, p. 101-103.

Fontaine, H. (1986)- The Permian of Southeast Asia. CCOP Techn. Bull. 18, p. 1-111.
(Extensive review of geology and paleontology of Permian of Thailand, Vietnam, Laos, Malaysia, Sumatra, etc. Followed by 7 appendices on Permian fauna-flora by Fontaine, Nguyen Tien, Vachard and Vozenin-Serra))

Fontaine, H. (2002)- Permian of Southeast Asia: an overview. J. Asian Earth Sci. 20, 6, p. 567-588.
(Permian rocks widespread in SE Asia. Many limestones with fusulinaceans recognized as Permian, but ones without fusulinaceans and previously assigned to Permian, found to be Triassic. Widespread massive limestones represent extensive carbonate platforms. Local occurrences of thick-bedded cherts indicate deep marine environments. Pebbly mudstones in Myanmar, Thailand, NW Malaysia and Sumatra formed in glacial environment. Volcanic rocks absent in NW Peninsular Malaysia and Thailand, but widespread in N Vietnam, Sumatra, E Malay Peninsula and Timor. Faunal and floral assemblages used to establish climatic conditions, environments of deposition and to define crustal blocks and Permian paleogeography)

Fontaine, H., P. David, R. Pardede, N. Suwarna, J.P. Bassoullet, L. Beauvais, E. Buffetaut & R. Ingavat (1983)- The Jurassic in Southeast Asia (Thailand, Laos, Cambodia, Viet Nam, Malay Peninsula, Sumatra, Borneo, West Philippines). CCOP Techn. Bull. 16, p. 1-75.

(Extensive review of Jurassic in SE Asia. Jurassic in Cambodia, Laos, Vietnam, E Thailand and Malay Peninsula mainly in continental facies, with occasional thin, shallow marine interbeds. Busuanga, Linapacan and Ili islands, NE of Palawan, Philippines, 200m thick Late Jurassic limestone with Cladocoropsis, Pseudocyclammina lituus, Salingoporella spp., Thaumatoporella, etc. (Fontaine et al. 1983, Bassoulet 1983). Late Jurassic- E Cretaceous limestones with Cladocoropsis- Pseudocyclammina at many localities across W Sumatra (NW Sumatra, Jambi, S Sumatra; all tied to 'Woyla Terranes'?; JTvG), U Jurassic Bau Limestone in W Sarawak, etc.)

Fontaine, H., C. Chonglakmani, I. Amnan & S. Piyasin (1994)- A well-defined Permian biogeographic unit: peninsular Thailand and northwest Peninsula Malaysia. J. Southeast Asian Earth Sci. 9, p. 129-151.
(M-U Permian-Triassic Ratburi Lst of Peninsular Thailand and Chuping Lst of NW Peninsular Malaysia with rel. low diversity corals and fusulinids (Pseudofusulina, Staffella, Monodiexodina), and with forams incl. Hemigordiopsis and Shanita. These characterize a well-defined biogeographic unit (Shan-Tai/ Sibumasu terrane; JTvG). Noted similarities of several fossil groups with Timor Permian faunas)

Fontaine, H., P. David, R. Pardede & N. Suwarna (1983)- Marine Jurassic in Southeast Asia. UN-ESCAP CCOP Techn. Bull. 16, p. 3-30.
(Jurassic in W Philippines (Palawan Block), W Borneo, W Sumatra, Malay Peninsula, Thailand, Kampuchea and Vietnam. Marine Jurassic generally in limited areas only, and incomplete sections. Strong faunal affinities with Tethyan realm in E-M Jurassic, with Jurassic of Japan in Upper Jurassic)

Fontaine, H. & V. Suteethorn (1992)- Permian corals of Southeast Asia and the bearing of a recent discovery of Lower Permian corals in Northeast Thailand. In: C. Piencharoen (ed.) Proc. Nat. Conf. Geologic resources of Thailand: potential for future development, Bangkok, Dept Min. Resources, p. 346-354
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1992/6234.pdf)
(Brief review of Permian corals of SE Asia. Permian corals of Thailand more diverse than Peninsular Thailand, NW Peninsular Malaysia and Timor, all of which are richer and more prolific than those from Australia. Timor corals rel. low diversity, mainly solitary Rugosa. Sumatra corals of Padang and W Jambi regions high diversity reefal limestone. Terbat Lst of W Borneo common fusulinids, but few or no corals. New Lower Permian fossil localities in NE Thailand (Loei) with solitary and compound rugose corals, incl. Kepingophyllidae)

Fortey, R.A. & L.R.M. Cocks (1998)- Biogeography and palaeogeography of the Sibumasu terrane in the Ordovician: a review. In: R. Hall & J.D. Holloway (eds.) Biogeography and geological evolution of SE Asia, Backhuys Publ., Amsterdam, p. 43-56.
(online at: http://searg.rhul.ac.uk/searg_uploads/2016/01/Fortey_Cocks.pdf)
(Sibumasu (=Shan-Tai) paleocontinent comprises Sumatra, Malaysia, W Thailand and Burma. Ordovician rocks in China, Burma, S Thailand and interior Australia mainly carbonates. Lower Ordovician shelf faunas from Thailand- Langkawi low-latitude faunas, with affinities with N China- Australia, but M-U Ordovician trilobites most similar to S China)

Fourcade, E., J. Azema, J.P. Bassoullet, F. Cecca, J. Dercourt et al. (1995)- Palaeogeography and palaeoenvironments of the Tethys during Jurassic Pangaean break-up. In: A.E.M. Nairn, L.E. Ricou et al. (eds.) The ocean basins and margins 8, The Tethys Ocean. Plenum, New York, p. 191-214.

Fournier, M., L. Jolivet, P. Davy & J. Thomas (2004)- Backarc extension and collision: an experimental approach to the tectonics of Asia. Geophysical J. Int. 157, 2, p. 871-889.
(online at: https://academic.oup.com/gji/article/157/2/871/2080608)
(Modeling of E Asia deformation. Large parts of SE Asia affected by subduction-related extension, interacting with far field effects of India- Asia collision. Major backarc basins associated with ~N-S right-lateral strike-slip faults which accommodate N-ward penetration of India into Eurasia)

Fujikawa, M. & T. Ishibashi (2000)- Paleozoic ammonoid paleobiogeography in Southeast Asia. Geosciences J. 4, 4, p. 295-300.

(Paleobiogeography of Late Paleozoic ammonoids in SE Asia. Sibumasu terrane separated from Gondwanaland in E-M Permian. Contrary to previous opinion, no close faunal resemblance between Indochina and S China from Pennsylvanian to M Permian)

Fujiwara, K.P., H. Zaman, A. Surinkum, N. Chaiwong, M. Fujihara, H.S. Ahn & Y. Otofuji (2014)- New insights into regional tectonics of the Indochina Peninsula inferred from Lower-Middle Jurassic paleomagnetic data of the Sibumasu Terrane. J. Asian Earth Sci. 94, p. 126-138.
(Sibumasu Terrane between CW-rotated Indochina Block and CCW-rotated S Sundaland Block. Paleomagnetic data from E-M Jurassic Umphang Gp red sandstones in Ratchaburi area variable declinations(348.5° and 44.7°) for Sibumasu. Sibumasu Terrane behaved as independent fragment when Indochina was undergoing CW rotation and S-ward displacement, as result of extrusion tectonics after India-Asia collision. CCW rotation of 15° estimated for Sibumasu Terrane, as result of continuous N-ward indentation of Australian Plate into S Sundaland Block)

Fuller, M., R. Haston, J.L. Lin, B. Richter, E. Schmidtke & J. Almasco (1991)- Tertiary paleomagnetism of regions around the South China Sea. J. Southeast Asian Earth Sci. 6, 3-4, p. 161-184.
(Paleomag data for Borneo, Malay Peninsula, Philippines)

Fyhn, M.B.W., P.F. Green, S.C. Bergman, J. Van Itterbeeck, T.V. Tri, P.T. Dien, I. Abatzis, T.B. Thomsen, S. Chea, S.A.S. Pedersen et al. (2016)- Cenozoic deformation and exhumation of the Kampot Fold Belt and implications for south Indochina tectonics. J. Geophysical Research, Solid Earth, 121, 7, p. 5278-5307.
(Latest Mesozoic- earliest Cenozoic deformation of Sundaland core between SE Asian fusion and Cenozoic era of rifting and basin formation. In S Cambodia and Vietnam major latest Cretaceous- Paleocene thrusting and uplift of Kampot Fold Belt and surrounding regions, with up to ~11 km exhumation. Latest Cretaceous-Paleocene orogenesis affected much of greater Indochina, probably due to plate collision along E Sundaland or combination of collisions along E and W Sundaland. AFTA and ZFTA data document protracted cooling of Cretaceous granites and locally elevated thermal gradients 10's of My afterr emplacement. Thermalgradient stabilized by E Miocene time, and Miocene cooling probably reflects renewed denudation pulse)

Gardiner, N.J., M.P. Searle, C.K. Morley, M.P. Whitehouse, C.J. Spencer & L.J. Robb (2016)- The closure of Palaeo-Tethys in Eastern Myanmar and Northern Thailand: new insights from zircon U-Pb and Hf isotope data. Gondwana Research 39, p. 401-422.
(Main Range and E Province granite belts of SE Asia represent magmatic expression of closure of Paleo-Tethys in Late Paleozoic- E Mesozoic times. New U-Pb zircon age data from N Thailand and E Myanmar constrain closure in Myanmar to ~230 Ma. Age of 219-220 Ma from Kyaing Tong granite imply N extension of Main Range Province into E Myanmar (E Triassic). Tachileik granite in far E Myanmar 266 Ma, consistent with E Province ages. Hf data suggest Paleoproterozoic crust underlies both Main Range and E Province granites)

Gatinsky, Y.G. (1986)- Geodynamics of Southeast Asia in relation to the evolution of ocean basins. Palaeogeogr. Palaeoclim. Palaeoecology 55, p. 127-144.
(Geodynamics of SE Asia closely connected with cyclic development of large oceanic basins: Paleotethys (M Paleozoic-E Mesozoic), Tethys (end Paleozoic- beginning Cenozoic), and Indian and Pacific Oceans (Late Mesozoic- Cenozoic). Opening of basins accompanied by simultaneous closing of earlier basins)

Gatinsky, Y.G. & C.S. Hutchison (1986)- Cathaysia, Gondwanaland, and the Paleotethys in the evolution of continental Southeast Asia. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 179-199.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986b10.pdf)

(Continental SE Asia dominated by Precambrian continental blocks overlain by Late Proterozoic-Paleozoic platform successions. Most blocks rifted and drifted from Australian Gondwanaland in Early Paleozoic and were in equatorial position by Permian time. Between blocks are intensely folded mobile belts. West Borneo block initial separation from Eurasia in Late Triassic-Jurassic (creation of Proto-South China Sea), then detached from Indosinia in Late Cretaceous-Paleogene and moved S along fault margin of Vietnam shelf)

Gatinsky, Y.G., C.S. Hutchison, N. N. Minh & T.V. Tri (1984)- Tectonic evolution of Southeast Asia. 27th Int. Geological Congress, Moscow, Rept. 5, p. 225-239.

(online at: www.igcp.itu.edu.tr/Publications/Golonka_06.pdf)
(Peak of Paleozoic orogenesis in SE Asia and S China in Silurian- earliest Devonian. In N Vietnam deep water Ordovician and Silurian synorogenic deposits overlain by continental E Devonian red beds. With plate tectonic map for Early Ordovician)

Golonka, J., M. Krobicki, J. Pajak, Nguyen Van Giang & W. Zuchiewicz (2006)- Global plate tectonics and paleogeography of Southeast Asia. Fac. Geology, Geophysics Environmental Protection, AGH University of Science and Technology, Arkadia, Krakow, p. 1-128.
(Major review of global plate tectonic evolution from Cambrian- Recent in 32 maps/ time slices, with detailed maps for SE Asia (Vietnam focused). Differs from recent Hall and Metcalfe models in depicting the more 'traditional' view of SW Borneo as always having been part of Indochina-Sibumasu (which rifted off Indochina/ S China by opening of Proto- South China Sea in Jurassic or Cretaceous))

Gorur, N. & A.M.C. Sengor (1992)- Paleogeography and tectonic evolution of the Eastern Tethysides: implications for the Northwest Australian margin breakup history. In: U. von Rad et al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results 122, College Station, p. 83-106.
(online at: www-odp.tamu.edu/publications/122_SR/VOLUME/CHAPTERS/sr122_05.pdf)
(Last major breakup from NW Australian continental margin (Exmouth, Wombat, Scott Plateaus) in Berriasian-Hauterivian. Major continental fragments in Asiatic Tethyside orogenic collage already collided with Asia by that time. Similarity of Mesozoic geological record suggests Sikuleh-Natal continental sliver in Sumatra, plus possible extensions in Java probably continental object that left NW Australia in Berriasian- Hauterivian. This sliver records E Cretaceous rapid subsidence and collision with Sumatra along Woyla suture in Late Cretaceous. NW Australian margin two older breakup events: (1) latest Carboniferous-earliest Permian: departure of Sibumasu block and E Cimmerian continent (Baoxan, W Thailand, E Burma), W Malaya and part of C Sumatra; (2) Late Triassic-Jurassic. Lhasa- C Burma block left Gondwanaland, which leads us to think breakup event was latest Triassic, probably Rhaetian)

Grant-Mackie, J.A., Y. Aita, B.E. Balme, H.J. Campbell, A.B. Challinor, D.A.B. MacFarlan, R.E. Molnar, G.R. Stevens & R.A.Thulborn (2000)- Jurassic palaeobiogeography of Australasia. In: A.J. Wright (ed.) Palaeobiogeogeography of Australasia, Mem. Assoc. Australasian Palaeontologists (AAP) 23, p. 311-353.
(Review of Australian Jurassic fossils distribution)

Grunow, A.M. (1999)- Gondwanan events and palaeogeography: a palaeomagnetic review. J. African Earth Sci. 28, 1, p. 53-69.

Guillot, S., K. Hattori, P. Agard, & S. Schwartz & O. Vidal (2009)- Exhumation processes in oceanic and continental subduction contexts: a review. In: S. Lallemand and F. Funiciello (eds.) Subduction zone geodynamics, Springer-Verlag p. 175-205.
(Review of exhumation of high and ultrahigh pressure metamorphic rocks and ophiolites. Three types of subduction zones: (1) Accretionary-type subduction zones exhume HP metasedimentary rocks by underplating; (2) Serpentinite-type subduction zones exhume HP to UHP in 1-10 km thick serpentinite subduction channel (incl. Bantimala, Sulawesi, Luk Ulo, C Java); (3) continental-type subductions exhume UHP rocks of continental origin. With examples from SE Asia)

Guo, F. (1990)- Terranes of Southwest China since the Late Paleozoic. In: T.J. Wiley et al. (eds.) Terrane analysis of China and the Pacific Rim, Circum-Pacific Council Energy and Mineral Resources, Houston, Earth Sci. Publ. 13, p.

Guo, F. (1991)- The boundary between Gondwana and Pacifica and the suturing ages of their allied terranes in Southwestern China. Acta Geologica Sinica (English Ed.) 4, p. 87-95.
(Two terrane groups in SW China: (1) with Permo-Carboniferous ice-rafted marine sediments and cold-water fauna of Gondwana facies (Gangmar Co, Lhasa, Sa' gya, Tengchong, Baoshan terranes), (2) with Yangtze-type U Paleozoic with Cathaysian flora and Pacific-type fusulinids (Changning-Menglian, Shuangjiang-Lancang, Qamdo and Bayan Har terranes). Longmu Co-Shuanghu-Dengqen- N Lancang River- Kejie-Mengding suture zone between two groups is boundary between Gondwana and Pacifica in SW China. Baoshan and Nyainrong-Sog in Lhasa composite terrane first combined with Asian continent in early E Jurassic. N Tibet- W Yunnan microplate (with Gangmar Co, Lhasa, Tengchong terranes) collided with Asia at end of E Cretaceous)

Hada, S., S. Bunopas, K. Ishii & S. Yoshikura (1997)- Rift-drift history and the amalgamation of Shan-Thai and Indochina/ East Malaysia Blocks. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Bangkok, Dept. Mineral Resources, 1, p. 273-286.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7641.pdf)
(Same paper as Hada et al. 1999)

Hada, S., S. Bunopas, K. Ishii & S. Yoshikura (1999)- Rift-drift history and the amalgamation of Shan-Thai and Indochina/East Malaysia Blocks. In: I. Metcalfe (ed.) Gondwana dispersion and Asian accretion (IGCP 321 Final Results Volume), Balkema, Rotterdam, p. 67-87.
(Nan-Chanthaburi suture zone in SE part of C Thailand, between Shan-Thai (=Sibumasu) in W and Indochina/ E Malaya Blocks in E, regarded as main branch of Paleo-Tethys ocean. Two belts: in W imbricated bedded Chanthaburi chert-clastic sequence (former active margin of Shan-Thai terrane; cherts with M-L Triassic radiolaria), in E Thung Kabin serpentinite melange (incl. red cherts with E, M and L Permian radiolaria and blocks of E and M Permian fusulinid limestone). Both belts unconformably overlain by ?U Triassic greywacke-andestic tuffaceous sequence, then Khorat Gp redbeds. Collision age believed to be latest Triassic)

Hada, S., K. Ishii, C.A. Landis, J. Aitchison & S. Yoshikura (2001)- Kurosegawa Terrane in Southwest Japan: disrupted remnants of a Gondwana-derived terrane. Gondwana Research 4, p. 27-38.
(Kurosegawa Terrane in SW Japan, between two Mesozoic subduction complex terranes, is exotic terrane with Permian limestones with fusulinacean forams Cancellina, Colania and Lepidolina, suggesting terrane once situated within Colania- Lepidolina territory in E Tethys-Panthalassa region at equatorial latitude, possibly close to E margin of S China or Indochina-E Malaya continental blocks. These blocks had rifted from Gondwana by Late Devonian. Amalgamated with proto-Asian continent (S China?) in Late Triassic (or later))

Hall, R. (2015)- Provenance and basement studies of SE Asia. In: Asia Petrol. Geosc. Conf. Exhib. (APGCE), Kuala Lumpur, 5p. *(Extended Abstract)*
(Brief review of recent Royal Holloway sandstone provenance work (Gunawan, Sevastjanova, Zimmermann))

Hall, R. & H. Breitfeld (2017)- Nature and demise of the Proto-South China Sea. Bull. Geol. Soc. Malaysia 63 (Geol. Soc. Malaysia 50th Anniversary Issue 1), p. 61-76.

(online at: www.gsm.org.my/products/702001-101708-PDF.pdf
(Proto-South China Sea should be used only for oceanic slab subducted beneath Sabah and Cagayan between Eocene- E Miocene; Paleo-Pacific Ocean used here for lithosphere subducted under Borneo in Cretaceous. Good evidence for subduction between Eocene- E Miocene below Sabah, and W limit of Proto-S China Sea subduction was W Baram Line; subducted slab imaged in lower mantle by P-wave tomography. Present-day NW Borneo Trough and Palawan Trough not subduction trenches: NW Borneo Trough flexural response to gravity-driven deformation of Neogene sediment wedge NW of Sabah. Palawan Trough is continent-ocean transition at SE edge of modern S China Sea)

Hall, R., M.A. Cottam & M.E.J. Wilson (2011)- The SE Asian gateway: history and tectonics of the Australia-Asia collision. In: R. Hall, M.A. Cottam & M.E.J. Wilson (eds.) The SE Asian gateway: history and tectonics of the Australia-Asia collision, Geol. Soc, London, Spec. Publ. 355, p. 1-6.
(Introduction to collection of geological papers on E Indonesia from 2009 SAGE conference)

Hallam, A. (1986)- Evidence of displaced terranes from Permian to Jurassic faunas around the Pacific margins. J. Geol. Soc. London 143, p. 209-216.
(Permian- Jurassic Tethyan marine invertebrate faunas from low latitude can be distinguished from less diverse higher latitude faunas. Displacement of these low-latitude faunas high latitudes around Pacific margins provides evidence for movement of displaced terranes. Fullest story worked out for W margin of N America, as far N as S Alaska. Also evidence for N-ward movement of continental segments along NE Asian margin. Torlesse Terrane of New Zealand appears to have moved considerable distance S-wards)

Halle, T.G. (1935)- On the distribution of the Late Palaeozoic floras in Asia. Geografiska Annaler 17, Suppl. (Sven Hedin volume), p. 106-111.
(First paper to recognize three Permian floral provinces in Asia: Indian Gondwanan-Glossopteris in SW, Angara flora in N, Cathaysian/ Sino-Malayan or Gigantopteris flora in SE. No figures)

Hao, S. & P.G. Gensel (1998)- Some new plant finds from the Posongchong Formation of Yunnan, and consideration of a phytogeographic similarity between South China and Australia during the Early Devonian. Science in China, ser. D, 41, 1, p. 1-13.
(online at: http://engine.scichina.com/publisher/scp/journal/Sci%20China%20Earth%20Sci-D/41/1/10.1007/BF02932414?slug=full%20text)
(E Devonian plants from Posongchong Fm of SE Yunnan, suggest E Devonian NE Gondwana phytogeographic unit in Equatorial position, comprising Australia, S China Block and perhaps Shan-Thai Block)

Harzhauser, M., A. Kroh, O. Mandic, W.E. Piller, U. Gohlich, M. Reuter & B. Berning (2007)- Biogeographic responses to geodynamics: a key study all around the Oligo-Miocene Tethyan Seaway. In: 48th Phylogenetic Symposium on historical biogeography, Zoologischer Anzeiger 246, 4, p. 241-256.
(Extensive terrestrial exchanges initiated by closure of Tethyan Seaway in Early Miocene. Until closure, marine faunal exchange via Mesopotamian Trough and Zagros Basin, reflected by Indonesian corals in Iran and 'western' gastropods in Pakistan and India. Divergences on both sides of seaway starting in Oligocene. Around closure event Proto-Mediterranean faunas already little in common with Indo-West Pacific Region)

Hasegawa, S. (1996)- Ridge subduction model- a mechanism for an earlier South China Sea opening and an alternative paleogeographic reconstruction of Southeast Asia. In: 11th Offshore SE Asia Conf. Exhib. (OSEA96), Singapore 1996, p. 155-167.
(Late Mesozoic- Tertiary plate reconstruction, generally compatible with Tapponnier extrusion model. The now subducted Kula-Pacific Ridge beneath Eurasia Plate caused S China basins rifting and provides heat under S China continental crust))

Hashimoto, W., E. Aliate, N. Aoki, G. Balce, T. Ishibashi, N. Kitamura, T. Matsumoto, M. Tamura & J. Yanagida (1975)- Cretaceous system of Southeast Asia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 15, p. 219-287.
(online at: http://twgeoref.moeacgs.gov.tw/star/1975/19750026/0219.pdf)

(Extensive review of Japanese work on Cretaceous stratigraphy and paleontology of Taiwan, Philippines, Borneo, Java, Sulawesi, etc.. Incl. significant details on Cretaceous Orbitolina occurrences on Borneo)

Hashimoto, W. & T. Sato (1980)- Correlation of the structural belts in East and Southeast Asia. In: T. Kobayashi, R. Toriyama et al. (eds.) Symposium on the geology and paleontology of SE Asia, Tsukuba 1978, Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 21, p. 343-356.
(Brief review of Mesozoic and Cenozoic structural belts of SE and East Asia)

Hayami, I. (1984)- Jurassic marine bivalve faunas and biogeography in Southeast Asia. In: T. Kobayashi et al. (eds.) Geology and Palaeontology of Southeast Asia 25, University of Tokyo Press, p. 229-237.
(Unique E Jurassic (Pliensbachian?) heavy bivalve assemblage from Timor with Lithiotis, Pachymegalodon, Gervilleioperna, etc. described from Fatu Lst of Timor by Krumbeck (1923). Upper Jurassic bivalves in W Borneo part of East Asian Province with Philippines and Japan. Timor-Roti, Seram, Misool, etc., are part of Maorian Province with Malayomaorica and Retroceramus haasti)

He, C., S. Dong, M. Santosh & X. Chen (2012)- Seismic evidence for a geosuture between the Yangtze and Cathaysia Blocks, South China. Nature Scientific Reports 3, 2200, p. 1-7.
(online at: https://www.nature.com/articles/srep02200.pdf)
(S China block composed of sub-blocks Yangtze in NW and Cathaysia in SE, , which collided and amalgamated in Neoproterozoic along Jiangnan Orogen. Felsic lower crust of Cathaysia Block and Jiangnan orogenic belt may represent fragments derived from Gondwana supercontinent)

Heine, C. (2002)- The tectonic evolution of the Northwest Shelf of Australia and southern Southeast Asia. M.Sc. Thesis Ruhr-Universat Bochum and University of Sydney, p. 1-94.
(online at: www.earthbyte.org/people/christian/media/Heine_02_MScThesis_e-version.pdf)
(Argo and Gascoyne Abyssal Plains off NW Australia are the only preserved patches of Tethyan ocean floor; rest destroyed by subduction. W Burma Block identified as continental fragment breaking up from NW Shelf in Late Jurassic and accreted to SE Asian mainland in Santonian-Coniacian (85-80Ma) near W Thailand)

Heine, C., R.D. Muller & C. Gaina (2004)- Reconstructing the lost Eastern Tethys Ocean basin: convergence of the SE Asian margin and marine gateways. In: P. Clift et al. (eds.) Continent-ocean interactions within East Asian marginal seas, American Geophys. Union (AGU), Geophys. Monograph Ser. 149, p. 37-54.
(Reconstruction of E Tethys (Mesotethys and Neotethys) ocean basin for last 160 Myr, with reconstructions in 20 Myr increments, constrained by magnetic anomalies in Argo and Gascoyne abyssal plains of Australia NW shelf, assuming symmetrical spreading, etc.)

Honza, E. & K. Fujioka (2004)- Formation of arcs and backarc basins inferred from the tectonic evolution of Southeast Asia since the Late Cretaceous. Tectonophysics 384, p. 23-53.
(New data in NW West Philippines basin Daito Ridge used to reconstruct Late Cretaceous- Tertiary plate tectonics of SE Asia. In model S Borneo rotated 90° CCW since Cretaceous)

Hou, Z. & H. Zhang (2015)- Geodynamics and metallogeny of the eastern Tethyan metallogenic domain. Ore Geology Reviews 70, p. 346-384.

(Major review of metallogeny of eastern Tethysides)

Houseman, G. & P. England (1993)- Crustal thickening versus lateral expulsion in the Indian-Asian continental collision. J. Geophysical Research 98, B7, p. 12233-12249.
(Since beginning of continental collision between India and Asia ~2500 km of convergence. N-ward movement of India accommodated by major internal deformation of Asian lithosphere, incl. crustal thickening in and around Tibetan Plateau. Experimental modeling suggests crustal thickening dominant mode of indentation strain accommodation. Although common 10- 30° paleomagnetic rotations, probably not accompanied by large Eastward 'extrusion')

Hsu, K.J., J. Li, H. Chen, Q. Wang, S. Sun & A.M.C Sengor (1990)- Tectonics of South China: key to understanding West Pacific geology. Tectonophysics 183, p. 9-39.
(S China is composite of Proterozoic-Mesozoic orogenic belts. Three continental blocks: Yangzi, Huanan, and Dongnanya. Yangzi separated from Gondwana in Late Precambrian. N margin of Huanan was N active Gondwana margin until Devonian. Huanan and Yangzi collided in Triassic. Huanan separated in Devonian, with continuous Devonian-Triassic sequence on S passive margin of Huanan. Dongnanya with Permian glacial marine deposits, separated from Gondwana in Late Permian and may be E continuation of Sibumasu)

Huang, H. & X. Jin (2014)- Paleoclimatic implications of Permian fusulinids and carbonates from the Baoshan Block, southwestern China. In: R. Rocha et al. (eds.) Strati 2013- First Int. Congress on Stratigraphy, At the cutting edge of stratigraphy, Springer, p. 1105-1108.
(Permian fusulinids of Baoshan Block (= part of 'Sibumasu Group') lower generic diversity than coeval tropical assemblages. Dominant elements change from mainly eurytopic genera in E Permian/Sakmarian grainstones (>30°S; Pseudofusulina, Eoparafusulina) to warmer water algal-foram limestones in M Permian Murghabian (with Schwagerina, Eopolydiexodina) and Midian (with Sumatrina, Verbeekina))

Huang, W., D.J.J. Hinsbergen, P.C. Lippert, Z. Guo & G. Dupont-Nivet (2015)- Paleomagnetic tests of tectonic reconstructions of the India-Asia collision zone. Geophysical Research Letters 42, 8, p. 2642-2649.
(Late Cretaceous and Paleogene paleolatitudes of Tibetan Himalaya difficult to reconcile with current hypotheses of collision age (34, 52 or 65 Ma) and inferred Asian shortening (600-900km))

Huang, Z.C., D.P. Zhao & L. Wang (2015)- P wave tomography and anisotropy beneath Southeast Asia: insight into mantle dynamics. J. Geophysical Research, Solid Earth, 120, 7, p. 5154-5174.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2015JB012098/epdf)
(Tomographic images of mantle under SE Asia show high-velocity zones high-V zones around SE Asia which generally represent subducting slabs. Slabs generally extend down to the Mantle Transition Zone. Low-velocity zones with trench-normal anisotropy in uppermost mantle, indicating back-arc spreading or secondary mantle-wedge flow induced by slab subduction. Trench-parallel anisotropy in deep upper mantle reflects structures in subducting slab or in upper mantle surrounding slab. Gap in slab under area between Sumatra and Java)

(online at: http://onlinelibrary.wiley.com/doi/10.1029/2007GC001806/epdf)
(Include examples of tomography sections across Indonesia))

Li, C., R.D. van der Hilst & M.N. Toksoz (2006)- Constraining P-wave velocity variations in the upper mantle beneath Southeast Asia. Physics Earth Planetary Interiors 154, 2, p. 180-195.
(Tomographic inversions reveal high-velocity roots beneath Archean Ordos Plateau, Sichuan Basin and other continental blocks in SE Asia. Beneath Himalayan Block high velocities, associated with subduction of Indian lithospheric mantle, visible above 410 km discontinuity, and may not connect to remnant of Neo-Tethys oceanic slab in lower mantle. Only SW part of Tibetan plateau underlain by Indian lithosphere)

Li, C.F. & J. Wang (2016)- Variations in Moho and Curie depths and heat flow in Eastern and Southeastern Asia. Marine Geophysical Research 37, 1, p. 1-20.

(Oldest continental and oceanic domains (N China craton, Pacific and Indian Ocean) thermally perturbed by events probably linked to small-scale convection or serpentinization in mantle and volcanic seamounts and ridges. W Philippine Sea Basin anomalously small Curie depths. W Pacific marginal seas have lowest Moho temperature; contrary in most parts of easternmost Eurasian continent.Magmatic processes feeding Permian Emeishan large igneous province along plate boundary may be caused by tectonic processes along plate margins, rather than by deep mantle plume)

Li, P., Gao Rui, J. Cui & Guan Ye (2004)- Paleomagnetic analysis of eastern Tibet: implications for the collisional and amalgamation history of the Three Rivers Region, SW China. J. Asian Earth Sci. 24, p. 291-310.
(Analysis of paleolatitudes and latitudinal displacements for S China, Simao, Baoshan, Shan-Thai, Indochina, Qiangtang, Lhasa and Himalayan blocks: (1) Simao Block S China-derived; (2) Baoshan and Shan-Thai blocks rapid N drift from Late Carboniferous- Late Permian; (3) Baoshan Block collided with Simao Block in Late Permian and continued to drift N, together with S China and Shan-Thai blocks until Late Triassic; (4) Paleo-Tethys separating Baoshan and Simao blocks possibly opened in E Silurian; (5) Meso-Tethys ranged in age from E Permian- E Cretaceous, and reached greatest width of ~42° latitude in Late Triassic)

Li, S., E. Advokaat, D.J.J. van Hinsbergen, M. Koymans, C. Deng & R. Zhu (2017)- Paleomagnetic constraints on the Mesozoic-Cenozoic paleolatitudinal and rotational history of Indochina and South China: review and updated kinematic reconstruction. Earth-Science Reviews 171, p. 58-77.
(Review of paleomagnetic data suggests (1) no significant rotations of S China Block relative to Eurasia since latest Jurassic; (2) No paleomagnetically resolvable S-ward motion of Indochina Block (inclinations lower than expected, probably due to inclination shallowing in sediments; (3) large rotating blocks in N Indochina and SE Tibetan margin (up to 70° CW), more than ~10-15° rotation of stable SE Indochina Block. Blocks bounded by fold-thrust belts and strike-slip faults, accommodating Cenozoic block rotations. NW part of Indochina extruded 350 km more along Ailao Shan-Red River fault than SE part, accommodated by internal NW Indochina rotation and deformation. 250 km of extrusion of SE part of Indochina)

Li, S., B.M. Jahn, S. Zhao, L. Dai, X. Li, Y. Suo, L. Guo, Y.M. Wang et al. (2017)- Triassic southeastward subduction of North China Block to South China Block: insights from new geological, geophysical and geochemical data. Earth-Science Reviews 166, p. 270-285.
(Subduction prior to assembly of S China and N China blocks traditionally considered directed N-ward, but new tectonic model suggests SE ward subduction of N China under S China. S margin of N China Block passive margin in Triassic, without arc magmatism, etc. Suture lateral subduction zone rather than collision zone)

Li, S., D.J.J. van Hinsbergen, C. Deng, E. Advokaat & R. Zhu (2018)- Paleomagnetic constraints from the Baoshan area on the deformation of the Qiangtang-Sibumasu terrane around the Eastern Himalayan syntaxis. J. Geophysical Research, Solid Earth 123, 2, p. 977-997.
(Sibumasu Block in SE Asia E-ward continuation of Qiangtang Block. New paleomagnetic study on M Jurassic and Paleocene rocks from Baoshan block (N Sibumasu) suggests ~70-80° CW rotation since Paleocene (rotation in Eocene- M Miocene associated with Indochina extrusion + rotation after M Miocene associated with E-W extension in C Tibet)

Li, S.Z., S.J. Zhao, X. Liu, H.H. Cao, S. Yu, S. Li, I. Somerville, S.Y. Yu & Y.H. Suo (2018)- Closure of the Proto-Tethys Ocean and Early Paleozoic amalgamation of microcontinental blocks in East Asia. Earth-Science Reviews 186, p. 37-75.
(Proto-Tethys paleo-ocean located between Tarim/N China and Sibamusu/Baoshan blocks opened from rifting of supercontinent Rodinia and mainly closed at end of E Paleozoic. Several continents/microcontinents in ocean. S suture marked by Longmu Co-Shuanghu-Changning-Menglian Suture. Tarim- Alax- N China Block to N of the Proto-Tethys Ocean no clear affinity with Gondwana, had S-ward subduction polarity and collided with Gondwana along N margin of Gondwana in E Devonian. Etc.)

Li, X.X. (1986)- The mixed Permian Cathaysia-Gondwana flora. The Palaeobotanist 35, 2, p. 211-222.
(online at: http://14.139.63.228:8080/pbrep/bitstream/123456789/1262/1/PbV35N2_211.pdf)
(Mixed Gondwanan- Cathaysian floras from Turkey to Saudi Arabia, Kashmir to Western New Guinea)

Li, X.X. & G.L. Shen (1996)- A brief review of the Permian macrofloras in southeast Asia and their phytological delimitation. J. Southeast Asian Earth Sci. 13, p. 161-170.
(Overview of Permian macrofloras of SE Asia, with map of Permian phytogeographical provinces. Djambi flora of C Sumatra is southernmost Cathaysian flora. New Guinea Permian flora mixed Gondwanan and Cathaysian)

Li, X.X. & X.Y. Wu (1994)- The Cathaysian and Gondwana floras; their contribution to determining the boundary between eastern Gondwana and Laurasia. J. Southeast Asian Earth Sci. 9, 4, p. 309-317.
(Permian floras suggest boundary between E Gondwana and Laurasia runs along Bangongeo-Dengqen suture of Qinghai-Xizang plateau, turns S near Qamdo in E Xizang, then possibly extends through Baoshan District of W. Yunnan to link up with Pham Sore and Bentong-Raub sutures of Thailand- Peninsular Malaysia, from where it continues further S across E Sumatra to Indian Ocean. Jambi flora of Sumatra, Jengka and Linggiu floras of Malaysia and Phetchabun and Loei floras of Thailand all contain elements of Cathaysian flora. W New Guinea Permian floras mixed Cathaysian-Gondwana flora.)

Li, X.X. & X.Y. Wu (1996)- Late Paleozoic phytogeographic provinces in China and its adjacent regions. Review Palaeobotany Palynology 90, p. 41-62.
(Review of Devonian-Permian floral provinces of China. Cathaysian Floral province two major blocks: Sino-Korean-Tarim (N China) and S China Block, both vegetated by Euramerican floras until Late Carboniferous when Cathaysian elements first began to differentiate Two Cathaysian provinces established by Permian. Cathaysian flora developed in tropical, ever-wet climatic zone. Tropical conditions persisted in S China throughout Permian, but in N China, by early Late Permian alternating wet and dry climates, and by late Late Permian most of N Hemisphere in extreme arid conditions. Large leaved forms like Taeniopteris more common in N China and Gigantopteris almost completely restricted to S China. S China also with abundant Psaronius tree ferns and Gleicheniaceous ferns)

Li, Z.X. & C.M. Powell (2001)- An outline of the palaeogeographic evolution of the Australasian region since the beginning of the Neoproterozoic. Earth-Science Reviews 53, p. 237-277.
(Plate reconstructions of Australian region from 1000 Ma- recent)

Li, Z.X., L. Zhang & C.M. Powell (1996)- Positions of the East Asian cratons in the Neoproterozoic supercontinent Rodinia. Australian J. Earth Sci. 43, p. 593-604.
(Three major E Asian crustal blocks (Tarim, N China and S China) have records of the Neoproterozoic rifting events that broke up supercontinent Rodinia. Tarim Block may have been adjacent to Kimberley region, S China Block between E Australia and Laurentia, and N China Block adjacent to NW corner of Laurentia and Siberia during E Neoproterozoic. All three blocks probably separated from larger cratons towards end of Neoproterozoic but stayed close to Australian margins of Gondwanaland from Cambrian-Devonian)

Liao, S.Y., D.B. Wang, Y. Tang, F.G. Yin, S.N. Cao, L.Q. Wang, B.D. Wang & Z.M Sun (2015)- Late Paleozoic Woniusi basaltic province from Sibumasu terrane: implications for the breakup of eastern Gondwanaôs northern margin. Geol. Soc. America (GSA), Bull. 127, 9-10, p. 1313-1330.
(Late Paleozoic detachment of E Cimmerian Sibumasu terrane from Australian Gondwana margin may be initiated by mantle plume of Woniusi basaltic province in Yunnan, SW China (Baoshan Block= N Sibumasu terrane). Woniusi basalt province spread over ~12,000 km2 and ~300-500m thick. Zircon U-Pb ages Late Carboniferous- late E Permian (301-282 Ma), synchronous with basaltic rocks from Panjal Traps, Tethyan Himalaya, Lhasa, and S Qiangtang, forming large, fragmented igneous province, possibly sharing common mantle plume centered in N Greater India. Baoshan Block no thick Permian rift series (basalts mainly E Permian?: overlie glacial diamictite; faunal data suggest post-M Artinskian age (Ueno 2002)?JTvG))

Liao, S.Y., F.G. Yin, Z.M. Sun, D.B. Wang, Y. Tang & J. Sun (2013)- Early Middle Triassic mafic dikes from the Baoshan subterrane, western Yunnan: implications for the tectonic evolution of the Palaeo-Tethys in Southeast Asia. Int. Geology Review 55, 8, p. 976-993.

(Zircon U-Pb data indicate tholeiitic dikes similar to enriched mid-ocean ridge basalts emplaced at N part of Sibumasu terrane at 240± 3 Ma. Mafic dikes interpreted to be generated during suturing of Baoshan (Sibumasu) and Simao (Indochina) subterranes)

Liao, W.H. (1990)- The biogeographic affinities of East Asian corals. In: W.S. McKerrow and C.R. Scotese (eds.) Palaeozoic biogeography and biogeography, Mem. Geol. Soc., London, 12, p. 175-179.
(In E Asia tabulate and rugose corals present from E Ordovician- end Permian. Ordovician corals of N China related to Americo-Siberian region; S China close affinity to E Australia in Early Silurian, but more akin to Urals and C Asia in M-L Silurian. E-M Devonian 5 biogeographic provinces in E Asia: (1) Arctic; (2) Junggar-Hinggan; (3) Uralo-Tian Shan; (4) Paleotethys and (5) S China. In E Permian N and S parts of Asia belong to cold-water Lytvolasma fauna, middle part warm-water Tethyan with Iranophyllum/ Ipciphyllum fauna)

Lin, J.L., M. Fuller & W.Y. Zhang (1985)- Paleogeography of the North and South China blocks during the Cambrian. J. Geodynamics 2, p. 91-114.
(Paleomagnetic results show S China block close to equator in Cambrian, probably adjacent to N Australia. This juxtaposes Cambrian marine basins in S China and Australia, explains stratigraphic similarity between late Precambrian Sinian System in S China and Adelaide System in Australia and continuing fossil affinities in Cambrium- Ordovician. Proposed geographic configuration lasted from late Precambrian (800 Ma)- E Ordovician (470 Ma). Paleomag from Cambrian of N China block indicates it was in S Hemisphere, with paleontological evidence suggesting it was close to Tibet, Iran and N India during Paleozoic)

Liou, J.G., W.G. Ernst, R.Y. Zhang, T. Tsujimori, B.M. Jahn (2009)- Ultrahigh-pressure minerals and metamorphic terranes- the view from China. J. Asian Earth Sci. 35, p. 199-231.
(Review of Ultra High-Pressure (UHP) metamorphic terranes in China and adjacent areas. These represent continental and oceanic crustal protoliths which experienced P-T conditions near coesite stability field (>~2.7 GPa and ~700°C). Typical products include eclogite, garnet peridotite, and UHP varieties of metapelite, quartzite, marble, paragneiss and orthogneiss. UHP metamorphic assemblages require relatively cold lithospheric subduction to mantle depths. Includes some data from Indonesia (Sulawesi,))

Liu, B.P., Q.L. Feng, C. Chonglakmani & D. Helmcke (2002)- Framework of Paleotethyan archipelago ocean of western Yunnan and its elongation towards north and south. Earth Science Frontiers 9, 3, p. 161-171.
(Changning Menglian belt of W Yunnan continues N to Gangmacuo suture of NW Tibet and S to cryptic suture in N Thailand. Nan Uttaradit suture of NE Thailand probably extends N, but hidden under Mesozoic Cenozoic red beds of Simao basin. No evidence for stable Simao block during Paleotethys stage: sedimentary melanges consist of oceanic bedded cherts, seamount carbonates and passive margin clastics (Mae Sariang zone of NW Thailand). E Paleotethys probably double main branches. Mae Sariang zone probably connects NW to Luxi ophiolitic melange zone between Baoshan and Tengchong blocks in W Yunnan)

Liu, B.P., Q.L. Feng & N.Q. Fang (1991)- Tectonic evolution of the Paleo-Tethys in Changning-Menglian Belt and adjacent Regions, Western Yunnan. J. China University of Geosciences 2, p. 18-28.

Liu, B.P., Q.L. Feng & N.Q. Fang, J. Jia & F. He (1993)- Tectonic evolution of paleo-Tethys poly-island-ocean in the Changning-Menglian and Lancangjiang belts, southwestern Yunnan, China. Earth Science, Journal of China University of Geoscience 18, 5, p. 529-539. *(in Chinese, with English Abstract)*
(Changning-Mengliang belt between Baoshan-Gengma and Simao-Lincang massifs is suture zone, representing closed branch of Devonian- M Triassic poly-island Paleotethys Ocean. Lincang Massif probably isolated Gondwana-affinity terrane that accreted to W margin of Simao massif in M Permian. May be connected to Nan-Uttaradit suture of N Thailand before Late Permian))

Liu, B.P., Q.L. Feng, N.Q. Fang, J. Jia & F. He, W. Yang & D. Liu (1997)- Tectono-paleogeographic framework and evolution of the Paleotethyan archipelagoes ocean in Changning-Menglian belt, Western Yunnan, China. In: Devonian to Triassic Tethys in Western Yunnan, China University of Geosciences Press, p. 1-12.

Liu, S., Tao Qian, Wangpeng Li, Guoxing Dou, and Peng Wu (2015)- Oblique closure of the northeastern Paleo-Tethys in central China. Tectonics 34, 10.1002/2014TC003784, p. 1-22.
(NE branch of Paleo-Tethys Ocean that separated N China and South China plates closed by oblique collision along two N-dipping suture zones in C China. Shangdan suture developed in Late Paleozoic; Mianlue suture to S in M-L Triassic (collisional sutures obscured by thrust faults in S Qinling-Dabieshan orogen))

Lohman, D.J., M. de Bruyn, T. Page, K. von Rintelen, R. Hall, P.K.L. Ng, H.T. Shih, G.R. Carvalho & T. von Rintelen (2011)- Biogeography of the Indo-Australian Archipelago. Annual Review Ecology Evolution Systematics 42, p. 205-226.
(online at: http://searg.rhul.ac.uk/pubs/lohmann_etal_2011%20Biogeography%20of%20Indo-Australian%20archipelago.pdf)
(Extraordinary species richness and endemism in Indo-Australian Archipelago. Present distribution patterns of species shaped largely by pre-Pleistocene dispersal and vicariance events, whereas more recent changes in connectivity of islands in Archipelago influenced partitioning of intraspecific variation)

Long, J.A. & E. Buffetaut (2001)- A biogeographic comparison of the dinosaurs and associated vertebrate faunas from the Mesozoic of Australia and Southeast Asia. In: I. Metcalfe et al. (eds.) Faunal and floral migrations and evolution in SE Asia-Australasia. Balkema, Lisse, p. 97-104.
(dinosaurs and associated vertebrate faunas known from Late Triassic- Cretaceous of Australia and mainland SE Asia. Most taxa are of Early Cretaceous age. No similarities between SE Asia and Gondwana, but clear affinities between SE Asia and northern hemisphere)

Luyendyk, B.P. (1974)- Gondwanaland dispersal and the early formation of the Indian Ocean. In: B.P. Luyendyk & T.A. Davies (eds.) Initial Reports Deep Sea Drilling Project (DSDP) 26, p. 945-952.
(online at: www.deepseadrilling.org/26/volume/dsdp26_37.pdf)
(Early paper on formation of Indian Ocean and dispersal of Gondwana pieces towards Asia. Shows Late Jurassic separation of Borneo and Sulawesi from NW Australian margin)

Lynner, C. & M. D. Long (2014)- Sub-slab anisotropy beneath the Sumatra and circum-Pacific subduction zones from source-side shear wave splitting observations. Geochem. Geophys. Geosystems 15, 6, p. 2262-2281.
(Source-side shear wave splitting measurements for C America, Alaska-Aleutians, Sumatra, Ryukyu and Izu-Bonin-Japan-Kurile subduction systems. Trench parallel fast splitting dominant beneath Izu-Bonin, Japan, S Kurile slabs and part of Sumatra system; fast directions paralleling motion of downgoing plate dominant in Ryukyu, C America, N Kurile, W Sumatra and Alaska-Aleutian regions. Older subducting lithosphere (>95 Ma) associated with trench parallel splitting, younger lithosphere with plate motion parallel fast splitting directions)

Marcoux, J. & A. Baud (1996)- Late Permian to Late Triassic Tethyan paleoenvironments. Three snapshots: Late Murgabian, Late Anisian, Late Norian. In: X. Nairn et al. (eds.) The Tethys Ocean, Plenum Press, New York, p. 153-190.
(Three paleogeographic reconstructions of Tethys Ocean, from Europe to Australia (similar to maps of Tethys Atlas Project by Dercourt et al., 1993))

Maruyama, S., J.G. Liou & T. Seno (1989)- Mesozoic and Cenozoic evolution of Asia. In: Z. Ben-Avraham (ed.) The evolution of the Pacific Ocean margins, Oxford University Press, Monogr. Geol. Geoph. 8, p. 75-99.

Maruyama, S., J.G. Liou & M. Terabayashi (1996)- Blueschists and eclogites of the world and their exhumation. Int. Geology Review 38, 6, p. 485-594.
(Includes brief descriptions of Indonesian (Java, SE Kalimantan, Sulawesi, Timor, N New Guinea) and SW Pacific (E PNG, New Caledonia, etc.) blueschist occurrences)

Maruyama, S., H. Masago, I. Katayama, Y. Iwase, M. Toriumi, S. Omori & K. Aoki (2010)- A new perspective on metamorphism and metamorphic belts. Gondwana Research 18, p. 106-137.
(Includes discussion of ongoing exhumation of continent collision-type metamorphic belt in Timor-Tanimbar region)

Maruyama, S., S. Omori, H. Senshu, K. Kawai & B.F. Windley (2011)- Pacific-type orogens: new concepts and variations in space and time from present to past. J. Geography (Chigaku Zasshi) 120, p. 115-223.
(online at: www.jstage.jst.go.jp/article/jgeography/120/1/115/_pdf)
(In Japanese with English summary. Overview of Pacific-type active margins, with examples from Indonesia. Show Miocene forearc spreading in Banda outer arc, creating ophiolites that now rest on metamorphic belts from Timor, through Leti-Moa-Sermata to Dai islands, etc.)

Maung, H. (1983)- A new reconstruction of Southeast Asia and Gondwanaland in relation to mantle plumes or hotspots. Proc. South East Asia Petroleum Expl. Soc. (SEAPEX) 6, p. 66-70.

Mayr, E. (1945)- Wallaceõs Line in the light of recent zoogeographic studies. In: P. Honig & F. Verdoorn (eds.) Science and scientists in the Netherlands Indies. Board for the Netherlands Indies, Surinam and Curacao, New York, p. 241-250.
(Wallace's zoogeographic line not boundary between Indo-Malayan and Australian regions, rather the edge of Sunda shelf area. Weber's Line separates islands in W with predominantly Indo-Malayan elements from islands in E with dominantly Australo-Papuan elements)

Mazur, S., C. Green, M.G. Stewart, J.M. Whittaker, S. Williams & R. Bouatmani (2012)- Displacement along the Red River Fault constrained by extension estimates and plate reconstructions. Tectonics 31, 5, TC5008, p. 1-22.
(New plate tectonic interpretations for Greater S China Sea area since 35 Ma, partly constrained by amounts of extension computed from gravity models. Best-fit plate model assumes 250 km of left-lateral displacement along Red River Fault (calculated at Vietnamese coast of Gulf of Tonkin) from 35- 20.5 Ma)

McCabe, R. (1984)- Implications of paleomagnetic data on the collision related bending of island arcs. Tectonics 3, 4, p. 409-428.
(Paleomagnetic studies from C Philippines, Sulawesi, Fiji-New Hebrides, etc., show differences in declination within same arc. Rotated segments of upper plate where buoyant feature on downgoing plate (seamount, continental fragment or island arc) locally deforms margin of upper plate. Stresses resulting from collision may result in (1) strike-slip faults causing sideward extrusion of portions of upper plate; (2) changes in subduction zone polarity; (3) strike-slip faults around margin of indenter; or (4) reorganization of entire plate margin)

McCabe, R. & J. Cole (1987)- Speculations on the Late Mesozoic and Cenozoic evolution of the South East Asian margin. In: M.K. Horn (ed.) Trans. 4th Circum-Pacific Energy and Mineral Resources Conference, Singapore 1986, p. 375-394.
(Sulu, Celebes and Banda Sea marginal basins all have E-W trending magnetic anomalies, progressively younging to North from Cretaceous to Paleogene, therefore believed to be parts of single marginal oceanic basin. With 6 plate reconstruction maps Cretaceous-Miocene (Subsequent work suggests Banda Sea not Cretaceous but Neogene age: JTvG))

McCabe, R. & J. Cole (1989)- Speculations on the Late Mesozoic and Cenozoic evolution of the Southeast Asian margin. In: Z. Ben-Avraham (ed.) The evolution of the Pacific Ocean margins, Oxford Monographs Geol. Geophysics 8, Oxford University Press, p. 143-160.
(Same as McCabe and Cole 1987)

McCabe, R., S. Harder, J.T. Cole & E. Lumadyo (1993)- The use of palaeomagnetic studies in understanding the complex Tertiary tectonic history of East and Southeast Asia. In: B.K. Tan et al. (eds.) 7th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA VII), Bangkok 1991, J. Southeast Asian Earth Sci. 8, p. 257-268.
(Paleomag data from Philippines, Indo-China, Japan. Many published paleomagnetic studies on Mesozoic-Paleozoic rocks show magnetizations that are same as that of overlying Cenozoic volcanics, suggesting possible resetting, and making older rocks results suspect)

McCabe, R., D. Merrill, J.T. Cole & E. Lumadyo (1996)- The use of palaeomagnetic studies in understanding the complex Tertiary tectonic history of East and Southeast Asia. In: G.P. & A.C. Salisbury (eds.) Trans. 5th Circum-Pacific Energy and Mineral Resources Conference, Honolulu 1990, Gulf Publishing, Houston, p. 369-383.
(Same paper as McCabe et al. 1993)

McElhinny, M.W., B.J.J. Embleton, H. Max & Z.K. Zhang (1981)- Fragmentation of Asia in the Permian. Nature 293, p. 212-216.
(Compilation of Permian paleomagnetic data. Asia is composite continent formed by accretion of crustal blocks. Malay Peninsula and Japan were situated near Equator in Permian and therefore separated from Asian continent. Permian of Sino-Korean and Yangtze blocks of China also near Equator)

McElhinny, M.W., N.S. Haile & A.R. Crawford (1974)- Paleomagnetic evidence shows Malay Peninsula was not a part of Gondwanaland. Nature 252, 5485, p. 641-645.
(Reconnaissance paleomagnetic survey on Malay Peninsula suggests it lay at 15° N in Late Paleozoic, so could not have been part of Gondwanaland)

McGowran, B., M. Archer, P. Bock, T.A. Darragh et al. (2000)- Australasian palaeobiogeography: the Palaeogene and Neogene record. In: A.J. Wright et al. (eds.) Palaeobiogeography of Australasian fauans and floras, Mem. Assoc. Australasian Palaeontologists (AAP) 23 23, p. 405-470.

McLoughlin, S. (2001)- The breakup history of Gondwana and its impact on pre-Cenozoic floristic provincialism. Australian J. Botany 49, 3, p. 271-300.
(From Carboniferous to Cretaceous S continents broadly similar floras but some species-level provincialism apparent at all times. Gondwanan floras radical turnovers near end Carboniferous, end Permian and end Triassic that appear unrelated to isolation or fragmentation of supercontinent. Throughout Late Paleozoic and Mesozoic high-latitude southern floras maintained different composition to paleoequatorial and boreal regions even though they remained in physical connection with Laurasia for much of this time)

McManus, J. & R.B. Tate (1978)- Fragmentation of the China Plate and the development of marginal seas of S.E. Asia. Proc. SEAPEX Offshore SE Asia Conf., Singapore 1978, 14p.
(Tectonics of SE Asia, particularly Sulu- Celebes Seas. Some marginal seas originated by intraplate spreading, others by border spreading)

Meert, J. (2003)- A synopsis of events related to the assembly of eastern Gondwana. Tectonophysics 362, p. 1-40.
(Assembly of E part of Gondwana supercontinent (incl. E Africa, Arabia, India, E Antarctica and Australia) resulting from complex series of orogenic events from ~750- 530 Ma. Rel. little on Australia, which in ~800-700 Ma restores to N Hemisphere)

Mei, S. & C.M. Henderson (2001)- Evolution of Permian conodont provincialism and its significance in global correlation and paleoclimate implication. Palaeogeogr. Palaeoclim. Palaeoecology 170, p. 237-260.
(Early Permian Gondwana Cool Water Province with Vjalovognathus in Canning, Carnarvon basins and W Timor. Permian conodont provincialism not distinct until Kungurian)

Mei, S. & C.M. Henderson (2002)- Comments on some Permian conodont faunas reported from Southeast Asia and adjacent areas and their global correlation. J. Asian Earth Sci. 20, 6, p. 599-608.
(Conodont faunas from SE Asia classified in new faunal provinces: Equatorial Warm Water (EWWP), peri-Gondwana Cool Water (GCWP) and N Cool Water (NCWP; N China). GCWP marked by Vjalovognathus, etc., EWWP by absence of Gondolelloides and Vjalovognathus in E-M Cisuralian, abundance of Sweetognathus and Pseudosweetognathus in Kungurian, etc. Mixed faunas between EWWP and GCWP include W Timor Artinskian, SE Pamirs Kungurian and Salt Range Guadalupian- Lopingian)

Mei, S., C.M. Henderson & B.R. Wardlaw (2002)- Evolution and distribution of the conodonts *Sweetognathus* and *Iranognathus* and related genera during the Permian, and their implications for climate change. Palaeogeogr. Palaeoclim. Palaeoecology 180, p. 57-91.
(On evolution of conodonts of E-M Permian Sweetognathus and Late Permian Iranognathus lineages)

Meister, C. (2007)- Les Phricodoceratidae Spath, 1938 (Mollusca, Cephalopoda): ontogenese, evolution et paleobiogeographie. Geodiversitas 29, 1, p. 87-117.
(p. 112-113: Lower Jurassic ammonites described from Roti by Krumbeck (1922; Pliensbachian Ibex zone) have N Tethys affinities, suggesting these are from exotic blocks now on S Tethys/ Australian margin?)

Metcalfe, I. (1983)- Southeast Asia. In: R.H. Wagner et al. (eds.) The Carboniferous of the world, 1, Int. Union Geol. Sci. Publ. 16, p. 213-243.
(Extensive review of Carboniferous in W and E Malay Peninsula, W and NE Thailand, Vietnam, Laos, N and E Sumatra, W Sarawak, etc. Sumatra Alas Fm of Late Visean age)

Metcalfe, I. (1984)- Stratigraphy, palaeontology and palaeogeography of the Carboniferous of Southeast Asia. Mem. Soc. Geologique France, N.S. 147, p. 107-118.
(Older continental part of SE Asia four tectonic blocks (Sibumasu, Manabor (Malaya- Natuna- W Borneo), Indochina, S China), with independent pre-Triassic histories. Carboniferous mainly shallow marine with subordinate epicontinental and continental deposits. Carboniferous of Sibumasu continental margin deposits with glacial-marine diamictites. Manabor block shallow marine clastics with reefal limestones and abundant volcanics interpreted as possible island arc. C part of Indochina Block emergent in Carboniferous and bordered by non-marine. Carboniferous faunas of SE Asia mainly of Eurasian aspect)

Metcalfe, I. (1986)- Late Palaeozoic palaeogeography of Southeast Asia: some stratigraphical, palaeontological and palaeomagnetic constraints. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 1, Bull. Geol. Soc. Malaysia 19, p. 153-164.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1986012.pdf)
(First of many Metcalfe papers on SE Asian tectonic blocks, their Gondwanan origins and histories of rifting, drift and collision with Asia. SE Asia 4 tectonic blocks, SIBUMASU, MANABOR, Indochina and South China. Indochina and S China rifted off Gondwana in Late Devonian- E Carboniferous and sutured to each other by M Carboniferous. SIBUMASU separated from Australian Gondwana in late Lower Permian. MANABOR accreted to Indochina/S China by Late Triassic, possibly earlier)

Metcalfe, I. (1988)- Origin and assembly of South-East Asian continental terranes. In: M.G. Audley-Charles & A. Hallam (eds.) Gondwana and Tethys, Geol. Soc., London, Spec. Publ. 37, p. 101-118.
(Documentation of stratigraphic successions and paleobiogeographic affinities of Sibumasu, East Malaya, Indochina and SW Borneo blocks)

Metcalfe, I. (1989)- Carboniferous and Permian palaeogeography of Southeast Asia. Comptes Rendus 9th Congres Intern. Stratigraphie Geologie Carbonifere, Beijing 1987, 4, p. 245-264.

Metcalfe, I. (1990)- Allochthonous terrane processes in Southeast Asia. In: J. Dewey et al. (eds.) Allochthonous Terranes, Philos. Trans. Royal Soc. London, Ser. A, 331, 1620, p. 625-640.

Metcalfe, I. (1991)- Late Palaeozoic and Mesozoic palaeogeography of Southeast Asia. Palaeogeogr. Palaeoclim. Palaeoecology 87, p. 211-221.

Metcalfe, I. (1992)- Ordovician to Permian evolution of Southeast Asian terranes: NW Australian Gondwana connections. In: B.D. Webby & J.R. Laurie (eds.) Global perspectives on Ordovician geology, Proc. 6th Int. Symposium on the Ordovician System, A. A. Balkema, Rotterdam, p. 293-305.

(Continental 'core' of SE Asia four main terranes: South China. Sibumasu, Indochina and East Malaya. Ordovician faunas of S China and Sibumasu strong affinities with N and NW Australia and Tasmania and include forms endemic to Australia and Gondwana. Affinities of E Palaeozoic faunas of Indochina and E Malaya not yetknown. N China placed near N Australia, Sibumasu adjacent to NW Australia and S China, Indochina, Tarim, Tsaidam, Lhasa and Changtang blocks formed part of North India-Iran margin of Gondwana.)

Metcalfe, I. (1993)- Palaeomagnetic research in Southeast Asia: progress, problem and prospects. Exploration Geophysics 24, 2, p. 277-282.
(Stratigraphical, sedimentological, paleobiogeographic and paleomagnetic data suggest that probably all SE Asian continental terranes derived from Gondwana. Terranes assembled between Late Paleozoic and Cenozoic. Progressive CCW rotation of Borneo- Malay Peninsula region during Late Cretaceous- Cenozoic. Most Paleozoic data from mainland Asia probably affected by Late Carboniferous and Cretaceous resets. Paleomagnetic data vital for constraining movements of crustal blocks)

Metcalfe, I. (1993)- Southeast Asian terranes: Gondwanaland origins and evolution. In: R.H. Findlay et al. (eds.) Gondwana Eight- Assembly, evolution and dispersal, Proc. 8th Gondwana Symposium, Hobart, 1991, Balkema, Rotterdam, p. 181-200.

Metcalfe, I. (1994)- Late Palaeozoic and Mesozoic palaeogeography of Eastern Pangea and Tethys. In: A.F. Embry et al. (eds.) Pangea: global environments and resources, Canadian Soc. Petrol. Geol. Mem. 17, p. 97-111.
(Evolution of E Pangea and Tethys in Late Paleozoic- Mesozoic involved rifting of continental slivers/fragments from NE Gondwanaland, N-wards drift and amalgamation/accretion to form proto East Asia. Three continental slivers rifted from NE Gondwanaland in Silurian- E Devonian (N China, S China, Indochina/ E Malaya, Qamdo-Simao and Tarim terranes), E-M Permian (Cimmerian continent, incl. Sibumasu, Lhasa and Qiangtang terranes) and Late Jurassic (W Burma terrane, Woyla terranes). N-ward drift of terranes effected by opening and closing of three successive Tethys oceans, Paleo-Tethys, Meso-Tethys and Ceno-Tethys)

Metcalfe, I. (1994)- Gondwanaland origin, dispersion, and accretion of East and Southeast Asian continental terranes. J. South American Earth Sci. 7, 3-4, p. 333-347.
(Assembly of Gondwana-derived terranes in SE Asia)

Metcalfe, I. (1996)- Pre-Cretaceous evolution of SE Asian terranes. In: R. Hall & J. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc., London, Spec. Publ. 106, p. 97-122.
(Pre-Cretaceous continental terranes of E and SE Asia all derived from Gondwanaland. Continental slivers rifted from N margin of Gondwanaland in Devonian (N China, S China, Indochina/East Malaya/Simao, Qaidam and Tarim), E-M Permian (Cimmerian continent incl. Sibumasu and Qiangtang); and Late Triassic-Late Jurassic (Lhasa, W Burma and Woyla). N drift of terranes accompanied by opening and closing of Paleo-Tethys, Meso-Tethys and Ceno-Tethys. Assembly of Gondwanaland-derived terranes began with amalgamation of S China and Indochina/ E Malaya in Late Devonian/E Carboniferous to form 'Cathaysialand'. Suturing of Sibumasu and Qiangtang to Cathaysia in Late Permian-Triassic. S and N China amalgamated, then accreted to Laurasia by Late Triassic-E Jurassic. Kurosegawa Terrane of Japan possibly from Australian Gondwana, accreted to Japanese Eurasia in Late Jurassic. Lhasa, W Burma and Woyla terranes accretion to SE Asia in Cretaceous. SW Borneo and Semitau terranes derived from S China/ Indochina by Cretaceous opening of marginal basin, subsequently destroyed by S-ward subduction during rifting of Reed Bank-Dangerous Grounds terrane from S China when S China Sea opened)

Metcalfe, I. (1996)- Gondwanaland dispersion, Asian accretion and evolution of the eastern Tethys. Australian J. Earth Sci. 43, p. 605-623.

Metcalfe, I. (1997)-The Palaeo-Tethys and Palaeozoic- Mesozoic tectonic evolution of Southeast Asia. In: P. Dheeradilok et al. (eds.) Proc. Int. Conf. Stratigraphy and tectonic evolution of Southeast Asia and the South Pacific (GEOTHAI'97), Dept. Mineral Resources, Bangkok, 1, p. 260-272.
(online at: http://library.dmr.go.th/library/Proceedings-Yearbooks/M_1/1997/7641.pdf)

(Main Paleotethys Ocean basin, which separates Late Paleozoic Gondwanaland terranes from Late Paleozoic Cathaysian terrane, represented by Triassic suture zones Lancangjian and Changning-Menglian (SW China), Nan-Uttaradit and Sra Kaeo (Thailand) and Bentong-Raub (Peninsular Malaysia). Subsidiary branches of Paleotethys represented by Ailaoshan suture in Yunnan, Song Ma suture in Vietnam (E Carboniferous) and other possible suture segments in N Thailand and S China. Radiolarian assemblages from deep marine cherts show Paleotethys opened in M-L Devonian and closed in Late Triassic)

Metcalfe, I. (1998)- Palaeozoic and Mesozoic geological evolution of the SE Asian region: multidisciplinary constraints and implications for biogeography. In: R. Hall & J.D. Holloway (eds.) Biogeography and geological evolution of SE Asia. Backhuys Publ., Leiden, p. 25-41.
(online at: http://searg.rhul.ac.uk/searg_uploads/2016/01/Metcalfe.pdf)
(On E and SE Asia 'jigsaw puzzle' of continental terranes))

Metcalfe, I. (1999)- The ancient Tethys Oceans of Asia: how many? how old? how deep? how wide? UNEAC Asia papers, University of New England, Armidale, 1, p. 1-9.
(online at: www.une.edu.au/asiacentre/PDF/Metcalfe.pdf)
(Tethys in E Asia three successive ocean basins: Paleo-Tethys (late E Devonian- M Triassic), Meso-Tethys (late E Permian- Late Cretaceous) and Ceno-Tethys (Late Triassic (W)/Late Jurassic (E)- Cenozoic). Ocean basins water depths comparable to modern ocean basins and all three had widths of 2000- 3000 km in E parts at maximum development)

Metcalfe, I. (1999)- The ancient Tethys Oceans of Asia: how many? how old? how deep? how wide? In: Ratanasthein, B. & S.L. Rieb (eds.) Proc. Int. Symposium on Shallow Tethys (ST) 5, Chiang Mai, Thailand, 1999, p. 1-15.

Metcalfe, I. (2002)- Permian tectonic framework and palaeogeography of SE Asia. J. Asian Earth Sci. 20, 6, p. 551-566.
(On Gondwanan versus S China/Indochina-derived continental terranes in SE Asia. 'Cathaysian' S China-Indochina and Simao terranes at equatorial paleolatitude in Permian, but derived from Gondwana in Devonian. Sibumasu attached to NW Australia Gondwana until Sakmarian, then evolved through Permian intermediate stage to Cathaysian, reflecting separation and N ward drift. W Birma and smaller terranes (Paternoster, W Sulawesi, Mangkalihat) split off Gondwana in Late Triassic- Jurassic. SW Borneo, Luconia, Reed Bank, Palawan derived from S China/ Indochina in Cretaceous. Various terranes in E Indonesia derived from New Guinea in Cenozoic)

Metcalfe, I. (2002)- Tectonic history of the SE Asian-Australian region. In: P. Kershaw et al. (eds.) Bridging Wallace's Line: the environmental and cultural history and dynamics of the SE Asian- Australian region, Advances in Geology 34, Catena Verlag, p. 29-48.

Metcalfe, I. (2005)- Asia: South-East. In: R.C. Selley et al. (eds.) Encyclopedia of Geology 1, Elsevier, Oxford, p. 169-198.
(Elegant review of plate tectonic evolution of SE Asia since Early Paleozoic and distributions of mineral resources)

Metcalfe, I. (2008)- Gondwana dispersion & Asian accretion: an update. In: Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516 and 5th APSEG, Bangkok, p. 23-25.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/003.pdf)
(Re-evaluations suggest W Sumatra and W Burma blocks separated from Gondwana in Devonian, along with Indochina and E Malaya and together with S China formed 'Cathaysialand' in Permian. 'Argoland', which separated from NW Australia in Jurassic previously interpreted to be W Burma but may be SW Borneo)

Metcalfe, I. (2009)- Late Palaeozoic and Mesozoic tectonic and palaeogeographic evolution of SE Asia. In: E. Buffetaut, G. Cuny et al. (eds.) Late Palaeozoic and Mesozoic continental ecosystems in SE Asia. Geol. Soc. London, Spec. Publ. 315, p. 7-23.
(online at: https://imetcal2.une.edu.au/web-data/PDF%20Files/Metcalfe%202009%20Geol%20Soc.pdf)
(SE Asia collage of continental terranes derived from India-Australian margin of E Gondwana. Late Paleozoic-Mesozoic rifting and separation of three elongate continental slivers from E Gondwana and opening and closure of Paleo-Tethys, Meso-Tethys and Ceno-Tethys ocean basins. W Sumatra, W Burma, Indochina and East Malaya blocks separated from Gondwana in Devonian and with S China formed 'Cathaysialand' in Permian. They were translated W to positions outboard of Sibumasu Terrane by strike-slip tectonics in Late Permian-E Triassic at convergence between Meso-Tethys and Palaeo-Pacific plates. SW Borneo, previously considered of 'Cathaysian' origin, is possibly 'Argoland' that separated from NW Australia in Jurassic)

Metcalfe, I. (2009)- Comment on ñAn alternative plate tectonic model for the Palaeozoic-Early Mesozoic Palaeotethyan evolution of Southeast Asia (Northern Thailand-Burma)ò by O.M. Ferrari et al. (2008). Tectonophysics 471, p. 329-332.

(Critique of Ferrari et al. redefining 'Shan-Thai' terrane in Thailand as Cathaysian, Indochina-derived terrane instead of traditional view of Gondwanan continental block, introducing unnecessary confusion. Mai Yuam Fault, identified as Paleo-Tethys suture, is Cenozoic fault. Paleo-Tethys suture zone represented by Inthanon Suture zone in Thailand, equivalent to previously recognized Inthanon zone. Concept of derivation of 'Orang Laut' terranes from S China- Indochina by back-arc spreading is innovative. Little evidence to support proposed S-wards subduction of Paleo-Tethys beneath E Gondwana in Permian)

Metcalfe, I. (2010)- Gondwana dispersion and Asian accretion: tectonic and palaeogeographic evolution of eastern Tethys. In: 6th Symp. Int. Geol. Correl. Program Project 516, Geological anatomy of East and South Asia, Kuala Lumpur 2010, p. 13-15.

(online at: https://imetcal2.une.edu.au/web-data/PDF%20Files/Metcalfe%202011%20Gond%20Res%20Sundaland.pdf)
(Sundaland collage of continental blocks derived from E Gondwana and assembled by closure of multiple Tethyan and back-arc ocean basins. Core of Sundaland comprises Sibumasu block in W and Indochina-E Malaya block in E, with island arc terrane, which formed on Indochina- E Malaya margin, in-between. Paleo-Tethys represented by Changning-Menglian, Chiang Mai/Inthanon and Bentong-Raub suture zones. W Sumatra and possibly W Burma blocks separated from Gondwana, with Indochina and E Malaya in Devonian and accreted to Sundaland core in Triassic. W Burma now considered Cathaysian, similar to W Sumatra, from which it separated by Andaman Sea opening. SW Borneo and E Java-W Sulawesi tentatively identified as 'Banda Block' and 'Argoland', which separated from NW Australia in Jurassic and accreted to SE Sundaland in Cretaceous (puzzling how these rifted off NW Australia at same time, switch relative E-W positions along way, then both accreted to Sundaland margin at similar time but with Meratus suture separating them?; JTvG))

Metcalfe, I. (2011)- Palaeozoic-Mesozoic history of SE Asia. In: R. Hall, M.A. Cottam & M.E.J. Wilson (eds.) The SE Asian gateway: history and tectonics of Australia-Asia collision, Geol. Soc., London, Spec. Publ. 355, p. 7-35.
(online at: https://www.academia.edu/13303900/Palaeozoic_Mesozoic_history_of_SE_Asia)
(One of later versions of Metcalfe SE Asia Cambrian- Eocene reconstructions of Gondwana-derived blocks and Tethyan oceans. Recent modification is identification of SW Borneo and/or E Java- W Sulawesi as missing ‘Argoland’ that separated from NW Australia in Jurassic and accreted to SE Sundaland in Cretaceous)

(online at: https://s3.amazonaws.com/academia.edu.documents/36381227/Metcalfe_2013_)
(Review paper on SE Asian plate tectonics. SW Borneo and E Java- W. Sulawesi now identified as missing 'Banda' and 'Argoland' blocks, separated from NW Australia in Late Triassic- Late Jurassic by opening of Ceno-Tethys and accreted to SE Sundaland by subduction of Meso-Tethys in Cretaceous)

Metcalfe, I. (2017)- Tectonic evolution of Sundaland. Bull. Geol. Soc. Malaysia 63 (Geol. Soc. Malaysia 50th Anniversary Issue 1), p. 27-60.
(online at: www.gsm.org.my/products/702001-101709-PDF.pdf)
(Latest in series of Metcalfe review papers on SE Asian plate tectonics. By Late Triassic principal continental core blocks of Sundaland (Sibumasu, Sukhothai Arc, Simao, Indochina) had amalgamated and collided with S and N China to form proto-E and SE Asia. Paleo-Tethys represented by Changning-Menglian, Chiang Mai-Chiang Rai, Chanthaburi and Bentong-Raub Suture Zones that form boundary between Sibumasu and Sukhothai Arc. Sukhothai Arc formed on margin of Indochina in Carboniferous, then separated by back-arc spreading in Permian. Jinghong, Nan-Uttaradit and Sra Kaeo Sutures represent this closed back-arc basin. Cathaysian W Sumatra Block with its continental margin arc may well be displaced segment of Sukhothai Arc system, translated outboard of Sibumasu by strike-slip tectonics in Triassic. W Burma Block was already attached to Sundaland

before Late Triassic and is likely disrupted part of Sibumasu. Nature of any hidden continental core of SW Borneo remains enigmatic. Etc.)

Monnier, C. (1996)- Mechanismes dôaccretion des domaines oceaniques arriere-arc et geodynamique de lôAsie du Sud-Est. These Doct. Universite de Bretagne Occidentale, p. 1-605.
('Accretion mechanisms of oceanic fore-arc domains and geodynamics of SE Asia')

Morley, C.K. (2001)- Combined escape tectonics and subduction rollback-back arc extension: a model for the evolution of Tertiary rift basins in Thailand, Malaysia and Laos. J. Geol. Soc., London, 158, 3, p. 461-474.
(Tertiary rift basins of Thailand and adjacent countries show considerable variability in timing of rifting and inversion episodes. Rift basins developed on blocks that were extruded SE-ward, possibly tied to Himalayan extrusion tectonics. In Thailand major sinistral strike-slip motion ceased at ~30 Ma, prior to formation of most rift basins. Alternative mechanism to open rift basins is subduction rollback of Indian plate W of Thailand)

Morley, C.K. (2002)- A tectonic model for the Tertiary evolution of strike-slip faults and rift basins in SE Asia. Tectonophysics 347, p. 189-215.
(Two types of SE Asia Tertiary evolution models: (1) escape tectonics with no proto-S China Sea, (2) subduction of proto-S China Sea oceanic crust beneath Borneo. Proposed tectonic model with key points: (1) Ailao Shan- Red River shear zone mainly active in Eocene-Oligocene tied to extension in S China Sea, less active in Miocene; (2) three regions of metamorphic core complex development affected Indochina from Oligocene-Miocene; (3) Subduction of proto-S China Sea in Eocene- E Miocene necessary to explain evolution of NW Borneo; (4) Eocene-Oligocene collision of NE India with Burma activated extrusion tectonics in mainland SE Asia and right lateral motion along Sumatran subduction zone)

Morley, C.K. (2004)- Nested strike-slip duplexes, and other evidence for Late Cretaceous-Palaeogene transpressional tectonics before and during India-Eurasia collision in Thailand, Myanmar and Malaysia. J. Geol. Soc. London 161, p. 799-812.
(Late Cretaceous S-type granites from Malaysia-Thailand to Myanmar long used to infer episode of crustal thickening, supported by late Cretaceous-Eocene ophiolites in Myanmar, but no evidence for associated fold-thrust belt. Fission-track studies of Thailand indicate modest regional uplift from ~80-40 Ma. Left lateral motion on major NW-SE-trending strike-slip fault zones (Mae Ping and Three Pagodas faults) in Myanmar and Thailand attributed to Himalayan-Tibetan escape tectonics, but fault zones are network of branching faults with important N-S trends as well as NW-SE trends. This diffuse 1000 km long/up to 250 km wide, branching network of strike-slip faults may represent Late Cretaceous- Paleogene transpressional belt. Himalayan escape tectonics represent later deformation)

Morley, C.K. (2007)- Variations in Late Cenozoic- Recent strike-slip and oblique-extensional geometries, within Indochina: the influence of pre-existing fabrics. J. Structural Geol. 29, p. 36-58.
(From Yunnan to N Thailand, Late Cenozoic-Recent faults strike predominantly NNE-SSW, N-S to NNE–SSW and NE-SW to ENE-WSW. Associated sedimentary basins are aligned NE-SW to N-S. Fault patterns commonly interpreted as strike-slip dominated deformation, but N Thailand interpreted to have evolved mainly by oblique extension. Multiple episodes of basin inversion in N Thailand during Miocene require changes in stress pattern)

Morley, C.K. (2009)- Evolution from an oblique subduction back-arc mobile belt to a highly oblique collisional margin: the Cenozoic tectonic development of Thailand and eastern Myanmar. In: P.A. Cawood & A. Kroner (eds.) Earth accretionary systems in space and time, Geol. Soc., London, Spec. Publ. 318, p. 373-403.

(N to NE subduction beneath SE Asia during Mesozoic-Cenozoic resulted in development of hot, thickened crust in Thailand-Myanmar region in back-arc mobile belt setting. Setting changed in Eocene-Recent to highly oblique collision when India coupled with W Burma block)

Morley, C.K. (2012)- Late Cretaceous- Early Palaeogene tectonic development of SE Asia. Earth-Science Reviews 115, p. 37-75.
(Late Cretaceous-E Paleogene history of continental core of SE Asia (Sundaland), prior to India- Asia collision. In Myanmar and Sumatra subduction s interrupted in Aptian-Albian by phase of arc accretion (Woyla and Mawgyi arcs) and in Java, E Borneo and W Sulawesi by collision of continental fragments rifted from N Australia. Subsequent resumption of subduction in Myanmar-Thailand sector explains: (1) early creation of oceanic crust in Andaman Sea in supra-subduction zone setting at ~95 Ma;(2) belt of granite plutons of Late Cretaceous- E Paleogene age in W Thailand and C Myanmar; (3) amphibolite grade metamorphism at 70-80 Ma in W and C Thailand; and (4) accretionary prism development in W Belt of Myanmar, until glancing collision with NE corner of Greater India promoted ophiolite obduction and deformation in E Paleogene)

Morley, C.K. (2013)- Discussion of tectonic models for Cenozoic strike-slip fault-affected continental margins of mainland SE Asia. J. Asian Earth Sci. 76, p. 137-151.
(On relationship between Cenozoic strike-slip faults of mainland SE Asia and adjacent sedimentary basins (Gulf of Thailand, Gulf of Martaban/Andaman Sea, Gulf of Tonkin. Most major onshore SE Asia strike-slip faults probably do not extend far offshore)

Morley, C.K. (2018)- Understanding Sibumasu in the context of ribbon continents. Gondwana Research 64, p. 184-215.
(Ribbon continent collision belts like Zealandia, provide analogues for Permo-Triassic development of Sibumasu. Key parameters for ribbon continents are width, and how rifting developed. Characteristics of Sibumasu tectonics: (1) basin inversion in Late Triassic and possibly E Jurassic, and mixed thick- and thin-skinned deformation; (2) extensional collapse around 215 Ma; 3) Slab delamination and extension-related decompression melting probably important for generating granites in addition to crustal thickening; (4) metamorphism is relatively high T, lower P).

Morley, C.K., R. King, R. Hillis, M. Tingay & G. Backe (2011)- Deepwater fold and thrust belt classification, tectonics, structure and hydrocarbon prospectivity: a review. Earth-Science Reviews 104, p. 41-91.
(Overview of deepwater fold-thrust systems. Two types: Type 1 mainly on passive margins, driven by sediment loading or local uplift, typically with high-quality continent-derived quartz sst reservoirs; Type 2 on active margins, in areas of continental convergence. Examples include NW Borneo, W Sulawesi- Makassar Straits, Banda Arc, Seram)

Morley, R.J. (2000)- Origin and evolution of tropical rain forests. John Wiley & Sons, New York, p. 1-362.
(SE Asia chapter describes Cenozoic vegetation response to plate tectonic evolution, as reflected in Indonesia palynology records. Middle Eocene arrival of palynomorphs known from older deposits in India is consequence of India-Asia collision. In M Eocene SW Sulawesi has Laurasian flora, and was attached to E Kalimantan. Makassar Straits became floral-faunal migration barrier in Late Eocene. First Australian- New Guinea floral elements (Casuarina, etc.) start appearing in W Java Sea around 22-21 Ma)

Moyne, S. & P. Neige (2007)- The space-time relationship of taxonomic diversity and morphological disparity in the Middle Jurassic ammonite radiation. Palaeogeogr. Palaeoclim. Palaeoecology 248, p. 82-95.

(Conodont faunas of allochthonous East Asian terranes show biogeographic affinities with Australasia during Cambrian- Permian, suggesting close proximity or Australian Gondwanaland from ~500- 250 Ma)

Nie, S., D.B. Rowley & A.M. Ziegler (1990)- Constraints on the location of Asian microcontinents in Palaeo-Tethys during the Late Palaeozoic. In: W.S. McKerrow & C.R. Scotese (eds.) Palaeozoic palaeogeography and biogeography, Geol. Soc., London, Mem. 12, p. 397-409.
(Overview of Permian terranes history, mainly of mainland Asia. Biogeographic provinces well developed in Late Paleozoic due to steep equator-to-pole gradients. As continents rifted from S margin of Paleo-Tethys, they lost temperate Gondwanan affinities and acquired sub-tropical to tropical floras and faunas. A S belt of terranes, from Helmand block in Iran-Afghanistan, through W Qiangtang and Lhasa blocks of Tibet to Sibumasu block of Thailand-Malaya, all rifted off margins of Gondwana in Permian. Cathaysian floras existed in N parts of Gondwana (New Guinea), and since Cathaysian plants like Gigantopteris had to be dispersed by seeds this suggests land connections between Cathaysian microcontinents and Gondwana)

Niu, Y., Y. Liu, Q. Xue, F. Shao, S. Chen, M. Duan, P. Guo, H. Gong, Y. Hu, Z. Hu, J. Kong et al. (2015)- Exotic origin of the Chinese continental shelf: new insights into the tectonic evolution of the western Pacific and eastern China since the Mesozoic. Science Bull. (China) 60, 18, p. 1598-1616.
(online at: http://engine.scichina.com/publisher/scp/journal/SB/60/18/10.1007/s11434-015-0891-z?slug=full%20text)
(Basement of continental shelf beneath E and S China Seas may be of exotic origin, geologically unrelated to continental lithosphere of E China. Jurassic-Cretaceous granitoids in region associated with W Pacific oceanic

subduction. 'Sudden' termination of granitoid magmatism at ~88 ± 2 Ma suggests trench jam at ~100 Ma, pointing to collision of buoyant oceanic plateau or microcontinent. Jammed trench (suture) located near coastline of SE continental China. Trench jam at ~100 Ma led to re-orientation of Pacific plate motion, making boundary between Pacific plate and newly accreted plate of E Asia transform fault E of exotic-origin continental shelf. This explains apparent ~40 Myr magmatic gap from ~88 to ~50 Ma)

Page, K.N. (2008)- The evolution and geography of Jurassic ammonoids. Proc. Geologists Assoc. 119, 1, p. 35-57.
(Jurassic ammonites 7 suborders, in ~20 distinguishable biogeographical provinces and subprovinces. S Pan-Tethyan Realm includes Mediterranean-Caucasian, E Pacific, Indo-Pacific and Austral realms/ subrealms. Indo-Malgach Province recognizable first in Callovian, with endemic Sphaeroceratidae (Macrocephalites, Subkossmatia) and Perisphinctidae (Indosphinctes, Choffatia, Kinkeliniceras, etc.). Persisted into Oxfordian times, with place of Macrocephalitinae taken by endemic Mayatinae. By Tithonian, several restricted Indo-Pacific/Austral genera and endemic species: Pachysphinctes, Virgatosphinctes, Aulacosphinctoides, Himalayitidae, Neocomitidae (incl. endemic Blanfordiceras), Uhligites, etc.)

Peltzer, G. & P. Tapponnier (1988)- Formation and evolution of strike-slip faults, rifts, and basins during the India-Asia collision: an experimental approach. J. Geophysical Research 93, B12, p. 15085-15117.

(More extensive discussion of Tapponnier et al. 1982 plasticine models, used to explain SE Asia extrusion)

Philippe, M., M. Bamford, S. McLoughlin, L.S.R. Alves, H.J. Falcon-Lang, S. Gnaedinger, E.G. Ottone, M. Pole, A. Rajanikanth, R.E. Shoemaker, T. Torres & A. Zamuner (2004)- Biogeographic analysis of Jurassic-Early Cretaceous wood assemblages from Gondwana. Rev. Paleobotany Palynology 129, p. 141-173.
(Distribution of Jurassic- Early Cretaceous fossil wood across Gondwana suggests 5 climate zones: summer wet, desert, winter wet, warm temperate, cool temperate. Araucarian-like conifer wood dominant, cosmopolitan element, whereas other taxa more provincialism)

Pitfield, P.E.J. (1987)- Report on the geochemistry of the Tin islands of Indonesia. British Geological Survey, Overseas Directorate, Report No. MP/87/9/R, p.

Pitfield, P.E.J. (1987)- Geochemistry of the Tin Islands granites of Indonesia in relation to those of Peninsular Malaysia. Warta Geologi 13, p. 125-133.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1987003.pdf)
(In Thai-Malay Peninsula two separate granite provinces established, separated by Raub-Bentong line suture: (1) Main Range granitoids (associated with 'Sibumasu' Lower Paleozoic shallow marine sequences) and (2) Eastern Province (C and E Belts) granitoids (associated with Permo-Triassic deeper water volcano-sedimentary sequences). Tin Islands of Indonesia largely fall in Permo-Triassic volcano-sedimentary terrain, but characteristics of granites variable. Comparisons of granitoids suggest S-ward extrapolation of Raub-Bentong line between Karimun (E Province type) and Kundur (Main Range type) along chain of isles comprising Merak gabbro. Further S it may pass through C Singkep Island between Dabo (E Province type) and unnamed Main Range pluton in SW Belitung seems to comprise largely E Province plutons)

Pitfield, P.E.J., E.J. Cobbing, M.C.G. Clarke, D.I.J. Mallick & L.H. Teoh (1987)- Granite provinces in the Southeast Asian Tin Belt. In: M.K. Horn (ed.) Trans. 4th Circum Pacific Energy and Mineral Resources Conf., Singapore 1986, p. 575-589.
(Four granite provinces delineated in SE Asia tin belt: (1) Eastern Province (I-type, Carboniferous- Triassic 200-280 Ma; volcanic arc, and 70-80 Ma), (2) Main Range (S-type, mainly Triassic, 200-230 Ma; syn-collisional), (3) N Thailand Migmatitic (S-type, Permo-Triassic; syn-collisional) and (4) Western (Peninsular Thailand- Burma, S and I-types, Cretaceous 82-98 and 130 Ma). E and C Belts of Peninsular Malysia distinguished by Hutchison (1977), but are similar. Tin Islands of Indonesia part of E Province, Permo-Triassic. Widespread Cretaceous post-orogenic plutons, but not in Main Range and Tin Islands and not associated with mineralization)

Pitfield, P.E.J., L.H. Teoh & E.J. Cobbing (1990)- Textural variation and tin mineralization in granites from the main range province of the Southeast Asian Tin Belt. Geological Journal 25, p. 419-429.
(Textural evolution from coarse K-feldspar megacrystic granite, through heterogeneous granite porphyry to microgranite corresponds to sequence of geochemical evolution)

Ridd, M.F. (1971)- South East Asia as part of Gondwana. Nature 234, p. 531-533.
(Stratigraphic evidence in Thailand and Malaya suggest they were once joined with India (E Permian tilloids in Phuket Group of Thailand, etc., cratonic clastic source from W for Malay Peninsula and Thailand, detrital diamonds in Permian Phuket Gp of Thailand, etc.). India and SE Asia must have drifted N to collide with mainland Asia after break-up of Gondwanaland. 'Interesting' reconstruction)

Ridd, M.F. (1980)- Possible Palaeozoic drift of SE Asia and Triassic collision with China. J. Geol. Soc., London, 137, 5, p. 635-640.
(Paleozoic- E Mesozoic of Thai-Malay Peninsula provide evidence of subduction zone to E and, in Lower Paleozoic, cratonic sediment source to W. First paper to recognize separation of W Thai- Malay Peninsula from Gondwana in mid-Paleozoic and collision with mainland Asia in Late Triassic)

Ridd, M.F. (2015)- East flank of the Sibumasu block in NW Thailand and Myanmar and its possible northward continuation into Yunnan: a review and suggested tectono-stratigraphic interpretation. J. Asian Earth Sci. 104, 5 160-174.
(E flank of Sibumasu block was passive continental margin, marked in NW Thailand by absence of M Permian-Triassic platform carbonates, widespread across Sibumasu further W. Instead, hemipelagic cherts, mudstones and sandstones including turbidites. Devonian-Triassic accretionary wedge in front of Sukhothai volcanic arc thrust W-wards across E flank of Sibumasu in M-L Triassic, then became source of terrigenous clastic rocks in foredeep basin in W. Boundary with Sibumasu Permo-Triassic carbonate platform further W is Mae Ping-Nam Teng Fault system. N-wards in Myanmar and Yunnan Sibumasu Permo-Triassic carbonate shelf continues as Shan Plateau and Baoshan Block. E flank is represented by Changning-Menglian Belt, and Paleotethys 'cryptic suture' in Thailand possibly joins with Lancangjiang Suture)

Ridd, M.F. (2016)- Should Sibumasu be renamed Sibuma? The case for a discrete Gondwana-derived block embracing western Myanmar, upper Peninsular Thailand and NE Sumatra. J. Geol. Soc., London, 173, 2, p. 249-264.
(Luxi-Nujiang suture extends from Yunnan into Myanmar and continues into Thailand and Malacca Strait. It separates the Gondwana-derived Sibumasu Block' into two terranes: (1) Irrawaddy Block in W, with thick Lower Permian, glacial diamictite-bearing sediments (= 'Phuket Slate Belt' of Thailand/ Tengchong Block of Yunnan/ Lhasa Terrane in Tibet? and much of Bohorok facies of Sumatra); (2) Sibuma Block in E, with local, rel. thin, Lower Permian marine ice-rafted deposits (= Shan-Tai Plateau of E Myanmar/ Baoshan Block of Yunnan/ Qiantang Terrane of Tibet?). NE Sumatra diamictite-bearing E Permian probably also part of Irrawaddy Block. Late Cretaceous-Paleogene dextral India-Australia oceanic transform propagated onshore as strike-slip fault, which disrupted Irrawaddy Block)

Rigby, J.F. (1998)- Upper Palaeozoic floras of SE Asia. In: R. Hall & J.D. Holloway (eds.) Biogeography and geological evolution of SE Asia, Backhuys Publ., Leiden, p. 73-82.
(online at: http://searg.rhul.ac.uk/searg_uploads/2016/01/Rigby.pdf)
(Minor Carboniferous flora in Thailand and W Malaysia (including 'Kuantan flora'), probably similar to S China floras. More extensive Permian floras known from Thailand, Laos, W. Malaysia, Sumatra and Irian

Jaya. All are 'Cathaysian' floras, but some floras from Thailand and Irian Jaya also contain Gondwanan Glossopteris)

Setchell, W.A. (1930)- The Wallace and Weber lines: a suggestion as to climate boundaries. Proc. 4th Pacific Science Congress, Java 1929, III, p. 311-321.

Seton, M. & R.D. Muller (2008)- Reconstructing the junction between Panthalassa and Tethys since the Early Cretaceous. In: J.E. Blevin et al. (eds.) Eastern Australasin basins symposium III, Energy security for the 21st century, Sydney, Petroleum Expl. Soc. Australia (PESA), Spec. Publ., p. 263-266.
(Series of reconstructions of now mostly vanished oceanic plates between Australia and Eurasia since 140 Ma)

Seton, M., R.D. Muller, S. Zahirovic, C. Gaina, T. Torsvik, G. Shephard, A. Talsma, M. Gurnis, M. Turner, S. Maus & M. Chandler (2012)- Global continental and ocean basin reconstructions since 200 Ma. Earth-Science Reviews 113, p. 212-270.
(Major review of ocean basins evolution, incl. Indian Ocean and Tethys)

Sevastjanova, I., R. Hall, M. Rittner, S.M.T.L. Paw, T.T. Naing, D.H. Alderton & G. Comfort (2015)- Myanmar and Asia united, Australia left behind long ago. Gondwana Research 32, p. 24-40.
(New data from heavy minerals and detrital zircon ages of Late Triassic Halobia-bearing Pane Chaung Fm turbidite sandstones of Chin Hills in E Indo-Burman Ranges of W Myanmar. Intercalated with ultramafic rocks. Sandstones derived from mix of metamorphic, sedimentary and contemporaneous volcanic rocks. Pre-Devonian ages of Myanmar ('W Burma') Triassic sands closely resemble Sibumasu and W Australia (incl. >2.6 Ga Archean zircons), but differ from Indochina. Significant Permian-Triassic zircon populations (peaks at ~240 and 260 Ma) in W Burma, but not present in NW Australia. This points to proximity of W Burma to SE Asia (tin granites, etc.) in Triassic, which is therefore not elusive Argo block, as suggested in some models)

Sewell, R.J., A. Carter & M. Rittner (2016)- Middle Jurassic collision of an exotic microcontinental fragment: Implications for magmatism across the Southeast China continental margin. Gondwana Research 38, p. 304-313.
(Major deformation event in Hong Kong between 164-161 Ma (M-L Jurassic) linked to collision of microcontinent along SE China continental margin. Accreted terrane zircon age spectra close affinities to sources along N Gondwana margin. Collision of exotic terrane and subduction rollback, hastened foundering of postulated flat slab beneath SE China, leading to widespread igneous event at 160 Ma)

Shahabpour, J. (2009)- Analagous tectonic evolution of the Tethyan and SE Asian regions. Iranian J. Science Techn., Trans. A, 33, A1, p. 57-64.
(Similar tectonic histories in W Tethys and SE Asia of microcontinents rifting off Gondwana in Devonian-Permian and collisions with Eurasia in Late Triassic, etc.)

Shao, W.Y., S.L. Chung, W.S. Chen, H.Y. Lee & L.W. Xie (2015)- Old continental zircons from a young oceanic arc, eastern Taiwan: implications for Luzon subduction initiation and Asian accretionary orogeny. Geology 43, 6, p. 479-482.
(Chimei igneous complex in Coastal Range of E Taiwan is N part of intra-oceanic Luzon arc that accreted onto Eurasian continental margin since ~5 Ma. Magmatic zircons with mean Pb/U age of ~9 Ma probably of emplacement age. Inherited older zircons with ages clustering at ~14 Ma, ~218 Ma (largest peak) and older ages of ~726, ~1863 and ~2522 Ma suggest Cathaysia-type sources, attributed to continental fragment that split off Eurasian margin by opening of S China Sea, then drifted and accreted to W Philippine Sea plate before Luzon subduction initiation. Shows importance of ribbon continents in Asian orogenesis)

Shaw, R.D. (1997)- Some implications of Eurasian and Indo-Australian plate collision on the petroleum potential of Tertiary intracratonic basins of Southeast Asia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum Systems of SE Asia & Australia, Jakarta 1997, Indon. Petroleum Assoc. (IPA), p. 63-80.
(Extensive intra-cratonic rift system within intra-cratonic SE Asia, with >70 Tertiary basins from N Thailand across Gulf of Thailand, SE-wards to Natuna Ridge. It includes significant hydrocarbon provinces (Malay, W Natuna, Pattani, Phitsanulok) and represents transtension along major faults and suture zones. Most rift basins affected by subsequent Miocene and Pliocene transpressional deformation. Onset of rifting tied to Eocene start of India- Eurasia plates collision)

She, Z., C. Ma, Y. Wan, J. Zhang, M. Li, L. Chen, W. Xu, Y. Li, L. Ye & J. Gao (2012)- An Early Mesozoic transcontinental palaeoriver in South China: evidence from detrital zircon U-Pb geochronology and Hf isotopes. J. Geol. Soc., London, 169, p. 353-362.
(Late Triassic- E Jurassic fluvial sandstones from S China Craton basins with four similar detrital zircon age populations: 2.6-2.4 Ga, 2.0-1.7 Ga (with remarkable age peaks at ~1.85 Ga), 850-700 Ma and 480-210 Ma. Hf values between -22.5 and +3.6, suggest derivation from reworked Archaean crust and minor late Paleoproterozoic juvenile crustal additions. Correlate well with E Cathaysia Block (not Yangtze). Similarities in provenance of Triassic- Jurassic around S China Craton delineate E-W sediment belt from Korea to W China and ~2000km long W-draining transcontinental paleo-river feeding basins in Korea, S and W China)

Shen, S., S. Dongli & G.R. Shi (2003)- A biogeographically mixed late Guadalupian (late Middle Permian) brachiopod fauna from an exotic limestone block at Xiukang in Lhaze county, Tibet. J. Asian Earth Sci. 21, p. 1125-1137.
(Km-size late M Permian limestone blocks in Indus-Tsangbo suture, Tibet, may be from carbonate build-up or seamount on oceanic crust. Fauna transitional between warm-water Cathaysian and cold- temperate Gondwanan faunas. Timorites ammonoid present, largely cool bi-temperate genus, occurring in W Timor, Japan, Tibet, Iran and W Texas. W Timor assigned to transitional Cathaysian- Gondwanan Cimmerian realm in M Permian (Shi and Archbold, 1995))

Shen, S.Z. & G.R. Shi (2000)- Wuchiapingian (early Lopingian, Permian) global brachiopod palaeobiogeography: a quantitative approach. Palaeogeogr. Palaeoclim. Palaeoecology 162, 3-4, p. 299-318.

(Late Permian brachiopods five marine biotic province: Cathaysian (tropical), W Tethyan (tropical), Himalayan (warm temperate), Austrazean (cold temperate) and Greenland-Svalbard (cold temperate). Also Cimmerian biogeographical region from Middle East through Afghanistan and Himalayas SE to Shan-Thai terrane and Timor, typified by mix of genera of both Cathaysian and Gondwanan affinities)

Shen, S.Z. & G.R. Shi (2004)- Capitanian (Late Guadalupian, Permian) global brachiopod palaeobiogeography and latitudinal diversity pattern. Palaeogeogr. Palaeoclim. Palaeoecology 208, p. 235-262.
(*Six paleogeographic provinces based on M Permian brachiopods: (A) Greenland-Svalbard (Arctic region), (B) Grandian (W North America), (D) Cathaysian (Paleotethys and Mesotethys), (F) Austrazean (E Australia- New Zealand), and two transitional zones (C) Sino-Mongolian-Japanese (N temperate zone) and (E) Himalayan (S temperate zone) Province. West Timor Aileu-Maubisse assemblages grouped with Lhasa, Chitichun and Zhongba assemblages of S Tibet and Salt Range (Pakistan) in 'Himalayan Province'*)

Shen, S.Z., G.R. Shi & N.W. Archbold (2003)- A Wuchiapingian (Late Permian) brachiopod fauna from an exotic block in the Indus-Tsangpo suture zone, southern Tibet, and its palaeobiogeographical and tectonic implications. Palaeontology 56, 2, p. 225-256.
(online at: http://onlinelibrary.wiley.com/doi/10.1111/1475-4983.00296/pdf)
(Late Permian (Wuchiapingian) brachiopod fauna from exotic reddish crinoidal limestone block in Indus-Tsangpo suture zone in S Tibet (= suture between Eurasian/Lhasa Block and Indian Plate). Comparable with faunas in Salt Range of Pakistan, Chitichun Lst in S Tibet and Basleo area of W Timor (incl. 'antitropical' peri-Gondwanan species Stenoscisma purdoni and S. timorense, etc.). Fauna mixed peri-Gondwanan and Cathaysian character, possibly seamount biota originally from S margin of Neotethys in Late Permian, displaced and sandwiched into younger marine deposits in Cenozoic India- Eurasia collision)

Shen, S.Z., G.R. Shi & Z.J. Fang (2002)- Permian brachiopods from the Baoshan and Simao Blocks in Western Yunnan, China. J. Asian Earth Sci. 20, 6, p. 665-682.
(Four Permian brachiopod assemblages from W Yunnan, SW China. Faunas from Baoshan Block dominated by species characteristic of Cathaysian Province with some links with Peri-Gondwanan faunas. Simao Block characterised exclusively by taxa of Cathaysian Province)

Shen, S.Z., H. Zhang, Q.H. Shang & W.Z. Li (2006)- Permian stratigraphy and correlation of Northeast China: a review. J. Asian Earth Sci. 26, p. 304-326.
(Review of Permian successions and fossils in NE China. Dominated by brachiopods, fusulinids and land plants, with limited ammonoids, conodonts and bivalves. Guadalupian (M Permian) in Manchuride, Altaid and Yanbian Belts with bi-temperate Roadian- E Wordian Monodiexodina fauna and late Wordian- Capitanian Codonofusiella- Schwagerina or Neoschwagerina-Yabeina faunas)

Shen, S.Z., H. Zhang, G.R. Shi, W.Z. Li, J.F. Xie, L. Mu & J.X. Fan (2013)- Early Permian (Cisuralian) global brachiopod palaeobiogeography. Gondwana Research 24, p. 104-124.
(Three paleolatitude-related brachiopod paleobiogeographic realms in E Permian. Six provinces distinguished in Asselian: Faunas from Gondwana not well differentiated at province level and form Indoralian province. From Sakmarian large transition zone (S Transitional Zone) between Paleoequatorial and Gondwanan Realms formed, with Austrazean province(E Australia- New Zealand) in E margin of Gondwanaland, contemporaneous with peak of Late Paleozoic Ice (Sakmarian Eurydesma- Bandoproductus-Cimmeriella assemblage, followed by Stereochia, Kasetia, Dyschrestia and Spiriferella faunas). Large Cathaysian province stretching from S China, Iran in W Palaeotethys to Mongolian continent in N. In E Permian cluster analyses Timor group brachiopods closest to Baoshan block in Group D (Southern Transition Zone, with links to paleoequatorial))

Sheng, J.Z. & Y.G. Jin (1994)- Correlation of Permian deposits in China. Palaeoworld 4, p. 14-113.

Shi, G.R. (1998)- Aspects of Permian marine biogeography: a review on nomenclature and evolutionary patterns, with particular reference to the Asian- Western Pacific region. In: Y. Jin. et al. (eds.) Permian stratigraphy, environments and resources 2, Palaeoworld 9, p. 97-112.

Shi, G.R. (2001)- Possible influence of Gondwanan glaciation on low-latitude carbonate sedimentation and trans-equatorial faunal migration: the Lower Permian of South China. In: IGCP Project No. 411 on the Geodynamic Processes of Gondwanaland-derived Terranes in Eastern Asia, Geosciences J. 5, 1, p. 57-63.
(Early Permian from S China Block with mixed Cathaysian and cold-water Gondwanan brachiopod taxa, widespread rosettes of calcite prisms ('Chrysanthemum stones') and lack of significant reef buildups, suggesting cold water influence in paleo-equatorial S China in E Permian (ample paleomag data for equatorial setting). Possibly upwelling of cold water along W coast of S China terrane during E Permian)

Shi, G.R. & N.W. Archbold (1995)- Permian brachiopod faunal sequences of the Shan-Thai terrane: biostratigraphy, palaeobiogeographical affinities and plate tectonic/palaeoclimatic implications. J. Southeast Asian Earth Sci. 11, p. 177-187.
(Five Permian brachiopod assemblages known from Shan-Thai terrane: Late Asselian-Tastubian cool-water fauna, three 'transitional' faunas of Sterlitamakian, Baigendzhinian- E Kungurian and Kazanian-Midian ages, and Late Permian (Dorashamian) warm-water Cathaysian fauna. Shan-Thai belonged to Indoralian Province of Gondwanan Realm in Asselian-Tastubian and was incorporated into Cathaysian Province in latest Permian)

Shi, G.R. & N.W. Archbold (1995)- A quantitative analysis on the distribution of Baigendzhinian- Early Kungurian (Early Permian) brachiopod faunas in the western Pacific region. J. Southeast Asian Earth Sci. 11, 3, p. 189-205.
(Cluster analysis of distribution of 222 species of E Permian brachiopods from 25 localities across E Asia-Australia suggest 6 bioprovinces. In SE Asia two provinces (both sub-provinces of Cimmerian terranes): (1) Group B, Shan-Tai/ Sumatra/ W Papua Birds Head (warm temperate to S-subtropical; with Stereochia-Stictozoster) and (2) Group C, Himalayan/ Lhasa/ Timor (S-temperate; with Reedoconcha, Callytharella; also fusulinid Monodiexodina). Notable conclusions: Timor (Maubisse) was southern extension of Lhasa terrane, W Thailand most similar to Birds Head, Sumatra Jambi and Padang faunas similar and grouped with Shan Tai)

Shi, G.R. & N.W. Archbold (1995)- Palaeobiogeography of Kazanian-Midian (Late Permian) western Pacific brachiopod faunas. J. Southeast Asian Earth Sci. 12, p. 129-141.
(*W Timor transitional Cimmerian province between Cathaysian and Gondwanan Realms in M Permian)*

Shi, G.R. & N.W. Archbold (1998)- Permian marine biogeography of SE Asia. In: R. Hall & J.D. Holloway (eds.) Biogeography and geological evolution of SE Asia, Backhuys Publ., Leiden, p. 57-72.
(Three main Permian biotic provinces in SE Asia: Cathaysian (Simao, Indo-China, E Malaya), Sibumasu (Shan-Tai, Tengchong, Baoshan, W Malaysia, NE Sumatra; until Late Midian when joined Cathaysian province) and short-lived Sakmarian-Asselian Indoralian province)

Shi, G.R., N.W. Archbold & M. Grover (eds.) (1998)- Strzelecki International Symposium on Permian of Eastern Tethys: biostratigraphy, palaeogeography and resources. Proc. Royal Soc. Victoria 110, p. 1-480.

Shi, G.R., N.W. Archbold & L.P. Zhan (1995)- Distribution and characteristics of mixed (transitional) mid-Permian (Late Artinskian-Ufimian) marine faunas in Asia and their palaeogeographical implications. Palaeogeogr. Palaeoclim. Palaeoecology 114, p. 241-271.
(Asia Permian marine biogeography 3 realms: Boreal, Tethyan and Gondwanan. In early E Permian sharp biogeographical boundaries, due to Gondwanan glaciation. In M Permian two transition zones with mixed faunas: (1) North (N China, Japan, etc.), with warm Cathaysian and temperate Boreal genera, (2) South (Arabia, Iran, Shan-Tai, Timor, W Irian Jaya, etc.) with both Gondwanan and Cathaysian elements. Both transition zones have anti-tropically distributed genera like Monodiexodina, Lytvolasma and Spiriferella and are succeeded by Late Permian tropical Tethyan faunas. Timor brachiopods from Sakmarian Maubisse Fm similar to W. Australia, Bitauni late E Permian assemblage mixed Gondwana-Tethyan elements, Late Permian Basleo fauna is 'Tethyan' subtropical-tropical)

Shi, G.R., Z.Q. Chen & L.P. Zhan (2005)- Early Carboniferous brachiopod faunas from the Baoshan Block, west Yunnan, southwest China. Alcheringa 29, 1, p. 31-85.

(38 brachiopod species from Yudong Fm in W Yunnan. Associated coral and conodont faunas suggest late Tournaisian (E Carboniferous) age, possibility extending into earlyVisean)

Shi, G.R., Z.J. Fang & N.W. Archbold (1996)- An Early Permian brachiopod fauna of Gondwana affinity from the Baoshan block, western Yunnan, China. Alcheringa 20, 81-101.
(E Permian brachiopod fauna from U Dingjiazhai Fm, 30km S of Baoshan, W Yunnan. Dominated by Stenoscisma. and Elivina yunnanensis n.sp.. Strong links with faunas from Bisnain assemblage of Timor and Callytharra Fm of W Australia. Late Sakmarian age suggested)

Shi, G.R. & T.A. Grunt (2000)- Permian Gondwana-Boreal antitropicality with special reference to brachiopod faunas. Palaeogeogr. Palaeoclim. Palaeoecology 155, p. 239-263.
(Permian marine antitropicality (genera from Boreal and Gondwanan Realms but absent in Paleoequatorial Realm) reported from most marine pelagic or benthic invertebrate groups, suggesting biotic interchanges between Gondwanan and Boreal Realms. Possible migration pathways and mechanisms reviewed: 'stepping-stone' migration via islands in E Paleotethys, migration along W coast of Paleotethys, etc.)

Shi, G.R. & S.Z. Shen (2001)- A biogeographically mixed, middle Permian brachiopod fauna from the Baoshan Block, Western Yunnan, China. Palaeontology 44, p. 237-258.
(Baoshan Block (= part of Sibumasu complex; JTvG) M Permian brachiopod assemblage with Cryptospirifer in from lower Shazipo Fm. Associated with fusulinids Nankinella, Polydiexodina spp. and Schwagerina. Overlying U Shazipo Fm 500-700m carbonate contains Shanita- Hemigordiopsis foram assemblage. Paleogeographical distribution of Cryptospirifer overlaps with slightly younger (Capitanian-Wuchiapingian) Shanita-Hemigordius (Hemigordiopsis) foram fauna, also endemic or largely confined to M Permian transitional faunas of Cimmerian region (Baoshan Block))

Shi, G.R. & J.B. Waterhouse (1990)- Sakmarian (Early Permian) brachiopod biogeography and constraints on the timing of terane rifting, drift and amalgamation in SE Asia, with reference to the nature of Permian óTethysô. Pacific Rim 90 Congress, p. 271-276.

Shi, G.R., J.B. Waterhouse & S. McLoughlin (2010)- The Lopingian of Australasia: a review of biostratigraphy, correlations, palaeogeography and palaeobiogeography. Geological Journal 45, 2-3, p. 230-263.
(Distribution of Lopingian (Late Permian) strata and biota in Australia, New Zealand, Timor and New Caledonia, with new paleogeographic reconstruction. In New Zealand Lopingian beds in several terranes, mainly representing displaced segments of volcanic arcs, fore-arc basins and accretionary complexes, originally located near NE Australia on convergent margin. Most non-marine successions in E Australia rich in coal. Marine Lopingian of W Australia and Timor dominated by carbonates with sparse siliciclastic sediments and volcanoclastics, accumulated in large basin on passive and rifted continental margin, sharing many shallow-marine invertebrate species with Himalayan region of Nepal, S Tibet and N India)

Shi, X., J. Kirby, C. Yu, A. Jimenez-Diaz & J. Zhao (2017)- Spatial variations in the effective elastic thickness of the lithosphere in Southeast Asia. Gondwana Research 42, p. 49-62.
(Maps of spatial variations of Effective elastic thickness for SE Asia from coherence of topography and Bouguer gravity anomaly data. Results suggest E Borneo may share similar crustal basement, and represent broad tectonic zone of destroyed Mesotethys Ocean extending from W-C Java, through E Borneo to N Borneo. Indosinian suture between Indochina and Sibumasu may extend further SE across Billiton to offshore SE Borneo, and Singapore platform and SW Borneo may belong to same block)

Shi, Y. & X. Jin (2015)- Is the West Burma block Gondwana- or Cathaysia-derived?- A Permian paleobiogeographic and regional geological reappraisal. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 97-99. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(W Burma block (= Mt Victoria Land), generally considered as small block of Gondwanan origin, but Barber and Crow (2009) suggested it could be extension of 'Cathaysian' West Sumatra block based on similarities of fusulinid faunas. W Burma two fusulinid assemblages: (1) Pseudofusulina postkraffti and (2)

Rugososchwagerina sp. and Parafusulina, which occur in Cathaysian region, but also in Gondwana-derived blocks Baoshan, Tengchong, etc.)

Shu, L., M. Faure, B. Wang, X. Zhou & B. Song (2008)- Late Palaeozoic-Early Mesozoic geological features of South China: response to the Indosinian collision events in Southeast Asia. Comptes Rendus Geoscience 340, 2, p. 151-165.
(Late Permian- E Triassic collision of S China- Indosinian blocks along Song Ma-Menglian suture closed Paleo-Tethys Ocean, caused folding and thrusting and granitic magmatism in S China Block (SCB). E and C parts of SCB SW-dipping paleoslope in Late Paleozoic-Early Mesozoic. Ophiolitic melanges of E SCB formed in Neoproterozoic, not Permian or Triassic (Neoproterozoic oceanic relics with Proterozoic acritarchs). M-U Triassic granitoids (235-205 Ma) belong to post-collision peraluminous S-type granites)

Shu, L.S., X.M. Zhou, P. Deng, B. Wang, S.Y. Jiang, J.H. Yu & X.X. Zhao (2009)- Mesozoic tectonic evolution of the Southeast China Block: new insights from basin analysis. J. Asian Earth Sci. 34, p. 376-391.
(On SE China Block two types of Mesozoic basins (1) Late Triassic- E Jurassic post-Indosinian orogenic basins and (2) M Jurassic- Cretaceous intracontinental extensional graben and half-graben basins. Modern basin and range framework was settled down in Cretaceous. In Late Triassic–Early Jurassic sediment source areas were to N and NE of outcrop region)

Silberling, N.J. (1985)- Biogeographic significance of the Upper Triassic bivalve *Monotis* in Circum-Pacific accreted terranes. In: D.G. Howell (ed.) Tectonostratigraphic terranes of the Circum-Pacific region, Circum-Pacific Council Energy and Mineral Resources, Houston, p. 63-70.
(Five biogeogeographic areas in Circum-Pacific region, based on Late Triassic thin-shelled bivalve Monotis. In SE Asia: (1) Bipolar fauna C (Monotis subcircularis + Eomonotis + Entomonotis ochotica) in E Asia, Japan, NW Borneo; (2) Fauna E (Monotis salinaria) in Tethyan rocks of Alpine- Himalayan belt and Banda Sea region (Timor, Seram?)

Silver, E.A. & R.B. Smith (1983)- Comparison of terrane accretion in modern Southeast Asia and the Mesozoic North American Cordillera. Geology 11, p. 198-202.
(Indo-Pacific region from Tonga Trench to E Indonesia proposed as analog with tectonic setting of North American Cordillera, which is also composed of numerous suspect terranes)

Simmons, N.A., S.C. Myers, G. Johannesson, E. Matzel & S.P. Grand (2015)- Evidence for long-lived subduction of an ancient tectonic plate beneath the southern Indian Ocean. Geophys. Res. Letters 42, 10.1002/2015GL066237, p. 1-9.
(New global tomographic image shows slab-like structure under S Indian Ocean, interpreted as ancient tectonic plate that sank into mantle along extensive intra-oceanic subduction zone that retreated SW across Tethys Ocean in Mesozoic. Jurassic-E Cretaceous oceanic volcanic arc system of Woyla terranes of W Sumatra may represent exposed remnant of this intra-oceanic system)

Simpson, G.G. (1977)- Too many lines; the limits of the Oriental and Australian zoogeographic regions. Proc. American Philosophical Soc. 121, p. 107-120.
(Discussion of boundary between Oriental/Asian and Australian zoogeographic regions (Muller Line, Wallace Line, Murray Line, Huxley Line, Weber Line, Lydekker Line, etc.))

Smith, A.B. (1988)- Late Palaeozoic biogeography of East Asia and palaeontological constraints on plate tectonic reconstructions. Philosophical Trans. Royal Soc. London, A, 326, p. 189-227.
(Biogeographic patterns of Carboniferous- Permian rugose corals of E Asia. In Carboniferous Cathaysian region one cohesive block (N and S China, Tarim, Kunlun, Qiangtang teranes), lying tropically or subtropically, biotically isolated from C Asia. S boundary of Cathaysian region does not coincide with single suture, nor sharply defined: gradual faunal impoverishment S-ward across Tibetan Plateau, implying faunal ranges controlled by prevailing climate, not by geographical barrier ('Paleotethys'). Region formed part of Gondwanaland craton, extending into tropical latitudes until separation in late Lower Permian)

Socquet, A., C. Vigny, N. Chamot-Rooke, W. Simons, C. Rangin & B. Ambrosius (2006)- India and Sunda plates motion and deformation along their boundary in Myanmar determined by GPS. J. Geophysical Research 111, B05406, p. 1-11.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2005JB003877/epdf)
(New GPS India-Eurasia motion slower than previous determinations and predict India-Sunda relative motion of 35 mm/yr oriented N10° at latitude of Myanmar. Sagaing Fault only accommodates 18 mm/yr of right-lateral strike slip. Two models of how and where remaining deformation may occur)

Sone, M. & I. Metcalfe (2008)- Parallel Tethyan sutures and the Sukhothai Island-arc system in Thailand and beyond. In: Proc. Int. Symp. Geoscience Resources and Environments of Asian Terranes (GREAT 2008), 4th IGCP 516, and 5th APSEG Bangkok, p. 132-134.
(online at: www.geo.sc.chula.ac.th/Geology/Thai/News/Technique/GREAT_2008/PDF/039.pdf)
(Short version of paper below)

Sone, M. & I. Metcalfe (2008)- Parallel Tethyan sutures in mainland Southeast Asia: new insights for Palaeo-Tethys closure and implications for the Indosinian orogeny. Comptes Rendus Academie Sciences, Paris, Geoscience 340, 2, p. 166-179.
(Two parallel tectonic sutures in Yunnan-Thailand region: (1) Changning-Menglian and Inthanon= M Triassic closure of M Devonian- M Triassic Paleo-Tethys Ocean (collision of Sibumasu) and (2) Jinghong- Nan-Sra Kaeo= Late Permian collapse of local Permian back-arc basin. Sukhothai Zone not part of Sibumasu Terrane, but part of Permian island-arc on W margin of Indochina Terrane)

Sone, M. & I. Metcalfe (2010)- Stratigraphic correlation between the Sukhothai island arc in Thailand and the East Malaya Terrane in Peninsular Malaysia. In: Proc. 6th Symp. Int. Geol. Correl. Progr. Project 516, Geological Anatomy of East and South Asia, Kuala Lumpur, p. 55. *(Abstract only)*
(Permo-Triassic Sukhothai island arc system, situated between Indochina and Sibumasu continental terranes, extends S into East Malaya Terrane, with similar granitoids and Carboniferous- Triassic marine sediments. At W side Paleo-Tethys/ Raub-Bentong suture, at E side short-lived Permian back-arc basin. Late Permian marine shales with Cathaysian lyttonid brachiopods succeeded by latest Permian limestones)

Song, P., L. Ding, Z. Li, P.C. Lippert, T. Yang, X. Zhao, J. Fu & Y. Yue (2015)- Late Triassic paleolatitude of the Qiangtang block: implications for the closure of the Paleo-Tethys Ocean. Earth Planetary Sci. Letters 424, p. 69-83.
(U Triassic Jiapila Fm volcanics on N edge of Qiangtang block of C Tibet (34.1°N) dated to 204-213 Ma. Paleomagnetic data suggest Late Triassic latitude for block at 31.7 ± 3.0°N. Closure of Paleo-Tethys Ocean at longitude of Qiangtang block most likely in Late Triassic)

Song, P., L. Ding, Z. Li, P.C. Lippert & Y. Yue (2017)- An early bird from Gondwana: paleomagnetism of Lower Permian lavas from northern Qiangtang (Tibet) and the geography of the Paleo-Tethys. Earth Planetary Sci. Letters 475, p. 119-133.
(online at: https://www.sciencedirect.com/science/article/pii/S0012821X17304016)
(Paleomagnetic data from Lower Permian Kaixinling Gp lavas on N Qiangtang block suggest paleolatitude of 21.9 ±4.7 °S at ~297 Ma. Corroborates earlier hypothesis that N Qiangtang block rifted away from Gondwana before Permian, and accreted to Tarim- N China continent by Norian time. Total N-ward drift ~7000km over ~100 My (~7 cm/yr). N Qiangtang no Laurasian affinity. C Qiangtang metamorphic belt possible intra-Qiangtang suture that developed at S latitudes outboard of Gondwanan margin)

Srivastava, A.K. & D. Agnihotri (2010)- Dilemma of Late Palaeozoic mixed floras in Gondwana. Palaeogeogr. Palaeoclim. Palaeoecology 298, p. 54-69.
(Carboniferous and Permian plant assemblages of N and S hemispheres distributed in four floral provinces. Mixed M and U Permian Cathaysian- Gondwanan floras from margins of Paleo-Tethys, i.e. New Guinea, Tibet, Kashmir, Oman, Jordan, etc. No clear explanation)

Srivastava, A.K., V.A. Krassilov & D. Agnihotri (2010)- Peltasperms in the Permian of India and their bearing on Gondwanaland reconstruction and climatic interpretation. Palaeogeogr. Palaeoclim. Palaeoecology 310, p. 393-399.
(First find of peltasperms in Permian of Gondwana, in Lower Permian Barakar Fm of Satpura Basin, C India, where they co-occur with diverse glossopterids. These are dominant group of N American- European arboreal vegetation and suggest floristic exchanges between Laurasia and Gondwana. Satpura occurrence assigns Indian subcontinent to low-latitude zone of mixed Laurasian/Gondwanan floristic assemblages)

Stait, B. & C. Burrett (1987)- Biogeography of Australian and Southeast Asian Ordovician nautiloids. In: G.D. McKenzie (ed.) Gondwana Six: stratigraphy, sedimentology and paleontology, American Geophys. Union (AGU), Geophys. Monograph 41, p. 21-28.
(E Ordovician faunas of SE Asia Sibumasu plate similar to those of Canning Basin, NW Australia)

Stampfli, G.M. (2000)- Tethyan Oceans. In: E. Bozkurt et al. (eds.) Tectonics and magmatism in Turkey and the surrounding area. Geol. Soc., London, Spec. Publ. 173, p. 1-23.
(Ordovician- Permian plate reconstructions of early Tethyan oceans (focused on W Tethys). Paleotethys opened in Ordovician-Silurian, with detachment of ribbon-like Hun Superterrane along Gondwana margin. Neotethys opened from Late Carboniferous- late E Permian from Australia- E Mediterranean, with drifting of Cimmerian superterrane and final closing of Paleotethys in M Triassic. N-ward subduction of Paleotethys triggered opening of back-arc oceans along Eurasian margin. Some closed during Eocimmerian collisional event, others stayed open and their delayed subduction induced opening of younger back-arc oceans (Black Sea, etc.). Subduction of Neotethys mid-ocean ridge responsible for major change in Jurassic plate tectonics)

Stampfli, G.M. & G.D. Borel (2002)- A plate tectonic model for the Paleozoic and Mesozoic constrained by dynamic plate boundaries and restored synthetic oceanic isochrons. Earth Planetary Sci. Letters 196, p. 17-33.
(Ordovician- Cretaceous reconstructions of greater Tethyan realm)

Stampfli, G.M., C. Hochard, C. Verard, C. Wilhem & J. von Raumer (2013)- The formation of Pangea. Tectonophysics 593, p. 1-19.
(New Neoproterozoic- Triassic global reconstructions, with latest Neoproterozoic creation of Gondwana, Devonian opening of Paleotethys, Carboniferous Variscan orogeny along W Paleotethys and creation of Pangea super-continent. E of Spain Paleotethys remained open until Triassic, subducting N under Laurasia. Rollback of Paleotethyan slabbed caused Permian rifts/ backarc basins, some becoming oceanized in Triassic. End-Triassic breakup of Pangea and opening of Alpine- Tethys oceanic seaways))

(Brief discussion of Ridd (1971) and Tarling (1972) reconstructions)

Stauffer, P.H. & C.P. Lee (1986)- Late Paleozoic glacial marine facies in Southeast Asia and its implications. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 2, Bull. Geol. Soc. Malaysia 20, p. 363-397.
(Carbo-Permian glacial-marine pebbly mudstones in S. Thailand, Langkawi islands (Singa Fm) and other areas form 2000 km long belt from Sumatra to C Burma. This suggests W side of Western SE Asia was attached to Gondwanaland in Carbo-Permian, while warm-climate Permian floras on other blocks suggest separate drift histories)

Stauffer, P.H. & C.P. Lee (1987)- The Upper Palaeozoic pebbly mudstone facies of peninsular Thailand and western Malaysia- continental margin deposits of Palaeoeurasia- Discussion. Geol. Rundschau 76, p. 945-948.
(Discussion of Altermann (1986) paper. Disputes Altermann's conclusions that Paleozoic pebbly mudstones are not glacial deposits)

Stauffer, P.H. & N. Mantajit (1981)- Late Palaeozoic tilloids of Malaysia, Thailand and Burma. In: M.J. Hambrey & W.B. Harland (eds.) Earthôs Pre-Pleistocene glacial records. Cambridge University Press, p. 331-335.
(Brief review of Carboniferous- earliest Permian glacial deposits. Extend from southern Malay Peninsula through W Thailand (Phuket region), Myanmar, into SW China. Best known section is thick Singa Fm of Langkawi islands, NW Malaya. Most common clasts quartz sandstones, minor limestone, granite, trondhjemite. Generally overlain by late E- M Permian limestone (Chuping Lst in Malaya, Ratburi Lst in Thailand, Plateau Lst in E Myanmar))

Stephenson, M.H. & L. Angiolini (2006)- Relating the fossil record to deglaciation in the early Permian of Gondwana: development of a Gondwana-wide biotic deglaciation model. Permophiles 47, p. 18. *(Abstract)*
(Maximum rate of deglaciation around time of Granulatisporites confluens Oppel-zone in late Asselian-early Sakmarian time)

Stephenson M.H., L. Angiolini & M.J. Leng (2007)- The Early Permian fossil record of Gondwana and its relationship to deglaciation; a review. In: M. Williams et al. (eds.) Deep-time perspectives on climate change: marrying the signal from computer models and biological proxies, Geol. Soc.London, p. 169-189.
(Biotic criteria for E Permian deglaciation sequences in Gondwana. Marine cold-water bivalves Eurydesma and Deltopecten and brachiopods Lyonia and Trigonotreta in earliest post-glacial marine transgressions, replaced by more diverse, temperate fauna. Palynomorph succession changes from monosaccate pollen assemblages, associated with fern spores, to more diverse assemblages with common bisaccate pollen. Organic matter shows decreasing d13 C trend, believed to be due to post-glacial global warming. E Permian O isotopes show d18O decline in Asselian- Artinskian, likely due to melting of glaciers at high latitudes)

(Correlating geological belts/ suture zones from N Thailand to S Peninsular Malaysia very difficult)

Tan, D.N.K. (1983)- Cherts of Southeast Asia. In: A. Iijima et al. (eds.) Siliceous deposits in the Pacific Region, Developments in Sedimentology 36, Elsevier, p. 79-91.
(Lower Paleozoic chert confined to peninsular Thailand and NW and C Peninsular Malaysia. Upper Paleozoic chert in Thailand, Indochina, and Peninsular Malaysia, with isolated occurrence in W Sarawak. Triassic chert in N Thailand, N Peninsular Malaysia, Singapore, Sumatra, Bangka, Sarawak, and N Palawan. Jurassic-Cretaceous chert in SE and NE Kalimantan, S and W Sumatra, C Java, S Sulawesi, Natuna, Sarawak, Sabah and Philippines (but not Thailand, Indochina, and Peninsular Malaysia). Tertiary age chert or older blocks in Tertiary melange in Indonesia (Nias, Timor, Philippines, Sarawak and Sabah)

Tapponnier, P., R. Lacassin, P.H. Leloup, U. Schairer, Zhong D., Liu X., Ji S., Zhang L. & Zhong J. (1990)- The Ailao Shan/Red River metamorphic belt: Tertiary left-lateral shear between Indochina and South China. Nature 343, p. 431-437.
(Ductile shear in Ailao Shan/Diancang Shan metamorphic belt along Red River in Yunnan, S. China, with >500 km of mylonites with horizontal lineations on steep, NW-striking foliation planes, and left-lateral kinematic indicators. U-Pb radiometric ages of ~23 Myr imply strike-slip movement in earliestMiocene. Collision of India with Asia displaced Indochina at least 500km SE relative to S China)

Tapponnier, P., G. Peltzer, A.Y. LeDain & R. Armijo (1982)- Propagating extrusion tectonics in Asia: new insights from simple experiments with plasticine. Geology 10, p. 611-616.
(Interesting and popular, but disputed tectonic model explaining major strike slip zones and blocks rotations in SE Asia as results of India- Asia collision in Eocene)

Tapponnier, P., G. Peltzer & R. Armijo (1986)- On the mechanics of the collision between India and Asia. In: M.P. Coward & A.C. Ries (eds.) Collision tectonics, Geol. Soc., London, Spec. Publ. 19, p. 115-157.
(Extended and updated version of SE Asia extrusion model. Since Eocene large prograding zone of deformation migrated across Asia, concurrently with N-ward movement of India collision front. Several large left-lateral strike-slip faults activated. In first 20-30 Ma of collision process, India may have pushed sideways S part of Sundaland (incl. SW Borneo, Sumatra and Peninsular Malaysia) then all of Sundaland (incl. S Yunnan, Indochina, Thailand and Shan Plateau. Red River Fault may have taken up 800-1000 km of extrusion to SE. In Oligocene- E Miocene Sundaland would have rotated clockwise by ~20-25°)

Tarling, D.H. (1988)- Gondwanaland and the evolution of the Indian Ocean. In: M.G. Audley-Charles & A. Hallam (eds.) Gondwana and Tethys, Geol. Soc., London, Spec. Publ. 37, p. 61-77.

Teasdale, J. & J. Bon (2017)- A new plate model for South East Asia aimed at understanding basin evolution. In: SEAPEX Exploration Conference 2017, Singapore, Session 7, 15p. *(Abstract + Presentation)*
(Eight SE Asia plate reconstruction models from 55- 0 Ma. SW Borneo and Peninsular Malaysia part of same rigid Sundaland basement terrane. 'Rotational extrusion' of Sundaland caused clockwise rotation of Sundaland + Borneo in two phases in Late Eocene and Oligocene. Counter-clockwise rotation of Bird's Head. E Indonesian 'salami-slicer' extends NW to Borneo, where it accounts for M Miocene Sabah Orogeny. Etc.)

Teichert, C. (1951)- The marine Permian faunas of Western Australia. Palaeont. Zeitschrift 24, 1-2, p. 75-90.
(W Australian Permian faunas more in common with Tethys than with E Australia. Timor faunas appear related, but significant differences. One record of fusulinid foraminifera in Desert Basin could not be relocated and is probably erroneous. Low diversity coral fauna, mainly indigenous with Australian species. Crinoid faunas related to Timor, but much impoverished)

Teichert, C. (1974)- Marine sedimentary environments and their faunas in Gondwana area. In: Plate Tectonics- assessments and reassessments, AAPG Mem. 23, p. 361-394.
(Widespread Paleozoic-Mesozoic marine rocks in W Australia, S Africa Antarctica, etc., inconsistent with hypothesis of Gondwanaland (?))

Tingay, M., C. Morley, R. King, R. Hillis & D. Coblentz (2009)- Southeast Asian stress map: implications for petroleum exploration and production. First Break 27, p. 81-88.
(Overview of new SE Asian Stress Map, with stress information from borehole breakouts, drilling-induced fractures, and focal mechanism solutions across 14 provinces in SE Asia. Intraplate stress field of SE Asia (Sundaland) is variable and not aligned with absolute plate motion)

Tingay, M., C. Morley, R. King, R. Hillis, D. Coblentz & R. Hall (2010)- Present-day stress field of Southeast Asia. Tectonophysics 482, p. 92-104.
(Variable stress pattern throughout SE Asia largely inconsistent with Sunda plate ESE motion direction. Present-day maximum horizontal stress in Thailand, Vietnam and Malay Basin predominately N-S, consistent with radiating stress patterns from E Himalayan syntaxis. Maximum horizontal stress in Borneo primarily NW–

SE; may reflect plate-boundary forces or topographic stresses exerted by C Borneo highlands. S and C Sumatra basins maximum horizontal stress NE–SW, perpendicular to Indo-Australian subduction front. Plate-scale stress field in SE Asia controlled by combination of Himalayan-related deformation, subduction forces (trench suction, collision) and intraplate sources of stress such as topography and basin geometry)

Tjia, H.D. (2008)- Tertiary stress regimes of western Southeast Asia. In: J.A. Katili et al. (eds.) Tectonics and resources of Central and SE Asia (Halbouty volume), Pusat Survei Geol., Bandung, Spec. Publ. 34, p. 125-138.
(In W SE Asia pre-Middle Miocene mainly extensional regimes. Changes in plate dynamics towards end E Miocene terminated spreading of S China Sea and Philippines basins and allowed impact of W-directed Pacific convergence. After short transition in Langhian (16.3-14.2 Ma) start of compressional regimes)

Tollman, A. & E. Kristan-Tollman (1985)- Paleogeography of the Tethys from the Paleozoic to the Mesozoic. In: K. Nakazawa & J.M. Dickens (eds.) The Tethys, her paleogeography and paleobiology, from the Paleozoic to the Mesozoic, Tokai University Press, Japan, p. 20-199.

Tong-Dzuy, T., H.F. Hou, T.H. Phuong, H.H. Nguyen et al. (1996)- Outlines of stratigraphy and remarks on paleobiography of Devonian in Southeast Asia. In: Proc. IGCP Symp. on Geology of SE Asia, Hanoi 1995, J. Geology, B, 1996, 7-8, p. 10-34.
(Review of Devonian stratigraphies and macrofaunas of of S China, Indochina W Malaysia. Lower Devonian in most places marine clastics, M Devonian mainly carbonates. Devonian faunas of SE Asa greater similarities with Europe than with Australia, questioning common wisdom that this region was derived from Gondwana)

Tong-Dzuy, T., P. Janvier & P. Ta Hoa (1996)- Fish suggest continental connections between South China and Indochina blocks in Middle Devonian times. Geology 24, 6, p. 571-574.
(Yunnanolepiform antiarch (placoderm fish) from Givetian Dong Tho Fm, C Vietnam, on Indochina Block, well S of Song Ma suture. Previously known only from Lower Devonian of South China block. Massive sandstones of Dong Tho Fm may be southern extension of Do Son Sst of Hai Phong area, S China)

Ueno, K. (2000)- Permian fusulinacean faunas of the Sibumasu and Baoshan Blocks: implications for the paleogeographic reconstruction of the Cimmerian continent. Geosciences J. 4 (Spec. Ed.), p. 160-163.
(Expanded version see Ueno (2003) below)

Ueno, K. (2002)- Geotectonic linkage between West Yunnan and mainland Thailand: Toward the unified geotectonic evolution model of East Asia. In: Geodynamic Processes of Gondwanaland-derived terranes in East and Southeast Asia, their crustal evolution, emplacement and natural resources potential, Fourth Symp. IGCP Project 411, Phitsanulok, p. 35-42.

Ueno, K. (2003)- The Permian fusulinoidean faunas of the Sibumasu and Baoshan blocks: their implications for the paleogeographic and paleoclimatologic reconstruction of the Cimmerian Continent. Palaeogeogr. Palaeoclim. Palaeoecology 193, p. 1-24.
(Permian fusulinids in four levels in Baoshan and Sibumasu Blocks. East Cimmerian continent poor Tethyan neoschwagerinid and verbeekinid genera in M Permian. Increase in diversity from E to late M Permian (N-ward drift of Cimmerian continent) and from E to W (W Cimmerian closer to tropical Tethyan domain than E). M Permian Cimmerian two subregions: W= Tethyan Cimmerian and E= Gondwanan Cimmerian. Rare Tethyan fusulinids in Baoshan and Sibumasu blocks suggests E Cimmerian continent still far from Cathaysian domain and in warm temperate- subtropical zone until end-Permian. E Cimmerian block migrated into tropical zone by Late Triassic with Carnian sponge-coral buildups in Sibumasu Block)

Ueno, K. (2006)- The Permian antitropical fusulinoidean genus *Monodiexodina*: distribution, taxonomy, paleobiogeography and paleoecology. J. Asian Earth Sci. 26, p. 380-404.
(Review of 'subtropical', late E Permian fusulinid genus Monodiexodina from 33 areas, incl. several Timor occurrences, all in middle part of Maubisse Fm. Type species of Monodiexodina is Schwagerina wanneri Schubert 1915 first described from Timor. Monodiexodina-bearing areas can be restored to either N or S middle latitudes, suggesting genus is paleobiogeographically anti-tropical taxon. Generally found in monotypic, crowded manner in sandy sediments with uni-directionally aligned shells. Long-ranging 'mid-Permian', Artinskian- E Midian (=Capitanian))

Uno, K., K. Furukawa & S. Hada (2011)- Margin-parallel translation in the western Pacific: paleomagnetic evidence from an allochthonous terrane in Japan. Earth Planetary Sci. Letters 303, 1-2, p. 153-161.
(Paleomagnetic study shows latitudinal translation of allochthonous Kurosegawa ribbon continent of Japan along W margin of Pacific Ocean. Terrane was at 4°N paleolatitude in Late Triassic, 18°N in E Cretaceous, then translated ~1500km N to present position, associated with sinistral strike-slip along E Asian continental margin, in Mid-Late Cretaceous. Also show SW Borneo plate in Equatorial position since Jurassic)

Uno, K., K. Hisada, K. Ueno, Y. Kamatad, H. Hara, M. Fujikawa et al. (2010)- Paleomagnetic evidence for latitudinal change of the Indochina Block during the Late Paleozoic to Mesozoic. In: C.P. Lee et al. (eds.) 6th Symp. Int. Geol. Correl. Progr. Project 516 (IGCP516), Geological anatomy of East and South Asia, Kuala Lumpur 2010, p. 26. *(Abstract only)*
(Paleomagnetic paleolatitude calculated for samples from around Loei, Thailand (17.6°N), suggest W Indochina Block was at 9°N or 9°S in E Permian and at 5°N or 5°S in Carboniferous. Two tectonic models conceivable. Most likely Indochina Block was near equator in Carboniferous and N-motion of block lasted through Permian)

Usuki, T., C.Y. Lan, K.L. Wang & H.Y. Chiu (2013)- Linking the Indochina block and Gondwana during the Early Paleozoic: evidence from U-Pb ages and Hf isotopes of detrital zircons. Tectonophysics 586, p. 145-159.
(Detrital zircons from river sediment in Truong Son Belt of Indochina block in N-C Vietnam with mainly Neoarchean (~2.5 Ga), Mesoproterozoic (1.7-1.4 Ga), Grenvillian (~0.95 Ga) and Pan-African (0.65–0.5 Ga) ages. Similarity of age distribution and Hf isotope compositions of Indochina and those of Tethyan Himalaya, W Cathaysia, and Qiangtang suggests Indochina was outboard of Qiangtang and S of S China in Indian margin of Gondwana in E Paleozoic. Results consistent with paleontological correlations of E Gondwana margin)

Van Balgooy, M.M.J. (1987)- A plant geographic analysis of Sulawesi. In: T.C. Whitmore (ed.) Biogeographical evolution of the Malay Archipelago, Clarendon Press, Oxford, p. 94-102.

Van der Meer, D.G., W. Spakman, D.J.J. van Hinsbergen, M.L. Amaru & T.H. Torsvik (2010)- Towards absolute plate motions constrained by lower-mantle slab remnants. Nature Geoscience 3, p. 36-40.
(Global mantle tomography model used to estimate longitude of past oceanic subduction zones. Identified 28 remnants of oceanic plates subducted into lower mantle and link these to mountain building zones from which they likely originated. Assuming remnants sank vertically through mantle, we reconstruct longitude at which they were subducted. No oceanic plate remnants from Carboniferous (~300-360 Ma))

Van der Meer, D.G., T.H. Torsvik, W. Spakman, D.J.J. van Hinsbergen & M.L. Amaru (2012)- Intra-Panthalassa Ocean subduction zones revealed by fossil arcs and mantle structure. Nature Geoscience 5, p. 215-219.

(Vast Panthalassa Ocean once surrounded supercontinent Pangaea, but subduction since then consumed most of ocean floor. Extinct intra-oceanic volcanic arcs accreted to N American and Asian continental margins. To constrain paleoposition of extinct arcs, they were correlated with remnants of subducted slabs identified in mantle from-wave tomographic models)

Van der Meer, D.G., D.J.J. van Hinsbergen & W. Spakman (2018)- Atlas of the underworld: slab remnants in the mantle, their sinking history, and a new outlook on lower mantle viscosity. Tectonophysics 723, p. 309-448.
(online at: www.sciencedirect.com/science/article/pii/S0040195117304055)
(Global inventory of 94 subducted slabs in mantle, as identified from tomography. Including slabs from SE Asia: Arafura, Banda, Burma (formerly part of Sunda slab), Halmahera (15-0 Ma), Kalimantan (active from ~70- 20 Ma: interpreted by some as deeper part of Sunda slab), Papua (base age 90-45 Ma, top age 26-20 Ma), Sangihe (base age 30-25 Ma; at shallow upper mantle levels separated into several slabs: Philippine Trench slab, Molucca Sea West slab, Sulu and Celebes Sea South slab) and Sunda slab (active since 50-45 Ma). (see also associated website: www.atlas-of-the-underworld.org/)

Van Leeuwen, T.M. (2014)- The enigmatic Sundaland diamonds- a review. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Ann. Conv. Indon. Soc. Econ. Geol. (MGEI), Palembang, p. 181-204.
(Review of alluvial diamond occurrences with no obvious primary sources in Myanmar, Thailand and Sumatra ('Sibumasu diamonds'; spatially associated with Carboniferous-Permian glacial pebbly mudstones, stretching from Myanmar to Sumatra) and in 4 districts in Kalimantan ('Kalimantan diamonds'). Together they are referred herein as 'Sundaland diamonds'. Three possible scenarios for formation of Kalimantan diamonds)

Van Waterschoot Van der Gracht, W.A.J.M. (1928)- The problem of continental drift. In: Proc. Symposium Theory of continental drift; a symposium on the origin and movement of land masses, both inter-continental and intra-continental, as proposed by Alfred Wegener, New York 1926, American Assoc. Petrol. Geol. (AAPG), p. 1-75.
(Overview of merits of the then still controversial theory of continental drift. On p. 57 points out that Dutch geologists working in 'East Indies' (Molengraaff, Brouwer, Wing Easton) all supportive of Wegener's hypothesis, because New Guinea obviously rapidly drifted to N, and very rapid active uplift and subsidence can be observed in E Indonesia)

Van Welzen, P.C., J.A.N Parnell & J.W.F. Slik (2011)- Wallaceȇs Line and plant distributions: two or three phytogeographical areas and where to group Java? Biol. J. Linnean Society 103, p. 531-545.
(online at: www.naturalscience.tcd.ie/assets/pdf/Wallace's%20line.pdf)
(No sharp E-W boundary in modern plant distributions in SE Asia. Three areas on basis of floristic affinities/ similarities (1) islands of Sunda Shelf, W Java (everwet Sundaland floristic group); (2) Wallacea, consisting of central islands and E Java, with two sub-areas: Java, the Philippines and Lesser Sunda Islands with more Oriental flora and Sulawesi and Moluccas with more Australian flora; (3) New Guinea/Sahul Shelf)

Van Welzen, P.C., J.W.F. Slik & J. Alahuhta (2005)- Plant distribution patterns and plate tectonics in Malesia. Biologische Skrifter Danske Vidensk. Selskab 55, p. 199-217.
(online at: http://phylodiversity.net/fslik/index_files/BiolSkr2005.pdf)
(Philippines, Borneo, and especially New Guinea comprise significantly more than average endemic plants. Three major distribution patterns in Malesia: Indian-Malesian, Circum-Pacific and Wallacea, the transition zone between Sunda and Sahul floras)

Wallace, A.R. (1869)- The Malay Archipelago. MacMillan & Co, UK, p. 1-525.

(With several reprint editions. Classic work of natural history/ faunal provinces of Indonesia (not much on geology))

Wang, P. (2004)- Cenozoic deformation and the history of sea-land interactions in Asia. In: P. Clift et al. (eds.) Continent-ocean interactions within East Asian marginal seas, American Geophys. Union (AGU), Geophys. Monograph Ser. 149, p. 1-22.
(After India-Asia collision in Eocene, Asia significantly enlarged its size and increased its altitude. W-tilting topography of E Asia reversed with uplift of Tibetan Plateau and opening of marginal seas, resulting in Asian fluvial system radiating from uplifted center of continent. Cenozoic deformation of Asia also responsible for initiation of Asian monsoon system in E Miocene and further strengthening at ~8 Ma and ~3 Ma)

Wang, W., Q.M. Qu & M. Zhu (2010)- A brief review of the Middle Palaeozoic vertebrates from Southeast Asia. Palaeoworld 19, p. 27-36.
(On Silurian-Devonian fish remains from Shan-Thai (=Sibumasu), Indochina and S China blocks and their biogeographic affinities. Vertebrate fossils suggest proximity between S China and Indochina terranes in M Paleozoic and close relationship between Shan-Thai and E Gondwana (Australia) in M Devonian)

Wang, Q., J. Deng, C. Li, G. Li, L. Yu & L. Qiao (2016)- The boundary between the Simao and Yangtze blocks and their locations in Gondwana and Rodinia: Constraints from detrital and inherited zircons. Gondwana Research 26, p. 438-448.
(Simao (N Indochina) and Yangtze (S China) continental blocks amalgamated in Late Paleozoic- Triassic by closure of Paleotethys branch (Ailaoshan ocean). Detrital and inherited zircons suggest Laowangzhai-Mojiang suspect terrane belongs to Simao-Indochina block, so Paleotethys suture along Ailaoshan late-Devonian- E Carboniferous ophiolite belt. Precambrian detrital zircon ages suggest Yangtze block not part of Australia or India in Rodinia, while Simao-Indochina block derived from Indian Gondwana)

Wang, X., K. Makato & W. Hongzhen (1996)- On the tectonic position of the Baoshan region during the Late Palaeozoic. J. Southeast Asian Earth Sci. 13, p. 171-183.
(Devonian- Permian fauna of Baoshan block in Yunnan, SW China, very similar to S Tibet, but not Yangtze region. Faunal and paleomagnetic data for Late Paleozoic show Yangtze region very close to Equator, but Baoshan and S Tibet in middle latitudes (~32-43°S; probably in Gondwana domain))

Wang, X., I. Metcalfe, P. Jian, L. He & C. Wang (2000)- The Jinshajiang- Ailaoshan suture zone: tectono-stratigraphy, age and evolution. J. Asian Earth Sci. 18, p. 675-690.
(On M Triassic age for Jinshajiang- Ailaoshan suture, formed by collision of Changdu-Simao Block with S China Block. Jinshajiang oceanic lithosphere formed (as oceanic marginal basin of S China Block) in latest Devonian- earliest Carboniferous)

Wang, X., I. Metcalfe, P. Jian, L. He & C. Wang (2000)- The Jinshajiang suture zone: tectono-stratigraphic subdivision and revision of age. Science in China, ser. D, 43, 1, p. 10-22.
(Jinshajiang suture zone in W Yunnan- W Sichuan is remnants of backarc basin in E part of Paleo-Tethys. Basin started in Late Devonian, closed in E-M Triassic)

Wang, X.D, W. Lin, S.Z. Shen, P. Chaodumrong, G.R. Shi, X. Wang & Q.L. Wang (2013)- Early Permian rugose coral *Cyathaxonia* faunas from the Sibumasu Terrane (Southeast Asia) and the southern Sydney Basin (Southeast Australia): paleontology and paleobiogeography. Gondwana Research 24, 1, p. 185-191.
(Sibumasu Terrane rifted from Gondwana in E Permian. Small solitary rugose Cyathaxonia coral faunas in Lower Permian of Sibumasu in SE Asia and Sydney Basin, SE Australia, suggesting cool shallow marine conditions, while Cathaysian corals reflect location near Paleo-equator. M Permian corals in Sibumasu dominated by solitary and compound Waagenophyllidae ('Cathaysian'), but, some endemic taxa in Sibumasu Terrane during this time suggest it was still independent paleobiogeographical entity. Eleven coral species including 5 new taxa described. No Late Carboniferous corals known from Gondwanan terranes in SE Asia)

Wang, X.D., G.R. Shi & T. Sugiyama (2002)- Permian of West Yunnan, Southwest China: a biostratigraphic synthesis. J. Asian Earth Sci. 20, p. 647-656.
(Permian stratigraphic successions in Changning-Menglian Belt range from passive margin, active margin to oceanic basin and seamounts. Permo-Carboniferous carbonate faunas typical Cathaysian (common fusulinids, compound rugose corals). Permian of Tenchong and Baoshan blocks different: Baoshan Block Lower Permian mainly siliciclastic with cool-water faunas and possibly glaciogene diamictites, overlain by basalts and volcaniclastics of probable rift origin, U Permian carbonates with mixed Cathaysian- Gondwanan faunas. Tengchong Block similar to Baoshan, but lacks volcanics)

Wang, X.D., G.R. Shi, T. Sugiyama & R.R. West (2003)- Late Palaeozoic corals of Tibet (Xizang) and West Yunnan, Southwest China: successions and palaeobiogeography. Palaeogeogr. Palaeoclim. Palaeoecology 191, 3, p. 385-397.
(On coral faunal provincialism on Carboniferous- Permian of Tibet- W Yunnan and Cimmerian terranes. Sakmarian-Artinskian Cyathaxonia fauna. In late E Permian development of Himalayan (N margin of Gondwana) and Cimmerian provinces (Lhasa- Qiantang, Tengchong, Baoshan, W Yunnan), with Roadian solitary corals, Wordian-Capitanian Waagenophyllidae and endemic Cimmerian taxa such as Thomasiphyllum and Wentzellophyllum persicum. Thomasiphyllum has distinctive paleogeographical distribution in M Permian of Cimmerian continents, also in W Sumatra, etc. Late Permian Himalayan fauna with small solitary corals only (Lytvolasma fauna) and Cathaysian with Ipciphyllum, Liangshanophyllum, etc.)

Wang, X.D. & T. Sugiyama (2002)- Permian coral faunas of the eastern Cimmerian continent and their biogeographical implications. J. Asian Earth Sci. 20, p. 589-597.
(Early Permian corals of E Cimmerian continent (= Sibumasu) of Peri-Gondwanan affinity with small solitary forms; different from Cathaysian area, where abundant large solitary and compound corals occur. In M Permian endemic Cimmerian- Cathaysian fauna of large solitary and massive Waagenophyllidae, with Cathaysian aspect. Late Permian corals all Cathaysian. Changes related to rifting of Cimmerian continent from Gondwanaland in late Early Permian and subsequent N-ward drift)

Wang, X.D., T. Sugiyama, K. Ueno, Y. Mizuno, Y. Li, W. Wang et al. (2000)- Carboniferous and Permian zoogeographical change of the Baoshan Block, SW China. Acta Palaeontologica Sinica 39, 4, p. 493-506.
(Carboniferous- Permian of Baoshan block three main sequences: (1) Lower Carboniferous carbonates (warm, diverse, and abundant 'Eurasian' faunas), (2) Lower Permian siliciclastics (cold, low diverse faunas; conodont Sweetognathus fauna at top; glacio-marine diamictites, Sakmarian- E Artinskian ;'peri-Gondwanan') (3)M Permian carbonates (warm water but low diverse fauna; 'marginal Cathaysian/Cimmerian'). Cimmerian blocks comparable in Carboniferous- E Permian. In M Permian E Cimmerian blocks (Sibumasu s.s, Baoshan, Tengchong) not far from palaeoequator, but further than W Cimmerian blocks (lack of Eopolydiexodina and Neoschwagerina fusulinids, corals Thomasiphyllum, Wentzellophyllumm)

Wang, X.D., K. Ueno, Y. Mizuno & T. Sugiyama (2001)- Late Paleozoic faunal, climatic, and geographic changes in the Baoshan block as a Gondwana-derived continental fragment in southwest China. Palaeogeogr. Palaeoclim. Palaeoecology 170, p. 197-218.
(Carboniferous-Permian of Boashan Block of W Yunnan 3 main sequences: (1) Lower Carboniferous carbonate (diverse warm-water 'Eurasian-affinity' faunas, incl. Cyathaxonia coral fauna), (2) Lower Permian Asselian-Sakmarian 'peri-Gondwanan' cold water siliciclastics with diamictites overlain by E Artinskian carbonate with low diversity fusulinids Pseudofusulina- Eoparafusulina, also Cyathaxonia coral fauna, and Artinskian rift basalts; (3) M Permian 'marginal Cathaysian/ Cimmerian' carbonates; warm water, but low diversity fusulinids incl. Eopolydiexodina, also Shanita and coral assemblage with Wentzellophyllum and of lower diversity than in Cathaysian regions. Upper Carboniferous absent)

Wang, X.D., Y.Q. Zhang & Wei Lin (2010)- Carboniferous-Permian rugose coral *Cyathaxonia* faunas in China. Science China, Earth Sciences, 53, 12, p. 1864-1872
(Cyathaxonia faunas of small solitary corals widely distributed in Carboniferous- Permian beds across China. 12 families and 40 genera recognized. Cyathaxonia faunas of Baoshan, W Yunnan and S Anhui, occur just below large dissepimented solitary and compound corals in continuous sequence, implying occurrence not

strictly related to Gondwanan or peri-Gondwanan cold water environment, but may reflect by deeper water, mud-rich, quieter sedimentary environments)

Wang, Y., X. Xing, P.A. Cawood, S. Lai, X. Xia, W. Fan, H. Liu & F. Zhang (2013)- Petrogenesis of early Paleozoic peraluminous granite in the Sibumasu Block of SW Yunnan and diachronous accretionary orogenesis along the northern margin of Gondwana. Lithos 182-183, p. 67-85.
(SW Yunnan Shan-Tai terrane with E-M Ordovician granitoids with zircon ages of 492-460 Ma. S-type granites, representing S-ward continuation of E Paleozoic granitic belt of E Gondwana N margin)

Wang, Y., X. Qian, P.A. Cawood, H. Liu, Q. Feng, G. Zhao, Y. Zhang, H. He & P. Zhang (2018)- Closure of the East Paleotethyan Ocean and amalgamation of the Eastern Cimmerian and Southeast Asia continental fragments. Earth-Science Reviews 186, p. 195-230.
(Review of geological features of Paleotethys suture zones, bounding continental fragments and magmatic, metamorphic and sedimentary records. Data from Changning-Menglian, Inthanon and Bentong-Raub suture zones argue for linkage with Longmu Co-Shuanghu suture zone in C Tibet and together constitute main E Paleotethys Ocean relict. E-ward subduction of ocean resulted in series of magmatic arc/ backarc basin/ continental fragments in SE Asia (from W to E: Lincang-Sukhothai-E Malaya arc, Jinghong-Nan-Sa Kaeo back-arc basin, Simao/ W Indochina fragment, Luang Prabang-Loei back-arc basin, S Indochina fragment, Wusu and Truong Son back-arc basins, N Indochina fragment, Jinshajiang-Ailaoshan-Song Ma branch/back-arc basin and S China Block. Assembly of these fragments resulted in Triassic (Indosinian) metamorphism and related tectonothermal event. Switch from subduction of main E Paleotethyan Ocean to collision of Sibumasu with Simao/Indochina at ~237 Ma. Timing of collision events along Jinshajiang-Ailaoshan-Song Ma suture generally ~10 Ma older than along Changning-Menglian, Inthanon and Bentong-Raub suture zones)

Wang, Y., L. Zhang, P.A. Cawood, L. Ma, W. Fan, A. Zhang, Y. Zhang & X. Bi (2014)- Eocene supra-subduction zone mafic magmatism in the Sibumasu Block of SW Yunnan: implications for Neotethyan subduction and India-Asia collision. Lithos 206-207, p. 384-399.
(Metabasic rocks in NW Yunnan crystallized at 50-55 Ma and metamorphosed at ~39 Ma. Suggest E Eocene magmatism in NW Yunnan represents E-ward continuation of Gangdese magmatic belt and Neotethyan subduction continued until ~50 Ma, followed by India-Asia collision. At least two E-dipping subduction zones in Neotethyan suprasubduction system before 55 Ma. Sudden decrease in convergence rate in E Eocene (55-50 Ma) stimulated rollback of downgoing slab and induced melting of mantle sources)

Wanless, H.R. & J.R. Cannon (1966)- Late Paleozoic glaciation. Earth-Science Reviews 1, 4, p. 247-286.
(Late Paleozoic glaciation reported from many localities on Gondwana, including India, Pakistan, Australia, etc. Nothing known from SE Asia yet)

Waterhouse, J.B. (1972)- The evolution, correlation, and paleogeographic significance of the Permian ammonoid family Cyclolobidae. Lethaia 5, 3, p. 251-270.
(Cyclolobidae of M Permian age. Waagenoceras- Timorites lineage inhabited paleotropical latitudes, and Timorites is found around rim of Pacific Ocean (both also found on Timor; JTvG))

Waterhouse, J.B. (1982)- An Early Permian cool-water fauna from pebbly mudstones in south Thailand. Geol. Magazine 119, 4, p. 337-354.
(E Permian (Asselian) small brachiopod fauna from E Permian pebbly mudstones- sandstones of Phuket Gp at Ko Muk and Ko Phi Phi islands, Andaman Sea. With Komukia, Cancrinelloides, Rhynchopora, Sulciplica, etc. At one locality associated with solitary coral Euryphyllum. Most genera found in temperate- high paleolatitudes, suggesting pebbly mudstones are cool water deposits, contemporaneous with Late Asselian Gondwana glacial deposits (=Phuket Gp is part of 'Sibumasu terrane'; JTvG))

Waterhouse, J.B. (1987)- Perceptions of the Permian Pacific- the Medusa hypothesis. In: E. Brennan (ed.) Proc. Pacific Rim Congress 1987, Gold Coast, Australasian Inst. of Mining and Metallurgy, Parkville, p. 607-614.

Waters, J.A. (1990)- The palaeobiogeography of the Blastoidea (Echinodermata). In: W.S. McKerrrow & C.R. Scotese (eds.) Palaeozoic palaeogeography and biogeography, Geol. Soc., London, Mem. 12, p. 339-352.
(Permian blastoids widespread but most diverse in SE Asia and Australia. Timor faunas Sakmarian-Asselian and Kazanian, and most diverse and abundant. Paleoecology and stratigraphy poorly understood. Some common species between Timor and Australia, but others conspicuously absent: Angioblastus, Deltoblastus not in Australia; Australoblastus not in Timor. Reasons for local endemism unclear. Kazanian Timor fauna is last successful blastoid community before going extinct)

Wilson, K.M., M.J. Rosol & W.W. Hay (1989)- Global Mesozoic reconstructions using revised continental data and terrane histories: a progress report. In: J.W. Hillhouse (ed.) Deep structure and past kinematics of accreted terranes, American Geophys. Union (AGU) Geophys. Monograph Series 50, p. 1-39.
(online at: www.agu.org/books/gm/v050/GM050p0001/GM050p0001.pdf)
(Series of interesting M Triassic- E Cretaceous global plate reconstructions, largely driven by faunal records)

Wnuk, C. (1996)- The development of floristic provinciality during the Middle and Late Paleozoic. Review Palaeobotany Palynology 90, p. 5-40.
(On evolution of floristic provinces since Silurian. Three main phytogeographic units in earliest fossil floras (Angara, Euramerica, Gondwana). Fourth unit (Cathaysia) differentiated from Euramerica in latest Carboniferous. Includes mention of New Guinea Gondwanan flora. Nothing on Sumatra or other SE Asia)

Wood, G.D., M.A. Miller, D.T. Pocknall, A.M. Aleman, J.A. Stein & R. Dino (1998)- Paleoclimatologic, paleoecologic and biostratigraphic significance of the Middle Cretaceous elaterate microfloral province, Gondwana. In: AAPG Int. Conf. Exhib., Abstracts, American Assoc. Petrol. Geol. (AAPG) Bull. 82, 10, p. 1982. *(Abstract only)*
(One of best defined Cretaceous phytogeographic realms is Albian-Cenomanian elaterate microfloral province, bracketing Cretaceous paleo-equator, in tropical-subtropical Africa- S America and outliers in China, Middle East and PNG. Typified by elater bearing pollen Elaterocolpites, Elateroplicites, Elateropollenites, etc. Parent plants inhabited paleotropical humid coastal plains of Proto-South Atlantic and Tethys oceans)

Wopfner, H. (1996)- Gondwana origin of the Baoshan and Tengchong terranes of West Yunnan. In: R. Hall & D. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc. London, Spec. Publ. 106, p. 539-547.
(Baoshan and Tengchong Blocks in W Yunnan, China, have Permo-Carboniferous glaciomarine deposits, cold-water faunas and Glossopteris flora, indicating Gondwana position at that time and part of Sibumasu tectono-stratigraphic unit. Glacial series of Baoshan Block rel. thin and overlain by thick basalts and red beds (volcanic rift setting?). Tengchong Block glacial marine beds >1000 m, followed by thick Lower Permian reefal limestones (passive margin?). Both terranes separated from Australian Gondwana in late E Permian. Docking started in Late Triassic, with closure of Changning-Menglian Belt)

Wopfner, H. (1999)- The Early Permian deglaciation event between East Africa and Northwestern Australia. J. African Earth Sci. 29, p. 77-90.
(Late Paleozoic glacigene deposits form base of Gondwana megasequence along entire length of Tethyan margin of Gondwana. Examples of deglaciation sequences, including Tanzania, S Oman, Lesser Himalaya, NW Australia and SW China. All deglaciation sequences Late Asselian- E Sakmarian age. High content of organic matter in deglaciation deposits, like Late Asselian-E Sakmarian Treachery Shale of Australian NW Shelf with microflora of Pseudoreticulatispora (= Granulatisporites) confluens. Peak sea level in Late Sakmarian- E Artinskians. Swift and synchronuous climatic amelioration reflect rapid and substantial global warming)

Wopfner, H. (2001)- Gondwana terranes of southwest China and their connections to India and Australia. J. Indian Assoc. Sedimentologists, Delhi, 20, p. 1-19.
(Two groups of terranes with Late Carboniferous-E Permian glacial deposts that separated from Gondwana in Permian (together also referred to Sibumasu Blocks?; JTvG): (1) LBS (Lhasa Block, Tibet and Baoshan, W Yunnan) and Shan Thai (E Burma) which evolved in volcanic rift setting with margin of Greater India and NW Australia, and separated from Gondwana in Artinskian; (2) TMS (Tengchong Block, peninsular Thailand, W Malay Peninsula and N Sumatra), developed on peri-continental non-volcanic rift along N margin of Australia and pre-Permian New Guinea and separated slightly earlier than LBS)

Wopfner, H. & X.C. Jin (2009)- Pangea megasequences of Tethyan Gondwana-margin reflect global changes of climate and tectonism in Late Palaeozoic and Early Triassic times- a review. Palaeoworld 18, p. 169-192.
(Late Carboniferous- M Triassic 'Pangea stage' similar trends across Gondwana. Late Carboniferous- E Permian glacial- periglacial deposits followed by deglaciation in E Sakmarian, with typical facies with coal measures and redbeds. In E Permian, large graben structures started to develop between Africa and India and between India and Australia. Rifting along Tethyan margin started in E Permian, associated with volcanism

between Kashmir and Yunnan and in NW Australia. Spreading of Neo-Tethys lead to separation of Cimmerian Blocks from Gondwana in late E Permian- Triassic. Two facies realms (1) intracratonic rift (Cashmere, Lhasa, Baoshan blocks) and (2) detached more distal blocks (Tengchong, Malaya, Sumatra))

Wright, A.J., G.C. Young, J.A. Talent & J.R. Laurie (eds.) (2000)- Palaeobiogeography of Australasian faunas and floras. Assoc. Australasian Palaeontologists, Mem. 23, p. 1-515.
(Collection of 10 papers describing Australasian floras-faunas and paleobiogeography from Cambrian-Quaternary (not including Triassic; JTvG))

Wu, G.Y. & B.L. Cong (1995)- Tethyan evolution and SE Asian continental accretion. In: Proc. Int. Symp. Geology of Southeast Asia and adjacent areas, Hanoi 1995, J. of Geol. Hanoi, B, 1995, 5-6, p. 293-301.

Wu, H.R., C.A. Boulter, B.J. Ke, D.A.V. Stow & Z.C. Wang (1995)- The Changning-Menglian suture zone; a segment of the major Cathaysian-Gondwana divide in Southeast Asia. Tectonophysics 242, p. 267-280.
(Changning-Menglian suture zone of W Yunnan, SW China, is major Cathaysia- Gondwana divide, representing closing of Paleo-Tethys Ocean. Narrow N-S zone of E Devonian- M Permian oceanic siliceous sediments and dismembered ophiolite complexes, including reef-capped oceanic islands. Simao terrane is E of suture, has Cathaysian affinities and not part of Sibumasu terrane as suggested by various authors. Subduction created active continental margin on W edge of Simao terrane throughout much of Triassic;until closure of this branch of Paleotethys in early Late Triassic)

Wu, J. & J. Suppe (2017)- Proto-South China Sea plate tectonics using subducted slab constraints from tomography. J. Earth Science (China), 29, p. 1304-1318.
(online at: https://link.springer.com/article/10.1007/s12583-017-0813-x)
(Reconstruction of vanished Proto-South China Sea ocean from tomography imaging of subducted slab. Two slabs identified, now at depths of 750-900 km. Proto-South China Sea consumed by double-sided subduction: (1) 'N Proto-South China Sea' (now under N S China Sea- Philippines) subducted in Oligo-Miocene under Dangerous Grounds southward, expanding S China Sea by in-place 'self subduction' similar to W Mediterranean basins; (2) limited S-ward subduction of proto-S China Sea under Borneo before Oligocene (35 Ma), represented by 800-900 km deep 'S Proto-South China Sea' slab (now under S S China Sea- N Borneo))

Wu, J., J. Suppe & R.V.S. Kanda (2012)- Constraints on the extrusion of SE Asia from subducted slabs of the Indian, Australian, Philippine Sea and Molucca Sea plates. EGU General Assembly, Vienna 2012, p. 10019 *(Abstract only)*
(Subducted slabs under SE Asia mapped from seismic tomography and seismicity, when unfolded and restored, show incompatibilities with existing plate-tectonic models. Philippine Sea, Molucca Sea and Celebes Sea plates are fragments of once much larger NE Indian-Australian Ocean, once continuous with Sunda slab and present Indian Ocean)

Wu, J., J. Suppe, R. Lu & R. Kanda (2016)- Philippine Sea and East Asian plate tectonics since 52 Ma constrained by new subducted slab reconstruction methods. J. Geophysical Research, Solid Earth, 121, 6, p. 4670-4741.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2016JB012923/epdf)
(Reconstructed Philippine Sea and E Asian plate tectonics since E Eocene from 28 slabs mapped from global tomography, with subducted area of ~25% of present-day global oceanic lithosphere. Slab constraints include subducted parts of existing Pacific, Indian and Philippine Sea oceans, plus subducted proto-S China Sea and newly discovered 8000 × 2500 km 'East Asian Sea' between Pacific and Indian Oceans at 52 Ma based on lower mantle flat slabs. Philippine Sea formed above Manus plume near Pacific- E Asian Sea plate boundary. Philippine Sea W-ward motion and post-40 Ma max. 80° CW rotation accompanied late Eocene-Oligocene collision with Caroline/Pacific plate. Philippine Sea moved N post-25 Ma over northern East Asian Sea, forming N Philippine Sea arc that collided with SW Japan-Ryukyu margin in Miocene (~20-14 Ma))

Xia, Y., X. Xu, Y. Niu & L. Liu (2017)- Neoproterozoic amalgamation between Yangtze and Cathaysia blocks: The magmatism in various tectonic settings and continent-arc-continent collision. Precambrian Research 309, p. 56-87.
(manuscript online at: http://dro.dur.ac.uk/21242/1/21242.pdf)
(Neoproterozoic amalgamation history of Yangtze and Cathaysia blocks, forming S China Block: (1) ~1000-860 Ma NW-ward intra-oceanic subduction and SE-ward ocean-continent subduction (with continental margin magmatism in Cathaysia Block); (2) ~860-825 Ma steepening subduction caused development of back-arc basin in intra-oceanic arc zone and slab rollback induced arc and back-arc magmatism in Cathaysia Block. NW-ward ocean-continent subduction formed continental margin magmatism in Yangtze Block; (3) ~825-805 Ma continent-arc-continent collision and final amalgamation between Yangtze and Cathaysia blocks (Jiangnan Orogen); (4) ~805-750 Ma collapse of Jiangnan Orogen and Nanhua rift basin formed)

Xu, C., H. Shi, C.G. Barnes & Z. Zhou (2016)-Tracing a late Mesozoic magmatic arc along the Southeast Asian margin from the granitoids drilled from the northern South China Sea. Int. Geology Review 58, p. 71-94.
(Granitoids drilled in N S China Sea two magmatic episodes: Late Jurassic (162-148 Ma) and E Cretaceous (137-102 Ma). Jurassic magmatism probably began in late M Jurassic, documented by inherited zircons. I-type granites, generated in continental arc environment. Arc granites of SCS, with accretionary wedge of Palawan terrane to SE and zone of lithospheric extension to N throughout SE China, define late Mesozoic SW-NE trench-arc-backarc setting for SE Asian continental margin , related to subduction of Paleo-Pacific slab beneath Asia)

Xu, C., L. Zhang, H. Shi, M.R. Brix, H. Huhma, L. Chen, M. Zhang & Z. Zhou (2017)- Tracing an Early Jurassic magmatic arc from South to East China Seas. Tectonics 36, 3, p. 466-492.
(E Jurassic granite and diorite in wells in NE South China Sea and SW East China Sea (198-187 Ma), probably part of arc-related granitoids,that, along with those from SE Taiwan, could define E Jurassic NE-SW trending Dongsha-Talun-Yandang magmatic arc zone along East Asian continental margin paired with Jurassic accretionary complexes from SW Japan, E Taiwan to W Philippines. Arc-subduction complex associated with oblique subduction of Paleo-Pacific slab beneath Eurasia)

Xu, J., Z. Ben-Avraham, T. Kelty & H.S. Yu (2014)- Origin of marginal basins of the NW Pacific and their plate tectonic reconstructions. Earth-Science Reviews 130, p. 154-196.
(Basins of Bohai Gulf, S China Sea, E China Sea, Japan Sea, Andaman Sea, Okhotsk Sea and Bering Sea typical geometry of dextral pull-apart. Java, Makassar, Celebes and Sulu Seas basins together with grabens in Borneo also dextral, transform-margin type basin system. Formation of gigantic linked dextral pull-apart basin system in NW Pacific due to NNE- to ENE-ward motion of E Eurasia, mainly response to Indo-Asia collision which started at ~50 Ma)

Xu, Y., P.A. Cawood, Y. Du, L. Hu, W. Yu, Y. Zhu & W. Li (2013)- Linking south China to northern Australia and India on the margin of Gondwana: Constraints from detrital zircon U-Pb and Hf isotopes in Cambrian strata. Tectonics 32, 6, p. 1547-1558.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/tect.20099/epdf)
(Cambrian sedimentary rocks in S part of S China Craton derived from source to S or SE, beyond current limits of craton. U-Pb ages and Hf isotope data on detrital zircons from Cambrian two age peaks at 1120 Ma and 960 Ma, with εHf(t) values similar to coeval detrital zircons from W Australia and Tethyan Himalaya zone, respectively. ~1120 Ma detrital zircons likely derived from Wilkes-Albany-Fraser belt (between SW Australia-Antarctica); ~960 Ma zircons possibly sourced from Rayner-Eastern Ghats belt (between India-Antarctica). Suggesting S China was at nexus between India, Antarctica, and Australia along N margin of E Gondwana)

Xu, Y., P.A. Cawood, Y.S. Du, H. Huang, & X. Wang (2014)- Early Paleozoic orogenesis along Gondwana's northern margin constrained by provenance data from South China. Tectonophysics 636, p. 40-51.
(Cambrian- Ordovician boundary unconformity in S part of S China Craton related to coeval orogenic activity along Indian margin of E Gondwana. Disconformity at base Ordovician part of regional break also documented in Himalaya, Qiangtang, Lhasa, Sibumasu and W Australia, with angular unconformity, metamorphism of older units and widespread magmatic activity. S China Craton also deformed and metamorphosed during mid-

Paleozoic intra-continental Kwangsian orogeny, with regional angular unconformity between Devonian cover and metamorphosed pre-Devonian along with granite intrusion between 460-400 Ma)

Xu, Y., Z. Yang, Y.B. Tong, H. Wang, L. Gao & C. An (2015)- Further paleomagnetic results for lower Permian basalts of the Baoshan Terrane, southwestern China, and paleogeographic implications. J. Asian Earth Sci., 104, p. 99-114.
(Baoshan Terrane of SW China part of Cimmerian block in Late Paleozoic. Paleomagnetic studies on lower Permian Woniusi Fm basalts suggest Baoshan Terrane located at latitude 38°S ± 3.7° in late E Permian. Comparison with E Permian from Gondwanan blocks suggests Baoshan Terrane located near junction of N India and NW Australia, and broke away from W Australia after E Permian. Basalts represent extensional setting and may represent start of separation between Baoshan and Gondwana)

Yamashita, I., A. Surinkum, Y. Wada, M. Fujihara, M. Yokoyama, H. Zaman & Y. Otofuji (2011)- Paleomagnetism of the Middle-Late Jurassic to Cretaceous red beds from the Peninsular Thailand: implications for collision tectonics. J. Asian Earth Sci. 40, 3, p. 784-796.
(Paleomagnetic data of Jurassic- Cretaceous red sandstones from Peninsular Thailand suggests two opposite tectonic rotations in Trang area. As part of Thai-Malay Peninsula underwent CW rotation after Jurassic together with Shan-Thai and Indochina blocks. Between Late Cretaceous and M Miocene, as part of S Sundaland Block (incl. Peninsular Malaysia, Borneo and S Sulawesi), up to 24.5° ± 11° CCW rotation relative to S China Block. N boundary of CCW rotated zone between Trang area and Khorat Basin)

Yan, J.X. & H. Yin (2000)- Paleoclimatic constraints for early Permian paleogeography of Eastern Tethys. In: H. Yin et al. (eds.) Permian-Triassic evolution of Tethys and Western Circum-Pacific, Developments in Palaeontology and Stratigraphy 18, Elsevier, p. 1-15.
(Paleoclimate indicators used to distinguish major Asian blocks. Early Permian cooler climate areas with diamictites and Glossopteris flora, warm climates have fusulinid limestones, Gigantopteris floras, etc.. Suggest N-ward movement in Permian of blocks like Sibumasu from S Hemisphere Gondwana to N Hemisphere Asia)

Yan, J.X. & D. Zhao (2001)- Advancement of the Mesotethys along the northern margin of the South China Sea. Marine Geol. Quaternary Geology, Beijing, 21, 4, p. 49-54.
(In Chinese. Marine Mesozoic strata along N margin of S China Sea indicate marine basin. Basin was a large ocean in Mesozoic and can be traced W-ward to Mesotethys (Meratus suture of Kalimantan, and Woyla suture on Sumatra), E-ward ocean connected to extinct ocean in Sakawa zone of Japan through Taiwan Straits. Ocean closed around M Cretaceous, resulting from docking of N Palawan Terrane and Reed Bank terrane)

Yan, J.X. & K. Zhao (2001)- Permo-Triassic paleogeographic, paleoclimatic and paleoceanographic evolutions in eastern Tethys and their coupling. Sci. China, Ser. D, 44, p. 968-978.
(Permian and Triassic (Chihsian, Wujiapingian, Anisian and Norian) reconstructions and paleogeography of E Tethys area, mainly driven by paleoclimate records)

Yan, Q.S. & X.F. Shi (2007)- Hainan mantle plume and the formation and evolution of the South China Sea. Geol. J. Chinese Universities 13, 2, p. 311-322.
(Seismic tomographic images suggest possible mantle plume beneath and around Hainan island (sub-vertical low-velocity column, extending from shallow depths to 660-km seismic discontinuity and continuously to depth of 1900 km. Large quantity of Cenozoic alkali basalts distributed in S China Sea and adjacent areas)

Yan, Q., X. Shi, I. Metcalfe, S. Liu, T. Xu, N. Kornkanitnan, T. Sirichaiseth, L. Yuan, Y. Zhang & H.Zhang (2018)- Hainan mantle plume produced late Cenozoic basaltic rocks in Thailand, Southeast Asia. Nature Scientific Reports 8, 2640, p. 1-14.
(online at: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5805767/pdf/41598_2018_Article_20712.pdf)
(Intraplate volcanism started after 16 Ma, shortly after cessation of seafoor spreading in S China Sea, affecting large areas. Geochemistry of Late Miocene- Pleistocene basalts from Khorat Plateau and Sukhothai arc terrane in Thailand show Oceanic Island Basalt -like characteristics. Post-spreading intra-plate volcanism around S China Sea region probably induced by Hainan mantle plume)

Yan, Q., Z. Wang, S. Liu, Q. Li, H. Zhang, T. Wang et al. (2005)- Opening of the Tethys in southwest China and its significance to the breakup of East Gondwanaland in late Paleozoic: evidence from SHRIMP U-Pb zircon analyses for the Garze ophiolite block. Chinese Science Bull. 20, 3, p. 256-264.
(U-Pb zircon analyses of gabbro from Garze ophiolite block from Garze-Litang melange mean age 292±4 Ma, suggesting earliest Permian age for sea floor spreading/ age of opening of Tethys at East Gondwanaland)

Yang, J., P.A. Cawood & Y. Du (2015)- Voluminous silicic eruptions during late Permian Emeishan igneous province and link to climate cooling. Earth Planetary Sci. Letters 432, p.166-175.
(Case study for ~260 Ma Emeishan Large Igneous Province in S China, where silicic volcanic rocks are minor component of preserved rock due to extensive Late Permian erosion. Silicic volcanic rocks ~30% of volume of eroded Emeishan volcanics. Basalt-derived silicic eruptions released sulfur gases into higher atmosphere, contributing to climate cooling at Capitanian-Wuchiapingian transition at ~260 Ma)

Yang, J., P.A. Cawood, Y. Du, H. Huang & L. Hu (2014)- A sedimentary archive of tectonic switching from Emeishan plume to Indosinian orogenic sources in SW China. J. Geol. Soc., London, 171, 2, p. 269-280.
(U Permian- M Triassic sediments in Youjiang Basin, S China, record change from Late Permian within-plate mafic-dominated source to NW (zircons ages ~260 Ma; mainly from Emeishan Large Igneous Province), to E-M Triassic mixed magmatic arc-recycled orogenic source to W (subduction–collision rocks of Indosinian Orogeny) and E (recycled Precambrian- E Paleozoic rocks in S China hinterland))

Yang, K. (1998)- A plate reconstruction of the Eastern Tethyan orogen in Southwestern China. In: M.F.J. Flower et al. (eds.) Mantle dynamics and plate interactions in East Asia, American Geophys. Union (AGU) Geodyn. Ser. 27, p. 269-287.
(E Tethyan orogenic belt in SW China includes S Tibet, N Tibet, Baoshan-Shan-Thai, Changdu-Simao-Indochina and Zhongza terranes between India and Yangtze continental plates, separated by sutures with dismembered ophiolites and arc volcanic belts, recording series of closed Carboniferous- Tertiary Tethyan ocean basins. Lancangjiang suture records Permo-Carboniferous Tethyan ocean, separating Gondwanaland and Eurasia. Two phases (1) Carboniferous-Triassic spreading of Lancangjiang, Jinshajiang and Garze-Litang oceans and breakup of Changdu-Simao-Indochina and Zhongza terranes from S margin of Eurasia; (2) Triassic-Tertiary spreading of Nujiang and Yarlung Zangpo oceans associated with breakup of S Tibet, N Tibet and Baoshan-Shan-Thai terranes from N Gondwanaland)

Yang, Z. & J. Besse (1993)- Paleomagnetic study of Permian and Mesozoic sedimentary rocks from Northern Thailand supports the extrusion model for Indochina. Earth Planetary Sci. Letters 117, p. 525-552.
(Paleomagnetic study of Jurassic- Cretaceous sediments on Khorat Plateau suggests 1500 ± 800 km of post-M Cretaceous left-lateral slip along Red River and Xian Shui He fault zones and 14 ± 7° CW rotation for Indochina block relative to S China block, in agreement with lateral extrusion model of Indochina during India-Asia collision. Additional data of Permian, U Triassic and Lw Jurassic suggest Indochina, Yunnan (S China), N China block and S China block probably in contact at least since Late Triassic)

Yang, Z., J. Besse, V. Sutheetorn, J.P. Bassoullet, H. Fontaine & E. Buffetaut (1995)- Lower-Middle Jurassic paleomagnetic data from the Mae Sot area (Thailand): paleogeographic evolution and deformation history of Southeastern Asia. Earth Planetary Sci. Letters 136, p. 325-341.
(Paleomagnetic study of E-M Jurassic limestones and sandstones from Mae Sot area, W Thailand (part of Shan-Thai-Malay).Mae Sot paleolatitude show STM was close to or had already accreted with Simao or Khorat blocks in E-M Jurassic (in Late Triassic). Relative S-ward motion of 8 ± 4° of Indochina and CW rotations (14-75°) relative to China)

Yap, S. (2002)- On the distributional patterns of Southeast-East Asian freshwater fish and their history. J. Biogeography 29, 9, p. 1187-1199.
(Present-day fresh water fish distributions classified into 19 biogeographical zones/ main river systems Sundaic islands grouped into four pairs: Malay Peninsula- N Sumatra, C Sumatra-W Borneo, N Borneo-E Borneo-

Sarawak and S Borneo-Java. Java is relatively small, but landbridge island connected it with large islands of Sumatra and Borneo during Pleistocene low sea level periods)

Yeh, M.W. & J.G. Shellnutt (2016)- The initial break-up of Pangaea elicited by Late Paleozoic deglaciation. Nature Scient. Reports 6, 31442, p. 1-9.
(online at: www.ncbi.nlm.nih.gov/pmc/articles/PMC4980595/pdf/srep31442.pdf)
(Rifting of Pangea began in E Permian along S Tethys margin and produced lenticular-shaped Cimmeria continent. Mantle-plume model explained rift-related volcanism but Cimmerian rifts do not correlate well with pre-existing suture zones. Location and timing of Cimmerian rifting resulted from exploitation of structural heterogeneities within crust that formed due to repeated glacial-interglacial cycles in Late Paleozoic. Effects of continental deglaciation helped to create shape of Cimmeria and Neotethys Ocean, suggesting climate change may influence location of rifting)

Yin, An (2010)- Cenozoic tectonic evolution of Asia: a preliminary synthesis. Tectonophysics 488, p. 293-325.
(Cenozoic tectonic evolution model of Asia, including lateral extrusion of SE Asia between 32- 17 Ma after India- Asia collision)

Yin, Hongfu (1997)- Triassic biostratigraphy and palaeobiogeography of East Asia. In: J.M. Dickins (ed.) Late Palaeozoic and Early Mesozoic Circum-Pacific events and their global correlation, Cambridge University Press, p. 168-185.
(Timor Triassic classified as 'Gondwanan Tethys' facies, similar to Lhasa- W. Birma?; different from 'India-Gondwana' and 'Cathaysian-Tethys'. Misolia is element of subtropical 'Gondwanan Tethys'. Gondwanan Tethys and Tropical Tethys merged in Late Triassic due to S-ward expansion of tropical-subtropical biota)

Yin, Hongfu, J.M. Dickins, G.R. Shi & J. Tong (eds.) (2000)- Permian-Triassic evolution of Tethys and Western Circum-Pacific. Developments in Palaeontology and Stratigraphy 18, Elsevier, 412p.
(Reviews of Permian-Triassic in mainland E Asia, New Zealand, etc.. Little on Indonesia, New Guinea)

Yin, Hongfu & Y. Peng (2000)- The Triassic of China and its interregional correlation. In: H. Yin et al. (eds.) Permian-Triassic evolution of Tethys and Western Circum-Pacific, Developments in Palaeontology and Stratigraphy 18, Elsevier, p. 197-220.
(Review of Triassic stratigraphy of China. Six regions, incl. NW Pacific (marine), tropical Cathaysian Tethys and warm-temperate Gondwanan Tethys (Himalayas and SE extension into Yunnan-Tengchong area)

Yin, Hongfu, S.D. Wu, Y. Du, J. Yan & Y. Peng (1999)- South China as a part of archipelagic Tethys during Pangea time. Proc. Int. Conf. on Pangea and the Paleozoic- Mesozoic transition, Wuhan 1999, p. 69-73.
(South China composed of several microplates in Late Paleozoic, at time when Eastern Tethys was an 'archipelagic Ocean' with numerous microplates that amalgamated into Paleoasia during Late triassic Indosinian orogeny)

Yin, Hongfu, K. Zhang & Q. Feng (1999)- The Archipelagic Ocean system of the Eastern Eurasian Tethys. Acta Geologica Sinica (English Edition) 78, 1, p. 230-236.
(Unlike typical oceans such as wide and 'clean' Atlantic, Tethys Ocean showed archipelagic pattern during all stages, especially E Tethys. Evolutionary history of Qinling-Qilian-Kunlun, S China and Xizang (Tibet) - Yunnan regions)

Yin, J. (2003)- Oxfordian (Jurassic) mayaitid (ammonite) dispersal in the Tibetan Himalaya as the first signal of the establishment of the Indo-Austral subrealm. Progress in Natural Science 13, 4, p. 282-287.
(Mid-Oxfordian ammonite fauna in Lanongla area, Tibetan Himalaya, characterized by endemic epimayaitids. Distribution of mayaitids around E Gondwana can be regarded as first signal establishment of Indo-Austral Subrealm in Late Jurassic-E Cretaceous)

Yu, C., X. Shi, X. Yang, J. Zhao, M. Chen & Q. Tang (2017)- Deep thermal structure of Southeast Asia constrained by S-velocity data. Marine Geophysical Research 38, 4, p. 341-355.

(Deep thermal structure of SE Asia, derived from empirical relation between S-velocity and T. Temperature at depth of 80 km in rifted and oceanic basins (Thailand Rift Basin, Gulf of Thailand, Andaman Sea and S China Sea) is ~200 °C higher than in plateaus (Khorat Plateau, Sumatra Island) and subduction zones (Philippine Trench). Surface heat flow in S China Sea mainly dominated by deep thermal state. Temperatures at 100-120 km depths more uniform. Estimated base of lithosphere corresponds to ~1400 °C isotherm; good correlation with tectonic setting.

Zahirovic, S., N. Flament, R.D. Muller, M. Seton & M. Gurnis (2016)- Large fluctuations of shallow seas in low-lying Southeast Asia driven by mantle flow. Geochem. Geophys. Geosystems 17, 9, p. 3589-3607.
(online at: http://ro.uow.edu.au/cgi/viewcontent.cgi?article=5216&context=smhpapers)
(On link between mantle flow and surface tectonics. SE Asia one of lowest lying continental regions in world, with half of continental area presently inundated by shallow sea. Widespread Late Cretaceous-Eocene regional unconformity in SE Asia likely driven by dynamic topography, i.e. several 100m of dynamic uplift and emergence of Sundaland between ~80-60 Ma due to slab breakoff after Late Cretaceous collision of Gondwana-derived terranes with Sundaland. Renewed subduction from ~60 Ma re-initiated dynamic subsidence of Sundaland, leading to submergence from ~40 Ma)

Zahirovic, S., K. Matthews, N. Flament, R. Muller, K. Hill, M. Seton & M. Gurnis (2016)- Tectonic evolution and deep mantle structure of the eastern Tethys since the latest Jurassic. Earth- Science Reviews 162, p. 293-337.
(Major review of plate tectonics of since 160 Ma. Rifting of 'Argoland' (E Java and W Sulawesi) in latest Jurassic from NW Australian shelf, likely colliding first with parts of Woyla intra-oceanic arc in mid-Cretaceous, and accreting to Borneo (Sundaland) core by ~80 Ma. Neo-Tethyan ridge likely consumed along intra-oceanic subduction zone S of Eurasia from ~105 Ma, leading to major change in motion of Indian Plate by ~100 Ma)

Zahirovic, S., K. Matthews, Ting Yang, N. Flament, D. Garrad, G. Brocard, J. Iwanec, K. Hill, M. Gurnis, R. Hassan, M. Seton & D. Muller (2018)- Tectonics and geodynamics of the eastern Tethys and northern Gondwana since the Jurassic. In: Proc. Australian Exploration Geoscience Conf. (AEGC 2018), Sydney, p. 1-6. *(Extended Abstract)*
(online at: http://www.publish.csiro.au/ex/pdf/ASEG2018abM1_1C)
(Evolution of E Neo-Tethys since latest Jurassic rifting along N Gondwana. New Guinea N-ward motion over subducted slabs (related to Sepik back-arc basin and Maramuni subduction system), resulted in long-term flooding of margin since ~20 Ma. Sundaland continental promontory dynamic uplift in latest Cretaceous-Eocene due to accretion of Woyla Arc at ~80 Ma, leading to slab breakoff and temporary interruption of subduction. Renewed subduction along Sunda margin resulted in renewed dynamic subsidence from ~30 Ma, amplified by regional basin rifting events. Sinking Sunda slab likely triggered mantle slab avalanche, resulting in contemporaneous basin inversion and dynamic subsidence from ~15 Ma)

Zahirovic, S., M. Seton & R.D. Muller (2014)- The Cretaceous and Cenozoic tectonic evolution of Southeast Asia. Solid Earth 5, p. 227-273.
(online at: www.solid-earth.net/5/227/2014/se-5-227-2014.pdf)
(Major review and new model of tectonic evolution of SE Asia in last 155 My, with significant differences from Hall, Metcalfe, etc. models. SW Borneo already part of SE Asia in Late Jurassic, and did not originate from NW Australian shelf. SE Java and W Sulawesi blocks rifted off New Guinea margin in Late Jurassic, etc.. With animation model in supplement)

Zakharov, Y.D., A.M. Popov & A.S. Biakov (2008)- Late Permian to Middle Triassic palaeogeographic differentiation of key ammonoid groups: evidence from the former USSR. Polar Research 27, p. 441-468.
(Incl. paleogeographic reconstructions with Late Permian- earliest Triassic (260- 247 Ma) distributions of ammonites in Paleotethys)

Zaw, K. (2014)- Metallogeny of mainland SE Asia. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Ann. Conv. Indon. Soc. Econ. Geol. (MGEI), Palembang, p. 27-33.

(Brief review of mainland SE Asia mineral resources associated with complex tectonic history; see also Zaw (2014) paper below)

Zaw, K., S. Meffre, C.K. Lai, C. Burrett, M. Santosh, I. Graham, T. Manaka, A. Salam, T. Kamvong & P. Cromie (2014)- Tectonics and metallogeny of mainland Southeast Asia- a review and contribution. Gondwana Research 26, p. 5-30.
(Review of SE Asia mineral resources associated with complex tectonic history of Gondwana supercontinent break-up, arc magmatism, backarc basin development and collisions that created present-day mainland SE Asia. This paper summarizes historical and current SE Asian geological research and ore deposit studies. Incipient arc/backarc basin magmatism is key to formation of many important ore deposits in Truong Son and Loei fold belts. Triassic to Cenozoic arc-continent and continent-continent collisions have led to the formation of sediment-hosted/orogenic gold deposits in Sukhothai and Sibumasu terranes. Oblique Cretaceous- Recent subduction along Andaman-Sunda trench responsible for gold and copper-gold-molybdenum porphyry and epithermal mineralization along arc in Myanmar and Sumatran volcanic arc)

Zenonos, A., L. De Siena, S. Widiyantoro & N. Rawlinson (2019)- P and S wave travel time tomography of the SE Asia-Australia collision zone. Physics Earth Planetary Interiors 293, 106267, p.
(P and S wave tomography show clear evidence of subducted slabs penetrating into mantle along Sunda arc, Banda arc and Halmahera arc. Also evidence for slab gaps or holes near E Java. Banda arc slab single curved subduction zone. High velocity mantle connection between N Australia and E margin of Sunda arc)

Zhang, C.L., M. Santosh, Q.B. Zhu, X.Y. Chen & W.C. Huang (2015)- The Gondwana connection of South China: evidence from monazite and zircon geochronology in the Cathaysia Block. Gondwana Research 28, 3, p. 1137-1151.
(E Paleozoic structures, metamorphism and magmatic activity suggest Cathaysia (= SE part of S China block) collisional orogenic belt rather than intraplate type. Angular unconformity between Silurian- Devonian; transition from collision to post-collision at ~430Ma. Some E Paleozoic clastics probably of Gondwana origin.)

Zhang, K.J. (1998)- The Changning-Menglian suture zone: a segment of the major Cathaysia-Gondwana divide in Southeast Asia- comment. Tectonophysics 290, p. 319-321.
(Commentary of Wu et al. 1995 paper. Jinshajiang-Ailaoshao suture is main Cathaysia- Gondwana divide in China, not Lancangjiang-Changning-Menglian suture)

Zhang, K.J. & J.X. Cai (2009)- NE-SW-trending Hepuï Hetai dextral shear zone in southern China: penetration of the Yunkai Promontory of South China into Indochina. J. Structural Geol. 31, 7, p. 737-748.
(NE-SW-trending Hepu-Hetai shear zone extends for ~480 km along Guangdong-Guangxi provinces boundary in S China.Dextral ductile strike-slip deformation, with estimated displacement of >500 km. Inclusions in quartz within mylonite suggest that ductile shear deformation under medium T/P conditions of greenschist facies; 40Ar/39Ar muscovite ages of 213-195 Ma. Shear zone originated via penetration of Yunkai Promontory of South China into Indochina during Late Triassic)

Zhang, Z.K. & J.X. Zhang (1986)- Paleomagnetic research on the upper Carboniferous basalts in Baoshan block, Yunnan and the tectonic belonging of the block. Bull. Inst. Geol. Chinese Acad. Geol. Sci., p. 184-189. *(In Chinese with English abstract. Xu et al. 2014: Paleomagnetic work on E Permian Woniusi Fm basalts 12 km NE of Baoshan, SW China, suggest terrane was at 34.1° S in E Permian. Result comparable to Xu et al. 2014)*

Zhang, Z.W., Q. Shu, X.Y. Yang, C. Wu, C. Zheng & J. Xu (2019)- Review on the tectonic terranes associated with metallogenic zones in Southeast Asia. J. Earth Science 30, 1, p. 1-19.
(Review of relations between tectonic terranes and distribution of 24 tectonic-metallogenic zones in SE Asia)

Zhao, D. (2012)- Tomography and dynamics of Western-Pacific subduction zones. Monogr. Environ. Earth Planets 1, 1, p. 1-70.
(online at: www.terrapub.co.jp/onlinemonographs/meep/pdf/01/0101.pdf)

Zhao, D., S. Maruyama & S. Omori (2007)- Mantle dynamics of Western Pacific and East Asia: insight from seismic tomography and mineral physics. Gondwana Research 11, p. 120-131.
(Tomography of E Asia, the location of double-sided subduction zone where old Pacific plate subducts from E, and Indo-Australia plate subducts from S)

Zhao, T., Q. Feng, I. Metcalfe, L.A. Milan, G. Liu & Z. Zhang (2017)- Detrital zircon U-Pb-Hf isotopes and provenance of Late Neoproterozoic and Early Paleozoic sediments of the Simao and Baoshan blocks, SW China: Implications for Proto-Tethys and Paleo-Tethys evolution and Gondwana reconstruction. Gondwana Research 51, p. 193-208.
(Detrital zircons from Ordovician? Lancang Gp (separate Lancang Block?) and Mengtong and Mengdingjie Gps (Baoshan Block) with three age peaks: older Grenvillian (1200-1060 Ma), younger Grenvillian (~960 Ma) and Pan-African (650-500 Ma), with εHf(t) values similar to W Australia and N India. E Paleozoic Proto-Tethys represents narrow ocean basin separating 'Asian Hun superterrane' (N China, S China, Tarim, Indochina, N Qiangtang blocks) from N margin of Gondwana in Late Neoproterozoic- E Paleozoic. Proto-Tethys closed in Silurian at ~440–420 Ma when 'Asian Hun superterrane' collided with N Gondwana margin. Lancang Block separated from Baoshan Block in E Devonian when Paleo-Tethys opened as back-arc basin)

Zhao, T., X. Qin & Q. Feng (2015)- Zircon U-Pb-Hf isotopes and whole-rock geochemistry of the Late Triassic rhyolites from Lampang Zone, northern Thailand: implications for the closure of Paleo-Tethys. In: Proc. 4th Int. Symposium Int. Geosciences Program (IGCP) Project 589, Bangkok 2015, p. 102-106. *(Extended Abstract)*
(online at: http://igcp589.cags.ac.cn/4th%20Symposium/Abstract%20volume.pdf)
(E Norian (225.1±1.2 Ma) ages of post-collisional rhyolites in Lampang area minimum age of final closure of E Paleo-Tethys between Sibumasu and Indochina blocks. Older age from inherited zircons (242±1.9 Ma) resembles arc volcanic rocks from Doi Luang belt in same area. High-K calc-alkaline Lampang rhyolites formed in post-collisional extensional environment, controlled mainly by lithospheric delamination or slab breakoff. Youngest pelagic sediments in Changning-Menglian and Inthanon Suture Zones M Triassic (Triassocampe deweveri radiolarian assemblage), suggesting Paleo-Tethys ocean not yet closed in M Triassic)

Zhao, X., R.S. Coe, S.A. Gilder & G.M. Frost (1996)- Palaeomagnetic constraints on the palaeogeography of China: implications for Gondwanaland. Australian J. Earth Sci. 43, 6, p. 643-672.
(Paleomagnetic data show three main blocks of China (North China, South China, Tarim) were at or near equatorial latitudes in E and M Paleozoic. Late Paleozoic data suggest they were too far N to be attached to Gondwanaland and suggest they rifted from Gondwanaland in Late Devonian and Carboniferous. Etc.)

Zharkov, M.A. & N.M. Chumakov (2001)- Paleogeography and sedimentation settings during Permian- Triassic reorganizations in biosphere. Stratigraphy Geol. Correl. 9, 4, p. 340-363.
(Artinskian- Kungurian Metaperrinites and Kungurian Perrinites faunas in Ratburi Group in N Central and S Central Thailand, represent part of Tethyan perrinitid belt from Crimea in W to Timor in E)

Zhong, D. (2000)- Paleotethysides in West Yunnan and Sichuan, China. Science Press, Beijing, p. 1-248.
(Collection of papers on evolution of W Yunnan- Sichuan, containing sector of Paleotethysides where it turns from E-W belts of Tibetan Plateau to N-S mountain belts of mainland SE Asia. Formed by closure of Paleotethys in Late Paleozoic by collision of Gondwan Tengchong and Baoshan Blocks with Eurasia (Yangtze, Simao blocks). Paleotethys composed of main intercontinental ocean with several smaller intra-continental oceans and troughs)

Zhou, Z. (1990)- The Early Mesozoic orogeny in the northern shelf of the South China Sea and its adjacent lands. In: X. Jin et al. (eds.) Proc. Symposium Recent contributions to the geological history of the South China Sea, Hangzhou 1990, p. 119-125.
(E Triassic continental collision (of Cimmerian Blocks) in SE China, marking beginning of E Mesozoic orogeny in region. In end-Jurassic, Borneo began rifting away from S China margin, creating Proto-South China Sea. Present S. China Sea has evolved after drifting away from S China margin of continental fragments such as N Palawan, Reed Bank, Xisha Islands, Zhongsha Islands and others)

Zhu, Z. & Z. Yang (2008)- Distribution, origin and mineralization of two types of Cenozoic adakite and adakite-like rocks in southeastern Asia. Dizhi Lixue Xuebao = J. Geomechanics, Beijing, 14, 4, p. 328-338.
(In Chinese with English summary.) (Adakite and adakite-like intermediate-acid magmatic rocks well developed in Cenozoic of Indonesia- New Guinea. Two types of origin: (1) oceanic type tholeiitic/calc-alkaline series with REE pattern of oceanic island arcs, seen at the oceanic islands; (2) continental type high-K calc-alkaline series with continental type REE patterns, often in continental margin orogenic zone and related to arc-continent collision zone or post-collision. Continental-type adakite similar distribution to large porphyry copper-gold deposits; oceanic island arc type adakite rocks related to epithermal gold zones and ehalation ore deposits)

(Permian- Jurassic reconstructions of terranes of N parts of Asia (Eurasia- China) based on paleomagnetic and flora data. Little or nothing on SE Asia)

I.3. Volcanism, Volcanic rocks geochemistry

(This listing is a limited selection of an extensive body of literature on Indonesia volcanic activity and its products. Many additional titles on volcanism specific to one region are included under these regions)

Abdurrachman, M., S. Widiyantoro, B. Priadi & T. Ismail (2017)- Geochemistry and seismic tomogram beneath Krakatoa volcano, Sunda Strait, Indonesia. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Malang (JCM 2017), 3p.
(S-wave tomographic image under Krakatoa shows subducted slab has been intruded by hot mantle material, suggesting possible tearing of subducting plate)

Abdurrachman, M., S. Widiyantoro, B. Priadi & T. Ismail (2018)-Geochemistry and structure of Krakatoa volcano in the Sunda Strait, Indonesia. Geosciences, 8, 4, 111, p. 1-10.
(online at: www.mdpi.com/2076-3263/8/4/111)
(Tomographic image and geochemical data of Krakatoa area lavas suggests subducted slab intruded by hot material of mantle upwelling. Partial melting of mantle wedge and mantle upwelling in upper mantle may be caused by thinning of subducted slab under Krakatoa Volcano)

Abdurrachman, M., M. Yamamoto, E. Suparka, I.G.B.E. Sucipta, I.A. Kurniawan & R.F. Hasibuan (2015)- Across arc variation of strontium isotope and K2O composition in the Quaternary volcanic rocks from West Java: evidence for crustal assimilation and the involvement of subducted components. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-138, 5p.
(No across-arc variation of K2O and Sr isotopic ratios in West Java Arc. Papandayan volcano medium-K series with high 87Sr/86Sr (0.7052-0.7059); Cikuray low-K, with low 87Sr/86Sr (0.70417-0.70426). Across arc variation of magma chemistry explained by crustal assimilation and involvement of subducted components)

Abrams, L.J. & H. Sigurdsson (2007)- Characterization of pyroclastic fall and flow deposits from the 1815 eruption of Tambora volcano, Indonesia using ground-penetrating radar. J. Volcanology Geothermal Res. 161, p. 352-361.
(Ground-penetrating radar helps image and characterize fall and pyroclastic flow deposits from Tambora 1815 eruption. Reflection of interface between pre-eruption clay-rich soil and pyroclastics reaches maximum thickness of 4m. Soil surface terraced and used for agriculture and buildings)

Agangi, A. & S.M. Reddy (2016)- Open-system behaviour of magmatic fluid phase and transport of copper in arc magmas at Krakatau and Batur volcanoes, Indonesia. J. Volcanology Geothermal Res. 327, p. 669-686.

Bahar, I. (1984)- Contribution a la connaissance du volcanisme indonesien: le Merapi (Centre Java), cadre structural, petrologie, geochimie et implications volcanologiques. Ph.D. Thesis Universite de Montpellier, p. 1-213. *(Unpublished)*
('Contribution to the knowledge of Indonesian volcanism: the Merapi (C Java), structural setting, petrology, geochemistry and volcanological implications')

Bahar, I. & M. Girod (1983)- Controle structural du volcanisme indonesien (Sumatra, Java-Bali); application et critique de la method de Nakamura. Bull. Soc. Geol. France (7), 25, 4, p. 609-614.
('Structural control on Indonesian volcanism (Sumatra, Java-Bali); application and critique of the Nakamura method')

Bani, P., G. Tamburello, E.F. Rose-Koga, M. Liuzzo, A. Aiuppa, N. Cluzel, I. Amat, D.K. Syahbana, H. Gunawan & M. Bitetto (2018)- Dukono, the predominant source of volcanic degassing in Indonesia, sustained by a depleted Indian-MORB. Bull. Volcanology 80, 5, p. 1-14.
(Little known Dukono volcano on N Halmahera island regularly erupting since 1933. Gas emissions show huge magmatic volatile contribution into atmosphere, with annual output of ~290 kt SO2, 5000 kt H2O, 88 kt CO2, 5 kt H2S and 7 kt H2 (in top 10 volcanic SO2 sources on Earth). Degassing sustained by depleted Indian-MORB mantle source, currently undergoing lateral pressure from steepening of subducted slab, downward force from Philippine Sea plate and W-ward motion of continental fragment along Sorong fault)

Borisova, A.Y., A.A. Gurenko, C. Martel, K. Kouzmanov & S. Sumarti (2016)- Oxygen isotope heterogeneity of arc magma recorded in plagioclase from the 2010 Merapi eruption (Central Java, Indonesia). Geochimica Cosmochimica Acta 190, p. 13-34.

Bronto, S. & Surono Martosuwito (eds.) (2014)- Indonesian arc magmatism- a collection of papers by Professor Udi Hartono. Center for Geological Survey (CGS), Geological Agency, Bandung, p. 1-623.
(Reprint collection of 39 papers, originally published between 1987-2011)

Broom-Fendley, S., M. Thirlwall, M. Cottam & R. Hall (2011)- Geochemistry and tectonic setting of Una-Una Volcano, Sulawesi, Indonesia. Goldschmidt Mtg, Prague 2011, Mineralogical Magazine 75, 3, p. 585. *(Abstract only)*
(Volcanic rocks from Una-Una (<~100 Ka) and nearby Togian islands (~2 Ma) both alkaline or high-K calc-alkaline trachyte. Isotopic trends and geochemistry indicate ancient continental contribution to magma source, possibly Indian Ocean pelagic sediment. Probably related to young extension of Gorontalo Bay due to slab rollback)

Brouwer, H.A. (1916)- Het vulkaaneiland Roeang (Sangi eilanden) na de eruptie van 1914. Tijdschrift Kon. Nederlandsch Aardrijkskundig Gen. 33, p. 89-94.
('The volcanic island Ruang (Sangi Islands) after the eruption of 1914')

Brouwer, H.A. (1921)- Het vulkaaneiland Roeang. Jaarboek Mijnwezen Nederlandsch Oost-Indie 49 (1920), Verhandelingen 2, p. 6-30.
('The volcano island Raung'. Active volcano in Sangi islands group)

Brouwer, H.A. (1939)- Leucite rocks of the active volcano Batoe Tara (Malay Archipelago). Proc. Kon. Nederl. Akademie Wetenschappen, Amsterdam, 42, 1, p. 23-29.
(online at: www.dwc.knaw.nl/DL/publications/PU00017280.pdf)
(Batoe Tara or Komba ~50 km N of Lomblen, E of Flores, rises from deep sea to nearly 750m above sea-level. Active volcano with different types of leucite rocks: leucite basanite, biotite-leucite tephrites, etc.)

Budd, D.A., V.R. Troll, F.M. Deegan, E.M. Jolis, V.C. Smith, M.J. Whitehouse, C. Harris, C. Freda, D.R. Hilton, S.A. Halldorsson & I.N. Bindeman (2017)- Magma reservoir dynamics at Toba caldera, Indonesia, recorded by oxygen isotope zoning in quartz. Nature Scientific Reports 7, 40624, p. 1-11.
(online at: https://www.nature.com/articles/srep40624.pdf)
(Quartz crystals from 75ka Toba tuffs rel. high δ18O values (up to 10.2‰), due to magma residence within and assimilation of local granite basement. Decrease in δ18O values in outer growth zones suggests assimilation of altered roof material and may represente eruption trigger in large Toba-style magmatic systems)

Buhring, C., M. Sarnthein & Leg 184 Shipboard Scientific Party (2000)- Toba ash layers in the South China Sea: evidence of contrasting wind directions during eruption ca. 74 ka. Geology 28, 3, p. 275-278.
(Cores from southern S China Sea with up to 3.5cm thick ash layers with rhyolithic glass shards. Dated at ~74 ka (O-isotope Stage 4-5 boundary), the age of youngest Toba eruption in N Sumatra. Composition of glass similar to Toba ash. Youngest Toba ash layers in S China Sea expand previously known ash-fall zone over >1800 km to E and increased volume estimates of erupted Toba ash. See also comments by Chen et al. 2000)

Carey, S. & H. Sigurdsson (1992)- Generation and dispersal of tephra from the 1815 eruption of Tambora volcano, Indonesia. In: E.T. Degens, H.K. Wong & M.T. Zen (eds.) The sea off Mount Tambora, Mitteilungen Geol. Paleont. Inst. Universitat Hamburg 70, p. 207-226.

(online at: http://ijog.bgl.esdm.go.id/index.php/IJOG/article/view/159/159)
(Volcano-tectonic earthquakes in September- November 2009 show epicentres aligning in NE- SW direction, coinciding with weak zone of Batur Volcano Complex, Bali. Focal zone depths ~1.5- 5.5 km beneath summit)

Hilton, D.R. & H. Craig (1989)- A Helium isotope transect along the Indonesian archipelago. Nature 342, 6252, p. 906-908.
(Banda arc 3He/4He ratios significantly lower than common ratio in mid-ocean-ridge basalts (MORB). 80% of radiogenic He is from subducting continental material. Measurements along Sunda arc show MORB-like ratios from W Java to sharp transition zone at Lomblen Island (N/NW of Timor), where low ratios of Banda arc begin)

Hilton, D.R., J.A. Hoogewerff, M.J. van Bergen & K. Hammerschmidt (1992)- Mapping magma sources in the east Sunda-Banda arcs, Indonesia: constraints from Helium isotopes. Geochimica Cosmochimica Acta 56, p. 851-859.

(He isotope analyses from 11 volcanoes from Flores (E Sunda arc) through inactive segment between arcs to Banda Island. Results consistent with involvement of crustal material in magma genesis throughout E Sunda/ Banda arcs, as far W as Iya in C Flores. Source of He in crustal component unlikely to be terrigenous sediments derived from Australian continent; rather, degassing of Australian continental crust)

Hoogewerff, J.A. (1999)- Magma genesis and slab-wedge interaction across an island-arc collision zone, East Sunda Arc, Indonesia. Geologica Ultraiectina 178, p. 1-199. (*Ph.D. Thesis University of Utrecht*)
(online at: http://dspace.library.uu.nl/handle/1874/272287)
(Study of Sr, Nd, Pb, Ra, Th and U isotopes and major and trace elements from five active and >10 inactive volcanic centres in Adonara-Lomblen-Pantar Sector of E Sunda Arc (E of Flores and W of volcanically inactive Alor-Wetar sector). Both mantle components (depleted Indian Ocean mantle) and subduction-related components (subducted continental material, which changes in composition from E to W (Indian Ocean pelagic sediment and detrital Australian shelf sediment?, and crystalline Australian continental crust) contribute to magma generation. Active Adonara-Pantar Sector volcanoes display strongest sedimentary or even 'continental' signal of Sunda-Banda Arcs volcanoes. Volcanic activity in Alor-Wetar sector started at least 12 Ma ago as intra-oceanic are, and ceased about 3 Ma ago)

Hoogewerff, J.A., M.J. van Bergen, P.Z. Vroon, J. Hertogen, R. Wortel et al. (1997)- U-series, Sr-Nd-Pb isotope and trace-element systematics across an active island arc-continent collision zone: implications for element transfer at the slab-wedge interface. Geochimica Cosmochimica Acta 61, 5, p. 1057-1072.
(Isotopic and trace element data consistent with three-component mixing whereby slab-derived hydrous fluid and siliceous melt both added to sub-arc mantle source. Hydrous fluid largely controls input in shallow part of subduction zone, siliceous melt dominates flux at deeper levels. Sedimentary material primary source of both)

Hutchison, C.S. (1975)- Correlation of Indonesian active volcano geochemistry with Benioff zone depth. Geologie en Mijnbouw 54, 3-4, p. 157-168.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0ak95aEQ5THJ5TWc/view)
(Indonesian arc >6000 km long from N Sumatra to Molucca Sea. Majority of products augite-hypersthene andesite or basalt. Leucite in volcanoes over deepest seismic contours. Overall increase in K and alkali % with Benioff zone depth, but rather high variability)

Hutchison, C.S. (1976)- Indonesian active volcanic arc: K, Sr, and Rb variation with depth to the Benioff zone. Geology 4, p. 407-408.
(K, Sr, and Rb vary with depth to Benioff zone. K2O increase most useful for Benioff zone depth prediction)

Hutchison, C.S. (1977)- Banda Sea volcanic arc: some comments on the Rb, Sr and cordierite contents. Warta Geologi (Newsl. Geol. Soc. Malaysia) 3, 2, p. 27-35.
(online at: https://gsmpubl.files.wordpress.com/2014/09/ngsm1977002.pdf)
(Unusually high Rb/Sr ratios in volcanic rocks and cordierite in rhyolite at Tanjong Illipoi (Wetar) indicate of strong continental crustal influence in source of volcanic rocks. Romang also higher Rb/Sr ratios than active volcanic arc. Wetar very different from other islands of Banda Arc because of abundant light grey rhyolite and dacite. This extinct, eroded and uplifted portion of Banda volcanic arc N of Timor affected by subducted Australian continental Plate. Cordierite in rocks of Ambon also imply continental crustal basement in N part of Banda Arc)

Hutchison, C.S. (1981)- Review of the Indonesian volcanic arc. In: A.J. Barber & S. Wiryosujono (eds.) The geology and tectonics of Eastern Indonesia. Proc. CCOP-IOC SEATAR Working Group Mtg., Bandung 1979, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 2, p. 65-80.
(Indonesian volcanic arc extends for 6000km from N Sumatra to Molucca Sea. Volcanism mainly calk-alkaline-high-K calc-alkaline with minor tholeiite and shoshonite. Lavas predominantly andesitic. Good correlation between depth of underlying Benioff zone of subduced Indian Ocean Plate and K2O content and Sr isotopes, indicating magma is of mantle origin. E-ward increase of 87Sr/86Sr from W Java to Bali suggests transition from continental to oceanic basement. Volcanoes above deep seismic contours are shoshonitic. Extinct arc of W

Sulawesi also shoshonitic. Pliocene cordierite dacite-granites very high Sr ratios, consistent with continental origin. And much more; JTvG)

Hutchison, C.S. (1982)- Indonesia. In: R.S. Thorpe (ed.) Andesites. John Wiley, New York, p. 207-224.

(Estimates of emission of volatile metals in volcanic sources of Indonesian Arc. SO2 emission 3.5 × 106 tons/ year, or ~20% of the annual worldwide volcanic flux of SO2. Trace metal (210Po, Pb, Bi, Cd, Zn and Cu) fluxes ~5-30% of global volcanic flux, i.e. low relatively low)

Nicholls, I.A. & D.J. Whitford (1976)- Primary magmas associated with Quaternary volcanism in the western Sunda arc. In: R.W. Johnson (ed.) Volcanism in Australasia, Elsevier, Amsterdam, p. 77-90.
(Pleistocene- Recent lavas of W Sunda Arc dominated by basaltic andesite and andesite, with average 55% silica. Most lavas have Mg/Mg +Fe2 values too low to be unmodified products of partial melting of peridotitic mantle. Further differentiation to produce andesitic- dacitic magmas probably at rel. low pressure)

Nicholls, I.A. & D.J. Whitford (1978)- Geochemical zonation in the Sunda volcanic arc, and the origin of K-rich lavas. Bull. Australian Soc. Exploration Geophysicists (ASEG) 9, p. 93-98.
(*Sunda volcanic arc good example of variation in geochemistry of lavas across island arc. In addition to correlation between K2O/SiO2 ratios and depths to Benioff Zone in Pleistocene-Recent-lavas of Java, there are well-defined relationships for 'incompatible' elements (Rb, Cs, Ba) and light rare earth elements. Volcanic centres of Java indicate progressive change in conditions of primary basaltic magma production across arc)*

Nicholls, I.A., D.J. Whitford, K.L. Harris & B. Taylor (1980)- Variation in the geochemistry of mantle sources for tholeiitic and calc-alkaline mafic magmas, western Sunda volcanic arc, Indonesia. Chemical Geology 30, p. 177-199.
(Quaternary lavas of normal island-arc basalt-andesite-dacite association in Java-Bali range from tholeiitic series over Benioff-zone depths of ~150 km to high-K calc-alkaline series over Benioff-zone depths of 250km. More abundant and diverse calc-alkaline lavas over intermediate Benioff-zone depths. Basaltic lavas become slightly more alkaline with increasing depth to the Benioff zone. Levels of incompatible minor and trace elements (K, Rh, Cs, Ba, Nb, U, Th, light REE) show increase of almost order of magnitude)

Ninkovich, D. (1979)- Distribution, age and chemical composition of tephra layers in deep-sea sediments off western Indonesia. J. Volcanology Geothermal Res. 5, p. 67-86.
(Volcanic ash layers in deep-sea sediments of NE Indian Ocean, adjacent to W Indonesian range in age from Late Miocene- Recent. Three provinces: (1) large Late Miocene and younger rhyolitic tephra province off Sumatra; (2) restricted dacitic province off Sunda Strait and W Java; and (3) andesitic province off E Java and Lesser Sunda Islands. Chemical composition of tephra layers in each province remains constant with time. E-ward decrease in silica content in tephras coincides with similar decrease in Indonesian arc lavas. High silica content in Sumatra linked to thick pre-Cenozoic crust. E of Sumatra crust is Cenozoic and thin)

Ninkovich, D. & W.L. Donn (1976)- Explosive Cenozoic volcanism and climatic implications. Science 194, 4268, p. 899-906.
(Study of volcanogenic material in DSDP and other cores from E and SE Asia. Indonesia Cenozoic magmatic history two major phases: first extended into Ey Miocene, second began in Late Miocene and lasted until today. With map of Indian Ocean areas covered with rhyolitic and andesitic ash layers SW of Sumatra and S of Java)

Ninkovich, D. & W.L. Donn (1977)- Cenozoic explosive volcanism related to East and Southeast Asian arcs. In: M. Talwani & W. Pitman (eds.) Island arcs, deep sea trenches and back-arc basins, American Geophys. Union (AGU), Maurice Ewing Ser. 1, p. 337-347.
(Study of history of Cenozoic explosive volcanism using DSDP and piston core data from Indian Ocean off Indonesia and W Pacific Ocean)

Oppenheimer, C. (2002)- Limited global change due to the largest known Quaternary eruption, Toba ~74kyr BP?. Quaternary Science Reviews 81, p. 1593-1609.
(≈74 kyr BP 'super-eruption' of Toba volcano in Sumatra is largest known Quaternary eruption. Possible 6 yr duration 'volcanic winter' following eruption has been proposed, but previous estimates of globally averaged surface cooling of 3-5°C after eruption probably too high; closer to 1°C)

Oppenheimer, C. (2003)- Climatic, environmental and human consequences of the largest known historic eruption; Tambora Volcano (Indonesia) 1815. Progress in Physical Geography 27, 2, p. 230-259.

Pacey, A., C.G. Macpherson & K.J.W. McCaffrey (2013)- Linear volcanic segments in the central Sunda Arc, Indonesia, identified using Hough Transform analysis: implications for arc lithosphere control upon volcano distribution. Earth Planetary Sci. Letters 369-370, p. 24-33.
(In Sunda Arc most volcanoes define four en echelon, linear segments, each of 500-700 km length. Volcanoes of Java that do not lie on these segments either formed at early stage in history of arc and erupted anomalous magma, or lie along other mapped structures)

Palfreyman, W.D., R.W. Johnson, R.J.S. Cooke & R.J. Bultitude (1986)- Volcanic activity in Papua New Guinea before 1944: an annotated bibliography of reported observations. Bureau Mineral Res. Geol. Geophysics, Canberra, Report 254, p. 1-194.

Rampino, M.R. & S. Self (1982)- Historic eruptions of Tambora (1815), Krakatau (1883) and Agung (1963), their stratospheric aerosols, and climatic impact. Quaternary Research 18, 2, p. 127-143.
(Decreases in surface temperatures after eruptions of Tambora, Krakatau and Agung were of similar magnitude, although amounts of dust and volatiles injected into stratosphere differed greatly. Large amounts of fine ash and volatiles dispersed into upper atmosphere by Krakatau and Tambora; Agung eruption in 1963 was smaller, but injected dust and volatiles into stratospheric aerosol layer more directly. Agung eruption relatively rich in SO2 and Cl. Relative amounts of fine ash produced by Tambora, Krakatau and Agung eruptions estimated at 150: 20: 1, atmospheric sulfate aerosols ~7.5: 3: 1. Decreases in surface T after volcanic eruptions mainly result of sulfate aerosols, rather than silicate dust)

Ranneft, T.S.M. (1979)- Segmentation of island arcs and application to petroleum geology. J. Petroleum Geol. 1, 3, p. 35-53.
(Island arcs commonly depicted as curved or sinuous, but most are composed of straight segments whose trend changes suddenly at hinge or boundary zones (multiple transverse faults). Fracture system may be related to structural, morphological, or movement of underthrusting slab, or movement in backdeep or overthrusting sheet. Transverse structural systems had effect on petroleum accumulations of island arc regions, both from stratigraphic and structural viewpoint. Examples of modern Indonesian arc system)

Reubi, O. & A. Nicholls (2004)- Variability in eruptive dynamics associated with caldera collapse: an example from two successive eruptions at Batur volcanic field, Bali, Indonesia. Bull. Volcanology 66, 2, p. 134-148.
(Batur volcanic field in Bali two caldera-forming eruptions, at 29,300 and 20,150 years BP., resulting in deposition of dacitic ignimbrites. Ubud Ignimbrite covers most of S Bali and consists dominantly of pyroclastic flow with minor pumice fall deposits. Gunungkawi Ignimbrite more limited extent, occurs only in central S Bali)

Reubi, O. & A. Nicholls (2004)- Magmatic evolution at Batur volcanic field, Bali, Indonesia: petrological evidence for polybaric fractional crystallization and implications for caldera-forming eruptions. J. Volcanology Geothermal Res. 138, p. 345-369.
(Batur volcanic field in Bali underwent complex evolution that comprised three periods of building and two major caldera-forming eruptions)

Reubi, O. & A. Nicholls (2005)- Structure and dynamics of a silicic magmatic system associated with caldera-forming eruptions at Batur Volcanic Field, Bali, Indonesia. J. Petrology 46, 7, p. 1367-1391.
(online at: http://petrology.oxfordjournals.org/content/46/7/1367.full.pdf+html)
(Quaternary Batur volcanic field in Bali ~150 km above Benioff zone and adjacent to active Agung volcano and extinct or dormant Bratan caldera. Two caldera-forming eruptions and broad range of compositions from low-SiO2 andesite to high-SiO2 dacite. Earliest volcanism was building of Penulisan basaltic-dacitic stratovolcano starting at least at ~510 ka. Collapse of first caldera associated with eruption of dacitic Ubud ignimbrite at 29,300 yrs BP. After formation of Bunbulan lava-dome complex collapse of second caldera, with eruption of Gunungkawi Ignimbrite at 20,150 yrs BP. Followed by 1700 m high, basaltic andesite Batur stratovolcano)

Rittmann, A. (1953)- Magmatic character and tectonic position of the Indonesian volcanoes. Bull. Volcanology 14, p. 45-58.
(Review of chemical compositions of magmas of Indonesian active volcanoes. Volcanoes classified as (1) Calc-alkaline (= Pacific; 30/ 91%), (2) Alkaline (= Atlantic; 2; 6%) and Potassic (= Mediterranean; 1/ 3%). Calc-alkaline character of magmas of active volcanoes decreases regularly in direction from foredeep to hinterland, becoming alkaline in hinterland itself. Also, at single volcanoes calc-aIkaline character decreases with time, 'confirming migration of axis of orogen towards foredeep')

(online at: www.dwc.knaw.nl/DL/publications/PU00010947.pdf)
(Four Mesozoic- Tertiary concentric belts of fold structures and plutonic rocks in Indonesia, connecting Burma with Philippines, each with own types of plutonic rocks and ore deposits: (1) Jurassic Malayan orogen of Malay Peninsula, Tin islands, possibly W, SW and C Kalimantan; (2) Late Cretaceous Sumatra orogen of Sumatra, C Java, Meratus; (3) M Miocene Soenda orogen (should be E Miocene; 'Old Andesites'; JTvG) of SW Sumatra, Java S Mountains, volcanic Lesser Sunda islands) and (4) the active Moluccan orogen. Late Quaternary volcanics two groups, 'Pacific' calc-alkaline and 'Mediteranean' potassic. Analyzed 157 samples for radioactivity and bulk chemical composition. Mesozoic granites from Tin islands very different petrochemistry from Kalimantan (Schwaner Mts, etc.) granites)

Westgate, J.A. P.A.R. Shane, N.J.G. Pearce, W.T. Perkins, R. Korisettar, C.A. Chesner et al. (1998)- All Toba tephra occurrences across Peninsular India belong to the 75,000 yr B.P. eruption. Quaternary Research 50, 1, p. 107-112.

Wetzel, A. (2009)- The preservation potential of ash layers in the deep-sea: the example of the 1991-Pinatubo ash in the South China Sea. Sedimentology 56, p. 1992-2009.
(After 1991eruption of Mount Pinatubo, Philippines, volcanic ash transported W to S China Sea in atmospheric plume, formed up to 10cm thick graded layer over >400,000 km2. Immediately after deposition surviving deep-burrowing animals re-opened connection to sea floor. Later, small meiofauna and macrofauna recolonized sea floor, mixing newly deposited organic material with underlying ash. Ash deposits <1mm thick not often observed as continuous layer when cored 6 years after eruption; ash ~2mm thick now patchily bioturbated. Areas affected by deposition of turbidites ash layer often preserved due to rapid burial)

Wheller, G.E. (1986)- Petrogenesis of Batur caldera, Bali, and the geochemistry of Sunda-Banda arc basalts. Ph.D. Thesis, University of Tasmania, p. 1-156. *(Unpublished)*

Wheller, G.E. & R. Varne (1986)- Genesis of dacitic magmatism at Batur volcano, Bali, Indonesia: Implications for the origin of stratovolcano calderas. J. Volcanology Geothermal Res. 28, p. 363-378.
(Batur active stratovolcano on Bali, Indonesia, with large caldera correlated with eruption at ~23,700 years ago that formed thick ignimbrite sheet. Formation of caldera due to change in lava composition from basaltic-andesitic to dacitic. Dacitic rocks characteristics consistent with origin by crystal-liquid fractionation from more mafic parent magmas in shallow chamber, possibly at 1.5 km depth and 1000-1070°C)

Wheller, G.E., R. Varne, J.D. Foden & M.J. Abbott (1987)- Geochemistry of Quaternary volcanism in the Sunda- Banda arc, Indonesia, and three-component genesis of island-arc basaltic magmas. J. Volcanology Geothermal Res. 32, 1-3, p. 137-160.
(Excluding Sumatra and Wetar (mainly dacitic and rhyolitic volcanics), four geochemical arc sectors in Sunda-Banda arc: W Java, Bali, Flores (each more K-rich eastwards, culminating in leucitite volcanoes Muriah, Soromundi, Sangenges and Batu Tara). Dominant source component common to all sectors probably peridotitic mantle. Second component, with high 87Sr/86Sr value, may be crustal material, most apparent in Banda sector, but also present to lesser extents in W Java and Flores sectors)

Whelley, P.L., C.G. Newhall & K.E. Bradley (2015)- The frequency of explosive volcanic eruptions in Southeast Asia. Bull. Volcanology 77, 1, p. 1-11.
(online at: http://link.springer.com/article/10.1007/s00445-014-0893-8?view=classic)
(~733 active and potentially active volcanoes in SE Asia region, of which 70 have erupted in last 100 years)

Whitford, D.J. (1975)- Strontium isotopic studies of the volcanic rocks of the Sunda arc, Indonesia, and their petrogenetic implications. Geochimica Cosmochimica Acta 39, p. 1287-1302.
(Pleistocene-Recent lavas from Sunda arc range from island arc tholeiitic series, through calc-alkaline to high-K alkaline rocks. Calc-alkaline suite decrease in 87Sr/86Sr from W Java to Bali with some evidence for increasing 87Sr/86Sr with increasing depth to Benioff zone. 87Sr enrichment due to isotopic equilibration of oceanic crust with sea water and disequilibrium melting in slab. Calc-alkaline lavas with high ratios best explained by sialic contamination, or presence of alkali basalt as component of downgoing slab. Sr isotopic data for high-K alkaline lavas suggest mantle origin. High ratio in Lake Toba rhyolite implies crustal origin)

Whitford, D.J., W. Compston, I.A. Nicholls & M.J. Abbott (1977)- Geochemistry of Late Cenozoic lavas from Eastern Indonesia: role of subducted sediments in petrogenesis. Geology 5, p. 571-575.
(Late Cenozoic basalts N of Timor from Solor to Serua primitive tholeiitic, but associated more silicic rocks suggest involvement of continental crust or sediment)

Whitford, D.J. & P.A. Jezek (1979)- Origin of Late Cenozoic lavas from the Banda arc, Indonesia: trace element and Sr isotope evidence. Contrib. Mineralogy Petrology 68, p. 141-150.
(Active arc located on what appears to be oceanic crust whereas associated subduction trench is underlain by continental crust. Recent lavas predominantly andesitic, tholeiitic in N to calc-alkaline varieties in S islands. High 87Sr/86Sr ratios in calc-alkaline lavas interpreted to result from mixing of sialic component with mantle derived component. Likely cause is subduction and melting of sea-floor sediments or continental crust)

Whitford, D.J. & P.A. Jezek (1982)- Isotopic constraints on the role of subducted sialic material in Indonesian island-arc magmatism. Geol. Soc. America (GSA) Bull. 93, 6, p. 504-513.
(In Banda Arc continental material (probably subducted sediments) appears to be subducting beneath volcanic arc that is underlain by oceanic crust)

Whitford, D.J. & I.A. Nicholls (1975)- Geochemistry of the volcanic rocks of the Sunda island arc of Indonesia. Exploration Geophysics 6, 2/3, p. 76-77. *(Abstract only)*
(Sunda volcanic arc from N of Sumatra, through Java, Bali, Lombok, Sumbawa, Flores, Lesser Sunda Islands, after which becomes Banda arc. Variety of tectonic environments. Sumatra crust ~40 km thick with Paleozoic granites. Benioff zone only to ~200 km. Beneath Java crust thinner and younger; oldest exposed rocks Mesozoic, and Benioff zone to ~600km beneath Java Sea to N. Further E, crust thinner (~15 km), oceanic in velocity structure and Benioff zone to great depths)

Whitford, D.J. & I. A. Nicholls (1976)- Potassium variation in lavas across the Sunda arc in Java and Bali. In: R.W. Johnson (ed.) Volcanism in Australasia, Elsevier, Amsterdam, p. 63-75.
Sunda arc of Java-Bali relatively simple tectonic setting above N-dipping Benioff seismic zone. Quaternary lavas of 'normal island arc association' (tholeiites to high-K calc-alkaline lavas) over Benioff zone depths from 120-250 km. High-K alkaline lavas above Benioff zone depths >300 km. Magmas derived mainly from mantle wedge above Beioff zone, where modified by water and/or melt from the subducted oceanic crust)

Whitford, D.J., I.A. Nicholls & S.R. Taylor (1979)- Spatial variations in the geochemistry of Quaternary lavas across the Sunda arc in Java and Bali. Contrib. Mineralogy Petrology 70, 3, p. 341-356.
(Island arc lavas range from tholeiites to high-K calc-alkaline lavas over Benioff zone depths 120 to 250 km. More abundant calc-alkaline lavas between these extremes. High-K alkaline lavas over Benioff zone depths over 300 km. Incompatible elements increase with depth to seismic zone. Java and Bali lavas geochemistry best explained by combination of mantle source melting and partial melting of that material at progressively greater depths. Primary tholeiitic magmas may form by 20-25% melting at 30-40 km, primary high-K calc-alkaline magmas by 5-15% melting at 40-60 km, and primary alkaline magmas by 5% melting at 80-90 km)

Whitford, D.J. & W.M. White (1981)- Neodymium isotopic composition of Quaternary island arc lavas from Indonesia. Geochimica Cosmochimica Acta 45, p. 989-995.
(143Nd/144Nd ratios in Quaternary lavas from Java and Banda arc exhibit inverse correlation with 87Sr/86Sr. Indonesian samples resemble Andean rather than island arc lavas)

Andersson, H.C. & A. Stigebrandt (2005)- Regulation of the Indonesian Throughflow by baroclinic draining of the North Australian Basin. Deep Sea Research I, 52, 12, p. 2214-2233.
(Mainly low-saline N Pacific water fills upper part of Indonesian seas and downstream buoyant (surface) pool (DBP) that stretches over large part of N Australian Basin. Long-term mean steric sea level in Indonesian seas equal to neighboring Pacific Ocean sea level. Change of steric sea level from Pacific to Indian Ocean sea level at border between DBP and Indian Ocean. Darwin situated inside DBP. Control of ITF set by baroclinic transport capacity of DBP relative to adjacent (Indian Ocean) water. Mean ITF, estimated as outflow from DBP to S Equatorial Current, is about 10 Sv. ITF imprint is fresh and cold. Atmospheric transfer of freshwater to N Pacific and vertical mixing in N Pacific provide driving of mean ITF and ITF is major branch of estuarine-type vertical circulation of N Pacific)

Cobb & Supardi (1993)- Allogenic and autogenic controls on sedimentation in the central Sumatra basin as an analogue for Pennsylvanian coal-bearing strata in the Appalachian basin. In: J.C. Cobb & C.B. Cecil (eds.) Modern and ancient coal-forming environments, Geol. Soc. America (GSA), Spec. Paper 286, p. 3-22.
(Modern influx of fluvial sediment to Sunda shelf/ Strait of Malacca from Sumatra restricted by rain forest cover in equatorial ever-wet climate belt. Much of marine and estuarine environments erosional or non-depositional, except for localized deposition in slack water areas, such as downstream end of islands. Thick (>13m), laterally extensive (>70,000 km2) peat deposits forming on poorly drained coastal lowlands)

Cecil, C.B., F.T. Dulong, R.A. Harris, J.C. Cobb, H.G. Gluskoter & H. Nugroho (2003)- Observations on climate and sediment discharge in selected tropical rivers, Indonesia. In: C.C Blaine et al. (eds.) Climate controls on stratigraphy, Soc. Sedimentary Geology (SEPM), Spec. Publ. 77, p. 29-50.

(Factors influencing fluvial sediment discharge include catchment-basin size, relief, gradient, tectonic setting, bedrock lithology, rainfall. Dominant variable affecting fluvial sediment discharge among islands of Indonesia appears to be seasonality in rainfall, regardless of tectonic setting, relief or catchment-basin size)

Chabangborn, A., K.K.A. Yamoah, S. Phantuwongraj & M. Choowon (2018)- Climate in Sundaland and Asian monsoon variability during the last deglaciation. Quaternary Int. 479, p. 141-147.

Christensen, B.A., W. Renema, J. Henderiks, D. de Vleeschouwer, J. Groeneveld, I.S. Castaneda, L. Reuning, K. Bogus et al. (2017)- Indonesian Throughflow drove Australian climate from humid Pliocene to arid Pleistocene. Geophysical Research Letters 44, 13, p. 6914-6925.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2017GL072977/epdf)
(Late Miocene- M Pleistocene sedimentary proxy records (incl. IODP Site U1463) show NW Australia underwent abrupt transition from arid to humid climate conditions at 5.5 Ma, likely receiving year-round rainfall. After ~3.3 Ma climate shift to increasingly seasonal precipitation, back to arid interval after 2.4 Ma. Linked to progressive restriction of flow of warm surface currents from Pacific (Indonesian Throughflow))

Clift, P.D. (2006)- Controls on the erosion of Cenozoic Asia and the flux of clastic sediment to the ocean. Earth Planetary Sci. Letters 241, p. 571-580.
(Rates of continental erosion reconstructed from volumes of clastic sediment, most of which offshore. Sediment flux from mainland Asia first peaked in E-M Miocene (24-11 Ma), well before initiation of glacial climate, indicating that rock uplift and precipitation are key controls on erosion over long periods of time. In E Asia faster erosion correlates with more humid, warm climates in E-M Miocene, changing to less erosive, drier climates after 14 Ma when Antarctic glaciation begins. Average sedimentation rates on most E Asian continental margins since 1.8 Ma 5-6 times less than modern fluvial flux)

Clift, P.D. & R.A. Plumb (2008)- The Asian monsoon: causes, history and effects. Cambridge University Press, p. 1-288.
(Asian monsoon large-scale seasonal reversal of normal atmospheric circulation pattern. Low-pressure systems develop in tropics due to rising hot air that cools and descends in subtropics (arid regions). In contrast, summer heating of Asian continent (mainly Tibetan Plateau) generates low-pressure cells and summer rains in S and E Asia. In winter reversed high-P system established, with dry, cold winds blowing out of Asia. Monsoon intensity varies in 21, 40 and 100 thousand year timescale, with periods of glacial advance and retreat: summer monsoons strong and winter monsoons weaker during warm, interglacial periods (reverse during glacial times)

(Sea surface temperature of Indo-Pacific Warm Pool during Last Glacial Maximum ~3°C cooler than today)

Galey, M.L., A. van der Ent, M.C.M. Iqbal & N. Rajakaruna (2017)- Ultramafic geoecology of South and Southeast Asia. Botanical Studies 58,18, p. 1-28.
(online at: https://link.springer.com/content/pdf/10.1186%2Fs40529-017-0167-9.pdf)
(Globally, ultramafic outcrops known for floras with high levels of endemism, including plants adapted to nickel or manganese hyperaccumulation. Soils derived from ultramafic regoliths generally nutrient-deficient, with major cation imbalances and high concentrations of potentially toxic trace elements, especially nickel. SE Asian region large surface occurrences of ultramafic regoliths, but geoecology still poorly studied)

Gallagher, S.J., M.W. Wallace, C.L. Li, B. Kinna, J.T. Bye, K. Akimoto & M. Torii (2009)- Neogene history of the West Pacific Warm Pool, Kuroshio and Leeuwin currents. Paleoceanography 24, PA1206, p. 1-27.
(Presence of Indo-Pacific larger foraminifera and smaller taxa Asterorotalia and Pseudorotalia on Australia NW Shelf at ~4 Ma and from 1.6- 0.8 Ma suggest periods of increased Indonesian Throughflow (connecting W Pacific Warm Pool and Indian Ocean). From 10 to 4.4 Ma lack of biogeographic connectivity between Pacific and Indian Oceans suggests Indonesian Throughflow restriction, when collision of Australia and Asia trapped warmer waters in Pacific, creating WPWP biogeographic province from equator to 26°N)

Ganssen, G., S.R. Troelstra, B. Faber, W.A. van der Kaars & M. Situmorang (1989)- Late Quaternary paleoceanography of the Banda Sea, Eastern Indonesian piston cores (Snellius-II expedition, cruise G5). In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. Sea Research 24, 4, p. 491-494.
(Late Quaternary paleoclimatology and oceanography deduced from two Banda Sea piston cores. Two-step deglaciation seen in oxygen isotopes, but did not lead to higher surface water temperatures but to wetter climate as recorded in palynofacies. Increasing monsoon regime around 10 ka. At ~10.5 ka climate got wetter. Upwelling intensity increased around 9.2 ka and monsoonal intensity decreased again at ~2.7 ka)

Gathorne-Hardy, F.J., Syaukani, R.G. Davies, P. Eggleton & D.T. Jones (2002)- Quaternary rainforest refugia in south-east Asia: using termites (Isoptera) as indicators. Biological J. Linnean Soc. 75, p. 453-466.
(online at: https://academic.oup.com/biolinnean/article/75/4/453/2639628)
(In SE Asia, during Quaternary glaciations increased seasonality and sea level drops of ~120m caused fragmentation of rainforest. During Last Glacial Maximum, most of Thailand, Peninsula Malaysia, W and S Borneo, E and S Sumatra, and Java probably covered by savannah. Rainforest refugia probably present in N and E Borneo, N and W Sumatra and Mentawai islands.)

Gingele, F.X., P. De Deckker, A. Girault & F. Guichard (2002)- History of the South Java Current over the past 80 ka. Palaeogeogr. Palaeoclim. Palaeoecology. 183, p. 247-260.
(Sediment core below South Java Current (SJC) used to reconstruct paleoclimate/ paleoceanography of past 80 ka. Considerable contrasts from glacial to Holocene. Presently below low-salinity tongue from Java Sea via Sunda Strait, with characteristic terrigenous matter. During last glacial stage sea level was lower, Sunda Strait was closed and terrigenous supply from that source ceased. Circulation patterns alternatively dominated by N Hemisphere E Asian Monsoon system and S Hemisphere Australian Monsoon system. Between 20-12 ka, (Australian) SE Winter Monsoon reached maximum and intensified W flowing S Java Current)

Gordon, A.L., R.D. Susanto & K. Vranes (2003)- Cool Indonesian throughflow as a consequence of restricted surface layer flow. Nature 425, p. 824-828.
(online at: https://www.atmos.umd.edu/~dwi/papers/gordon_dwi_nature03.pdf)
Within Makassar Strait (primary pathway of Indonesian throughflow), flow far cooler than estimated earlier. During boreal winter monsoon, wind drives buoyant, low-salinity Java Sea surface water into S Makassar Strait, creating N-ward pressure gradient in surface layer of strait. This surface 'freshwater plug' inhibits warm surface water from Pacific Ocean from flowing S into Indian Ocean, leading to cooler Indian Ocean sea surface, which may weaken Asian monsoon. Summer wind reversal eliminates obstructing pressure gradient, by transferring more-saline Banda Sea surface water into S Makassar Strait)

Gourlan, A.T., L. Meynadier & C.J. Allegre (2008)- Tectonically driven changes in the Indian Ocean circulation over the last 25 Ma: Neodymium isotope evidence. Earth Planetary Sci. Letters 267, p. 353-364.
(Nd isotopic composition of Indian and Pacific Ocean cores for past 25 Ma reflect paleo-oceanography. Prior to 14 Ma broad passage between Indian and Pacific Oceans. Progressive closure of Indonesian gateway due to N movement of Australia and S-ward motion of Sunda block induced reorganization of paleoceanic circulation at ~14 Ma. Further reduced flux of Pacific water into Indian Ocean between 4- 2.5 Ma caused by final closure of Indonesian Gateway)

Griffiths, M.L., R.N. Drysdale, M.K. Gagan, J.X. Zhao, J.C. Hellstrom, L.K. Ayliffe & W.S. Hantoro (2013)- Abrupt increase in East Indonesian rainfall from flooding of the Sunda Shelf ~9500 years ago. Quaternary Science Reviews 74, p. 273-279.
(Stalagmite record from Liang Luar Cave, Flores, suggests rapid increase in Indonesian monsoon rainfall at ~9.5 ka, synchronous with rapid expansion of rainforest in NE Australia, regional freshening of S Makassar Strait and ~1.5 °C cooling in upper thermocline of Timor Sea, indicative of reduced surface heat transport by Indonesian Throughflow when Java Sea opened during postglacial sea-level rise. Increase in monsoon rainfall tied to sudden increase in ocean surface area and/or temperature in monsoon source region as Sunda Shelf flooded during deglaciation)

Husein, S. (2006)- Tidal influence on sedimentation processes of the Mahakam Delta, East Kalimantan. Proc. 35th Ann. Conv. Indon. Assoc. Geol. (IAGI), Pekanbaru, 13p.
(Hydrodynamic measurements and bottom samples study in Mahakam Delta. Sand at bottom of distributaries at delta apex and gradually fines seaward but does not extend to channel mouths. Most bedload sediment transport during spring tide. Mud dominates offshore, in estuaries and distal reaches of distributaries. Sand-mud couplets upstream to at least delta apex. Benthic marine organisms up to 20 km upstream in distributaries. Fluvial dominance constrained to upper reaches of active distributaries, tides most important process on delta)

Kamaludin B. & B.Y. Azmi (1997)- Interstadial records of the last glacial period at Pantai Remis, Malaysia. J. Quaternary Science 12, 5, p. 419-434.
(Two eustatic high sea stands during last glacial period recognised at Pantai Remis, both lower than present-day sea-level: (1) -14.6m , synchronous with Oyxgen Isotope Stage 5a ; (2) -4.3 m , dated as ~54ka. Palynology data show interstadial coastal Pandanus and mangrove swamps, succeeded by mixed freshwater swamp forests of Campnosperma- Calophyllum assemblage, followed by drier mixed swamp forest)

Kamikuri, S. & T.C. Moore (2017)- Reconstruction of oceanic circulation patterns in the tropical Pacific across the Early/Middle Miocene boundary as inferred from radiolarian assemblages. Palaeogeogr. Palaeoclim. Palaeoecology 487, p. 136-148.

(Reconstruction of changes in tropical Pacific oceanic circulation patterns across E-M Miocene boundary based on radiolarian assemblages at IODP Site U1335 in E tropical Pacific. Upwelling taxa increased during four intervals between 18.4-13.4 Ma. Sea surface T relatively high from 16.8-16.0 Ma and gradually decreased from 16.0-14.6 Ma and thereafter to 12.7 Ma. Starting around 17 Ma radiolarian assemblages dominated by different taxa in E and W tropical Pacific, indicating deeper thermocline in W. Increasing difference between E and W since latest E Miocene tied to closure of Indo-Pacific seaway and development of W Pacific warm pool along with development of strong Equatorial Undercurrent)

Karas, C. (2010)- Mid-Pliocene restriction of the Indonesian Gateway and its implication on ocean circulation and climate. Ph.D. Thesis Christian-Albrechts University, Kiel, p. 1-96. *(online at: https://macau.uni-kiel.de/servlets/MCRFileNodeServlet/dissertation_derivate_00003139/Karas_diss.pdf)*

Karas, C., D. Nurnberg, A.K. Gupta, R. Tiedemann, K. Mohan & T. Bickert (2009)- Mid-Pliocene climate change amplified by a switch in Indonesian subsurface throughflow. Nature Geoscience 2, June 2009, p. 434-438.
(Partial closing of Indonesian Gateway between 4-3 Ma supposedly triggered switch in source of waters feeding Indonesian Throughflow into Indian Ocean from warm- salty S Pacific water to cool and relatively fresh N Pacific Ocean waters. Planktonic foraminifera suggest surface conditions in E tropical Indian Ocean rel. stable from 5.5- 2 Ma, but subsurface waters freshened and cooled by about 4°C between 3.5- 2.95 Ma. Restriction of Indonesian Gateway led to cooling and shoaling of thermocline in tropical Indian Ocean)

Karas, C., D. Nurnberg, R. Tiedemann & D. Garbe-Schonberg (2011)- Pliocene Indonesian Throughflow and Leeuwin Current dynamics: implications for Indian Ocean polar heat flux. Paleoceanography 26, PA2217, 9p.
(Planktonic foraminifera reflect Pliocene hydrography of W tropical Indian Ocean (Site 709C) and Leeuwin Current in E subtropical Indian Ocean (Site 763A) in response to Indonesian Gateway dynamics. Indonesian Throughflow and warm S-flowing Leeuwin Current off W Australia are essential for polar heat transport in Indian Ocean. During 3.5-3 Ma, sea surface T Leeuwin Current area 2-3°C cooler than rather unchanged sea surface T from tropical Indian Ocean, probably induced by tectonically reduced surface Throughflow)

Kawamura, H., A. Holbourn & W. Kuhnt (2006)- Climate variability and land-ocean interactions in the Indo-Pacific Warm Pool: a 460-ka palynological and organic geochemical record from the Timor Sea. Marine Micropaleontology 59, 1, p. 1-14.
(Climatic conditions in W Timor Sea and adjacent NW Australia reconstructed for last 460 ka from IMAGES Core MD01-2378. Reduced precipitation and elevated productivity characterize glacial stages. Long-term reduction in precipitation over last 320 ka in two steps at ~300 ka and 180 ka BP. Paleoproductivity and paleoclimate appear to be related to precession-controlled Australian monsoon system)

Kazmierczak, J. & S. Kempe (1993)- Recent cyanobacterial counterparts of Paleozoic *Wetheredella* and related problematic fossils. Palaios 7, p. 294-304.
(Recent calcareous structures resembling stromatolites generated by cyanobacteria in alkaline crater lake of small Satonda island, N of Sumbawa)

Kempe, S. & J. Kazmierczak (1990)- Chemistry and stromatolites of the sea-linked Satonda Crater Lake, Indonesia: A recent model for the Precambrian sea? Chemical Geology 81, 4, p. 299-310.
(First discovery of Recent stromatolites, produced by coccoid cyanobacteria in crater Lake of Satonda Island near Sumbawa. Started to grow 4000 yrs ago. pH (8.45) and calcite saturation higher than in seawater, due to biogenic CO2 and weathering of volcanic silicates. May provide analogue to Precambrian stromatolite environments)

Krebs, U., W. Park & B. Schneider (2011)- Pliocene aridification of Australia caused by tectonically induced weakening of the Indonesian throughflow. Palaeogeogr. Palaeoclim. Palaeoecology 309, p. 111-117.
(Climate model to test response of climate to E-M-Pliocene tectonic changes, which constricted and uplifted passages between New Guinea and Sulawesi. Associated changes in Indonesian throughflow influenced amount of heat transported from Pacific to Indian Ocean and contributed to Pliocene climate change of Indo-Pacific)

Kuenen, P.H. (1939)- Sediments of the East Indian Archipelago. In: P.D. Trask (ed.) Recent marine sediments: a symposium, SEPM Spec. Publ. 4 (1955?), p. 348-355.
(Sediments of Indonesian Archipelago vary greatly in different areas. In shallow Java Sea relatively fine-grained and rich in volcanic debris on S side near Java, relatively coarse-grained and quartz-rich on N side near Borneo. Deep water sediments generally low in carbonate, mainly due to relatively high % terrigenous debris. Calcium carbonate decreases with depth from ~50% in water <500m deep to <5% for water >5000m deep. Sediments of Kau Bay contain H2S and FeS; also rich in organic matter and black in color, suggesting condition of stagnation in this bay (500m deep and shallow connection with sea)

Kuenen, P.H. (1942)- Bottom samples, Section I: Collecting of the samples and some general aspects. In: The Snellius Expedition in the eastern part of the Netherlands East Indies (1929-1930), 5. Geological Results, 3, 1, Brill, Leiden, p. 1-46.

(Paleoclimate reconstructions from core SO184-10043 offshore southernmost Sumatra, 2171m water depth)

Linsley, B.K. (1991)- Carbonate sedimentation in the Sulu Sea linked to the onset of Northern Hemisphere glaciation, 2.4 Ma. In: E.A. Silver at al. (eds.) Proc. Ocean Drilling Program (ODP), Scient. Results, 124, p. 375-378.
(online at: www-odp.tamu.edu/publications/124_SR/VOLUME/CHAPTERS/sr124_28.pdf)
(Sulu Sea ODP Sites 768 and 769 currently above carbonate compensation depth (4800 m), in deep marine silled basin. Pliocene- Pleistocene sediments with common pelagic material, but no pelagic carbonate before 2.4 Ma. Timing of increase in carbonate accumulation constrained by Gauss/Matuyama paleomagnetic reversal and coincides with onset of N Hemisphere glaciation at 2.4 Ma. Not clear if increase in carbonate accumulation at 2.4 Ma is due to productivity changes, preservation changes, or combination of two)

Linsley, B.K., Y. Rosenthal & D.W. Oppo (2010)- Holocene evolution of the Indonesian Throughflow and the western Pacific warm pool. Nature Geoscience 3, 8, p. 578-583.
(online at: https://marine.rutgers.edu/pubs/private/Holocene%20WPWP-ITF_N.Geo2010_w_SOM.pdf)
(Sediment cores from across Indonesian Throughflow area suggest that from ~10,000 to 7000 years ago, (Holocene Climate Optimum) sea surface T in western W Pacific warm pool ~0.5 °C higher than during pre-industrial times. About 9500 years ago, when South China and Indonesian seas connected by rising sea level, surface waters in Makassar Strait became relatively fresher)

Linsley, B.K., R.C. Thunell, C. Morgan & D.F. Williams (1985)- Oxygen minimum expansion in the Sulu Sea, western equatorial Pacific, during the last glacial low stand of sea level. Marine Micropaleontology 9, p. 395-418.
(Sulu Sea deep silled, dysaerobic basin, ventilated through single sill at 420m depth to China Sea. Increases in planktonic foraminifera Neogloboquadrina dutertrei and Ng. pachyderma and light d18 O values suggest reduced surface water salinities during last glacial maximum, with expansion of mid-water oxygen minimum layer and increased organic carbon preservation at mid-water depths at this time. Oridorsalis umbonatus dominant benthic foram species between water depths of 2000-4200m. Bolivina robusta found only in oxygen minimum zone at 1700 m and in zone of oxygen depletion in deep part of basin. Below 4000 m, bottom waters maintained some degree of oxygenation during last glacial maximum. Radiolarians 3-8% of fauna at water depths <4000 m, gradually increasing in abundance to >50% below 4500 m)

Liu, J.P., D.J. DeMaster, T.T. Nguyen, Y. Saito, V.L. Nguyen, T.K.O. Ta & X. Li (2017)- Stratigraphic formation of the Mekong River Delta and its recent shoreline changes. In: Sedimentation and survival of the Mekong Delta, Oceanography 30, 3, p. 72-83.
(online at: https://tos.org/oceanography/assets/docs/30-3_liu.pdf)
(Mekong River discharges into S China Sea and formed third largest delta plain in world (~50,000 km2; after Amazon and Ganges-Brahmaputra). Subaerial delta prograded ~220 km SE-ward in last 7500 years, showing 15m thick sigmoidal clinoforms immediately off distributaries. Mekong-derived sediment extends ~300 km along shelf to SW. From 1973- 2005 seaward shoreline growth decreased gradually, due to construction of dams, sand mining, delta subsidence, increasing storms and sea level rise)

Liu, Z., H. Wang, W.S. Hantoro, E. Sathiamurthy, C. Colin, Y. Zhao & J. Li (2012)- Climatic and tectonic controls on chemical weathering in tropical Southeast Asia (Malay Peninsula, Borneo, and Sumatra). Chemical Geology 291, p. 1-12.

(Clay mineralogy and major element geochemistry of 58 surface sediment samples in 27 rivers draining Malay Peninsula, Borneo, and Sumatra. High kaolinite in Malay Peninsula (av. 80%), Sumatra (58-78%), and S Borneo (41-55%), high illite in N Borneo (47-77%), moderate smectite in Sumatra (6-29%). Intensive chemical weathering in all three regions, increasing from N Borneo to S Borneo, and further to Malay Peninsula and Sumatra. Monsoon climate with constant warm temperature and abundant precipitation principal forcing factor on chemical weathering)

Davies, P.J., P.A. Symonds, D.A. Feary & C.J. Pigram (1989)- The evolution of the carbonate platforms of Northeast Australia. In: P.D. Crevello et al. (eds.) Controls on carbonate platform and basin development, SEPM Spec. Publ. 44, p. 233-258.
(Carbonate platforms of NE Australia (Great Barrier Reef, Queensland, Marion and Eastern Plateaus S of PNG) contain record complex interactions over past 60 My. Size, shape, and location of carbonate platforms determined by continental rifting. N-ward plate movement controlled distribution of climate facies in Great Barrier Reef sequence. Rising and high sea-level periods favored increased carbonate deposition, falling low sea-levels restricted carbonate deposition. Oceanographic factors affected platform evolution, e. g., inhibition of reef development by high oceanic-phosphate levels during E-M Miocene. Development of foreland basin on N edge of NE Australian region initially caused dramatic expansion of carbonate facies, but ultimately terminated carbonate deposition as result of uplift and inundation by clastic detritus)

Davies, P.J., P.A. Symonds, D.A. Feary & C.J. Pigram (1989)- The evolution of the carbonate platforms of Northeast Australia. Geol. Soc. Australian Spec. Publ. 18, 1991, p. 44-78

Droxler, A.W. & S.J. Jorry (2013)- Deglacial origin of barrier reefs along low-latitude mixed siliciclastic and carbonate continental shelf edges. Annual Review Marine Science 5, p. 165-190.
(Modern coral barrier reefs extend along edges of some low-latitude siliciclastic shelves for 10's-1000's of km (Great Barrier Reef, NE Australia). Onset of rapid sea-level rise during early deglaciations was opportune time

for coralgal communities establishment on top of maximum lowstand siliciclastic coastal deposits (beach ridges, lowstand shelf-edge deltas). Most modern barrier reefs relatively thin (~120m), late-Quaternary deposits, dating from mid Brunhes (~400 ky?)- Recent, composed of 4-5 stacked coralgal units, separated by exposure horizons (reflecting 100,000-year glacial-interglacial cycles) and covering older nonreefal, often siliciclastic deposits. Includes examples from Gulf of Papua)

Eberli, G.P., F.S. Anselmetti, A.R. Isern & H. Delius (2010)- Timing of changes in sea-level and currents along Miocene platforms on the Marion Plateau. In: W.A. Morgan, A.D. George et al. (eds.) Cenozoic carbonate systems of Australasia, Soc. Sedimentary Geology (SEPM), Spec. Publ. 95, p. 219-242.
(N and S Marion Platforms off NE Australia studied by ODP 194 wells and seismic. Built by cool, subtropical faunal assemblages and asymmetric geometry. Four megasequences subdivided into 14 sequences. E-M Miocene sequences are prograding and aggrading sequences. From late M Miocene, mounded geometries in basinal area where large drift deposits accumulated. Two most prominent sequences boundaries are drowning unconformities, at 11.1 Ma (N) and ~7 Ma (S Marion Platform). Timing of many Neogene sequence boundaries coincides with boundaries on Queensland Plateau (ODP Leg 133) and along Bahamas Transect (ODP Leg 166), suggesting global synchroneity of Neogene 3^{rd} order sea-level changes)

Edinger, E.N. (1998)- Effects of land-based pollution on Indonesian coral reefs; biodiversity, growth rates, bioerosion, and applications to the fossil record. Ph.D. Thesis, McMaster University. Hamilton, p. 1-297.
(Pollution damage measured in surveys of 8 Java Sea reefs and 8 reefs in Ambon and Sulawesi. Reefs subject to land-based pollution 30-60% less diverse at 3-10m depth. Polluted reefs dominated by massive and submassive corals, and have almost no Acropora corals. Unpolluted reefs dominated by Acropora at 3m and by branching or foliose corals at 10m)

Edinger, E.N., J. Kolasa & M.J. Risk (2000)- Biogeographic variation in coral species diversity on coral reefs in three regions of Indonesia. Diversity and Distribution 6, p. 113-127.
(Coral species diversity along transects from 14 reefs in Ambon S Sulawesi and Java Sea. Sites relatively unaffected by land-based pollution in E Indonesia 20% more diverse than Java Sea. Despite fact that Java Sea was exposed during Pleistocene lowstands, and was recolonized only within last 10 000 years, coral species diversity and assemblage composition on Java Sea reefs similar to open ocean reefs in E Indonesia)

Ehrenberg, S.N. (2004)- Porosity and permeability in Miocene carbonate platforms of the Marion Plateau, offshore NE Australia: relationships to stratigraphy, facies and dolomitization. In: C.J.R. Braithwaite et al (eds.) The geometry and petrogenesis of dolomite hydrocarbon reservoirs, Geol. Soc., London, Spec. Publ. 235, p. 233-253.
(Analyses of porosity and permeability in two Miocene carbonate platforms cored by ODP Leg 194, seaward of Great Barrier Reef, at N Marion Platform mostly preserved as limestone) and S Marion Platform (mostly dolomitized))

Ehrenberg, S.N., G.P. Eberli & G. Baechle (2006)- Porosity-permeability relationships in Miocene carbonate platforms and slopes seaward of the Great Barrier Reef, Australia (ODP Leg 194, Marion Plateau). Sedimentology 53, p. 1289-1318.
(Porosity-permeability analyses of Early- Late Miocene platform and deep water carbonates cored on Marion Plateau. Platforms experienced widely varying calcite cementation, dolomitization and dissolution but little evidence of meteoric diagenesis, suggesting subaerial exposure played little role in porosity-permeability evolution. Permeability controlled by grain size and calcite cement content in grainstones and shelter pores and vugs in mud-rich samples. Dolomitization reduces permeability variation. 'Windward' (current-facing) settings overall higher permeability (less muddy depositional facies, greater cementation, and lesser grain dissolution))

Ehrenberg, S.N., J.M. McArthur & M.F. Thirlwall (2006)- Growth, demise and dolomitization of Miocene carbonate platforms on the Marion Plateau, Offshore NE Australia. J. Sedimentary Res. 76, p. 91-116.
(Sr-isotope stratigraphy used to determine timing of depositional events and dolomitization in two Miocene carbonate platforms cored by ODP Leg 194, seaward of Great Barrier Reef. Initial transgression of Marion Plateau volcanic basement E Oligocene (29-31 Ma). Main growth of carbonate platforms in Miocene (23-7

Ma), with five depositional sequences. Both platform-demise events (10.7 and 6.9 Ma) coincide with falls in global sea level combined with decreasing water temperature)

(Genetic diversity has largely recovered on reefs decimated by eruption of Krakatau in 1883. Recolonization occurred mainly from Pulau Seribu, but also larval input from other regions. Recovery of genetic diversity in coral reef animals can occur on order of decades and centuries rather than millennia)

Sun, S.Q. & M. Esteban (1994)- Paleoclimatic controls on sedimentation, diagenesis and reservoir quality: lessons from Miocene carbonates. American Assoc. Petrol. Geol. (AAPG) Bull. 74, 4, p. 519-543.
(Reservoir quality of Miocene carbonates primarily controlled by prevailing paleoclimate. Two end members: (1) humid, oceanic tropical-subtropical settings (e.g. Miocene of SE Asia). Warming trend and rising sea level allowed thick coral reefs and skeletal banks to develop. Typically several 3rd-order cycles, separated by discontinuities in platform growth with subaerial exposure, with porosity development associated with meteoric leaching and karstification. Basal transgressive carbonates mostly tight; (2) arid, land-locked temperate-subtropical settings with elevated salinities and relatively low temperature restricting growth of buildups. Mainly thin, narrow fringing coral reefs with small lagoons in rhodalgal ramps, with minimal meteoric dissolution during subaerial exposure. Evaporitic lagoons cause of pervasive dolomitization, leaching and generation of moldic, vuggy and intercrystalline porosity. Often with anhydrite cement)

(Alor in Banda Sea is in core of Indo-Pacific warm Pool. 18O isotopes of coral growth stages used to monitor inter-annual climate changes. El Nino events in last 30 years clearly reflected by increased 18O)

Webster, J.M., J.C. Braga, D.A. Clague, C. Gallup, J.R. Hein, D.C. Potts, W. Renema, R. Riding et al. (2009)- Coral reef evolution on rapidly subsiding margins. Global Planetary Change 66, p. 129-148.
(Series of submerged coral reefs in Huon Gulf (PNG) and around Hawaii. Rapid subsidence (2-6 m/ka over last 500 ka), combined with eustatic sea-level changes, responsible for repeated drowning and backstepping of coral reefs. Reef drowning characterized by distinct biological and sedimentary sequence. In short term, rate and amplitude of eustatic sea-level changes control initiation, growth, drowning or sub-aerial exposure, subsequent reinitiation, and final drowning. Over longer time scales (>100-500 ka) tectonic subsidence and basement substrate morphology influence reef morphology and backstepping geometries)

Webster, J.M., L. Wallace, E. Silver, B. Applegate, D. Potts, J.C. Braga & C. Gallup (2004)- Drowned carbonate platforms in the Huon Gulf, Papua New Guinea. Geochem. Geophys. Geosystems 5, 11, Q11008, p. 1-31.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2004GC000726/pdf)
(W Huon Gulf actively subsiding foreland basin with 14 drowned carbonate platforms and many pinnacles/ banks, increasing in age (~20-450 kyr) and depth (0.1-2.5 km) NE to Ramu- Markham Trench. Superimposed on downward flexing of platforms toward trench is tilting of deep platforms to NW and shallow platforms to SE. This may reflect encroaching thrust load from NW (Finisterre Range). Over shorter time scales (~100 kyr)

eustatic sea level changes critical in controlling initiation, growth, drowning of platforms. Tectonic subsidence and basement morphology influence backstepping geometry and tilting of platforms over longer timescales)

Webster, J.M., L. Wallace, E. Silver, D. Potts, J.C. Braga, W. Renema, K. Coleman-Riker & C. Gallup (2004)- Coralgal composition of drowned carbonate platforms in the Huon Gulf, Papua New Guinea: implications for lowstand reef development and drowning. Marine Geology 204, p. 59-89.
(Coral, algae, larger forams facies models and development of Pleistocene carbonate platforms, Huon Gulf. Facies from shallow to deep: 1. coral reef lst (reef flat-upper reef slope <20m; with Calcarina), 2. coralline algal- foraminiferal nodule limestone, 3. Halimeda limestone (deep fore-reef slope ~20-60m; with Amphistegina, Heterostegina, Operculina), 4. Coralline algal- foraminiferal crust limestone (deeper fore-reef slope ~60-90m; with Amphistegina, Cycloclypeus, Heterostegina operculinoides, Operculina) and 5. Planktonic foraminifera limestone (with Amphistegina, Cycloclypeus, Heterostegina))

(On potential Pre-Tertiary 'basement' play in W Glagah Kambuna Block, offshore N Sumatra Basin, N of Medan. Basement of W Glagah Kambuna area probably mainly Permian-Triassic, similar to outcrops in W, which consist of Permian Tapanuli Gp and Batumilmil crinoidal Lst, and Triassic Kaloi Lst and Kualu Fm claystone (with Norian bivalve Halobia charlyana), which outcrop to W (all part of Sibumasu Block). (with some unusual K-Ar radiometric age dates of sedimentary rocks?; JTvG)

Barber, A.J. (2000)- The origin of the Woyla Terranes in Sumatra and the Late Mesozoic evolution of the Sundaland margin. J. Asian Earth Sci. 18, 6, p. 713-738.
(Jurassic-Cretaceous Woyla Gp of N Sumatra includes fragments of volcanic arcs and imbricated oceanic assemblage. Arc rocks intruded by granitic batholith and separated from original margin of Sundaland by oceanic assemblage. Arc assemblage underlain by continental basement. Quartzose sediments correlated with units in Paleozoic basement. Continental sliver separated from margin of Sundaland in Late Jurassic-Early Cretaceous in extensional strike-slip faulting regime, producing short-lived marginal basin. Separated Sikuleh and Natal microcontinents. In mid-Cretaceous extension followed by compression, crushing continental fragments back against Sundaland, with destroyed marginal basin now represented by imbricated oceanic assemblage. Volcanic assemblage and intrusive granites in Natal area part of Eocene-Oligocene volcanic arc. Radiolarian chert in Woyla Gp of Natal and Padang areas show it is part of Triassic- M Cretaceous ocean basin. Sikuleh microcontinent may be allochthonous and may have originated on N margin of Gondwana)

Barber, A.J. & M.J. Crow (2003)- An evaluation of plate tectonic models for the development of Sumatra. Gondwana Research 6, 1, p. 1-28.
(Greater part of Sumatra considered to form part of Sibumasu Block, which accreted to Indochina Block in Triassic. S part of Sibumasu divided into Malacca and Mergui microplates by Mutus Assemblage, which represents another suture. Permo-Carboniferous in N Sumatra with tilloids links Sumatra to Sibumasu Block in N. Permo-Carboniferous in C Sumatra contains Cathaysian Jambi flora and fauna related to Indochina Block and is associated with E Permian volcanic arc, which probably formed at margin of Cathaysian Block and was emplaced in present position by strike-slip faulting. Woyla Group is Jurassic- E Cretaceous oceanic volcanic arc, which was thrust over W margin of Sumatra in mid-Cretaceous)

Beck, M.E. (1983)- On the mechanism of tectonic transport in zones of oblique subduction. Tectonophysics 93, p. 1-11.
(Sumatra oblique subduction created strike-slip fault that traverses magmatic arc)

Beddoe-Stephens, B., J.A. Aspden & T.J. Shepherd (1983)- Glass inclusions and melt compositions of the Toba Tuffs, Northern Sumatra. Contrib. Mineralogy Petrology 83, p. 278-287.
(Glass (melt) inclusions in quartz and feldspar phenocrysts in Toba Tuff ignimbrites all highly evolved, rhyolitic compositions, identical to glass forming matrix of rocks. Ignimbritic magmas at Toba erupted from ~3-4 kms depth and represent silicic cap to batholithic body consolidating beneath Toba caldera)

Beddoe-Stephens, B., T.J. Shepherd, J.F.W. Bowles & M. Brook (1987)- Gold mineralization and skarn development near Muara Sipongi, West Sumatra, Indonesia. Economic Geology 82, 7, p. 1732-1749.
(Gold-mineralized skarns along Sumatra Fault Zone near Muara Sipongi, W Sumatra, mined in Pagaran Siayu mine before WW II. Hosted in Permo-Triassic limestones and andesitic volcanics, into which Late Jurassic I-type diorites and granodiorites intruded in volcanic arc-related environment. Rb-Sr dating of emplacement of Muara Sipongi batholith 158 ±23 Ma)

Bellier, O., H. Bellon, M. Sebrier, Sutanto & R. Maury (1999)- K/Ar age of the Ranau tuffs: implications for the Ranau caldera emplacement and slip-partitioning in Sumatra (Indonesia). Tectonophysics 312, p. 347-359.
(Great Sumatran dextral Fault follows approximately magmatic arc, where major calderas are installed. Ranau caldera tuff sample yielded K-Ar ages of 0.55±0.15 Ma for separated feldspars, which places major Ranau caldera collapse between 0.7- 0.4 Ma)

Bellier, O. & M. Sebrier (1994)- Relationship between tectonism and volcanism along the Great Sumatran Fault zone deduced by SPOT image analyses. Tectonophysics 233, p. 215-231.
(Satellite images provide evidence for numerous stepovers, pull-apart grabens and volcanic structures along NW-trending right-lateral Great Sumatran Fault Zone. Geometry of strike-slip fault evolves through time. Huge volcanic calderas in large releasing stepover fault zones and bounding faults of rectangular pull-apart basins are analogous to circular ring faults of calderas. Toba caldera elongated parallel to present trace of Great Sumatran Fault and associated with wide pull-apart basin not active at present)

Bellier, O. & M. Sebrier (1995)- Is the slip rate variation on the Great Sumatran Fault accommodated by fore-arc stretching? Geophysical Research Letters 22, p. 1969-1972.
(Along Great Sumatran Fault zone, which is associated with oblique convergent Sunda subduction system, a N-ward increase of slip rate, from <10mm/yr near Sunda Strait to ~20mm/yr near Lake Toba to >40mm/yr in Andaman Sea. Transpressional back-arc deformation accommodates part of slip rate variation while no significant fore-arc stretching is observed. Oblique convergence may be accommodated by deformation of 500 km wide zone, from fore-arc toe back-arc domains)

Bellier O., M. Sebrier & S. Pramumijoyo (1991)- La grande faille de Sumatra: geometrie, cinematique et quantite de deplacement mises en evidence par l'imagerie satellitaire.Comptes Rendus Academie Sciences, Paris, 312, 2, p. 1219-1226.

('The Great Sumatra fault zone: kinematics and amount of displacement as shown by satellite imagery'. Satellite image analysis of S-most part of fault zone suggests right-lateral strike slip motion at ~6 ± 4 mm/yr (close to 40mm/ year near Andaman Sea?))

Bellier, O., M. Sebrier, S. Pramumijoyo, T. Beaudouin, H. Harjono, I. Bahar & O. Forni (1997)- Paleoseismicity and seismic hazard along the Great Sumatran Fault (Indonesia). J. Geodynamics 24, p. 169-183.
(Great Sumatran Fault is 1650km-long dextral strike-slip fault zone which accommodates part of oblique convergence of subduction between Indo-Australian and Eurasian plates. Segmentation map shows 18 major fault segments (45-200 km long). Historical seismicity 17 earthquakes since 1835. N-ward increase of segment lengths, which parallels GSF slip-rate increase. Seismic gap of 300 km between 3-5°N)

Bellon, H., R.C. Maury, Sutanto, R. Soeria-Atmadja, J. Cotton & M. Polve (2004)- 65 m.y.-long magmatic activity in Sumatra (Indonesia), from Paleocene to Present. Bull. Soc. Geologique France 175, 1, p. 61-72.
(NW-SE volcanic arc location closely follows Great Sumatran Fault Zone (GSFZ). K-Ar ages show magmatic activity from Paleocene (~63 Ma) until Present. Spatial distribution increased at ~20 Ma, possibly connected to development of GSFZ. Position of Plio-Quaternary magmatic rocks shifted away from trench by few 10's of km relative to Paleogene- Miocene arcs, consistent with Cenozoic tectonic erosion of Sundaland margin. Samples display typical subduction-related signatures, but no clear geochemical trends. Lack of regular variations reflects complex igneous petrogenesis where contribution of Sundaland continental crust overprinted those of mantle wedge and subducted slab)

Bennett, J.D. (1978)- The structure and metamorphism of Sumatra North of latitude 38°N. In: Proc. Second Symposium Integrated Geological Survey North Sumatra, 1977, Directorat Min. Resources, Bandung, Indonesia, 3, 1, p. 5-19.

Chesner, C.A. (1998)- Petrogenesis of the Toba Tuffs, Sumatra, Indonesia. J. Petrology 39, p. 397-438.
(online at: http://petrology.oxfordjournals.org/content/39/3/397.full.pdf+html)
(In last 1-2 my, at least 3400 km3 of magma erupted in four ash flow tuff units from Toba Caldera Complex. Fourth eruption at 74 ka was largest, producing 2800 km3 of magma and caldera of 100 x 30 km. First phase dacite, successive eruptions rhyodacite-rhyolite with up to 40% crystals of quartz, sanidine, plagioclase, biotite and amphibole. Much of crystallization of quartz-bearing tuffs between 700-760°C at depths of 10 km. Dense welding of all units except top of youngest unit, and thick rhyodacitic magma in collapsing calderas)

Chesner, C.A. (2012)- The Toba caldera complex. Quaternary Int. 258, p. 5-18.
(online at: http://pages.mtu.edu/~raman/VBigIdeas/Supereruptions_files/Toba%20QI.pdf)
(Review of Toba Caldera, N Sumatra. During past 1.3 My Toba erupted intermediate lavas, followed by intermediate pyroclastics. Three quartz-bearing silicic tuffs, followed by intermediate to silicic lavas. Apparent migration of activity to W. Oldest Toba Tuff with 40Ar/39Ar age of 840 ka (Diehl et al., 1987). Middle Toba Tuff ~500ka age? Youngest Toba Toff age 74 ka)

Chesner, C.A. & A.D. Ettlinger (1989)- Composition of volcanic allanite from the Toba Tuffs, Sumatra, Indonesia. American Mineralogist 74, p. 750-758.
(Toba Tuffs with common accessory allanite (monoclinic member of epidote group), which is rare or absent in most volcanic rocks. Allanite compositions vary with magma composition and temperature)

Chesner, C.A. & J.F. Luhr (2010)- A melt inclusion study of the Toba Tuffs, Sumatra, Indonesia. J. Volcanology Geothermal Res. 197, p. 259-278.
(Quartz-rich Pleistocene Toba Tuff with melt inclusions indicating that parental melts were high-silica rhyolites, with 74.5- 77% SiO2)

Chesner, C.A. & W.I. Rose (1991)- Stratigraphy of the Toba tuffs and the evolution of the Toba caldera complex, Sumatra, Indonesia. Bull. Volcanology 53, p. 343-356.
(During past 1.2 Ma magma chamber of batholithic proportions developed under 100 x 30 km Toba Caldera Complex, N Sumatra. Four eruptions occurred within present collapse structure, which formed from eruption of Youngest Toba Tuff (YTT) at 74 ka. Calderas of three older tuffs obscured by collapse and resurgence resulting from YTT eruption. Samosir Island composed of thick YTT caldera fill, whereas Uluan Block consists mainly of Oldest Toba Tuff (OTT). Toba eruptions document growth of laterally continuous magma body)

Chesner, C.A., W.I. Rose, A. Deino, R. Drake & J.A. Westgate (1991)- Eruptive history of Earth's largest Quaternary caldera (Toba, Indonesia) clarified. Geology 19, 3, p. 200-203.
(Two youngest Toba tuffs dated as ~73 and 501 Ma. Timing of youngest and largest eruption coincident with early Wisconsin glacial advance)

Clarke, M.C.G. & B. Beddoe-Stephens (1987)- Geochemistry, mineralogy and plate tectonic setting of a Late Cretaceous Sn-W granite from Sumatra, Indonesia. Mineralogical Magazine 51, 3, p. 371-387.
(online at: www.minersoc.org/pages/Archive-MM/Volume_51/51-361-371.pdf)
(Hatapang granite in N Sumatra S-type two-mica granite with Sn and W mineralization. Rb-Sr and biotite K-Ar ages of 80 Ma, emplaced in Tapanuli Gp Carboniferous-Triassic greywackes with diamictites. Identification of

Cretaceous Sn-W granite in N Sumatra provides link with economically important Late Cretaceous Sn-W granites in Thailand and Burma)

Clarke, M.C.G., S.A. Ghazali, H. Harahap, Kusyono & B. Stephenson (1982)- Geologic map of the Pematangsiantar Quadrangle (0718), Sumatra, 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.
(Geologic map of sheet between N and C Sumatra basins, E of Laka Toba. In Barisan Mts below Toba volcanic cover mainly Permian conglomeratic Bohorok Fm and finer Tapanuli Gp, intruded by Permo-Triassic? (or Cretaceous?) Hatapang and other granites. With remnants of Miocene- Pliocene sediments)

Clarke, M.C.G., W. Kartawa, A. Djunuddin, E. Suganda & M. Bagdja (1982)- Geologic map of the Pakanbaru Quadrangle (0816), Sumatra, 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.
(C Sumatra map sheet. Most of map Cenozoic C Sumatra basin around Pakanbaru, with Minas Field. Oldest rocks in Barisan Mts Permo-Carboniferous Kuantan and Bohorok Fms with Triassic granite intrusives. Overlain by Miocene Sihapas and Telisa Fms))

(Sumatra many granite units within batholiths such as Lassi, Bungo and Garba, as well as numerous isolated plutons. Carboniferous-Permian and Late Triassic-E Jurassic cycles of syn-post collisional granites, peaking at 220-200 Ma, with tin granites. Younger plutonism associated with arc volcanism, broad age range: 203-5 Ma)

Costa, A., V.C. Smith, G. Macedonio & N.E. Matthews (2014)- The magnitude and impact of the Youngest Toba Tuff super-eruption. Frontiers Earth Sci. 2014, 2, 16, p. 1-8.
(online at: http://journal.frontiersin.org/article/10.3389/feart.2014.00016/full)
(Model of ash distribution and volume of Youngest Toba Tuff, erupted 75,000 years ago. Eruption dispersed ~8600 km3 of ash (= ~3800 km3 dense rock equivalent/ DRE), covering ~40 million km2 with >5 mm of ash. Total volume (incl. 1500 km3 DRE pyroclastic density current deposits on Sumatra) was ~5300 km3 DRE)

Crippa, G., L. Angiolini, I. Van Waveren, M.J. Crow, F. Hasibuan, M.H. Stephenson & K. Ueno (2014)- Brachiopods, fusulines and palynomorphs of the Mengkarang Formation (Early Permian, Sumatra) and their palaeobiogeographical significance. J. Asian Earth Sci. 79, p. 206-223.
(Brachiopods, fusulines and palynomorphs from Lower Permian Mengkarang Fm, Jambi, part of W Sumatra Block Volcanic Arc deposits. Brachiopods 6 genera (mainly Stereochia aff. S. irianensis, and Neochonetes carboniferus, also Marginifera, Reticulatia, etc.), mainly anti-tropical taxa (but here grouped with warm water taxa rather than with cold water taxa from Gondwanan-Perigondwanan region). Fusulinids at one level at Teluk Gedang (poor assemblage of 6 species, mainly Pseudofusulina rutschi Thompson, also Eostaffella, Schubertella, Pseudoschwagerina cf. afghanensis, P. meranginensis, Eoparafusulina ?haydeni), rel. poor assemblage of widespread genera but of tropical Tethyan affinity due to common occurrence large schwagerinids. Most likely age Sakmarian, but E Artinskian age cannot be excluded. Palynomorphs dominated by Laevigatosporites spp., Florinites florini and Convolutispora sp., different from coeval assemblages of Gondwanan region, but affinity with Cathaysian province as represented in N China, etc.)

(Large Martabe gold mine SE of Sibolga near W coast of N Sumatra province, producing since mid-2012. Martabe deposit cluster of 6 high-sulfidation epithermal deposits in ~8 x 1.5 km N-S corridor. Limited geology)

Crow, M.J. (2005)- Pre-Tertiary volcanic rocks. In: A.J. Barber, M.J. Crow & J.S. Milsom (eds.) Sumatra- geology, resources and tectonic evolution, Geol. Soc., London, Mem. 31, chapter 6, p. 63-85.
(Long range of volcanic activity in Sumatra, mainly arc volcanics: Carboniferous, Permian (W Sumatra belt), Triassic, Jurassic-Late Cretaceous (oceanic volcanic arc in Woyla terrane, associated with limestones). Most widespread E-M Permian and Late Jurassic- Early Cretaceous)

Crow, M.J. (2005)- Tertiary volcanicity. In: A.J. Barber, M.J. Crow & J.S. Milsom (eds.) Sumatra- geology, resources and tectonic evolution, Geol. Soc., London, Mem. 31, chapter 8, p. 98-119.
(Well-defined Paleocene- E Eocene 'Kikim Volcanics' (65-50 Ma) in S Sumatra, Late M Eocene along W coast, 50-46 Ma non-volcanic interval, Late Eocene- E Oligocene volcanic episode (~37-30 Ma), Late E- M Miocene arc volcanics along W coast and high K- shoshonitic intrusions in C Sumatra back arc basin, Late Miocene-Pliocene (6-1.6 Ma; mainly in Sumatra, contemporaneous with back-arc inversion at ~5 Ma?) (for Sumatra Quaternary volcanism see Gasparon 2005))

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1993)- The simplified geology and known metalliferous mineral occurrences, Padang Quadrangle, Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 49-B, p. 1-18.
(Brief review of W Sumatra Padang map sheet geology and metallic mineral occurrences (Au-Ag, Cu, Pb-Zn). With old gold-silver mines Mangani, Balimbing, Pamicikan, Pagadis, etc., in epithermal quartz veins, associated with Plio-Pleistocene andesitic volcanics and young extensional faults. Also Pb-Zn anomalies at Salodako NNE of Padang near skarn associated with Tertiary granite)

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1993)- The simplified geology and known metalliferous mineral occurrences, Solok Quadrangle Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 50-B, p. 1-19.
(Summary of SW Sumatra Solok quad geology and metallic mineral occurrences (Cu, Au, Ag, Fe). Gold-silver in quartz veins hosted in Oligo-Miocene volcanics, copper mineralization in hydrothermal veins (Timbulan) and limestone skarns and alluvial gold deposits in Bengkalis area)

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1993)- The simplified geology and known metalliferous mineral occurrences, Painan Quadrangle, Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 52-B, p. 1-30.
(Painan Sheet of W Sumatra with basement of Carboniferous? and Permo-Triassic metasediments (with Permian arc volcanism, deep marine Triassic), Late Triassic- Jurassic granitoids, late Jurassic- E Cretaceous metalimestones and clastics (Woyla Gp), also serpentinite bodies. Unconformably overlain by Oligocene and younger sediments and volcanics. With listing of metallic mineral occurrences)

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1993)- The simplified geology and known metalliferous mineral occurrences, Sungaipenuh and Ketaun Quadrangles, Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 54-B, p. 1-17.
(SW Sumatra map sheets, with active Lebong Tandai gold-silver mine in mineralized breccia in Ketaun Quad. Oldest rock is extreme NE corner: M Permian volcanics of Palepat Fm, intruded by laterst Triassic- E Jurassic Tantan Granite. M-L Jurassic flysch-type Asai Fm and shallow marine Late Jurassic- E Cretaceous Peneta Fm (part of Woyla Gp foreland to island arc). With listing of metallic mineral occurrences (Cu, Pb, Zn, Au, Ag))

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1994)- The simplified geology and known metalliferous mineral occurrences, Bengkulu Quadrangle Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 57-B, p. 1-19.
(Map sheet dominated by Tertiary- Recent volcanic products of Barisan Range. In SE corner Gumai Mts with remnants of Late Mesozoic subduction Complex, similar to Woyla Gp in N Sumatra. With many former mines of Lebong Mining District, active between ~1906-1941. Etc. With listing of metallic mineral occurrences (Au, Ag, Pb, Zn, Cu))

Crow, M.J., C.C. Johnson, W.J. McCourt & Harmanto (1994)- The simplified geology and known metalliferous mineral occurrences, Manna Quadrangle (0911), Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 59-B, p. 1-19.
(SW Sumatra map sheet dominated by Tertiary- Recent volcanic products of Barisan Arc and flanking Bengkulu forearc basin. With listing of metallic mineral occurrences (Au, Pb- Zn, Ag, Cu), mainly around Tanjungsakti of Sumatra Fault Zone)

Crow, M.J., W.J. McCourt & Harmanto (1994)- The simplified geology and known metalliferous mineral occurrences, Rengat Quadrangle, southern Sumatra (0915). Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 51-B, p. 1-22.
(SE Sumatra map sheet with oldest exposed rocks metasediments and NW-SE striking low metamorphic Permo-Carboniferous Tigapuluh Gp meta-clastics and limestones (probaby correlative to glacial or debris flow Bohorok Fm of N Sumatra). Intruded by porphyritic granitoids with K-Ar ages from ~198-128 Ma (most whole rock radiometric ages too young; granites may be slightly younger (earliest Jurassic) continuation of Late Triassic (~220 Ma) Main Range-equivalent S-type granites of Malay Peninsula). Three deformation phases. Many small alluvial Sn, W(cassiterite) occurrences near granites of Tigapuluh Mts in S, Au occurrences in W. Also primary cassiterite veins in greisen at Sungei Isahan granite))

Crow, M.J., W.J. McCourt & Harmanto (1994)- The simplified geology and known metalliferous mineral occurrences, Muarabungo and Jambi Quadrangles Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 53-B, p. 1-19.
(Oldest rocks exposed in Tigapuluh Mts: NW-SE striking low metamorphic Permo-Carboniferous Tigapuluh Gp meta-clastics and limestones, intruded by Late Triassic- E-M Jurassic granitoids (K-Ar mineral ages ~198, 180 Ma). With Permian pebbly mudstones, probaby correlative to glacial Bohorok Fm of N Sumatra. Etc. With listing of metallic mineral (Sn, Au) deposits (rel. common alluvial cassiterite, but non-economic))

Crow, M.J., W.J. McCourt, C.C. Johnson & Harmanto (1994)- The simplified geology and known metalliferous mineral occurrences, Baturaja Quadrangle, Southern Sumatra. Direct. Mineral Resources, Bandung/ British Geol. Survey, Spec. Publ. 60-B, p. 1-19.
(Oldest rocks exposed in Baturaja Sheet in Garba Mts and are ?Carboniferous- Mesozoic metasediments. Mesozoic of Garba Mts includes highly tectonized late Jurassic- E Cretaceous radiolarian cherts, associated with metavolcanics, melange and ultrabasic rocks; can be correlated with Lingsing series of Gumai Mts and oceanic sequences of Woyla Gp. Granitoids along E side of Barisan Range of M-L Cretaceous age (115-80 Ma), postdating accretion of Woyla Gp. With listing of metallic (Au, Ag, Sn) mineral deposits)

Crow, M.J. & T.M. van Leeuwen (2005)- Metallic mineral deposits. In: A.J. Barber, M.J. Crow & J.S. Milsom (eds.) Sumatra- geology, resources and tectonic evolution, Geol. Soc., London, Mem. 31, chapter 12, p. 147-174.
(Review of Paleozoic- Neogene mineral deposits of Sumatra: Paleozoic lead-zinc, Late Triassic- E Jurassic tin granites, Late Cretaceous tin, gold, Mio-Pliocene arc magmatism with copper, molybdenum, silver, gold)

Crow, M.J. & I.M. Van Waveren (2010)- A preliminary account of the Karing Volcanic Complex in the Permian West Sumatra Volcanic Arc. In: C.P. Lee et al. (eds.) 6th Symp. Int. Geol. Correl. Progr. Project 516 (IGCP516), Geological anatomy of East and South Asia, Kuala Lumpur 2010, p. 36 *(Abstract only)*
(Karing Volcanic Complex, host of E Permian Cathaysian 'Jambi Flora', is eroded remnant of subaerial volcanic complex on margin of Permian W Sumatra volcanic arc. Mineralogy of complex entirely volcanic provenance, with no 'continental' mineral components. Olivine basalts and dacitic pyroclastics may support E-M Permian oceanic island arc within W Sumatra Block)

Crow, M.J., I.M. Van Waveren & S.K. Donovan (2008)- Tobler's oyster and the age of the Tabir Formation, Jambi Province, Central Sumatra. Geological Journal 44, 1, p. 117-121.
(Tabir Fm of Jambi long considered to be Upper Jurassic, based on small molluscs collected by Tobler and assigned to Ostrea by Frech. These are not oysters and other fauna/flora show Tabir Fm is Late Permian)

Crow, M.J., I.M. Van Waveren & F. Hasibuan (2015)- Two Hg-Au occurrences in the West Sumatra Permian volcanic-plutonic arc West of Bangko in Sumatra, Indonesia. In: Proc. PACRIM 2015 Congress, Hongkong, Australasian Inst. of Mining and Metallurgy (AusIMM), Melbourne, Publ. Ser. 2/2015, p. 573-578. *(Presentation)*
(online at: http://www.pacrim2015.ausimm.com.au/Media/PACRIM2015/presentations/Day%202/1415%20-%20Au-Hg%20Sumatra_PACRIM.pdf)

(Two Hg-Au occurrences W of Bangko in W Sumatra Permian Volcanic Plutonic Arc: (1) Melipun Hg-Au occurrence, exploited in 1970's, with mineralisation in hydrothermally altered cupola of buried intrusion; (2) Salak Hg-Au occurrence in outcrop of Asselian Dusunbaru pluton/ volcanic center, likely within caldera in which (Triassic?) hydrothermal mineralisation developed. Both formed late in history of volcanic arc, probably Triassic- E Jurassic)

Crow, M.J., I.M. Van Waveren & F. Hasibuan (2019)- The geochemistry, tectonic and palaeogeographic setting of the Karing Volcanic Complex and the Dusunbaru pluton, an Early Permian volcanic - plutonic centre in Sumatra, Indonesia. J. Asian Earth Sci. 169, p. 257-283.
(online at: https://www.sciencedirect.com/science/article/pii/S1367912018303407)
(E Permian Karing Volcanic Complex and Dusunbaru Pluton comprise volcanic-plutonic centre in Volcanic-Plutonic Arc on W margin of Kluet-Kuantan basin of West Sumatra Block. Karing Volcanics mainly intermediate tuffs interfingering with volcaniclastics and sediments of Mengkarang Fm. Eight cycles of tuffs overlain by volcaniclastics and sediments in Merangin river section. Zircon CA-IDTMS dates from tuffs bracket volcanic activity over 630 kyrs within Asselian (296.77- 296.14 Ma). Dusunbaru pluton composed of gabbroids, granitoids with subordinate metabasalt and tuff xenoliths. Metabasalts and Gabbroids derived from N-MORB lithospheric mantle, granitoids reacted with lower crust. Chemistry of the Dusunbaru Pluton typical of continent margin volcanic-plutonic arcs. Late hydrothermal event event during which Dusunbaru Pluton was faulted against Karing Volcanic Complex attributed to collision of Woyla oceanic terrains with Sumatra in late-mid Cretaceous. West Sumatra Volcanic Arc and Kluet-Kuantan Basin resembles Sukhothai Volcanic Arc in Indochina Block. West Sumatra Block originally was appendage to Indochina Block at paleolatitude 5-15° S)

Dahlius, A.Zardi, A. Purba & H. Wibowo (2007)- Geology and alteration-mineralization characteristics of Timbaan epithermal gold deposit in South Solok, West Sumatra, Indonesia. Proc. Joint Conv. 32nd HAGI, 36th IAGI and 29th IATMI, Bali, p. 1339-1346.

Da Silva Carvalho, H., Purwoko, Siswoyo, M. Thamrin & V. Vacquier (1980)- Terrestrial heat flow in the Tertiary basin of Central Sumatra. Tectonophysics 69, p. 163-188.
(Heat flow in C Sumatra basin of calculated from 92 wells. Average T gradient 3.7 °F/ 100' (= 67.6°C/km) and average heat flow 3.27 ± 0.93 HFU, twice world average. Gradient and heat flow vary inversely with depth. Heat flow in N Sumatra basin, S Sumatra Basin, Sunda Strait and W Java is 2.5 HFU, while in Java E of 110°E it drops to 1.9 HFU)

Davies, P.R. (1989)- Tectonics of North Sumatra. In: B. Situmorang (ed.) Proc. 6th Regional Conf. Geology mineral hydrocarbon resources of Southeast Asia (GEOSEA VI), Jakarta 1987, IAGI, p. 207-227.
(*Tertiary structural evolution of N Sumatra basin described as consequence of position along trailing edge of Sunda Plate. Oblique convergence during Eocene- E Oligocene caused N-propagating dextral overstepping wrench faults along W edge of plate. Counterclockwise rotating Sunda microplate, starting in Late Oligocene. E-M Miocene uplift, followed by rapid subsidence. Second phase of CCW rotation in late M Miocene. LateM Miocene regional compression with Barisan Mts uplift and regressive sedimentation across N Sumatra basin*)

Elbert, J. (1909)- Magnet- und Roteisenerzvorkommen in Sud-Sumatra. Zeitschrift Praktische Geologie 17, p. 509-513.
('Magnetite and hematite occurrences in S Sumatra'. Occurrence of iron ores in mica schist formation of Lampung. Most of Lampong area composed of mica schists (more than mapped by Verbeek), mostly covered by laterite. Main strike of schist WNW-ESE, dips up to 75°. Locally significant magnetite ore bodies in schist (= banded iron ore formation of Subandrio & Tabir 2006?; JTvG). Intrusions of red granites with some gold-silver mineralization. No figures)

Erb, F. (1905)- Beitrage zur Geologie und Morphologie der sudlichen Westkuste von Sumatra. Zeitschrift Gesellschaft Erdkunde zu Berlin 4, p. 251-284.
('Contributions to the geology and morphology of the southern West coast of Sumatra'. Mainly summary of observations on coastal geomorphology of Bengkulu province)

Faridsyah, W.A., R. Yustiawan, N. Muhamad, U. Sukanta & A. Wibowo (2015)- Basement rocks of the Malacca Strait coastal plain, Central Sumatra Basin. Proc. Joint Conv. HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-087, 11p.
(On Pre-Tertiary basement rocks in Malacca Straits PSC. Late Triassic melange/suture zone between Sibumasu and Indochina terranes believed to propagate S across coastal plain of C Sumatra Basin where Malacca Straits PSC is located. Wells in PSC penetrated quartzite, meta-siliciclastics and black shale-limestone facies. Basement cores from Kurau field fractured and recrystallized limestone and claystone with K-Ar age of 275 Ma (late E Permian), and correlated to Gua Musang Fm in Central Belt of Malay Peninsula)

Fauzi, R.M., R. McCaffrey, D. Wark, P.Y. Prih Haryadi & Sunarjo (1996)- Lateral variation in slab orientation beneath Toba caldera, northern Sumatra. Geophysical Research Letters 23, p. 443-446.
(Investigator Fracture zone subducts beneath Toba caldera, suggesting possible relationship to volcanism. High rate of seismicity along subducted Investigator Fracture Zone uncommon at subducted fracture zones)

Fediaevsky, A. & Sujatmiko (1975)- Existence d'une episode climatique aride a la base du Tertiaire de Sumatra. Proc. 9th Int. Sedimentology Congress, Nice 1975, 1, p. 79-85.
('Existence of a dry climate period at the base of the Tertiary of Sumatra'. Faceted sand-blasted pebbles from basal Tertiary conglomerate near Murobungo, Barisan mountain front, C Sumatra, below Talang Akar Fm white quartz-rich sandstones)

Fennema, R. (1876)- Sumatra's Westkust. Verslag No. 8. Onderzoek naar het voorkomen van kwikerts bij den berg Sombong in de nabijheid van Sibelaoe, zoomede aan de riviertjes Tapir en Gade-Talang, Sumatra's Westkust. Jaarboek Mijnwezen Nederlandsch Oost-Indie 5 (1876), 1, p. 35-70.
('Investigation of the occurrence of mercury ore near Sombong mountain, near Sibelaoe, as well as in creeks Tapir and Gade-Talang, Sumatra west Coast'. Area of steeply dipping slates and massive limestones with (Permian) brachiopods, intruded by porphyry granite and veins, W of Sibelabu and along Tapir River, Tanah Datar district, S Padang Highlands. Alluvial cinnabar associated with magnetite, from veins in slate)

Fennema, R. (1887)- Topographische en geologische beschrijving van het Noordelijk gedeelte van het Gouvernement Sumatra's Westkust. Jaarboek Mijnwezen Nederlandsch Oost-Indie 16 (1887), Wetenschappelijk Gedeelte, p. 129-252.
('Topographic and geologic description of the northern part of the Sumatra West Coast province'. Geologic description of W Sumatra from Tapanuli Bay in NW to Fort de Kock (Bukittinggi) in SE. With 1:500,000 geologic map, 11 cross sections. Oldest rocks 'old slate-quartzite' formation. Overlain by unfossiliferous steeply dipping shales and limestones, probably of Carboniferous age (now assigned to Permian; JTvG). Intruded by granites and diabase. Unconformably overlain by rel. gently dipping Eocene/ Old Tertiary with quartz sandstones and thin coal beds. Late Tertiary volcanics. Minor occurrences of gold, copper, lead)

Fernandez-Blanco, D., M. Philippon & C. von Hagke (2016)- Structure and kinematics of the Sumatran Fault system in North Sumatra (Indonesia). Tectonophysics 693, B, p. 453-464.

(online at: www.ged.rwth-aachen.de/files/publications/publication_2733.pdf)
(Study of northern sector of Sumatran Fault System at northernmost tip of Sumatra and islands to NW. Fault bifurcates into two fault strands and two independent kinematic regimes evolve: E branch is classic Riedel system, W branch features fold-thrust belt, accommodating ~20% of shortening of system in study area)

Furqan, R.A. (2014)- The geology of Pinang-Pinang Au-Cu±Mo skarn, Aceh, Indonesia. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Indon. Soc. Econ. Geol. (MGEI) Ann. Conv., Palembang, p. 291-299.
(Pinang-Pinang gold-copper±molybdenum project ~20km SE of Tapaktuan on SW coast of Aceh consists of two skarn deposits,~3km apart. Granitoids and limestones present but no ages discussed)

Gafoer, S. (2002)- Stratigrafi dan karakter mintakat Pra-Tersier di Sumatra bagian selatan. J. Geologi Sumberdaya Mineral 12, 121, p. 2-24.
('Stratigraphy and character of the Pre-Tertiary zone in South Sumatra'. Four basement terranes in S Sumatra: (1) MTB Tigapuluh- Bohorok (Permo-Carboniferous, incl. glaciomarine deposits, with Late Triassic- E Jurassic granites; paleolatitude 41°S, 115° CW rotation) (=Sibumasu); (2) MKD-Kuantan- Duabelas (Carboniferous- Cretaceous sediments and low-grade metamorphics, from N latitudes; 30°N paleolatitude for E Permian Mengkareng Fm with 'Jambi flora'; ~90° CW rotation; with Late Permian, Late Triassic- E Jurassic and Cretaceous granites); (3) MGk-Gunungkasih (pre-Carboniferous? high metamorphic rocks, also with Late Permian, Late Triassic- E Jurassic and Cretaceous granite, from low-latitude S Hemisphere (19°N/ 339°CW rotation for Pre-Carboniferous in Table4?; JTvG)= Malacca microcontinent of Pulunggono and Cameron 1984); (4) MGW- Garba-Woyla Terrane (latest docked; Jurassic- E Cretaceous oceanic and accretionary zone rock types with ultramafics). Raub-Bentong suture interpreted to run through N Bangka)

Gafoer, S. & T.C. Amin (1993)- Tinjauan kembali geologi Pra-Tersier daerah Garba, Sumatera Selatan. Bull. Geol. Res. Dev. Centre 16, p. 17-26.
(New geologic observations in the pre-Tertiary area of Garba, S Sumatra. Oldest rocks are low-grade metamorphics of possible Carboniferous age. Tectonically juxtaposed against Late Jurassic- E Cretaceous volcanic rocks and chert of possible oceanic affinity in E Cretaceous (melange complex of Barremian- Aptian age 125-120 Ma). Both rock types intruded by Late Cretaceous granites; 116-80 Ma)

Gafoer S., T.C. Amin & R. Pardede (1992)- Geological map of the Bengkulu Quadrangle (0912), Sumatra, 1: 250,000, 2nd Ed., Geol. Res. Dev. Centre (GRDC), Bandung.
(Geologic map sheet of SW Sumatra NE of Bengkulu, with folded Oligo-Miocene clastics in Bengkulu forearc area, young volcanics only in Barisan Mountains and SW part of S Sumatra (Palembang) Basin in NE. In SE corner Gumai Mts anticlinorium with Late Jurassic- E Cretaceous interfingering Saling Fm andesitic-basaltic lavas and Lingsing Fm bathyal clastics (=oceanic; Barber et al. 2005), both unconformably overlain by Sepingtiang Fm reefal limestones (with Orbitolina?) and calcarenites, unconformably overlain by ?Paleo-Eocene Kikim Tuffs)

Gafoer S., T.C. Amin & R. Pardede (1993)- Geological map of the Baturaja Quadrangle, Sumatra. Geol. Res. Dev. Centre (GRDC), Bandung.
(Geologic map of SE part of S Sumatra Basin, with folded Late Oligocene- Miocene sediments, incl. E Miocene limestone outcrops at Baturaja town and around Garba Mts. Pre-Tertiary rocks in Garba Mts Anticlinorium look like Cretaceous accretionary complex with Late Paleozoic/ E Carboniferous? Tarap Fm meta-sediments, Late Jurassic- E Cretaceous Garba Fm with radiolarian cherts and basalts interbedded with chert and occasional serpentinite, with NW-SE foliation, mid-Cretaceous melange complex (mixed boulders in scaly clay), intruded by M-L Cretaceous Garba Granite (~115, 80 Ma ages; Saefudin 2000), unconformably overlain by Tertiary sediments (incl. Paleogene quartz sandstone of Cawang Fm, Kikim volcanic breccia and tuffs)

Gafoer, S., G. Burhan & J. Purnomo (1986)- The geology of the Palembang Quadrangle, Sumatra (Quadrangle 1013), 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung, 18p. + map.

(Also 2nd Edition 1995. Map sheet of folded Miocene- Pleistocene sediments of South Sumatra Basin NW of Palembang. Large NW-SE trending anticlines (Babat, Keluang, Tamiang, Berau-Bentayan, etc.))

Gafoer, S., T. Cobrie & J. Purnomo (1986)- The geology of the Lahat Quadrangle, Sumatra (Quadrangle 1012), 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung, 25p. + map.
(Map sheet mainly of SW part of S Sumatra (Palembang) Basin. With large Pendopo- Limau and Benuang-Prabumulih anticlines, all with old oil fields. Series of smaller anticlines in Muara Enim- Lahat area in SW with outcrops of coal-bearing M-L Miocene sediments, intruded by Quaternary volcanic necks (Bukit Serelo, etc.))

Gafoer, S. & K.D. Kusumah (2002)- Cekungan batubara Paleogen daerah Pangkalan Kotabaru dan sekitarnya, Sumatra Barat-Riau. J. Geologi Sumberdaya Mineral 12, 129, p. 2-22.
('Paleogene coal basins in the area of Pangkalan Kotabaru and surroundings, Sumatra West Riau'. W margin of C Sumatra rift basin near Barisan Mts front with outcrops of up to 8m? thick M-L Eocene coals in Pematang Fm (age supported by Florschuetzia trilobata, Gemmatricolporites pilatus a.o.))

Gafoer, S., K.D. Kusumah & N. Suryono (2001)- Kegiatan tektonik Tersier: hubunannya dengan pembentukan cekungan dan akumulasi batubara di sub-cekungan Jambi bagian Barat. Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 26, p. 73-97.

(Oldest rocks in S Sumatra locally metamorphosed Carboniferous and Permian sediments. Silurian- Devonian granites known from two wells. Also Permian volcanics, unconformably overlain by Triassic clastics. Late Triassic tin-granites on Bangka-Belitung. Flysch-type U Jurassic- Lw Cretaceous. M-Late Cretaceous granites and Kikim Tuffs. Widespread Late Oligocene- earliest Miocene 'Old Andesite' along Barisan Range)

Gasparon, M. (1993)- Origin and evolution of mafic volcanics of Sumatra (Indonesia): their mantle sources, and the role of subducted oceanic sediments and crustal contamination. Ph.D. Thesis, University of Tasmania, p. 1-395.
(online at: http://eprints.utas.edu.au/19511/1/whole_GasparonMassimo1994_thesis.pdf)
(Sediments, or fluids derived from sediments subducted along Sunda Trench, affect chemistry of Quaternary arc volcanics in some sectors of Sunda arc, whereas isotopic signature of other sectors mainly reflects composition of mantle source. Two groups of ganitoids identified in Sumatra: (1) Arc-related granitoids along calcalkaline trend of arc rocks, with Sr, Nd, and Pb isotope systematics similar to those of Indian Ocean basalts (including basalts from S Sumatra);(2) E of Semangko fault, granitoids and pyroclastic rocks mainly of 'S-type', with high 87Sr/86Sr values, similar to C Granitoid Province of SE Asia. Therefore, Semangko fault and Quaternary arc may define SE margin of Sibumasu terrane. No systematic variations in geochemical and isotopic composition from N to S Sumatra observed in two groups of granitoids. Sr, Nd, and Pb isotopes suggest pre-Mesozoic continental crust present in Sumatra and W Java, but absent from E Java- Lombok)

Gasparon, M. (2005)- Quaternary volcanicity. In: A.J. Barber, M.J. Crow & J.S. Milsom (eds.) Sumatra: geology, resources and tectonic evolution, Geol. Soc. London, Mem. 31, Chapter 9, p. 120-130.
(Quaternary volcanics of Sumatra rel. rich in young silicic volcanic rocks, associated with major caldera-forming events)

Gasparon, M. & R. Varne (1995)- Sumatran granitoids and their relationship to Southeast Asian terranes. Tectonophysics 251, p. 277-299.
(Three subparallel Late Paleozoic- Mesozoic granitoid provinces in SE Asia: (1) East (E peninsular Malaysia); (2) Central (NW Thailand to W Peninsular Malaysia and 'Tin Islands', Indonesia) and (3) West (W Thailand-Burma). Compositions of Sumatran granitoids suggest (1) granitoids in E/ NE Sumatra (incl. 'Tin Islands', Bukit Batu near Palembang, Hatapang pluton, Lake Toba area and possibly Sijunjung pluton in C Sumatra), all have high Sr-87/86 values and other S-type similarities, and can be related to 'Sibumasu terrane'/ Central Granitoid Province;(2) granitoids W of Semangko fault and in basement of Quaternary volcanics low initial Sr-

87/Sr-86 values and I-type characteristics, similar to young arc volcanics and may represent young post-Gondwanan Sumatran arc lithosphere; (3) Granitoids comparable to W Province not known in Sumatra, and (4) granitoids similar to E Province are rare. Semangko fault and Sunda Strait may mark SW- and SE-most limits of Sibumasu terrane. Boundary between Central and E Granite Provinces may run through 'Tin Islands')

Gibbons, A., J.M. Whittaker & P. Muller (2010)- Revisiting the magnetic anomalies along the West Australian margin identifies a new continental fragment that accreted to Sumatra during the Early Eocene. American Geophys. Union (AGU), Fall Meeting 2010, Poster Abstract T13C-2223. *(Abstract only)*
(Reconstruction of abyssal plains along W Australian margin reveals that, apart from Greater India and Argoland, a third continental block (Gascoyneland) rifted from Australia since Jurassic. From 132 Ma (Hauterivian; E Cretaceous) it formed stretched continental crust of Exmouth Plateau, then oceanic crust of Gascoyne and Cuvier abyssal plains. At 115 Ma (= late Aptian) Gascoyneland began moving N while Greater India continued West. Gascoyneland would have reached W Sumatra at ~60 Ma. Woyla Group, consisting of Sikuleh, Natal and Bengkulu terranes, along W coast of Sumatra, identified as oceanic arc, which accreted in Jurassic-E Cretaceous after formation of short-lived, narrow marginal sea and may overlie continental crust due to presence of Sikuleh granitoid batholith. Gascoyneland now probably buried beneath Woyla Terrane)

(On distribution of ash from large Toba eruption of 75,000 years BP, N Sumatra)

Hariawan, M.N. & T. Mulya (2017)- Spatial relations between gold, associated metals and lithologies at the Miwah acid-sulfate (high sulfidation) epithermal deposit, Aceh, North Sumatra, Indonesia. Proc. 14th SGA Biennial Meeting- Mineral resources to discover, Quebec 2017, 4, p.1353-1356.

Harlan, J.B., M.L. Jones, B. Sutopo & T. Hoschke (2005)- Discovery and characterization of the Martabe epithermal gold deposits, North Sumatra, Indonesia. In: H.N. Rhoden et al. (eds.) Proc. Window to the world Symposium, Geol. Soc. Nevada, Reno, p. 917-942.
(Newmont Martabe District high sulphidation epithermal gold deposits 1997 discoveries E of Sibolga. Near strand of Sumatra Fault Zone. See also Sutopo et al. 2003, 2013)

Harris, L. (1989)- Conjugate faulting associated with orthogonal subduction in Indonesia: structural constraints for the timing of the rotation of Sumatra. SGTSG Conference, Kangaroo Island 1989, Geol. Soc. Australia, Abstracts 24, p. 59-60. *(Abstract only)*

Hartmann, E. (1917)- Over de geologie van de Lampongsche Distrikten en het zuidelijk deel der residentie Palembang, Zuid Sumatra. Jaarboek Mijnwezen Nederlandsch Oost-Indie 44 (1915), Verhandelingen 2, p. 90-132.
('On the geology of the Lampung Districts and the southern part of the Palembang Residency, S Sumatra' Results of 1915 reconnaissance. Pretertiary metamorphics and granites, overlain by folded 'Eocene' quartz sandstones with coal, Oligocene Baturaja Limestone (few 100m thick; should be E Miocene age; JTvG), 500m or more marine Telisa/ Gumai clays, tuffs and limestones, 1000m of Miocene-Pliocene L-M Palembang clays-sandstones (rel. little coal in this area) and 500m Upper Palembang Fm quartz-rich tuffs. Overlain by unfolded Quaternary conglomerates and volcanics)

Hartmann, E. (1921)- Geologisch rapport over het kolenvoorkomen in de mijnconcessies 'Soekamarinda' en 'Boenian' en het tusschen deze beide gelegen kolenveld 'Ajer Serillo', gelegen in de onderafdeeling Lematang Oeloe, Residentie Palembang. Jaarboek Mijnwezen Nederlandsch Oost-Indie 47 (1918), Verhandelingen 2, p. 108-140.
(Detailed study of Middle Palembang Fm coals in 3 mining concessions in Lematang Ulu area, Palembang Residency, S Sumatra. Interseting 'progressive superposition' model, suggesting back-stepping/ transgressive stacking of Middle Palembang Fm coal beds)

Hartono, U. (2002)- Permian magmatism in Sumatra: their tectonic setting and magmatic source. J. Geologi Sumberdaya Mineral 12, 129, p. 33-46.
(Permian magmatism in W Sumatra demonstrated by volcanic rocks in Barisan Mts in Palepat and Silungkang areas (= Kuantan-Duabelas Mts Block= Mergui Plate). Tectonic setting debated, Volcanic rocks vary from low-K, medium-K to high-K affinities and consist of basalt, andesite and rhyolite. Low MgO and Ti02, enriched in large ion lithophile elements, light Rare Earth Elements (LREE), etc, indicate subduction zone environment. Magma source peridotitic upper mantle. Origin of rhyolite still unknown; characteristics no relationship to andesite)

Hartono, U., A. Achdan & S. Andi Mangga (1998)- Fractionation process evidences on the Palepat volcanic magmatism in Southern Sumatra. J. Geologi Sumberdaya Mineral, 8, 79, p. 2-9.
(Permian Palepat and Silungkang Fm volcanics are oldest rocks exposed along E flank Barisan Mts in S Sumatra. Three groups: (1) low-K basalt, basaltic andesite and low-medium-K andesites (subduction magmatism); (2) high-K andesite and rhyolite and (3) Low Na andesite and rhyolite (origins of 2 and 3 still unclear, but not co-magmatic with Group 1) (Suparka and Asikin 1981: not result of subduction))

Hartono, U., S. Andi Mangga & A. Achdan (1996)- Geochemical results of the Permian Palepat and Silungkang volcanics, southern Sumatra. J. Geologi Sumberdaya Mineral, 5, 56, p. 18-24.
(Permian Palepat and Silungkang volcanics from SW Sumatra (Kuantan- Duabelas Mts Zone= Mergui Plate of Pulunggono and Cameron, 1984). Predominantly andesitic and basaltic in composition, with minor rhyolites. Previously interpreted as products of melting of continental crust (Suparka & Asikin, 1981), but geochemistry

more typical of subduction-related magmatism, with high Al2O3 and low MgO and Ti02 concentrations. Silungkang volcanics characterised by FeO enrichment typical of tholeiite, Palepat rocks evolved from tholeiitic basalts to calc-alkaline andesites (no localities information or justification of age assigment; JTvG))

Hasibuan, F. (1993)- *Posidonia* dari Sumatera Barat. Proc. 22nd Ann. Conv. Indon. Assoc. Geol. (IAGI), Bandung, 2, p. 1061-1074.
('Posidonia from West Sumatra'. Two varieties of Triassic (Carnian?) marine mollusc Posidonia cf. kedahensis Kobayashi (A and B) from shaly horizon below M-L Triassic Sawahlunto Limestone in two localities NE of Padang, W Sumatra: S of Sawahlunto (E of Lake Singgkarak) and Sulit Air/ Mt Si Karikir (NE of Lake Singkarak). Associated with ammonite Trachyceras (Protrachyceras). Overlain by limestone with mollusc Paleocardita spp.))

Hasibuan, F. (2007)- A study on paleoflora (Permian) of Jambi, South Sumatera. In: Geologi Indonesia: dinamika dan produknya, Geol. Res. Dev. Centre (GRDC), Bandung, Spec. Publ. 33, 2, p. 135-147.
(Revisit of Mengkarang Fm along Merangin River, W of Bangko, W Jambi, by multi-disciplinary team in 2003. Mengkarang Fm 400m thick, basal basalt overlain by fluviatile system, with marine limestone beds ands shale interbeds containing fusulinids, crinoids, ammonites, and brachiopods. Two plant associations of Jambi Early Permian paleoflora, suggesting one new local and one probable S Cathaysian affinity paleofloral domain)

Hasibuan, F., S. Andi Mangga & Suyoko (2000)- *Stereochia semireticulatus* (Martin) dari Formasi Mengkarang, Jambi, Sumatra. Geol. Res. Dev. Centre, Seri Paleontologi 10, Bandung, p. 59-69.
(Permian brachiopods from Jambi series along Mengkarang River, SW of Bangko, C Sumatra. All belong to Stereochia semireticulatus (Martin), called Productus semireticulatus by Woodward (1879) (reclassified as Stereochia aff. S. irianensis by Crippa et al. 2014) (Sterochia believed to range from Sakmarian- Kungurian; Grant 1976; also known from Bitauni, Timor (Broili 1916) as Productus semireticulatus; JTvG))

Kadir, W.G.A., S. Sukmono, M.T. Zen, L. Hendrajaya & D. Santoso (1996)- Gravity evidence for the thinning of the crust around the North Sumatra area. Proc. 25th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 81-91.
(Structural discontinuity around N Sumatra effect of split in descending oceanic plate along continuation of Investigator Ridge Transform Fault. Discontinuity reflected by sharp change of Sumatra Fault, volcanic line offset and major changes to strike of Batee fault and Batee trench. Area around discontinuity low gravity anomaly with higher anomaly in center, indicating low density body of mantle material intruded by higher density igneous material in center. Gravity model pattern reflects thinning of crust beneath N Sumatra due to regional tensional stresses of mantle depth at ~20 km depth)

Katili, J.A. (1974)- Sumatra. In: A.M. Spencer (ed.) Mesozoic-Cenozoic orogenic belts, Geol. Soc., London, Spec. Publ. 4, p. 317-331.
(Brief review of Sumatra geology. Oldest known rock are of Permo-Carboniferous age, deposited in elongated marine basin, in which thick sequence of bathyal and neritic sediments was deposited. Pelitic sediments dominated, but also volcanic activity, at first mainly tuffs, but later also andesitic lavas, which alternated with thin limestone and shale. Triassic dominantly shale and sandstone in M. Triassic, mainly limestone and marl in U Triassic. In Gumai Mts. volcanic activity continued till E Cretaceous, when volcanic breccias andesitic lava flows formed in alternation with limestones. Main phase of folding in M Cretaceous, when all pre-Tertiary pelitic rocks deformed into isoclinal folds, accompanied by emplacement of granitic and granodioritic rocks. Uplift in younger Cretaceous. Old Andesites in Oligo-Miocene, etc.)

('The deposits of Simau, Residency of Bengkulu'. On gold-silver deposits in Simau (= Lebong Tandai) mine area, SW Sumatra. These mines were in production by 'Mijnbouw Maatschappij Simau' from 1910-1941 and connected to outside world only by 30km narrow guage rail line)

Koulakov, I., E. Kasatkina, N. Shapiro, C. Jaupart, A. Vasilevsky, S. El Khrepy, N. Al-Arifi & S. Smirnov (2016)- The feeder system of the Toba supervolcano from the slab to the shallow reservoir. Nature Communications 7, 12228, p. 1-12.
(online at: www.nature.com/ncomms/2016/160719/ncomms12228/pdf/ncomms12228.pdf)
(Toba Caldera site of several recent, large explosive eruptions, including world's largest Pleistocene eruption 74,000 years ago. Major cause may be subduction of fluid-rich Investigator Fracture Zone under continental crust of Sumatra and possible tear of slab. Seismic tomography model shows multi-level plumbing system. Large amounts of volatiles originate in subducting slab at of ~150 km depth, migrate up and cause melting in mantle wedge. Volatile-rich basic magmas accumulate at base of crust in a ~50,000 km3 reservoir. Overheated volatiles continue ascending through crust, cause melting of upper crust rocks, leading to shallow crustal reservoir responsible for supereruptions)

Koulakov, I., T. Yudistira, B.G. Luhr & Wandono (2009)- P, S velocity and VP/VS ratio beneath the Toba caldera complex (Northern Sumatra) from local earthquake tomography. Geophysical J. Int. 177, 3, p. 1121-1139.
(online at: https://academic.oup.com/gji/article/177/3/1121/625322)
(Local seismicity data beneath Lake Toba caldera and other volcanoes suggest negative P- and S-velocity anomalies of 18% in uppermost layer, 10-12% in lower crust and ~7% in uppermost mantle. At depth of 5 km beneath active volcanoes, small patterns (7-15 km size) with high VP/VS ratio that might be magma chambers with partially molten material. In mantle wedge vertical anomaly with low P and S velocities and high VP/VS ratio that link cluster of events at 120-140 km depth with Toba caldera, possibly image of ascending fluids/ melts released from subducted slab)

Kristanto, A.S. (1991)- Structural analysis of the Sumatran Fault Zone around the Semangka Bay. Proc. 20th Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, p. 354-375.
(Fault movements along Semangka segment of right-lateral Sumatra fault in Lampung intermittently active in at least 3 periods: (1) E-M Miocene NNE-SSW compression, creating Tabuan island, (2) Late Miocene? NE-SW extension creating Semangka Bay pull-apart structure; (3) E Pliocene (~5 Ma) WNW-ESE extension)

Krumbeck, L. (1914)- Obere Trias von Sumatra (Die Padang-Schichten von West-Sumatra nebst Anhang). Palaeontographica Suppl. IV, Beitrage Geologie Niederlandisch-Indien II, 3, p. 195-266.
(online at: http://sammlungen.ub.uni-frankfurt.de/botanik/periodical/pageview/4499569)
('Upper Triassic of Sumatra (The Padang Beds of West Sumatra)'. With review of geologic setting of Triassic beds E of Lake Singkarak in Padang Highlands by Verbeek (Triassic overlies Permocarboniferous granites, clastics and fusulinid limestones, described by Volz 1904, and overlain by Eocene sandstones of Ombilin Basin). Stratigraphy- paleontology of >210m thick U Triassic Padang beds from two main localities, Lurah Tambang and Bukit Kandung/Katialo. Poorly fossiliferous clastics with four layers of dark, marly fossiliferous, bituminous platy limestones, rich in thick-walled bivalves that look related to Carnian North Alpine 'Cardita facies': 38 species, incl. Pecten (Aequipecten) verbeeki, Myophoria myophoria, Cardita globiformis, Cassianella verbeeki n.sp., Gervilleia bouei, Pinna blanfordi, Halobia sumatrana n.sp., etc.. Most similar to fauna from Napeng Beds of Upper Myanmar as described by Healy (1908). (Also similar to Jurong Fauna of Singapore; Kobayashi & Tamura 1968) (Some species described earlier by Boettger 1881, but erroneously assigned E Eocene age; JTvG) (Absence of Misolia, despite same age as Fogi Beds of Buru?; JTvG))

McCarthy, A.J. & C.F. Elders (1997)- Cenozoic deformation in Sumatra: oblique subduction and the development of the Sumatran fault system. In: A.J. Fraser & S.J. Matthews (eds.) Petroleum Geology of SE Asia. Geol. Soc., London, Spec. Publ. 126, p. 355-363.
(Sumatra pre-Tertiary history of accretion was followed byPaleogene basin formation. Strong mid-Miocene inversion event recorded in onshore part of forearc basin in S Sumatra, same time as inception of seafloor spreading in Andaman Sea and probable inception of major strike-slip movement along the SFS, possibly following clockwise rotation of Sumatra towards it present NW-SE trend. SFS complex deformation history including polyphase reactivation of fault surfaces and contemporaneous strike-slip and orthogonal compression or extension. New estimate of ~150 km offset of Mesozoic units across SFS in C Sumatra proposed. Several basins formed along SFS in Quaternary)

McCarthy, A.J., B. Jasin & N.S. Haile (2001)- Middle Jurassic radiolarian chert, Indarung, Padang District, and its implications for the tectonic evolution of western Sumatra, Indonesia. J. Asian Earth Sci. 19, 1-2, p. 31-44.
(Radiolaria chert in Indarung Area, 10km E of Padang of Aalenian (lower M Jurassic) age. Beds dipping steeply to to SW. Lubuk Peraku Lst dated as U Jurassic- E Cretaceous based on occurrence of Lovcenipora (= Cladocoropsis?; JTvG). Interbedded with volcanics and limestone conglomerate/breccias, Interpreted as carbonate cap on seamount. Limestone overlain by Golok crystal tuffs (K/Ar age of ~105 ± 3 Ma/ Albian, but suspect?). M Jurassic Ngalau bedded chert probably faulted into younger limestone during Cretaceous ENE-directed compression. Radiolarian assemblage Aalenian or E Bajocian Transhsuum hisuikyoense Zone (= part of oceanic assemblage of Woyla Group: M- Late Cretaceous SW dipping accretionary prism with M Jurassic seafloor oceanic material and Late Jurassic volcanic seamount; JTvG)

McCloskey, J., D. Lange, F. Tilmann, S.S. Nalbant, A.F. Bell, D.H. Natawidjaja & A. Rietbrock (2010)- The September 2009 Padang earthquake. Nature Geoscience 3, February, p. 70-72.
(Mw= 7.6 earthquake of 30 September 2009 with epicenter WNW of Padang at depth of 80-90 km, within lower part of Wadati-Benioff zone. Did not rupture Sunda megathrust or relax stress on Mentawai segment)

McCourt, W.J. & E.J. Cobbing (1993)- The geochemistry, geochronology and tectonic setting of granitoid rocks from southern Sumatra, western Indonesia. South Sumatra Geol. Mineral Exploration Project (SSGMPE) Report 9, Geol. Res. Dev. Centre (GRDC), Bandung, p. *(Unpublished)*
(Includes Eocene (52-57 Ma) ages for Lassi granite/ diorite, 53-55 Ma and 129-169 Ma for Bungo batholith, 79-85 Ma for Padean granite, 111-113 Ma for Sulan pluton, 82-117 Ma for Garba Pluton, 138-149 Ma and 192 Ma for Sulit Air granite, etc. (Barber et al. 2005))

McCourt, W.J., M.J. Crow, E.J. Cobbing & T.C. Amin (1996)- Mesozoic and Cenozoic plutonic evolution of SE Asia: evidence from Sumatra, Indonesia. In: R. Hall & D. Blundell (eds.) Tectonic evolution of Southeast Asia, Geol. Soc., London, Spec. Publ. 106, p. 321-335.
(Barisan Mts of S Sumatra four periods of plutonic activity: Miocene-Pliocene (20-5 Ma), E Eocene (60-50 Ma), Mid-Late Cretaceous (117-80 Ma) and Jurassic-E Cretaceous (203-130 Ma). Also plutonic activity in Permian (287-256 Ma) and suggestions of magmatism in Late Triassic- E Jurassic (220-190 Ma) and M Jurassic-E Cretaceous (170-130 Ma). Ages from E Sumatra indicate Triassic- E Jurassic (240-195 Ma) tin-belt magmatism of Peninsular Malaysia Main Range extends into area. Plutonic suites in NW-SE trending belts. Breaks in plutonic activity correspond to changes in approach angle and/or rate of subduction, and in some instances relate to periods of collision and accretion of allochthonous material. At least two such events: early

M Cretaceous collision and accretion of oceanic Woyla terranes, and latest Cretaceous possible collision of continental sliver/block, the W Sumatra terrane to Sundaland margin)

Metcalfe, I. (1983)- Conodont faunas, age and correlation of the Alas Formation (Carboniferous), Sumatra. Geol. Magazine 120, 6, p. 737-746.
(Conodonts Spathognathodus campbelli, S. scitulus, Synprioniodina microdenta and Gnathodus girtyi rhodesi from NW Sumatra Alas Fm shelfal limestones suggest Late Visean (E Carboniferous) age, making it oldest dated formation on Sumatra. Previously single solitary coral identified as Allotropiophyllum sinense Grabau thought to indicate E Permian age. Brachiopods from same locality identified as Cleiothyridina and Marginalia or Inflatia, suggesting probable Visean age)

Metcalfe, I. (1986)- Conodont biostratigraphic studies in Sumatra: preliminary results. In: G.H. Teh & S. Paramananthan (eds.) Proc. 5th Reg. Congress Geology, Mineral and Energy Resources of SE Asia (GEOSEA V), Kuala Lumpur 1984, 2, Bull. Geol. Soc. Malaysia 20, p. 243-247.

(Network of 30 short-period seismic stations in 2014 recorded 1790 local earthquake events in 10 months in Central Aceh, N. Sumatra. Seismicity distribution correlates with active segments of Great Sumatra Fault and its main secondary faults)

Muksin, U., C. Haberland, K. Bauer & M. Weber (2013)- Three-dimensional upper crustal structure of the geothermal system in Tarutung (North Sumatra, Indonesia) revealed by seismic attenuation tomography. Geophysical J. Int. 195, p. 2037-2049.
(Geothermal potential in Tarutung controlled by Sumatra Fault system and young arc volcanism. Spatial distribution of seismic attenuation was used to map subsurface temperature anomalies and fluid distribution. In SW of Tarutung Basin high attenuation zone associated with Martimbang volcano. In Sarulla region anomaly along graben near Hopong caldera)

Muksin, U., C. Haberland, M. Nukman, K. Bauer & M. Weber (2014)- Detailed fault structure of the Tarutung pull-apart basin in Sumatra, Indonesia, derived from local earthquake data. J. Asian Earth Sci. 96, p. 123-131.
(Tarutung pull-apart basin in N central segment of dextral strike-slip Sumatran Fault System. Earthquake lineations reflect extensional duplex fault system and negative flower structure within basin. Focal mechanisms of events at edge of basin dominantly strike-slip type representing dextral strike-slip Sumatran Fault System. N-S striking normal fault events along extensional zones correlate with maximum principal stress direction which is direction of Indo-Australian plate motion)

Mulya, R.C. & D. Hendrawan (2014)- The Anjing Hitam underground zinc lead deposit, North Sumatra. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Indon. Soc. Econ. Geol. (MGEI) Ann. Conv., Palembang, p. 309-317.
(Anjing Hitam deposit large shale-hosted Zn-Pb system within Late Carboniferous or E Permian Tapanuli Gp in N Sumatra. Includes black shale-hosted massive sulfide Zn-Pb mineralisation, Zn mineralisation in veins, breccias, polymetallic Zn-Pb-Cu- Ag vein mineralisation and secondary Zn-Pb mineralisation Same as Dairi project of earlier authors)

Munasri, M.M. Mukti, H. Permana & A.M. Putra (2015)- Jejak subduksi Mesozoikum di Komplek Garba, Sumatra bagian Selatan berdasarkan fosil radiolaria dan data geokimia. In: H. Harjono et al. (eds.) Pros. Pemaparan Hasil Penelitian Geoteknologi 2015, Pusat Penelitian Geoteknologi (LIPI), Bandung, p. 63-72.
(online at: http://pustaka.geotek.lipi.go.id/wp-content/uploads/2016/04/Prosiding-2015.pdf
('Traces of Mesozoic subduction in the Garba Complex, S Sumatra, from radiolarian fossils and geochemical analysis'. In S Sumatra trace of Mesozoic subduction complex(es) exposed in Gumai, Garba and Gunung Kasih (Lampung). In SE Garba Mts subduction complex rocks from continental margin and from oceanic plates. Presence of island arc basalts and radiolaria of possible Triassic age)

Munasri & A.M. Putra (2019)- First evidence of Middle to Late Triassic radiolarians in the Garba mountains, South Sumatra, Indonesia. Island Arc 28, 3, 13p.
(M-L Triassic (Ladinian-Carnian) radiolaria in cherts of Situlanglang Member of Garba Fm, S Sumatra, which is generally regarded as of Late Jur assic- E Cretaceous age. With Annulotriassocampe sulovensis, Triassocampe postdeweveri, Spongotortilispinus tortilis, etc. May indicate deposition after collision of Sibumasu and East Malaya blocks. SitulanglangMember proposed to be contemporaneous with M-U Triassic Kualu and Tuhur Fms in N and C Sumatra)

Muraoka, H., M. Takahashi, H. Sundhoro, S. Dwipa, Y. Soeda, M. Momita & K. Shimada (2010)- Geothermal systems constrained by the Sumatran Fault and its pull-apart basins in Sumatra, Western Indonesia. Proc. World Geothermal Congress 2010, Bali, 8p.
(online at: http://b-dig.iie.org.mx/BibDig/P10-0464/pdf/1248.pdf)
(Two types of geothermal systems in Sumatra (1) on the slope of volcanic edifices and (2) in pull-apart basins along the Sumatran strike-slip fault zone. Thirteen pull-apart basins identified)

Musper, K.A.F.R. (1928)- Indragiri en Pelalawan. Uitkomsten van het mijnbouwkundig- geologisch onderzoek in de jaren 1922-1926. Jaarboek Mijnwezen Nederlandsch Oost-Indie 56 (1927), Verhandelingen 1, p. 1-245.
(Report on 1922-1926 geological-mining investigations in Indragiri and Pelalawan. Extensive geological descriptions and maps based on 5-year mapping program with 3 geologists in SW part of Central Sumatra basin and adjacent Barisan Range. With 1:25,000 scaledetail maps of anticlines (some later drilled by NKPM/Stanvac and contain Lirik- Japura, etc. oilfields; JTvG))

Musper, K.A.F.R. (1928)- Geologische waarnemingen in de Padangsche Bovenlanden, I. Over een voorkomen van Trias in de omgeving van Sawahloento. De Mijningenieur 9, 7, p. 124-127.
('Geological observations in the Padang Highlands, I. On an occurrence of Triassic in the area of Sawahlunto'. Sawahlunto at SW side of Tertiary Ombilin Basin. Pretertiary limestones SW of Sawahlunto originally believed to be Permian fusulinid-bearing limestones by Verbeek, but fusulinids are present only in reworked limestone clasts in basal Tertiary conglomerates. In-situ limestone series at least 500m thick, thin-bedded, and locally

rich in Triassic bivalve molluscs: Myophoria verbeeki, M. myophoria, Cardita globiformis, Gonodon sphaerioides, Anatina and possible Gervilleia (fauna described by Boettger 1881 and Krumbeck 1914) (limestones overlie Permian 'Silungkang Fm' diabase-shale series?; JTvG))

Musper, K.A.F.R. (1929)- Geologische waarnemingen in de Padangsche Bovenlanden, II. Het Si Karikir-gebergte. De Mijningenieur 10, 5, p. 112-118.
('Geological observations in the Padang Highlands, II. The Si Karikir Mountains'. Mountain chain between Ombilin River and Lake Singkarak composed of intensely folded, grey Upper Triassic limestone, similar to described in 1928 in Sawahlunto area. Limestone at least 750m thick, locally rich in molluscs (Cardita, Myophoria myophoria, Gervilleia, possible Gonodon sphaerioides; no Halobia), rare corals and ammonoids (Trachyceras, Cyrtopleurites, Drepanites). Limestones conformable over 'Kiezel en mergel schiefers' of Verbeek. Intruded by younger granodiorite of Mesozoic age, because erosional products present in E Tertiary)

Musper, K.A.F.R. (1930)- Beknopt verslag over uitkomsten van nieuwe geologische onderzoekingen in de Padangsche bovenlanden. Jaarboek Mijnwezen Nederlandsch Oost-Indie 58 (1929), Verhandelingen, p. 265-331.
('Brief report on the results of new geological investigations in the Padang Highlands. Fieldwork in 1927-1928, in area E of Lake Singkarak and surrounding Tertiary Ombilin Basin with its Eocene fish locality. Presence of folded limestones of (1) M Permian (Guguk Bulat and E of Lake Singkarak: fusulinid limestones interbedded with porphyrite/tuffs; see also Lange 1925), (2) Carboniferous (N of Moeko Moeko; with Paleozoic tabulate corals) and (3) >500m thick (Late?) Triassic (S of Sawah Loento; rich in Triassic bivalves Cardita, Myophoria, Gonodon) and ammonoid Trachyceras. Also Mesozoic granites and Tertiary sediments including basal Miocene/ Te limestones)

(Permian flora and fauna in intact positions in Mengkarang coal bearing formation in Jambi Province. Fossil flora includes Lepidodendracreae shaped stems and leaves of tree or branched fork-shape Sphenophyllaceae. Coal organic facies suggest deposition in swamp zone, in area surrounded by active volcanoes)

Nakano, M., H. Kumagai, S. Toda, R. Ando, T. Yamashina, H. Inoue & Sunarjo (2010)- Source model of an earthquake doublet that occurred in a pull-apart basin along the Sumatran fault, Indonesia. Geophysical J. Int. 181, p. 141-153.
(2007 earthquake doublet along Sumatran Fault Zone near Padang Panjang, C Sumatra. Focal mechanisms indicate right-lateral strike-slip faults, consistent with geometry of Sumatran fault. Both nucleated below N end of Lake Singkarak, which is pull-apart basin between Sumani and Sianok segments of Sumatran fault system)

Nash, J.M.W. (1929)- Radiolarienhoudende gesteenten van Sumatra. De Mijningenieur 10, 11, p. 249-255.
('Radiolarian-bearing rocks from Sumatra'. Many new localities with radiolarians in S Sumatra, but no age-diagnostic species identified. Listing of radiolarian-bearing rocks encountered across Sumatra:7 in S Palembang area (Muara Dua Massif= Garba Mts?), 1 in S Bengkulu, 1 near Singkarak Lake in W Sumatra (in Permian- Triassic transition beds),12 localities in Lampung Districts on middle peninsula of S Sumatra (some associated with E Cretaceous Orbitolina; in Ratai Bay red deep sea clay). No true radiolarites anywhere, but all interpreted as deep marine deposits (No ages given; probably ranging from Permian- Cretaceous; JTvG))

Nash, J.M.W. (1930)- De Trias ten zuiden van Sawah Loento. De Mijningenieur 11, 8, p. 159-164.
('The Triassic South of Sawahlunto'. In area S of Sawahlunto intensely folded Upper Triassic marls and limestone with bivalves Myophoria, Gervilleia, etc., mainly dipping to N-NE, unconformably overlain by Eocene and younger quartz sandstones. Triassic sediments intruded by augite-microdiorite porphyry in Jurassic or Cretaceous, during or after folding)

Natawidjaja, D.H. (2002)- Neotectonics of the Sumatran Fault and paleogeodesy of the Sumatran subduction zone. Ph.D. Thesis California Institute of Technology, Pasadena, p. 1-289.
(online at: http://thesis.library.caltech.edu/1939/)
(Australian-Indian plate is subducting under Sumatran plate boundary at ~60 mm/yr. Oblique convergence partitioned into trench-parallel slip, accommodated largely by Sumatran fault zone and trench-perpendicular slip, accommodated by subduction zone. Sumatran fault zone highly segmented. Largest geomorphic offsets along fault zone ~20 km, and may represent total offset across fault. Location of Sumatran fault and active volcanic arc highly correlated with shape and character of underlying subducting oceanic lithosphere. Coral microatolls in W Sumatra used to document evidence for deformation)

Natawidjaja, D.H. (2014)- The Sumatran Fault Zone: neotectonics, magmatism, and metal resources. In: I. Basuki & A.Z. Dahlius (eds.) Sundaland Resources, Proc. Ann. Conv. Indon. Soc. Econ. Geol. (MGEI), Palembang, p. 59-87.
(Extensive review of 1900km-long, trench-parallel Sumatran fault zone. SFZ highly segmented, with 18 major segments. Many volcanoes, geothermal activities and metal resources near breaks between segments and also on and around major fault traces. Maximum offsets of rivers and folds along fault ~20-25 km. Measured fault slip rates 10- 27 mm/year, suggesting presently active SFZ may only about 1-3 Myrs old, which correlates with ages of most of major gold mineralizations between 1-3 Ma)

Natawidjaja, D.H. (2018)- Updating active fault maps and slip rates along the Sumatran Fault Zone, Indonesia. Proc. Global Colloquium on GeoSciences and Engineering, Bandung 2017, IOP Conf. Series, Earth Environm. Science 118, 012001, p. 1-11.
(online at: http://iopscience.iop.org/article/10.1088/1755-1315/118/1/012001/pdf)

(Latest geological and GPS studies suggest slip rates along Sumatran Fault Zone ~15 mm/yr. Total amount of extension in the Sunda-strait marine grabens ~18.7 km, almost identical with largest geomorphic offset along SFZ. Sumatran fore-arc moving N along SFZ like rigid block instead of being stretched)

Natawidjaja, D.H. (2018)- Major bifurcations, slip rates, and a creeping segment of Sumatran Fault Zone in Tarutung-Sarulla-Sipirok-Padangsidempuan, Central Sumatra, Indonesia. Indonesian J. Geoscience 5, 2, p. 137-160.
(online at: http://ijog.bgl.esdm.go.id/index.php/IJOG/article/view/451/264)
(Study of active Tarutung-Sarulla-Sipirok-Padangsidempuan fault. Slip rates at Sianok to Renun segments ~14 mm/year. In bifurcation zone partitioned into ~9.3 mm/yr on Toru and ~4- 5 mm/yr on Angkola segment)

Natawidjaja, D.H., K. Bradley, M.R. Daryono, S. Aribowo & J. Herrin (2017)- Late Quaternary eruption of the Ranau Caldera and new geological slip rates of the Sumatran Fault Zone in Southern Sumatra, Indonesia. Geoscience Letters (AOGS) 4, 21, p. 1-15.
(online at: https://geoscienceletters.springeropen.com/articles/10.1186/s40562-017-0087-2)
(Paleosols buried under Ranau Tuff constrain large caldera-forming eruption to ~33,830-33,450 yrs BP. In N Sumatra lateral displacement of river channels incised into Ranau Tuff show right-lateral channel offsets of ~350 ± 50m (minimum slip rate 10.4 ± 1.5 mm/yr). S of Suoh pull-apart depression. In SW Sumatra West Semangko segment offsets Semangko River by 230 ± 60m, (slip rate of 6.8 ± 1.8 mm/yr))

Natawidjaja, D.H., L. Handayani & C. Widiwijayantani (1994)- Proses subduksi miring pengaruhnya terhadap variasi slip-rate sesar Sumatra serta deformasi pada busur depan: pendekatan model kuantitatif tektonik dan elemen hingga. Proc. 23rd Ann. Conv. Indon. Assoc. Geol. (IAGI), Jakarta, 1, p. 413-432.
(The oblique subduction process and its effects on slip-rate variation of the Sumatra fault and deformation of the forearc: quantitative tectonic model and finite element approach')

Natawidjaja, D.H. & W. Triyoso (2007)- The Sumatran fault zone- from source to hazard. J. Earthquake and Tsunami 1, 1, p. 21-47.
(Substantial portion of Sumatran oblique convergence accommodated by Sumatran fault. 1900 km-long active strike-slip fault, 20 major segments, ranging from ~60- 200 km. Slip rates along fault increase NW-ward, from ~5 mm/yr around Sunda Strait to 27 mm/yr around Toba Lake)

Neeb, E.A. (1902)- Verslag omtrent het onderzoek naar tinertsafzettingen in een gedeelte van Midden- Sumatra, omvattende de landschappen V. Kota, III. Kota Kampar, IV. Kota di Moedik, VII. Kota Kampar di Ilir, Rokan Kiri, IV. Kota, Koento, Ramba, Daloe-Daloe, Kapenoean en aangrenzende streken. Jaarboek Mijnwezen Nederlandsch Oost-Indie 31 (1902), p. 113-145.
('Report on the investigation of tin ore deposits in a part of C Sumatra, in the areas of Kota, Kota Kampar, etc.'. Oldest rocks slates and quartzites ('probably Silurian or Devonian', but no fossils), locally with crystalline limestone (Permian?). Concludes that, despite some local exploitation, there are no commercial tin deposits left in this part of C Sumatra. With two 1:100,000 scale geologic maps of Upper Kampar, Rokan Kiri rivers areas)

Ninkovich, D. (1976)- Late Cenozoic clockwise rotation of Sumatra. Earth Planetary Sci. Letters 29, p. 269-275.
(Clockwise rotation of Sumatra of ~20° about axis near Sunda Strait inferred from: (1) Sumatra volcanic arc at angle of 20° with volcanic arc farther E; (2) Benioff zone maximum depth of 600 km E of Sunda Strait, but decreases to 200 km NW along Sumatra island; (3) age of volcanic activity younging to NW (?). Increase in sea-floor spreading rate since 10 Ma pushed N Sumatra and Malaya NE for ~500 km along system of presently inactive faults, causing CW of Sumatra and Malaya. When this rotation ceased underthrusting of N Sumatra begin, producing shallow and short Benioff zone and delayed volcanic activity)

Ninkovich, D., N.J. Shackleton, A.A. Abdel-Monem, J.D. Obradovich & G. Izett (1978)- K-Ar age of the Pleistocene eruption of Toba, North Sumatra. Nature 276, p. 574-577.

(Late Pleistocene eruption of Toba is largest explosive eruption documented from Quaternary. K–Ar dating of the uppermost Toba Tuff (welded tuff along Asahan River) gives age of ~75,000 yr. Similar in composition to widepread ash layer in Indian Ocean deep sea cores and 1.5m thick ash bed at Tampan, W Malay Peninsula)

Ninkovich, D., R.S.J. Sparks & M.T. Ledbetter (1978)- The exceptional magnitude and intensity of the Toba eruption, Sumatra: an example of the use of deep-sea tephra layers as a geological tool. Bull. Volcanology 41, 3, p. 286-298.
(Eruption of Toba, N Sumatra at 75,000 yr BP, is largest magnitude Quaternary eruption. Produced largest-known caldera (100 x 30 km), surrounded by rhyolitic ignimbrite covering area of >20,000 km2. Associated deep-sea tephra layer found in piston cores in NE Indian Ocean covering minimum area of 5 M km2. Volume of ignimbrite and distal tephra fall deposit of Toba eruption at least 1000 km3 of dense rhyolitic magma. Eruption estimated to last 9-14 days)

Nishimura, S., E. Abe, J. Nishida, T. Yokoyama, A. Dharma, P. Hehanussa & F. Hehuwat (1984)- A gravity and volcanostratigraphic interpretation of the Lake Toba region, North Sumatra, Indonesia. Tectonophysics 109, p. 253-261, 265-272.

Osberger, R. (1954)- Die Geologie des Sibumbungebirges nebst Beschreibung der hier und in benachbarten Gebieten liegenden Ertzvorkommen (Mittel-Sumatra). Sitzungsberichte Osterreich. Akademie Wissenschaften, Math.-Naturwiss. Kl., 1, 163, 9-10, p. 689-723.
(online at: https://www.zobodat.at/pdf/SBAWW_163_0689-0723.pdf)
('The geology of the Sibumbun Mountains with description of associated and nearby ore occurrences (Central Sumatra)'. Summary of geology and copper and iron mineralizations associated with Carboniferous- Triassic

intrusives in area NE of Singkarak Lake, Padang province. At least 1400m thick Carboniferous-Permian-Triassic series, followed by non-deposition from Late Triassic to end-Mesozoic. Intruded by various intrusive rocks, from dacite to gabbro to granodiorite)

Osberger, R. (1955)- Uber Deckenbau und andere geologische Probleme im Pratertiair Sumatras. Neues Jahrbuch Geol. Palaont., Monatshefte 1955, 8, p. 321-341.
('On nappe structures and other geological problems in the Pre-Tertiary of Sumatra'. Assumes existence of nappe structure in Padang Highlands and Toba area of N Sumatra. Main thrusting was to NE and took place in post-Turonian Cretaceous time. Folding at depth in Tertiary responsible for movement to SW. Neither rock facies nor structural evidence supports view that root zone of nappes is in Riau islands or Malaya)

Osberger, R. (1956)- On the nappe structure and other geological problems in the Pre-Tertiary of Sumatra. 20th Sess. Int. Geological Congress, Mexico, 5, p. 411-420.
(Similar to paper above. Previous investigators showed nappe structures Jambi province, C Sumatra. Present studies confirmed existence of nappe in Padang highlands and probable existence of post-Turonian(?) 'Toba nappe' in E part of N Sumatra. Lithofacies studies indicate Permo-Carboniferous continent E of Malaya and Sumatra. Main thrusting was to NE in Cretaceous)

Ozawa, Y. (1929)- A new occurrence of *Schwagerina princeps* in Sumatra. Eclogae Geol. Helvetiae 22, p. 51-52.
(online at: http://retro.seals.ch/cntmng?type=pdf&rid=egh-001:1929:22::8&subp=hires)
(Short paper on fusulinids in Productus limestone of Teluk Gedang on Merangin River, below plant beds with Pecopteris ('Jambi Flora'; JTvG) of Garing River. Some already described by Lange (1925). Schwagerina princeps, Neoschwagerina craticulifera Fusulina japonica not reported from Sumatra before. (Schwagerina princeps from this locality re-described as Pseudoschwagerina meranginensis n.sp. by Thompson (1936))

Page, B.G.N. (1981)- Late Palaeozoic pebbly mudstones in Sumatra. In: M.J. Hambrey & W.B. Harland (eds.) Earth's pre-Pleistocene glacial record, Cambridge University Press, p. 337. *(Brief abstract only)*
(Pebbly mudstones dated as Carboniferous- E Permian found in Sumatra along Barisan Mountain Range. In places they are interbedded with limestones and calcareous siltstones. Glacial origin less likely than submarine mass-flow deposit along continental margin)

Page, B.G.N., J.D. Bennett, N.R. Cameron, D.M. Bridge, D.H. Jeffrey et al. (1979)- A review of the main structural and magmatic features of northern Sumatra. J. Geol. Soc., London, 136, 5, p. 569-579.
(Three main periods of Cenozoic volcanism in N Sumatra: E Oligocene, Oligo-Miocene and Miocene- Recent. Large transcurrent movements on SFS indicated by (a) regional slivers of oceanic crust trapped at leading junction of W continental plate as it moved NW against main mass of island; (b) paleomagnetic evidence showing E Sumatra as part of Malaya block and in equatorial position since Cretaceous, while paleolatitude of NW tip of Sumatra (W of SFS), was farther S; (c) juxtaposition of Li-rich and Li-poor geochemical provinces along SFS. Sumatran magmatic arc commenced at least in Mesozoic. Offset of current arc to E at Lake Toba ascribed to change in angle of Benioff Zone, divided by split in descending plate coincident with prolongation of Investigator transform fault)

Page, B.G.N. & R.D. Young (1981)- Anomalous geochemical patterns from northern Sumatra: their assessment in terms of mineral exploration and regional geology. J. Geochemical Exploration 15, p. 325-365.
(Stream sediment geochemical survey in Sumatra N of 4°N. Linear high-copper zone along axial Barisan Mts, derived from ophiolites and copper-rich calc-alkaline intrusives. High chromium over ophiolites. High lead E of linear copper zone and along oil and gas basins of E coast strip. High tin values W of copper-rich intrusives. Pattern does not conform to classic zonation of mineral deposits across simple subduction system. High Lithium values E Sumatran Fault System and virtually absent W of it)

Pardede, R. & K. Brata (1984)- Geologic map of the Sungaipenuh and Ketaun Quadrangles, Sumatra (Quadrangle 0812 and 0813), 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.
(see also 2nd Edition, Kusnama et al. 1995)

(Plio-Pleistocene uplift of Sundaland led to thrust wedge orogeny in N Sumatra Basin. Compressive structures in mountain front and continue to subsurface foreland. Thrust wedge developed in Pre-Tertiary stratigraphy and generated NW-SE thrusts along Barisan Mountain Front. Thrust wedge orogeny initiated since E Pliocene and transpressive deformation since Late Pliocene to Recent. Foreland setting developed in N Sumatra Basin, updating previous knowledge of strike-slip dominated basin inversion)

Putra, A.M. & Munasri (2016)- Characteristics of Radiolaria and its bearing rocks in the Garba mountains, South Sumatra. Proc. GEOSEA XIV and 45th Ann. Conv. Indon. Assoc. Geologists (IAGI) (GIC 2016), Bandung, p. 576-578.
(Massive chert of Situlanglang Mb of Garba Fm in Garba Mts with poor-moderate preserved radiolaria, low diversity and abundance. Presence of Triassocampe suggests Triassic age (older than supposed Jurassic-Cretaceous age of Woyla Group)

Putra, P.S. & E. Yulianto (2017)- Karakteristik endapan tsunami Krakatau 1883 di daerah Tarahan, Lampung. J. Riset Geologi Pertambangan (LIPI) 27, 1, p. 83-95.
(online at: http://jrisetgeotam.com/index.php/jrisgeotam/article/view/301/pdf)
('Characteristics of the 1883 Krakatau tsunami deposits in the Tarahan area, Lampung'. Tsunami deposit of 1883 Krakatau volcano eruption off Lampung Bay is f-c sand layer (10-30cm thick?) with pumice and volcanic ash. Shallow marine benthic foraminifera and molluscs show tsunami waves erode sea floor sediments down to 30-40m depth. Four fining upward patterns indicate at least four tsunami waves inundated study area.

Qiu, Z., X. Han, X. Jin, Y. Wang, & J. Zhu (2014)- Tephra records from abyssal sediments off western Sumatra in recent 135 ka: evidence from Core IR-GC1. Acta Oceanol. Sinica 33, 12, p. 75-80.
(Three volcanic ash layers in deep-sea Core IR-GC1 from NE Indian Ocean, adjacent to W Indonesian arc, ~1000km W of Lake Toba. Tephra dominated by glass shards with minor plagioclase, biotite, and hornblende. Layer A correlated to youngest Toba tuff (~76–80 ka), Layer B with older eruption of Toba caldera (~98-100 ka), Layer C (>135 ka) different composition and originated from another volcanic eruption event)

Rampino, M.R. & S.H. Ambrose (1992)- Volcanic winter in the Garden of Eden: the Toba supereruption and the late Pleistocene human population crash. Geol. Soc. America (GSA), Spec. Paper 345, p. 71-82.

Rampino, M.R. & S. Self (1992)- Volcanic winter and accelerated glaciation following the Toba super-eruption. Nature 359, 6390, p. 50-52.
(Eruption of Toba in Sumatra 73,500 years ago largest known explosive volcanic event in Late Quaternary. Model calculations of climatic effects of volcanic cloud suggest it may have produced 'volcanic winter', followed by few years surface-temperature decreases of 3-5 °C. Eruption during Stage 5a-4 transition of oxygen isotope record may have accelerated shift to glacial conditions that was already underway)

Rampino, M.R. & S. Self (1993)- Climate- volcanism feedback and the Toba eruption of ~74000 years ago. Quaternary Research 40, p. 269-280.
(Toba eruption (~74,000 yrs ago) during δ18O Stage 5a-4 transition period of rapid ice growth and falling global sea level, which may have been a factor in creating stresses that triggered volcanic event. Stratospheric dust and sulfuric acid aerosol clouds may have created brief cooling ('volcanic winter'), with N Hemisphere surface T decreases of ~3°-5°C. Summer T decreases of >10°C at high N latitudes adjacent to regions already covered by snow may have increased snow/ sea-ice extent, accelerating cooling already in progress)

Ratman, N. & G.P. Robinson (1999)- Umur batuan sedimen meta dan batugamping Mesozoikum di daerah Tembesi, Jambi, Sumatera Bagian Selatan. J. Geologi Sumberdaya Mineral 9, 89, p. 2-9.
('Age of Mesozoic metasediments and limestones in the Tembesi area, S Sumatra'. Middle? Jurassic- U Cretaceous 'flysch-type' accretionary wedge sediments of M Jurassic Asai Fm (but with Late Jurassic nannofossils?) and Late Jurassic- Cretaceous Rawas Fm, with some serpentinites W of Jambi and SW of Bangko (= Woyla Terrane of Pulunggono & Cameron 1984, Schieferbarisan of Tobler 1922). ?Unconformably overlain by Mersip Fm limestone Mb with Maastrichtian nannofossils (Watznaueria spp, etc.). Arai Granite with K-Ar age 141 Ma (earliest Cretaceous))

Reid, M.R. & J.A. Vazquez (2017)- Fitful and protracted magma assembly leading to a giant eruption, Youngest Toba Tuff, Indonesia. Geochem. Geophys. Geosystems 18, 1, p. 156-177.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2016GC006641/epdf)
(Eruption of 74 ka Youngest Toba Tuff of N Sumatra produced 2800 km3 of ignimbrite and coignimbrite ashfall. Relatively many zircons nucleated before earlier eruption at 501 ka, but most zircons yielded interior dates 100-300 ka thereafter. Zircon growth likely episodic over protracted time intervals of >100- >500 ka. Repeated magma recharge may have contributed to development of compositional zoning in YTT, but perturbations to magma reservoir over >400 ka did not lead to eruption until 74 ka)

Congress Carboniferous and Permian, Nanjing, J. of Stratigraphy 31, Suppl. 1, p. 138-139. *(Abstract only)*
(Fusulinids in Telok Gadang limestone bed at base of Mengkarang Fm (below E Permian 'Jambi flora'). Samples collected in 2004 contain Pseudoschwagerina meranginensis, Pseudofusulina rutschi, and others. Comparison with N Afghanistan study by Leven (1971) suggest Sakmarian age (Late Asselian age proposed by Vachard, 1989). Younger 21m-thick, dark gray, fusulinid limestone in Palepat Fm at Batu Impi (18 km W of Bangko) with Minojapanella, Toriyamaia, Praeskinnerella, Chalaroschwagerina, Paraschwagerina, etc., indicating Yakhtashian or Bolorian (= ~Artinskian- Kungurian) age, most probably Yakhtashian due to absence of Brevaxina and Misellina)

Ueno, K., S. Nishikawa, I.M.van Waveren, F. Hasibuan, Suyoko, P.L. de Boer, D.S. Chaney et al. (2006)- Early Permian fusuline faunas of the Mengkarang and Palepat Formations in the West Sumatra Block, Indonesia: their faunal characteristics, age and geotectonic implications. In: Proc. 2nd Int. Symp. Geological anatomy of East and South Asia, paleogeography and paleoenvironment in Eastern Tethys (IGCP 516), Quezon City, p. 98-102. *(Extended Abstract)*
(Rel. high diversity E Permian fusulinid assemblages in Bangko area of Jambi (W Sumatra Block), associated with famous 'Jambi flora'. Mengkarang Fm ~360m thick paralic clastics with intercalations of shallow marine limestone and thin coal seams. In lower part ~5m thick dark grey limestone at Telok Gedang on Merangin River, ~17 km SW of Bangko with Pseudoschwagerina and Pseudofusulina? suggesting Asselian age (N.B.: same genera as E coast of Peninsular Thailand= Sibumasu; Ingavat-Helmcke 1993?). Overlying Palepat Fm >200m arc volcanics with limestone interbeds with fusulinids (first described by Thompson 1938, Tien 1989).

Restudy of Batu Impi locality shows Minojapanella, Schubertella, Toriyamaia, Praeskinnerella, Chalaroschwagerina? and Paraschwagerina?, suggesting Artinskian- Kungurian age and Cathaysian/ Tethyan paleobiogeographic affinity (similar to E Malay Peninsula Terengganu Lst fauna described by Fontaine et al. 1998?; also similar age as basal Ratburi Lst in Sibumasu Block of Thailand?; JTvG))

(map online at: https://digitalcollections.universiteitleiden.nl/view/item/812709)
('Geological map of Sumatra 1: 200,000, 8 (Menggala Sheet)'. Coastal area of SE Sumatra, much of it coastal swamp. Slightly folded Late Miocene-Pliocene Middle Palembang lignite-bearing tuffaceous sandstones and lignite-free Upper Palembang Fm)

Van Tuijn, J. (1937)- Geologische kaart van Sumatra 1:200.000. Toelichting bij blad 9 (Gedongratoe). Dienst Mijnbouw Nederlandsch-Indie, Bandung, p. 1-37.
(map online at: https://digitalcollections.universiteitleiden.nl/view/item/813284)
('Geological map of Sumatra 1: 200,000, 9 (Gedongratu Sheet)'. Map sheet in SE Sumatra on Lampung Plateau, between sheet 8 (Menggala) in E and 10 (Baturaja) in W. Most outcrops are of Upper Palembang Fm. Oldest rocks are 'Old Andesites', overlain by marine Telisa Fm sediments with Miogypsina borneensis and M. indonesiensis (Younger than E Miocene Baturaja Limestone fauna). Lower Palembang Fm also with Miogypsina indonesiensis)

Van Tuijn, J. (1937)- Geologische kaart van Sumatra 1:200.000. Toelichting bij blad 13 (Wiralaga). Dienst Mijnbouw Nederlandsch-Indie, Bandung, p. 1-28.
(maponline at: https://digitalcollections.universiteitleiden.nl/view/item/814599)
(Geological map of Sumatra, Wiralaga sheet SE of Palembang. Mainly coastal plain, with low hills up to 25m elevation, composed of weakly folded, unfossiliferous (M-Late Miocene?) 'Middle Palembang Fm' tuffaceous deposits and lignites, surrounded by swamps area with near-recent sediments)

Van Valkenburg, S. (1922)- Geomorphologische beschouwingen over de Padangsche Bovenlanden. Jaarboek Topographischen dienst 1921, Batavia, p. 1-30.
('Geomorphologic observations on the Padang Highlands'. Geomorphologic description of W Sumatra highlands. Most of area underlain by folded Late Paleozoic- Mesozoic clastic sediments and limestones, intruded by Pretertiary granites and intruded/ overlain by Quaternary volcanics)

Van Waveren, I.M. (2019)- A morphometric analysis of *Tobleria bicuspis*, a *Voltziales* seed cone from the Early Permian Jambi palaeoflora, Sumatra (Indonesia). PhytoKeys 119, p. 67-95.
(online at: https://phytokeys.pensoft.net/article/29555/)
(Tobleria bicuspis Jongmans and Gothan is coniferophyte seed cone from E Permian Jambi flora, W Sumatra. Tobleria regarded as having a voltzian Voltziales affinity, but ~16-26 Myr older than other such cones (e.g. Euramerican Lebowskia))

Van Waveren, I.M., M. Booi, M.J. Crow, F. Hasibuan, J.H.A. van Konijnenburg-van Cittert, A.P. Perdono & S.K. Donovan (2018)- Depositional settings and changing composition of the Jambi palaeoflora within the Mengkarang Formation (Sumatra, Indonesia). Geological Journal 53, 6, p. 2969-2990.
(Merangin River section in W Sumatra exposes Lower Permian (late Asselian) Mengkarang Fm. Section ~400m thick, composed of 8 fining-upward of volcanic tuffs and volcaniclastic sedimentary rocks, incl. pyroclastic flows, overlain by their reworked alluvial products. Base of section marine, with common brachiopods. Zircon dating indicates duration of ~630,000 years (296.77 ± 0.04 near base to 296.14 ± 0.09 Ma near top). Change in paleobotanical composition from dominated by Cordaites, ferns or club mosses, to seed fern-dominant. Similar paleofloral trends observed in other areas of Paleotethys)

Van Waveren, I.M., M. Booi, J.H.A. van Konijnenburg van Cittert (2006)- Paleogeographic and ecologic aspects of the Early Permian flora of Sumatra (Indonesia). In: Galtier Conference, A life of ferns and gymnosperms, Montpellier April 2006, p. 29.
(Early Permian Jambi paleoflora is tropical wet flora, best matched to S Cathaysian floras, in accordance with reconstructions that place W Sumatra Terrane in contact with Indochina and S Cathaysia blocks)

Van Waveren, I.M., M. Booi, J.H.A. van Konijnenburg van Cittert, M.J. Crow & S.K. Donovan (2019)- Climate-driven biodiversity fluctuations on a volcanic slope from the low latitudes of the Paleotethys (early Permian, West Sumatra). 6th Int. Congress Agora Paleobotanica, Lille 2019, 1p. *(Abstract only)*

(Asselian Mengkarang Fm in Merangin section, W Sumatra, series of volcanic accretion wedges at foot of volcanic slope. Palaeoflora varies from tropical wet taxa (Cordaites and ferns) to mesic-xeric (seedferns). Paleofloral transition across 14 consecutive lahars shows gradual increase in ratios of gymnosperms (Macralethopteris hallei, Sphenopteris sp., Dicranophyllum molle, Tobleria bicuspis and gigantopterids). Highest ratio of gymnosperms interpreted as glacial maximum)

Van Waveren, I.M., F. Hasibuan, Suyoko, Makmur, P.L. de Boer, D. Chaney, K. Ueno, M. Booi et al. (2005)- Taphonomy, paleoecology and paleobotany and sedimentology of the Mengkarang Formation (Early Permian, Jambi, Sumatra, Indonesia). In: S.G. Lucas & K.E. Zeigler (eds.) The non-marine Permian, New Mexico Museum Natural History and Science, Bull. 30, p. 333-341.
(Mengkarang Fm W of Bangko is 360m thick Asselian-Sakmarian regressive sequence with 'Jambi Flora'. Floodplain deposits of meandering system follow marine and deltaic deposits. Bottom of section intrusive Triassic or Jurassic granite. Braided river deposits in upper part, followed by alluvial fan conglomerates. Both delta and braided river systems hold tree trunks and tree roots. Jambi Flora is North Cathaysian flora)

Van Waveren, I.M., E.A.P. Iskandar, M. Booi & J.H.A. van Konijnenburg-van Cittert (2007)- Composition and palaeogeographic position of the Early Permian Jambi flora from Sumatra. Scripta Geologica 135, p. 1-28.
(Online at: www.repository.naturalis.nl/document/144475)
(E Permian Jambi flora from Mengkareng Fm on W Sumatra Block first described by Posthumus (1927) and Jongmans & Gothan (1935). Revision of flora results in fewer taxa (60; 18 of which 'endemic'). Brachiopods and fusulinids indicate E Permian age (Asselian-Sakmarian?). Five groups of Pecopteris-type ferns. Paleogoniopteris and Gothanopteris considered to be primitive 'Cathaysian' gigantopterids. Posthumus (1927) reported presence of Walchia conifer, but this is Lepidodendrales. Comparisons with E Asian Permian floras of Cathaysian realm indicate Jambi paleoflora greatest similarity with (M Permian) Lower Shihhotse beds in N China, a relatively xeric Cathaysian flora, possibly indicative of relatively high latitude in S Hemisphere)

Vazquez, J.A. & M.R. Reid (2004)- Probing the accumulation history of the voluminous Toba magma. Science 305, 5686, p. 991-994.
(Age and compositional zonation in allanite crystals from Youngest Toba Tuff retain record of 150,000 years of magma storage and evolution. Subvolcanic magma relatively homogeneous for ~110,000 years. In 35,000 years before eruption diversity of melts increased as system grew in size before erupting 75,000 years ago)

Veldkamp, J. (1957)- Mechanism of shallow and intermediate earthquakes in Sumatra. Verhandelingen Kon. Nederl. Geol.-Mijnbouwkundig Gen., Geol. Serie 18 (Gedenkboek Vening Meinesz), p. 295-303.
(Mechanism of shallow earthquakes in Sumatra region points to widely variable stress systems)

Verbeek, R.D.M. (1875)- De fossielen in de kolenkalksteen van Sumatra's westkust. Jaarboek Mijnwezen Nederlandsch Oost-Indie 4 (1875), 2, p. 186-189.
('The fossils of the coal-limestone of Sumatra's west coast'. Kolenkalk ('coal-limestone') is Dutch term for Carboniferous limestone that underlies coal measures in NW Europe (and look like Permian limestones from Sumatra). Fusulinid limestones from Padang Highlands with brachiopods (Productus semireticulatus, Euomphalus, Spirifer, Streptorhynchus), trilobites (Phillipsia) and crinoids. No illustrations. (Fossils initially believed to be of Carboniferous age, but subsequently shown to be of E-M Permian age; JTvG))

Verbeek, R.D.M. (1875)- On the geology of Central Sumatra. Geol. Magazine, new ser., decade 2, 11, p. 477-486.
(Introduction to series of papers by Gunther, Rupert Jones, Woodward and Brady on Sumatra fossils collected by Verbeek in 1873-1874 in Padang Highlands of W Sumatra and Nias island. Oldest rocks in Padang Highlands are granites, overlain by Carboniferous or Permian with clay slate in lower and fusulinid limestone in upper part, intruded by probably younger quartz porphyries. Unconformably overlain by Tertiary sedments with basal breccias and marl-slates with Eocene fish and plant fossils (highly variable thickness), overlain by sandstones with clays and coals, (300-500m; with Ombilin coalfield), then marls (500m) and limestones rich in Orbitoides (120m). Finally middle-late Tertiary trachytic and andesitic volcanic series. With small map and two cross-sections)

('Chemical analysis of granitoid basement rock of the Jambi sub basin, South Sumatra, based on data from wells JSB-3, JSB-4 and JSB-6'. Pre-Tertiary granitoid basement rocks in wells JSB-3 (~1990m) intermediate-acid magma, calc-alkaline, medium-high K, metalluminous (subduction at active continental margin). Granitoids at JSB-4 (2654m) and JSB-6 (2342m) magnetite series and I type, probably extension of Thailand-Burma granite province)

Zen, M.T. (1970)- Origin of Lake Singkarak in the Padang Highlands (Central Sumatra). Inst. Teknologi Bandung (ITB) J. Science 5, 1, p. 1-8.
(online at: http://journals.itb.ac.id/index.php/jmfs/article/view/9736/3711)
Lake Singkarak in Padang Highlands previously interpreted as volcanic caldera, but Singkarak Trough is fault-bounded depression, and part of Sumatra Rift zone, stretching for 1650km from Sumatra's N tip to Semangko valley in SE, and already identified by Westerveld (1952), Katili (1967), etc.)

Zen, M.T. (1971)- Structural origin of Lake Singkarak in Central Sumatra. Bull. Volcanologique 35, 2, p. 453-461.
(Lake Singkarak neither volcanic ruin nor volcano-tectonic depression, but part of 1650 km graben zone along Sumatra's Semangko Fault zone. Lake results from damming process by volcanic material produced by Marapi-Singgalang-Tandikat volcanoes in N and from Talang volcano in S)

Zen, M.T. (1972)- The origin of several pyroclastic plateaux in the Padang Highlands (Central Sumatra). Proc. Inst. Tekn. Bandung (ITB) 6, 3, p. 81-88.
(online at: http://journal.itb.ac.id/index.php?li=article_detail&id=602)
(Several pyroclastic plateaux known in Padang Highlands. Westerveld (1952) suggested rhyolitic volcanics are sheet- like fissure eruptions/ ignimbrites. However, pyroclastic, plateau of Bukit Tinggi may be result of airborn tuff deposition from giant eruption of Maninjau volcano before caldera formation (exposure neither layered nor welded))

Zen, M.T. (1983)- Krakatau and the tectonic importance of Sunda Strait. Bull. Jurusan Geol. (ITB), 12, p. 9-22.

Zen, M.T. (1989)- Seismicity of the Sumatra fault zones. In: B. Situmorang (ed.) Proc. 6th Regional Conf. Geology mineral hydrocarbon resources of Southeast Asia (GEOSEA VI), Jakarta 1987, IAGI, p. 197-205.

(Earthquakes in W Sumatra either shallow and related to oblique subduction of Indian-Australian plate, or related to right-lateral Sumatra Fault)

Zhang, X., S.L. Chung, Y.M. Lai, A.A. Ghani, S. Murtadha, H.Y. Lee & C.C. Hsu (2018)- Detrital zircons dismember Sibumasu in East Gondwana. J. Geophysical Research, Solid Earth 123, 7, p. 6098-6110.
(Detrital zircon isotopic data from Sumatra. Scarcity of E Neoproterozoic (~970 Ma) zircons in West Sumatra (from Triassic and younger rocks), suggests no direct connection between W Sumatra and Cathaysia. Detrital zircons from E Sumatra (Permian Bohorok Fm) with age profiles similar to Lhasa, W Burma and W Australia. Zircon age patterns from Sibusima (= Sibumasu without East Sumatra) resemble S Qiangtang and Tethyan and High Himalaya terranes, most likely derived from N India. Requires disaggregation of Sibumasu, with East Sumatra and West Burma occupying position outboard Lhasa along NW Australian margin and Sibusima on N Greater Indian margin (NB: more important observation: Precambrian- Paleozoic zircon age profiles of supposed East and West Sumatra 'blocks' very similar and possibly single tectonic block?; HvG))

Zulkarnain, I. (2005)- Geochemical signatures of volcanic rocks related to gold mineralization: a case of volcanic rocks in Pasaman Area, West Sumatra, Indonesia. J. Riset Geologi Pertambangan (LIPI), 15, 1, p. 27-40.

Zulkarnain, I. (2007)- Variasi geokimia batuan volkanik daerah Bengkulu di sabuk pegunungan Bukit Barisan, Sumatera dan implikasi tektoniknya, Jurnal Teknologi Mineral (ITB) 14, 2, p. 89-102.
(‘Geochemical variation of volcanic rocks in the Bengkulu area in the Barisan mountain belt and tectonic implications’. Bengkulu volcanics derived from two sources. Magma “one” in E area indicates young (<30 Ma) and hot subducted slab involved in subduction, producing adakite-like volcanics. Geochemical character reflects backarc-side of volcanic arc)

Zulkarnain, I. (2007)- Geochemical character of Hulusimpang Formation volcanics around Kota Agung area, and their genetic implication. Jurnal Teknologi Mineral (ITB) 14, 3, p. 156-167.
(Hulusimpang Fm Oligocene- E Miocene volcanics mainly in S Sumatera Bengkulu and Lampung Provinces and associated with gold mineralization. Around Kota Agung bimodal medium-K calc-alkaline magmas of basalt and dacite. Absence of andesitic rocks indicates change from basaltic to dacitic caused by contamination processes instead of fractional crystallization or magmatic differentiation. REE diagrams suggest Hulusimpang Fm rocks derived from same magma source, similar to backarc 'magma one' of Bengkulu; Zulkarnain 2007)

Zulkarnain, I. (2008)- Petrogenesis batuan vulkanik daerah tambang emas Lebong Tandai, Provinsi Bengkulu, berdasarkan karakter geokimianya. J. Geologi Indonesia 3, 2, p. 57-73.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/220)
('Petrogenesis of volcanic rocks in the Lebong Tandai gold mine, Bengkulu Province, based on geochemical character'. Lebong Tandai in N Bengkulu known as gold mine since Dutch time. Hulusimpang Fm volcanics dominated by andesites with minor dacite and basalt, transitional between calc-alkaline and tholeiite. Derived from adakitic source. Magma activity since >30 Ma in back-arc environment. Gold mineralization corresponded with observation from Phillippine that adakitic rocks contain higher gold concentration than calc-alkaline rocks)

Zulkarnain, I. (2009)- Geochemical signature of Mesozoic volcanic and granitic rocks in Madina Regency area, North Sumatra, Indonesia, and its tectonic implication. J. Geologi Indonesia 4, 2, p. 117-131.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/246)
(Permian-Triassic basalts, Triassic-Jurassic granitic rocks, and Miocene andesite from Madina Regency area, W Sumatra Block. Three different geological settings proposed for W Sumatra Permian Plutonic-Volcanic Belt (1) island-arc, (2) subduction related continental margin arc and (3) continental break-up. Permian-Triassic Silungkang Fm basalts from Kotanopan and Muara Sipongi in Madina Regency low-K rocks of tholeiitic affinities, indicative of volcanism in back-arc marginal basin tectonic setting. Mesozoic granitic rocks and Miocene andesite reflect active continental margin)

Zulkarnain, I. (2011)- Geochemical evidence of island-arc origin for Sumatra Island; a new perspective based on volcanic rocks in Lampung Province, Indonesia. J. Geologi Indonesia 6, 4, p. 213-225.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/317)
(Volcanic rock chemistry from (young?) Lampung volcanics suggest suggests volcanics from W are from island-arc fragment and E part belongs to Eurasia continental margin. Collision zone between Sumatra island-arc fragments with Eurasia continental margin probably located along Sumatra Fault System)

Zulkarnain, I. (2012)- New geochemical data of island-arc origin for Sumatera: the Bengkulu case. J. Riset Geologi Pertambangan (LIPI) 22, 1, p. 11-23.
(online at: www.geotek.lipi.go.id/riset/index.php/jurnal/article/viewFile/45/5)
(Sumatra generally viewed as margin of Eurasia continental plate, where Indian oceanic plate is subducting beneath continental material. Subduction system produced magmatic rocks on Sumatera since Cretaceous. Chemical analyses of volcanic rocks from Bengkulu Province show island-arc signature in W and Active Continental Margin signatures in E, similar to results from Lampung area by Zulkarnain (2011). Sumatra continental margin probably ends along E side of Sumatera Fault Zone (ages of volcanic rocks not clearly described; JTvG))

Zulkarnain, I. (2014)- Geochemical evidence of island-arc origin in volcanic rocks of Central Sumatra. J. Riset Geologi Pertambangan (LIPI) 24, 1, p. 23-41.
(online at: http://jrisetgeotam.com/index.php/jrisgeotam/article/view/79/pdf_20)
(Geochemical signatures of trace elements in Pliocene- Recent volcanics in Painan and Muara Labuh in W Central Sumatera confirmed pattern of two volcanic belts (separated by Sumatra Fault Zone?): (1) island-arc tectonic environment in W (Painan; not part of continental margin of Eurasia) and (2) island-arc and continental tectonic environments in E (Solok; more common acidic rocks), similar to pattern found before in Lampung and Bengkulu areas of S Sumatra. Also evidence for third tectonic environment, reflecting back-arc tectonic setting)

Zulkarnain, I. (2016)- Sumatra is not a homogeneous segment of Gondwana derived continental blocks: a new sight based on geochemical signatures of Pasaman Volcanic in West Sumatra. J. Riset Geologi Pertambangan (LIPI) 26, 1, p. 1-13.
(online at: http://jrisetgeotam.com/index.php/jrisgeotam/article/view/271/pdf_84)
(Geochemical signatures of Miocene? Pasaman calk-alkaline volcanics from W Sumatra shows rocks derived from two different tectonic settings: active continental margin (10) and oceanic arc (5). Supports previous results in Lampung, Bengkulu and C Sumatra (but not clearly tied to geographic distribution/ terranes?; JTvG))

Zulkarnain, I., S. Indarto, Sudarsono & I. Setiawan (2005)- Geochemical signatures of volcanic rocks related to gold mineralization; a case of volcanic rocks in Pasaman area, West Sumatera, Indonesia. J. Riset Geologi Pertambangan (LIPI) 16, 1, p. 27-40.
(Gold deposits always associated with volcanics, but not all volcanics gold-bearing. Gold-bearing volcanics can be characterized with trace elements (<10 ppm Ytrium, depleted HREE, etc.))

Caughey, C.A. & T. Wahyudi (1993)- Gas reservoirs in the Lower Miocene Peutu Formation, Aceh Timur, Sumatra. Proc. 22nd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 191-218.
(Peutu Fm outcrops along Barisan Mts foothills vary from thin planktonic shaly beds to 75 m thick skeletal carbonates. Units dip E beneath coastal plain where gas-bearing carbonate buildups reach 300-500 m. Vuggy porosity in foram grainstones and coral boundstones. Platform facies thinner (50m), tight limestone, sandstone, and shale. Widespread gas-prone reservoirs in Peutu Lst. Exploration success depends on (1) field size: presence of buildups critical for commercial accumulations and (2) gas composition: Peutu reservoirs contain H_2S (generally manageable) and CO_2 (6- 82%). CO_2 from thermal decomposition of carbonates, highest where Peutu deeply buried and unconformably on Tampur dolomite or pre-Tertiary basement)

(Brief communication on presence of well-preserved leaves of fern plant fossil Meniscium proliferum from Late Miocene-Pliocene Upper Palembang Fm tuffs at Sungi Tjaban in Minyak Itam oilfield. No figures)

Christensen, A.N., C. Jones, L.B. Kocijan, H. Booth, S. Rouxel & B. Kunjan (2018)- Airborne gravity gradiometer survey over the Pelarang Anticline, onshore Kutai Basin, Indonesia. In: Proc. Australian Exploration Geoscience Conf. (AEGC 2018), Sydney, p. 1-6. *(Extended Abstract)*
(online at: www.publish.csiro.au/ex/pdf/ASEG2018abT7_3B)
(Pelarang Anticline part of NNE-SSW-trending Samarinda Anticlinorium in detached fold-thrust belt of onshore Kutai basin. Detachment fold, ~30km long, with steeply dipping flanks. Airborne gravity shows anticline associated with strong positive gravity anomaly, possibly from ~2000m high, high-pressured shale core. Two commercial hydrocarbon accumulations, Sambutan and Mutiara)

Clure, J. (1991)- Spreading centres and their effect on oil generation in the Sunda Region. Proc. 20th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 37-49.
(High-T spreading centre subducted beneath Sumatra, making cool area warmer. Indian Ocean crustal thickness thickens away from spreading centres, affecting Sunda Craton thermal regimes as spreading centres collided with craton. Wharton Ridge paleo-spreading centre collided with Sumatran subduction zone and created ridge/trench triple junction. Collision of Sunda Craton and W Sumatran spreading centre results in parts of trench with thinner crust and certain locations to be hotter. Outer arc basins usually considered non-prospective due to low thermal gradients caused by extra thickness of crust, but areas where spreading centre collides will only be slightly greater than one plate thick and warmer, increasing petroleum potential)

Clure, J. (2005)- Fuel resources: oil and gas. In: A.J. Barber, M.J. Crow & J.S. Milsom (eds.) Sumatra- geology, resources and tectonic evolution, Geol. Soc., London, Mem. 31, p. 131-141.

Clure, J. & N. Fiptiani (2002)- Hydrocarbon exploration in the Merang Triangle, South Sumatra Basin. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 803-824.
(Merang Triangle, S of Jambi, limited exploration. Talang Akar Fm production in Gelam Field in Baturaja carbonates and further stratigraphic potential highlighted. Plio-Pleistocene Sembilang High structural uplift resulted in erosion of thousands of feet. Uplift associated with regional tilt to SE, causing possible re-migration. Recent faulting broke up carbonate complex and off-reef platform facies now structurally higher than original reef crest, which resulted in earlier drilling missing build-up)

(Type and rank variation of Ombilin and Bukit Asam Tertiary coals assessed in 170 samples. Coals dominated by vitrinite, common liptinite and rare inertinite and mineral matter. Ombilin coals not affected by contact alteration vitrinite reflectances 0.53-0.83%, Bukit Asam coals not affected by contact alteration 0.30-0.57%. Higher vitrinite reflectance of some coals result of the local igneous intrusions in both areas (also in 36th Ann. Conv. IAGI, 2007, p. 464-470))

Davies, P.R. (1984)- Tertiary structural evolution and related hydrocarbon occurrences, North Sumatra Basin. Proc. 13th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 19-49.
(N Sumatra along trailing edge of counterclockwise (CCW) rotating 'Sunda Microplate' in Tertiary. Eocene-Lower Oligocene high-angle convergence between Sunda and Indian-Australian Plates generated N-propagating, dextral, overstepping wrench faults along W edge of microplate. Late Oligocene CCW rotation of Sunda Microplate result of rifting in Thai and Malay basins. N Sumatra basin developed in Late Oligocene- E Miocene as horst and graben structures between reactivated dextral wrench faults along W edge of microplate. E-M Miocene uplift reactivated earlier rifted structures of N Sumatra basin, causing widespread erosion, followed by subsidence and first marine deposits. Second phase of Sunda CCW rotation in late M Miocene, continuing to present day, caused by emplacement of oceanic crust in Andaman Sea. Renewed convergence since late M Miocene at less acute angle, causing compression, inception of subduction complex along W edge Sumatra, uplift of Barisan Mountains, and regressive sedimentation across N Sumatra basin. Evolution of N, C and S Sumatran basins essentially identical)

Davis, R.C., W.O. Ardjakusumah & I.S. Soemantri (1998)- Kinetic modeling of the Pematang-Sihapas(!) petroleum system, Malacca Strait PSC, Central Sumatra. Proc. 26th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 35-50.
(Principal and probably only source rock for Malacca PSC oil is Paleogene Pematang Group lacustrine Brown Shale Mb., mature in Bengkalis Graben. Modeling indicates discovery farthest from Bengkalis kitchen likely sourced by long distance migration (~25 km), as local sub-basin (Rangsang Trough) is immature. Other sub-basin (Padang Trough) highly mature due to very high geothermal gradient. Heating event responsible for petroleum expulsion extremely recent in C Sumatra Basin)

Dawson, W.C., W.R. Almon, J.B. Sangree & CALTEX Sequence Stratigraphy Team (2005)- Petroleum system and Miocene sequence stratigraphy: Central Sumatra Basin, Indonesia. In: P. Post et al. (eds.) Petroleum systems of divergent continental margin basins, Proc. 25th Gulf Coast Section SEPM (GCSSEPM) Foundation Annual Bob F. Perkins Research Conf., p. 987-1015.
(C Sumatra basin most prolific petroleum system in SE Asia. Oil sourced from Pematang Gp lacustrine Brown Shale in basal rift sequence, migrated vertically until thick paleosol horizon (25.5 Ma SB), then migrated to E margin of basin charging giant Minas and Duri fields. Erosional truncation (incised valley development) of

paleosols and faults provided windows for migration into overlying Miocene Sihapas Gp sandstone reservoirs. Incision common at 25.5, 22, 21, and 17.5 Ma sequence boundaries. Oil accumulated preferentially in basal transgressive sandstones. ~80% of recoverable oil in lower 21 Ma sequence (Bekasap Fm estuarine sst). Marine sandstones in 16.5 and 15.5Ma sequences, but fine-grained and low permeability. Regional top seal for Sihapas reservoirs is Telisa Gp shales of maximum Miocene transgression. Small oil accumulations in underlying Pematang Gp alluvial-fluvial- lacustrine sandstones poor reservoir and sealed by paleosols)

(Cenozoic stratigraphy of N and E parts of N Sumatra well established, from oil and gas exploration activities. Modified formation names proposed. Depositional model postulates presence off NW of Sumatra, of a chain of non-volcanic outer arc islands between 35/32 Ma- 18/17 Ma, similar to present Nias-Mentawai islands. E-M Miocene uplift of Asahan Arch and volcanism, mid-Miocene orogeny linked to initial opening of Andaman Sea, Late Miocene- Quaternary volcanism, and latest Plio-Pleistocene orogenic pulse)

Keil, K.F.G. (1931)- Over het ontstaan van karakteristieke kalk concreties in de Telisa-lagen aan den oostrand van het Goemai-gebergte. De Mijningenieur 12, p. 193-198.
('On the origin of characteristic calcareous concretions in the Telisa beds at the E margin of the Gumai Mountains'. Septarian nodules in E Miocene marine Telisa Fm, S Sumatra, formed by physical-chemical processes)

Kelley, P.A., B. Mertani & H.H. Williams (1995)- Brown Shale Formation: Paleogene lacustrine source rocks of Central Sumatra. In: B.J. Katz (ed.) Petroleum source rocks, Springer-Verlag, Berlin, p. 283-308.
(Review of geochemistry of M-L Eocene? organic-rich lacustrine Brown Shale Fm of Paleogene Pematang Gp. Brown Shale with fresh-water gastropods and algae. Hydrocarbon generation and expulsion from Brown Shale and Coal Zone Fms in Balam, Aman and Kiri Troughs began at ~10 Ma, followed by wet gas and condensate at ~5 Ma (earlier in Rangau and deeper Aman Troughs). Asymmetry of rift troughs drives dominant lateral migration of oil-gas towards gentle hinge margin. Minor vertical migration related to faults and fractures)

Kesumajana, A.H.P. (2009)- Pengaruh mekanisme pembentukan Cekungan tersier terhadap sejarah temperatur dan pembentukan hidrokarbon di Cekungan Sumatra Selatan. Dokt. Dissertation Inst. Teknologi Bandung (ITB), p. 1- . *(Unpublished)*
('The influence of the formation mechanism of a Tertiary Basin and temperature history and the formation of hydrocarbons in the South Sumatra Basin'. S Sumatra basin categorized as hot basin, with average of heat flow value of 108 mWm-2. Start of rifting phase in Late Oligocene (30-25 Ma) re-activating three patterns of old basement faults. Thermal modeling along 3 sections. Thermal model and gravity models indicate Moho depth at 15.6 - 19.5 km (thin crust). Heat flow increased at 15-5 Ma, with average of 117 mW/m2, corresponding with onset of Bukit Barisan volcanic activity. Early mature oil generation reached at 25.2 Ma, end of gas generation at 16 Ma. Top Oil window at 1433m depth)

Kesumajana, A.H.P., D. Noeradi, B. Sapiie & A. Priono (2010)- The role of hydrocarbon maturation modeling, a case study: South Sumatra Basin. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-G-147, 4p.
(Summary of thermal modeling study in S Sumatra basin from hydrocarbon maturity data. Five phases: (1) increase in heat flow during rift phase (30.5- 25 Ma), (2) decrease during sag phase (25- 20 Ma), (3) increase again due to magmatic activity (20- 10 Ma), (4) decline after cessation of magmatism (10- 1.6 Ma) and (5) final increase with final magmatic activity (1.6- 0 Ma).

Khiram, S.U., A.B. Samudra & A. Budianto (2013)- Biogenic gas exploration in Karangringin area, South Sumatra Basin, Indonesia. Proc. Joint Conv. Indon. Assoc. Geoph. (HAGI) - Indon. Assoc. Geol. (IAGI), Medan, JCM2013-0196, 5p.
(Karangringin area with shallow gas occurrences in Late Miocene Muara Enim Fm in wells Sagu 1, Siarak 1, etc.. Main gas reservoir 7-30' thick sand layer at 935-1310' below sea level. Carbon isotopic composition of gas (δ13C) -60.38‰ for methane and for C2 -32.28 and -35.13‰, suggesting biogenic origin)

Khiram, S.U., A.B. Samudra & A. Budianto (2014)- Biogenic gas exploration in Karangringin Area, South Sumatra Basin, Indonesia. Majalah Geologi Indonesia (IAGI) 29, 1, p. 85-99.

(Early geochemical study of hydrocarbon generation-migration of N Sumatra Basin. Adequate source rock believed to be confined to deeper basinal areas at level of Lower Miocene shales (today most models assume Eocene lacustrine and Oligocene coaly sources; same paper as Kingston (1978) below)

Kingston, J. (1978)- Oil and gas generation, migration and accumulation in the North Sumatra Basin. SEAPEX Proc. 4, Singapore 1977/78, p. 158-182.
(N Sumatra Tertiary source rocks are deep in basin and older than lower Middle Miocene; same as Kingston (1978))

Kirby, G.A., R.J. Morley, B. Humphreys, C.J. Matchette-Downes, M.J. Sarginson, G.K. Lott et al. (1993)- A re-evaluation of the regional geology and hydrocarbon prospectivity of the onshore central North Sumatra basin. Proc. 21st Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 243-264.
(BGS/ LEMIGAS study of onshore central N Sumatra Basin. Results indicate possibility of hydrocarbons in stratigraphic traps and closures in Miocene sediments and Paleogene half-grabens which are believed to have been source kitchens. Marine mudstones poor source potential for gas only. Source rocks probably lacustrine, very mature, located in Paleogene half grabens. Oil generation began at ~11 Ma in deepest of half-grabens)

Kirby, G.A., B. Situmorang & B. Setiardja (1989)- Seismic stratigraphy of the Baong and Keutapang Formations, North Sumatra Basin. Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 289-301.

(Seismic stratigraphy of M-L Miocene sandstones in Pertamina Unit I area, N Sumatra. Dominantly deltaic sequences of Keutapang Fm in S and marine Upper Baong Shale to N. Three phases of delta progradation. Clastic source directions mainly from SSW and SW, from rising Barisan Mountains. Besitang River Sst in NE from continental source in East)

Kjellgren, G.M. & H. Sugiharto (1989)- Oil geochemistry: a clue to the hydrocarbon history and prospectivity of the southeastern North Sumatra Basin, Indonesia. Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 363-384.
(Oils from onshore and offshore N Sumatra basin two separate phases. Oldest severely biodegraded and probably expelled from syn-rift E Oligocene Bampo Fm. Widespread post-rift Late Oligocene- M Miocene Lower Baong/Belumai Fm is source for second and final oil phase)

Koesoemadinata, R.P. & T. Matasak (1981)- Stratigraphy and sedimentation: Ombilin Basin, Central Sumatra (West Sumatra Province). Proc. 10th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 217-249.
(Ombilin basin asymmetric intermontane basin, folded in E part. Carboniferous Limestones (Kuantan Fm), Permian volcanics (Silungkang Fm) and Triassic sediments, intruded by granites. Paleocene Sangkarewang Fm lacustrine shales with fish fossils, interfingering with Brani Fm alluvial fan conglomerates. In NW these units overlain by probably Eocene coal bearing Sawahlunto Fm. Paleogene ~2600m thick, overlain by Ombilin Fm marine clay-marls (Lower Miocene), unconformably overlain by Ranau Fm Quaternary tuffs)

Koning, T. (1985)- Petroleum geology of the Ombilin intermontane basin, West Sumatra. Proc. 14th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 117-137.
(Sinamar No. 1 first oil exploration well in Tertiary intermontane basin in Indonesia. Ombilin Basin rel. small (~1500 km2), but up to 4600m of M Eocene -E Miocene sediments with significant depositional hiatuses. Massive debris flows and extensive alluvial fan deposits on basin margins and large Eocene lake in center. Uplift and erosion since M Miocene reduced Ombilin Basin to present area. Located in Sumatra magmatic arc, but temperature gradients cooler than Sumatra back-arc basins. Eocene lacustrine shales and Oligocene marine shales likely source rocks for hydrocarbons tested in Sinamar 1 and oil seeps along basin margins)

Koning, T. (1992)- Oil production from Pre-Tertiary basement rocks in Indonesia: examples from Sumatra and Kalimantan. AAPG Ann. Mtg. Calgary 1992 *(Abstract)*
(Beruk NE (1976) field in C Sumatra produces from pre-Tertiary basement. Beruk NE 1 tested 1680 BOD and ~2 MBO produced from metaquartzites, weathered argillites and granite. Radiometric ages E Permian- E Cretaceous. Unusual production problems due to reservoir variability, four separate oil-water contacts, and possible unrecognized water-bearing fracture systems. Tanjung field in Barito basin, S Kalimantan (1938), produced 21 MBO from Pre-Tertiary volcanics, pyroclastics and metamorphosed sandstones and claystones, locally weathered and fractured. Both fields faulted anticlines, and oil source rocks adjacent Tertiary shales)

Koning, T. & K. Aulia (2000)- Exploration in the Ombilin intermontane basin, West Sumatra. AAPG Int. Conf. Bali 2000. *(Abstract only)*
(Caltex 1984 Sinamar-1 first well in intermontane Ombilin Basin in Barisan Mts., with noncommercial oil and gas. Apache 1994 South Sinamar-1 was 1140m dry hole. Despite small area (1500 km2), up to 4600m of Tertiary sediments. Basin initially Early Tertiary intermontane trough with debris flows and alluvial fans on margins and Eocene lake in center. Uplift-erosion since M Miocene reduced original basin extent. Although in present-day magmatic arc and partially covered by volcanics, T gradients lower than Sumatra back-arc basins. Eocene lacustrine shales likely source for hydrocarbons in Sinamar-1 and two oil seeps along basin margin)

Koning, T. & F.X. Darmono (1984)- The geology of the Beruk Northeast Field, Central Sumatra; oil production from Pre-Tertiary basement rocks. Proc. 13th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 385-406.
(Beruk NE oil field in C Sumatra discovered in 1976. Tested 1680 BOPD from Pre-Tertiary fractured metaquartzites, weathered argillites, and weathered granite. Radiometric ages mainly Jurassic- E Cretaceous. Bohorok Fm pebbly mudstone in nearby Cucut 1 well contains E-M Carboniferous flora and granitic clast with Rb-Sr age of 348±10 Ma (Visean, E Carboniferous))

(Horizontal wells drilled by Chevron in C Sumatra Basin, mainly in Bekasap and Menggala sandstone reservoirs of 1960's Petani and Bekasap oil fields)

Morley, R.J. (1982)- A palaeoecological interpretation of a 10,000 year pollen record from Danau Padang, Central Sumatra, Indonesia. J. Biogeography 9, p. 151-190.

Morton, A.C., B. Humphreys, D.A. Dharmayanti & Sundoro (1994)- Palaeogeographic implications of the heavy mineral distribution in Miocene sandstones of the North Sumatra Basin. J. Southeast Asian Earth Sci. 10, 3-4, p. 177-190.
(Heavy minerals record changes in provenance in N Sumatra Basin. E Miocene Belumai Mb (Peutu Fm) sandstones derived from granitic terrain in E or SE. Uplift of Barisan Mts in early M Miocene led to introduction of sand from W or SW (Keutapang Fm), from metamorphosed pelitic rocks intruded by granites. Contemporaneous intermediate- acidic volcanic rocks also involved. Chrome spinel abundant in Lower Keutapang but rare in Upper Keutapang Mb, indicating ultramafic rocks important component of Barisan Mountain source in M Miocene, but insignificant by Late Miocene)

Moss, S.J. & A. Carter (1996)- Thermal histories of Tertiary sediments in western Central Sumatra, Indonesia. J. Southeast Asian Earth Sci. 14, 5, p. 351-371.
(AFT and OM data suggest Tertiary sediments exposed in Ombilin Basin have low-medium thermal maturities (Ro-average 0.39–0.50%). This suggests outcrops studied were not part of main Paleogene-Neogene graben system that was subsequently inverted, but likely represent marginal, rift shoulder sedimentation)

Moss, S.J. & C.G. Howells (1996)- An anomalously large liquefaction structure, Oligocene, Ombilin Basin, West Sumatra, Indonesia. J. Southeast Asian Earth Sci. 14, 1-2, p. 71-78.

Moulds, P.J. (1989)- Development of the Bengkalis Depression, Central Sumatra and its subsequent deformation- a model for other Sumatra grabens? Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 217-245.
(Bengkalis Depression N-S Paleogene graben complex: chain of interconnected lozenge-shaped depressions with several side grabens. Formed by extension, with complexities related to basement inhomogeneities. Neogene-Recent compression caused uplift, erosion and destruction of graben and its fill, progressively from S. Compression and tectonic overprinting of earlier extension produced major basement block uplift, normal fault rejuvenation and strike-slip faulting. Interplay of lines of basement weakness with structural grain and compression have produced variety of features: en echelon folds, chains of anticlines and Sunda Folds)

Mount, V. & J. Suppe (1992)- Present-day stress orientations adjacent to active strike-slip faults: California and Sumatra. J. Geophysical Research, Solid Earth, 97, B8, p. 11995-12013.
(Present-day stress directions from well bore breakouts near crustal-scale strike-slip faults (San Andreas in California and Great Sumatran fault in Sumatra) indicate maximum horizontal stress direction (SH) at high angle (70°-90°) to both faults. Young deformation from C and S Sumatra, as determined from borehole

breakouts in Stanvac wells, is compressional, indicating decoupling of strike-slip and compressional components of deformation within broadly transpressive zones)

Rashid, H., I.B. Sosrowidjojo & F.X. Widiarto (1998)- Musi Platform and Palembang High: a new look at the petroleum system. Proc. 26th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 265-276.
(Musi Platform and Palembang High in S Sumatra important exploration targets. Source rocks Lahat/ Lemat Fm Paleogene lacustrine shales and fluvio-deltaic to marginal marine Talang Akar shales- coals. Three oil groups: marine, lacustrine, deltaic. Palembang High oils fluvial-deltaic, probably mix of two oils from S and N Palembang High. Marine carbonate oil in condensate from Pre-Tertiary Basement fracture in Musi Platform)

Ratiwi, A.P. & Akmaluddin (2017)- Biostratigrafi nannofossil gampingan pada sumur 'SSB' sub-cekungan Palembang Selatan, Cekungan Sumatera Selatan. Proc. 10th Seminar Nasional Kebumian, Dept. Teknik Geologi, Universitas Gadjah Mada (UGM), Yogyakarta, PSP-01, p. 793-805.
('Calcareous nannofossil biostratigraphy of well 'SSB', South Palembang sub-basin, S Sumatra'. Nannofossils study of (unspecified) well, from Lahat to Air Benakat Formations. Five zones, from Sphenolithus ciperoensis (NP 25) to Reticulofenestra minuta (NN5). Age of Lahat Fm NP25-NN1 (25.2-24.3 Ma), Talang Akar Fm NN1-early NN2 (24.3-23.9 Ma), Baturaja Fm NN2-NN4 (23.9-17.6 Ma), Gumai Fm NN4-early NN5 (17.6-14.9 Ma), and Air Benakat Fm NN5 (14.9-14.8 Ma) or younger. Age of Lahat Fm younger than generally assumed Eocene (see also Agustin et al. 2017 for sequence strat interpretation of same well)

Reaves, C.M. (1996)- Variations in sour gas concentrations in the NSB 'A' Field, Offshore North Sumatra. Proc. 25th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 453-464.
(NSB 'A' field gas H_2S content <0.5% to >5%. CO_2 also variable. Variations in sour gas concentrations controlled by production of gas from formation water)

Reaves, C.M. & A. Sulaeman (1994)- Empirical models for predicting CO_2 concentrations in North Sumatra. Proc. 23rd Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 33-43.
(Up to 95% CO_2 in N Sumatra gases, primarily from inorganic sources. Empirical models developed which utilize reservoir lithology, temperature and pressure to calculate CO_2 concentrations. Principal mechanism controlling CO_2 in clastic reservoirs is interaction of silicate transformations and carbonate dissolution. Carbonate reservoirs exposed to significant up dip fluid flow will possess CO_2 concentrations representative of base or entry point of regional flow system)

Redfern, J. (1998)- The deep gas potential of the Batu Raja Formation in South Sumatra. a case history: the Singa gas discovery. Warta Geologi 24, 6, p. 309. *(Abstract only)*.
(Singa 1 gas discovery in E Miocene Baturaja Limestone in Lematang Trough at ~12,000' depth with 258' gross gas reservoir interval)

Redfern, J., P. Ebdale & S. Oesman (1998)- The deep gas potential of the Batu Raja Formation in South Sumatra. A case history : the Singa gas discovery. In: Offshore South East Asia Conf. (OSEA98), Singapore, SEAPEX, p. 123. *(Abstract only)*
(Singa 1 (1997) well tested Batu Raja reefal limestone buildup, deep in Lematang Trough (~12,000'), ~3000' deeper than any wells previously drilled in area. Tested gas at 30.7 MMSCFD from 258' gross interval)

Reksalegora, S.W. & P. Riadini (2013)- Critical parameters in basin modeling of Bungamas PSC, South Sumatra Basin. Proc. 37th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA13-G-109, p. 1-15.
(Bungamas PSC in SW margin of the S Sumatra Basin (W edge of S Palembang Sub-basin). Plio-Pleistocene compression resulted in formation of WNW-ESE trending folds Hydrocarbon generation model shows hydrocarbons in Bungamas PSC were generated mostly from kitchen in E half of block from Talang Akar and Gumai source rocks. Source rock started expelling hydrocarbon since M Miocene)

Renaud, G.P.A. (1885)- Onderzoek naar steenkolen ter westkust van Atjeh. Jaarboek Mijnwezen Nederlandsch-Indie 14 (1885), Wetenschappelijk Gedeelte, p. 131-157.
('Investigation of coal at the West coast of Aceh'. Brief survey of coal deposits near Taloq Penjupian in area of Tampat Tuan mountain, at rugged W coast of Aceh, N Sumatra. Claystone with two up to 60cm thick coal bed, dipping 35° and steeper. Associated with dense recrystallized limestones without clear fossils. Coals not deemed suitable for commercial exploitation. With 1:10,000 scale map)

Renaud, G.P.A. (1890)- Verslag van een onderzoek naar petroleum in Langkat. Jaarboek Mijnwezen Nederlandsch-Indie 19 (1890), Technisch Admin. Ged. 2, p. 1-9.

('Application of sequence stratigraphy on the Belumai- Peutau- Aru- Langkat Fms, N Sumatra basin')

Riadhy, S. & A. Sulaeman (1995)- The Baong reservoir distribution prediction using sequence stratigraphy analysis: a regional study in North Sumatra Basin. Proc. 24th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 581. *(Abstract only)*

(M Miocene Baong Fm with lower Baong shale (zones N8-N11 in age, overlain by M Miocene (N11) sandstone viewed as lowstand sand sourced mainly from Malacca Platform with minor contributions from Asahan Arch. Second package of sandstones, sourced from Malacca platform and prograded from that direction, interpreted as highstand to shelf margin systems tract. Shift in sediment supply from N (Malacca) to S (Barisan) during M Miocene zone N13, suggesting emergence of landmass to S. Prograding highstand sands following flooding event in zone N13, but less attractive exploration target due to poor quality and rel. thin sands)

Rich, P.V. & H.R. Marino-Hadiwardoyo (1977)- *Protoplotus beauforti*: the world's oldest member of the bird family Anhingidae. Geosurvey Newsletter 9, Direktorat Geologi, Bandung, p. .
(On water bird originally described by Lambert (1931) from Eocene lacustrine deposits of Ombilin Basin)

Richmond, W.C., H. Dwidjojuwono, A. Tastari & B. Toha (2002)- Reservoir compartmentalization: an integrated evaluation of supermature Minas oil field, Central Sumatra. Proc. 28th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 137-156.
(Minas oil field produced >4 BBO since early 1950's. NW-SE trending anticline. Main producing reservoirs, originally thought to be regionally continuous fluvial/deltaic sands, commonly compartmentalized due to complex stratigraphic-structural setting, with post-depositional diagenesis. Detailed depositional framework built using 1430 wells. Sequence stratigraphic framework of E Miocene Bekasap Fm reservoir 11 regionally correlatable flooding surfaces and five sequence boundaries in overall regressive-transgressive package)

Robinson, K.M. & A. Kamal (1988)- Hydrocarbon generation, migration and entrapment in the Kampar Block, Central Sumatra. Proc. 17th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 211-256.
(Kampar Block 3 oil types. Majority of oils in fields along Merbau and Lirik Trends plus Pekan and Binio Fields, sourced from deep lacustrine, non-marine algal Kelesa shales. Panduk and N Merbau probably sourced from lake edge, mainly terrestrial/minor algal Kelesa shales. Parum Field probably sourced from Kelesa or, Lakat coals and coaly shales. Generation of oils over narrow maturity range of Ro = 0.55- 0.64%. Lacustrine Kelesa shale source rock in deepest parts of S Bengkalis half graben. Lateral extent mapped by paleogeography of pre-29 mybp sequence. Source rock mature and in main to late phase of oil generation. Onset of major oil generation in Plio-Pleistocene, probably due to increase in heat flow. Distribution of oil fields fault controlled. Migration distance small (2-10 km). Quantification of oil charge to prospects/Fields along Lirik and Merbau Trends indicate Kelesa source can easily account for oil found in Block to date)

Rodriguez Maiz, N.D. (2012)- Source rock facies characterization from organic geochemistry in the Central Sumatra Basin, Indonesia. M.Sc Thesis University of Oklahoma, Norman, p. 1-106.
(Geochemical composition of 32 oil samples in C Sumatra Basin from Aman, Balam, Tanjung Medan, Kiri and Bengkalis Troughs. Oils derived from Eocene-Oligocene lacustrine Brown Shale Fm. Molecular and carbon isotopic composition reveal five source rock facies: (1) deep lacustrine; (2) shallow lacustrine; (3) saline lacustrine; (4) coal; (5) mixed coal/ lacustrine shale. Deep stratified lakes developed in Aman and Bengkalis Troughs. Oils in Kiri graben mainly from shallow lacustrine facies, oils S of Aman and Kiri grabens more saline lacustrine facies. Oils from coal and mixed coal/lacustrine shale facies restricted to N part of C Sumatra Basin. Oils in Aman Trough suggest paleoproductivity and paleoclimatic changes during source rock deposition, possibly associated with Eocene-Oligocene paleoclimatic transition)

Rodriguez, N.D. & R.P. Philp (2012)- Productivity and paleoclimatic controls on source rock character in the Aman Trough, north central Sumatra, Indonesia. Organic Geochem. 45, p. 18-28.
(C Sumatra Basin oil sourced from Brown Shale Fm of Pematang Gp. Oils in Aman Trough variable molecular and isotopic compositions, reflecting lateral facies variations in source rock. Source rock deposited in fresh to brackish water stratified lake with CO2 limiting conditions. Isotopic data indicate changes in paleoclimatic conditions, possibly associated with Eocene-Oligocene paleoclimatic transition)

Rodriguez, N.D. & R.P. Philp (2015)- Source rock facies distribution predicted from oil geochemistry in the Central Sumatra Basin, Indonesia. American Assoc. Petrol. Geol. (AAPG) Bull. 99, 11, p. 2005-2022.
(Composition of n-alkanes in 30 oil samples from C Sumatra Basin analyzed to determine facies variations in Eo-Oligocene Brown Shale Fm source rocks. Biomarkers indicate algal and terrigenous organic matter,

primarily under oxic or sub-oxic depositional conditions. Five source facies: deep lacustrine (dominant in Aman and Bengkalis Troughs), shallow lacustrine and lacustrine saline (S Aman and Kiri Troughs) to coal and mixed coal and lacustrine shale (N part of basin, in Tanjung Medan and N of Balam grabens))

(online at: https://ro.uow.edu.au/theses/2648/)
(Evaluation of undeveloped Banko Barat coal field SE of Tanjung Enim, S. Sumatra. Coal deposits in M-L Miocene Muaraenim Fm. Formation mainly in peat/swamp facies and subdivided into units, M1 to M4. M2 unit most important for economically mineable coal seams, with Manggus (A), Suban (B) and Petai (C) seams. Vitrinite reflectance relatively uniform; no evidence that Banko Barat coal affected by Bukit Asam intrusion)

Wang, Y.F., F.M. Budijanto, M.L. Johnson & R.S.A. Siringoringo (1989)- Neogene seismic sequences and structural styles in "B" and Peusangan Blocks, North Sumatra Basin, Indonesia. Proc. 18th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 339-361.
(Ten Neogene seismic sequences. E Miocene Peutu Fm deposited during rising sea level, with reefal buildups and subaerial erosion over highs; hemipelagic deposition in lows. M Miocene Baong Fm deep marine shales onlapped and buried highs. In Late Miocene Barisan Mts began emerging, with regressive Keutapang and Lower Seurula Fms. Pliocene U Seurula and Julu Rayeu Fms two prograding units, interrupted by four unconformities of possible eustatic origin. Sedimentation and structural style different across NW trending wrench fault on W flank of Arun-Cunda-Peusangan High. To E sedimentation more responsive to eustatic changes: sediments less disturbed and well-defined sequence boundaries. To W overpressure facilitates thrusting and slumping and wrench faults cut into shallow structures, complicating correlations)

Waren, R. & Dardji Noeradi (2010)- Reservoir geometry identification of tide dominated estuarine environment deposits and its implication to reservoir qualities: case study within the upper sand of Bekasap Formation, Gadang Field, Central Sumatra Basin, Indonesia. Proc. 34th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, IPA10-SG-043, 11p.
(Core description and well logs of Bekasap Fm in Gadang field, C Sumatra, suggest tide-dominated estuarine environment: WSW-ENE trending estuarine channels and tidal flat/ sand bar)

(Discussion of Gluyas & Oxtoby 1995 paper, disputing proposed rapid cementation rates)

Williams, H.H. & R.T. Eubank (1995)- Hydrocarbon habitat in the rift graben of the Central Sumatra Basin, Indonesia. In: J.J. Lambiase (ed.) Hydrocarbon habitat in rift basins, Geol. Soc. London, Spec. Publ. 80, p. 331-371.
(C Sumatra prolific oil attributed to graben sequences with thick organic-rich lacustrine shales, overlying marine sag sequence with excellent reservoirs, development of early structures and high heat flows. Geothermal gradient, average 3.38°F/100'. Distribution of oilfields largely fault controlled. Oil migrated vertically out of Eocene-Oligocene Pematang lacustrine shales and laterally up flanks of graben, generally in E direction, filling Miocene Sihapas Fm reservoirs. Hydrocarbos also in rift-fill sequence. Migration distance up to 20km. Differences in oils reflect different depositional and environmental histories of lake systems)

Williams, H.H., P.A. Kelley, J.S. Janks & R.M. Christensen (1985)- The Paleogene rift basin source rocks of Central Sumatra. Proc. 14th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 2, p. 58-90.
(Most of oil and gas in C Sumatra Basin Generated from organic-rich lacustrine shales of Eo-Oligocene Pematang Gp. Oils paraffin-based, with 4-30% wax. Large freshwater lake systems developed in structurally controlled rift basins. Palynology indicates mainly freshwater conditions (with common Pediastrum), but also occurrences of slightly saline conditions or occasional marine incursions)

Willis, B.J. & F. Fitris (2012)- Sequence stratigraphy of Miocene tide-influenced sandstones in the Minas Field, Sumatra, Indonesia. J. Sedimentary Res. 82, 6, p. 400-421.
(online at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.902.8446&rep=rep1&type=pdf)
(E Miocene Sihapas Group in Minas field, C Sumatra, composed of succession of 10s of m thick, erosionally based, tide-influenced sandstone intervals interbedded with marine shale intervals. Past interpretations suggested reservoir sandstone intervals are incised-valley deposits. New interpretation suggests tide-influenced shorelines. Five major reservoir intervals over low-grade metamorphic basement. Two older intervals multiple upward-coarsening tide-influenced regressive shoreline successions capped by thin marine shelf transgressive sandstone and shale. Upper three reservoir intervals 4th-order regressive shoreline deposits variably reworked by tidal currents, together comprising 3rd-order forward-stepping sequence set)

Yarmanto, T.L. Heidrick, Indrawardana & B.L. Strong (1995)- Tertiary tectonostratigraphic development of the Balam depocenter, Central Sumatra basin, Indonesia. Proc. 24th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, p. 33-45.
(Three major Tertiary tectonic- stratigraphic episodes in Balam Depocenter. Eocene (?)- Oligocene rifting (F1, ±45-25.5 Ma) created N-NNW-trending half-grabens. Balam depocenter compartmentalized. Rift margin faults N-S (Manggala) or NNW-SSE (Jakun and Balam) and dip E-ENE at low-angles. ENE-trending Antara-Nella Accommodation Zone (ANAZ) subdivides Balam Depocenter into shallow N and deep central sections. Regional base Miocene unconformity marks beginning of F2 tectonism (25.5-13.8 Ma). It cuts across basement platforms and F1 inversion structures and grades laterally into sag disconformities above F1 graben thicks. Isopach-lithofacies suggest N-S incised braided stream system. Final structuring (F3, 13.8 Ma- Recent) linked to widespread inversion of faults and folds. Giant Bangko and Balam S fields results of F3 structural episode)

(Model for interaction between strike-slip faulting and forearc basin evolution off NW Sumatra between 2°N and 7°N. In Simeulue- and Aceh forearc basins strike-slip faulting controlled forearc basin evolution since Late Miocene. The Mentawai Fault Zone N of Simeulue Island and probably connected to Sumatran Fault Zone until end Miocene. Simeulue Basin two major Neogene unconformities, documenting differences in subsidence evolution along N Sumatran margin linked to subduction processes and strike-slip deformation)

Berglar, K., C. Gaedicke, S. Ladage & H. Thole (2017)- The Mentawai forearc sliver off Sumatra: a model for a strike-slip duplex at a regional scale. Tectonophysics 710-711, p. 225-231.
(At Sumatran oblique convergent margin Mentawai and Sumatran Fault right-lateral fault zones accommodate most of trench- parallel component of strain and bound Mentawai forearc sliver that extends from Sunda Strait to Nicobar Islands. Set of wrench faults obliquely connect two major fault zones, separating at least four horses of regional strike-slip duplex forming forearc sliver, each comprising individual basin in forearc. Duplex formation started in M-L Miocene SW of Sunda Strait, then propagated N-wards over 2000 km until E Pliocene)

Berglar, K., C. Gaedicke, R. Lutz, D. Franke & Y.S. Djajadihardja (2008)- Neogene subsidence and stratigraphy of the Simeulue forearc basin, Northwest Sumatra. Marine Geology 253, p. 1-13.
(Simeulue forearc basin Neogene sedimentary fill up to 5s TWT. Three stages of subsidence evolution after formation of regional basal Neogene unconformity. E-M Miocene stage marked by subsidence in half grabens along W border of basin. Late Miocene/Pliocene change to steadily subsiding trench-parallel trough. Present setup of forearc region under influence of strike-slip faults due to oblique subduction active at least since this time as evidenced by wrench faulting. At end of this stage subsidence expanded significantly E-ward, drowning large carbonate platform that evolved in the then shallows and E parts of basin. Central part of Simeulue basin presently subject to inversion, probably related to reactivation of E-M Miocene half grabens)

Brennan, P.A. & J.H. Shaw (2005)- Wedge structure, Nias Basin, Sumatra, Indonesia. In: J.H. Shaw et al. (eds.) Seismic interpretation of contractional fault-related folds; an AAPG seismic atlas, American Assoc. Petrol. Geol. (AAPG), Studies in Geology 53, p. 141-143.
(Complex inversion structure on seismic in Nias basin between Nias Island and SW Sumatra. Miocene and younger sediments deposited over basement composed of earlier Tertiary subduction complex. Basin underwent E-M Miocene extension, followed by compression in Late Miocene, Pliocene and Pleistocene)

Bradley, K., Y. Qin, H. Carton, N. Hananto, F. Villanueva Robles, F. Leclerc, Wei Shengji, P. Tapponier et al. (2019)- Stratigraphic control of frontal decollement level and structural vergence and implications for tsunamigenic earthquake Hazard in Sumatra, Indonesia. Geochem. Geophys. Geosystems 20, 3, p. 1646-1664.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2018GC008025)
(Propagation of fault rupture to seafloor likely cause of enhanced tsunami generation during megathrust earthquakes. New seismic profiles and swath bathymetry reveal significant and systematic lateral variations in stratigraphic level of frontal Sunda megathrust and vergence of frontal ramp faults. Where ramp faults are uniformly seaward vergent, décollement on top of pelagic sediments. Where ramp faults bivergent décollement within the subducting clastic sequence above transparent distal fan muds. Where ramp faults uniformly landward vergent décollement directly on top of oceanic crust of subducting Investigator Fracture Zone)

Briggs, R.W., K. Sieh, W.H. Amidon, J. Galetzka, D. Prayudi, I. Suprihanto, N. Sastra, B. Suwargadi, D. Natawidjaja & T.G. Farr (2008)- Persistent elastic behavior above a megathrust rupture patch: Nias island, West Sumatra. J. Geophysical Research 113, B12406, p. 1-28.
(Fore-arc deformation quantified using fossil reefs. Elevated coral reef flats and chenier plains show outer arc island of Nias experienced slow long-term uplift and subsidence during Holocene, but island rose up to 2.9 m during Mw 8.7 Sunda megathrust rupture in 2005. Average uplift rates since mid-Holocene 1.5- 0.2 mm/yr, highest on E coast of Nias, where coseismic uplift was nearly zero in 2005)

Briggs, R.W., K. Sieh, A.J. Meltzner, D. Natawidjaja, J. Galetzka, B. Suwargadi et al. (2006)- Deformation and slip along the Sunda megathrust in the great 2005 Nias-Simeulue earthquake. Science 311, 5769, p. 1897-1901.
(Seismic rupture produced deformation above a 400-kilometer strip of Sunda megathrust, off N Sumatra. Trench-parallel belts of uplift up to 3m on outer-arc islands above rupture and 1 subsidence farther from trench. More than 11m of fault slip under islands)

Budhitrisna, T. (1989)- Melange di Pulau Pagai dan Pulau Sipora, Kepulauan Mentawai. Bull. Geol. Res. Dev. Centre 13, p. 1-8.
('Melange of Pagai and Sipora islands, Melawai Islands'. Islands off W Sumatra with basal melange of sheared rocks with clasts of ophiolite, pelagic sediments, metamorphics, etc., overlain by Miocene-Pliocene sediments)

Budhitrisna, T. & S. Andi Manggal (1990)- Geological map of the Pagai and Sipora Quadrangle (0712-0713), Sumatra, 1:250,000. Geol. Res. Dev. Centre (GRDC), Bandung.

Howles, A.C. (1984)- Structural and stratigraphic interpretation of the Bengkulu shelf, southwest Sumatra. M.Sc. Thesis University South Carolina, p. 1-94.

Howles, A.C. (1986)- Structural and stratigraphic evolution of the southwest Sumatran Bengkulu shelf. Proc. 15th Ann. Conv. Indon. Petroleum Assoc. (IPA), Jakarta, 1, p. 215-243.
(Paleogene basin with >10,000' sediment under Bengkulu shelf interpreted as continuation of S Sumatran graben system. Mid-Oligocene unconformity truncates basement high and signifies possible change in tectonic configuration of region. Switch of rapid subsidence from E side of basement high to W side with initiation of Sumatran forearc. Right-lateral slip along Sumatran fault began in M Miocene. Restoring ~150 km offset along Sumatran fault causes graben to line up with S Sumatra Benakat Gully. Neogene transgressive cycle began with deposition of E Miocene Baturaja carbonates. M Miocene Parigi carbonate between fine clastics and younger deltaic regressive sequence. Erosion of Barisan Mountains generated Plio-Pleistocene deltaic/slope deposits which prograde onto E flank of Sumatran forearc basin)

Huot, G. & S.C. Singh (2018)- Seismic evidence for fluid/gas beneath the Mentawai fore-arc basin, Central Sumatra. J. Geophysical Research, Solid Earth 123, 2, p. 957-976.
(Since 2004 three Mw > 8.0 earthquakes offshore Sumatra, rupturing megathrust and possibly also backthrusts that bound Andaman Islands to Mentawai Islands toward forearc basins. Tomography and waveform inversion in region of 2007 Mw 8.4 Bengkulu earthquake show low-velocity anomaly above backthrust, probably caused by small amount of gas (2-13%) or 17-40% of fluids. Fluids may originate locally from dewatering of sediments from accretionary wedge or forearc basin or of deeper origin)

Hupers, A., M.E. Torres, S. Owari, L.C. McNeill, B. Dugan, T.J. Henstock, K.L. Milliken, K.E. Petronotis, J. Backman et al. (2017)- Release of mineral-bound water prior to subduction tied to shallow seismogenic slip off Sumatra. Science 356, 6340, p. 841-844.

Icke, H. & K.Martin (1907)- Over Tertiaire en Kwartaire vormingen van het eiland Nias. Sammlungen Geol. Reichs-Museums Leiden, Ser. 1, 8, p. 204-252.
(online at: www.repository.naturalis.nl/document/552383)
('On Tertiary and Quaternary deposits of Nias Island'. Mainly descriptions of 51 species of gastropods and bivalve molluscs. With 5 plates, but no locality maps. Larger foraminifera from same samples studied by Douville (1912))

Izart, A., B.M. Kemal & J.A. Malod (1994)- Seismic stratigraphy and subsidence evolution of the northwest Sumatra fore-arc basin. Marine Geology 122, 1-2, p. 109-124.
(New seismic in Sumatra margin fore-arc. Area of oblique subduction with two large strike-slip faults parallel to subduction trench: onshore Sumatra fault and offshore Mentawai fault, separating accretionary prism from fore-arc basin. Widespread truncation at Top Paleogene reflects uplift and erosion event. Followed by Miocene

subsidence, evidenced by two transgressive-regressive shelf sequences. In Pliocene-Quaternary fore-arc basin segmented into several sub-basins (Aceh, Simeulue and Nias basins) by compressional zones or strike-slip faults. Subsidence rate increased, producing sequence 3 for Pliocene, and 4 for Quaternary. Local variations in sediment thickness indicate tectonics prevail over eustacy)

Kallagher, H.J. (1989)- The structural and stratigraphic evolution of the Sunda Forearc basin, North Sumatra. Ph.D. Thesis University of London, p. 1-387. *(Unpublished)*

Kallagher, H.J. (1990)- K-Ar dating of selected igneous samples from the Sibolga Basin, Meulaboh and Semeulue Island, Western Sumatra. Lemigas Scientific Contr. 14, 1, Spec. Issue, p. 99-111.
(Biotite from granodiorite in Seumayam Complex in Barisan Mts K-Ar age of ~98.6 Ma; biotites from Meuko River granodiorite ~56.2 and 53.2 Ma, compatible with Cretaceous- E Paleogene granitic activity recorded elsewhere in N Sumatra. Gabbro from E Simeulue ophiolite 35.4± 3.6 and 40.1 ± 2.7 Ma (Late Eocene), possibly representing formation as part of Indian Ocean floor. Basaltic- andesitic volcanics from Barisan Mts on E margin of Sibolga Basin 16- 9 Ma (M-L Miocene). Start of volcanic activity in M Miocene coincided with uplift of Barisan Mts along E margin of Sibolga Basin (E- M Miocene sediments only minor evidence of contemporaneous volcanic activity))

Karig, D.E. (1980)- Material transport within accretionary prisms and the "knocker" problem. J. Geology 88, 1, p. 27-39.
(On presence of high-pressure metamorphic rocks as blocks (knockers) and thrust sheets within non-metamorphic rocks in accretionary complexes. Using analog of modern Sumatra trench system, where deformation is concentrated near base of trench slope, whereas blueschist formation is assumed to occur much deeper. Mixing of incompatible lithologies in subduction complexes might better be explained by strike-slip faulting along trends sub-parallel to arc)

Karig, D.E., M.K. Lawrence, G.F. Moore & J.R. Curray (1980)- Structural framework of the fore-arc basin, NW Sumatra. J. Geol. Soc. London 137, p. 77-91.
(Sumatra fore-arc basin subsiding trough between rising subduction complex and elevated continental core. Up to 4 km of Miocene-Recent on E flank of basin over unconformity cut across Paleogene continental margin that was uplifted and disrupted in Late Oligocene. Large step-like offsets of paleo-shelf edge attributed to right-lateral strike-slip faults, splaying across fore-arc from Sumatra Fault Zone. Offsets up to 100 km+, producing marginal re-entrants that became sites of turbidite-filled basins behind growing Neogene accretionary prism. Larger re-entrants may be floored with oceanic crust. Seaward flank of fore-arc basin migrated W during Neogene subduction. By late M Miocene, trench slope break was near sea level and formed shelf edge high. Thrusting and folding related to subduction probably decreased gradually upslope until LatePliocene, when large flexures and E-directed reverse faults developed)

Karig, D.E., G.F. Moore, J.R. Curray & M.B. Lawrence (1980)- Morphology and shallow structure of the lower trench slope off Nias Island, Sunda Arc. In: D.E. Hayes (ed.) The tectonic and geologic evolution of Southeast Asian seas and islands-1, American Geophys. Union (AGU), Geophys. Monograph 23, p. 179-208.
(In Sunda Arc subduction system 90% of shortening due to plate convergence occurs in distal accretionary prism, within 25 km of trench. Deformation in slope basins decreases rapidly upward as age decreases)

Karig, D.E., S. Suparka, G.F. Moore & P.E. Hehunassa (1978)- Structure and Cenozoic evolution of the Sunda Arc in the Central Sumatra region. UN ESCAP, CCOP Techn. Bull. 12, p. 43-86.
(Same paper as Karig et al. 1978 below)

Karig, D.E., S. Suparka, G.F. Moore & P.E. Hehunassa (1978)- Structure and Cenozoic evolution of the Sunda Arc in the Central Sumatra region. In: J.S. Watkins et al. (eds.) Geological and geophysical investigations of continental margins, American Assoc. Petrol. Geol. (AAPG), Mem. 29, p. 223-237.
(W Sumatra margin reflects effects of subduction and right-lateral slip. Nias consists of mid-Tertiary melange and less deformed younger beds. Forearc basin at least 4km sediment. Unconformity around Paleogene-

Miocene boundary. Inner shelf and coastal mountains common Oligocene andesitic intrusives and volcanics (farther W than younger and older volcanic centers). Major uplift of Barisan Mts in Late Miocene- Pliocene)
